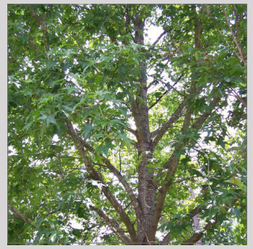
Landscape plant materials are living, dynamic, sustainable natural systems that define form, space and order in the urban environment. The design intent for the use of plant material is to provide for the health safety and welfare of people and our environment. Plant material also adds interest, ornamentation and when thoughtfully located, can provide aesthetic continuity, reduce noise and reduce pollution. Relief from exposure to the elements and to unsightly elements may be achieved by landscape screens and tree canopies. All planting material should fit the climate, design character and maintenance requirements for which they are planted. Urban environments present unique challenges to the health of vegetation including the effects of pollution, and damage from pedestrians, maintenance and automobiles. Specific site conditions must be fully understood prior to plant selection. Micro-climates and soil conditions are key factors that determine where and which plant material will thrive. Ultimately, plant material should be selected that is safe, maintenance friendly and use / treat water efficiently and effectively.

FIG. 14

RECOMMENDED STREET TREES



▶AMERICAN SWEETGUM
LIQUIDAMBAR STYRACIFLUA

- Medium-sized tree growing 65 to 115' tall, with a trunk up to 6.5' in diameter.
- The leaves look somewhat similar to maples; are a dark green and glossy, and in most cases turn orange, red, and purple colors in autumn.

▶CALIFORNIA FAN PALM
WASHINGTONIA FILIFERA

- Native to Southern California;
- Grows up to 75' in good growing conditions.
- When the leaves die they bend downwards and form a skirt around the trunk.

▶TORREY PINENUT
PINUS TORREYANA

- A broad, open-crowned pine growing 25 to 50' tall with long needles growing in groups of five.
- Grows slowly in dry, sandy soil.

▶INDIAN LAUREL FIG
FICUS NITIDA

- A small to medium-sized evergreen tree with smooth gray bark, aerial roots, upright growing branches and very dense foliage.
- Grows 30 to 60' tall, with a 30' spread; does well in full sun.

▶LONDON PLANE
PLATANUS X HISPANICA

- Large deciduous tree growing from 65 to 115' tall, with a trunk up to 10' or more in circumference.
- Its leaves are thick and stiff-textured and the bark is usually pale grey-green and smooth.

2.3.3 GENERAL LANDSCAPE PLANTING MATERIAL GUIDELINES

2.3.3.1 TREES

Trees are generally the most monumental and enduring of the plant materials and can ultimately determine the success of a landscape design. Significant to trees are their presence, character and role in the landscape. Trees vary in shape, color, texture and scale, and can be a focal point in the form of a specimen or massed to define a space. They can frame and / or screen views, noise and wind, and provide shelter in the form of shade and wildlife habitat. Trees can be a valuable component of stormwater treatment and management and help to clean the air. Specific to urban design, trees can unify districts visually and create continuous pedestrian-scale spaces that link commercial and non-commercial streets and neighborhoods. The urban environment is more comfortable and safe when there are trees to provide shade, beauty and amenity. For recommended street trees, please see Fig. 14 (left).

▶LOCATION

- Protect and preserve existing trees to be saved.
- The placement of street trees should respond to the use of the street as well as adjacent land uses. A variety of species that have similar characteristics are encouraged for continuity and to avoid the challenges of over planting a single species.
- Plant only a single species where the design concept is to unify an area.
- Plant trees for mature growth that will fit a space or define the desired public space.
- Consider mature tree size and maintenance while designing to avoid conflicts with signs, lights, overhead and underground utilities, utility poles and fire hydrants. Ensure that trees have adequate room to grow.
- Plant trees 25' on center for most species. Reduced spacing may be appropriate depending on the space and species.
- When planting or replacing trees adjacent to existing trees, select new trees of similar characteristics to those being replaced including form, scale, texture, and color.
- Maintain minimum sight triangle and corner triangle distances for safe view of oncoming traffic and pedestrians.
- Trees must not interfere with visibility of traffic control devices, especially at intersections.
- Trees adjacent to alleys should be located per code.
- Trees should be located a minimum of 54" from the face of the curb.
- The location of trees should not conflict with the performance of street lights. Individual species and site conditions will vary.
- All trees should be located and adjusted as necessary to ensure the drivers visibility of regulatory signs.

▶SIZE

- Trees should be large enough when planted to provide beneficial shade and meet the design criteria for which they are intended (eg. street trees should define the clear route of travel and when appropriate create a sense of separation from automobile circulation).
- Street trees in tree grates (high pedestrian traffic areas) should be 3" caliper minimum with high branching for a variety of reasons, including pedestrian safety.
- The branching height of mature trees on the pedestrian side of the street should be no less than 8' above the sidewalk.
- The branching height of mature trees on the automobile traffic side of the street should be no less than 13' – 6" above the sidewalk. Special consideration should be given to the location and maintenance of trees adjacent to bus stops.

▶SELECTION

- Street trees should be thornless and fruitless to minimize pedestrian hazards and maintenance. The form should ideally be single trunked with upright growth. Trees should be strong wooded, resistant to disease and insects and have a medium to long life expectancy.
- Trees selected to be located adjacent to station area identification signage and retail store fronts should not obstruct signage.
- Trees that require minimal water should be considered. Irrigation must be designed to deliver the appropriate amount of water to each tree with minimal waste until the tree is established (typically two years). Ideally, trees will provide water quality treatment characteristics as a component of a stormwater drainage treatment system.
- Small varieties of thornless and fruitless trees may be used where lower branching habit will not interfere with pedestrians, vehicles or driver visibility.

FIG. 15

RECOMMENDED SHRUBS

▶BUSH POPPY
DENDROMCON RIGIDA / D. HARFORDII

- A native California evergreen shrub growing up to 6' tall.
- Can be maintained at 3'.
- Leaves are blue-gray-green and the bush is covered in yellow blooms.
- Very drought tolerant once established.

▶CLEVELAND SAGE
SALVIA CLEVELANDII

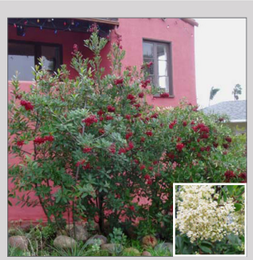
- A California native with graceful silvery-green leaves, arching branches, and whorls of purple flowers in spring and summer.
- Grows up to 4' tall.

▶COFFEEBERRY
RHAMNUS CALIFORNICA

- Attractive native California shrub, 6 to 8' high.
- Bears black berries and tolerates all soil types.
- Ideal as a background or screen plant.

▶REDBERRY
RHAMNUS CROCEA

- Medium evergreen California native shrub.
- Grows 4 to 10' tall, as wide as it is tall.
- Tight clusters of small, waxy, pinkish-white flowers give way to red berries in springtime.



▶CHRISTMAS BERRY, HOLLY BERRY OR TOYON
HETEROMELES ARBUTIFOLIA

- This California native is an evergreen shrub that produces delicate white flowers and large clusters of red berries that birds love.
- Can be pruned into a small tree.

2.3.3.2 SHRUBS – DESIGN PRINCIPLE

Shrubs are the most varied and versatile of planting materials and provide numerous shapes, colors and textures. Shrubs can be ornamental and often massed to define space. They frame and / or screen views, help buffer noise and screen against wind. Shrubs are also elemental in stormwater treatment and stormwater management and help clean the air. Specific to urban design, shrubs must be carefully selected and located so as not to create unsafe conditions (eg. define spaces that are not defensible and feel unsafe). Shrubs can unify districts visually and create continuous pedestrian-scale spaces that link commercial and non-commercial streets and neighborhoods. Shrubs make the urban environment more comfortable and safe by providing beauty and streetscape amenity.
For recommended shrubs, please see Fig. 15 (left).

▶LOCATION

- Locate shrubs to define focal point (eg. specimen planting).
- Massing / grouping: locate masses or groups of shrubs to be a focal for ornament.
- Locate shrubs to screen unsightly views, wind and noise.
- Locate shrubs to provide fencing for safety.
- Locate shrubs to define access and circulation routes.

▶SIZE

Anticipate full growth. However, the installed plant size should be large enough and in quantity to provide the intended effect.

FIG. 16

RECOMMENDED GROUNDCOVER & CLIMBING VINES

▶BEACH STRAWBERRY
FRAGARIA CALIFORNICA / FRAGARIA CHILOENSIS

- Forms lush, compact mat 4-6" high.
- Glossy dark green leaves and white flowers.
- Mow or cut back annually to force new growth.

▶GERMANDER OR WALL GERMANDER
TEUCRIUM CHAMAEDRYS OR T. X LUCIDRYS

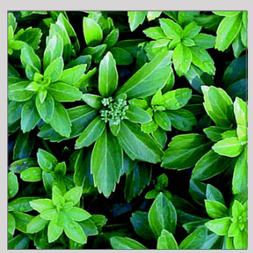
- This plant can be sheared into a neat groundcover or allowed to grow to a full height (about 1').
- Produces lavender flowers in the spring.

▶ASIAN JASMINE OR IVORY STAR JASMINE
TRACHELOSPERMUM ASIATICUM

- Evergreen, vining groundcover up to 20' across.
- Has glossy, dark green leaves and pale yellow, pinwheel-shaped flowers with a jasmine scent.

▶SAN DIEGO MARSH ELDER
IVA HAYESIANA

- This fast-growing native is widely used for slope coverage and erosion control.
- Grows 1 to 2' tall and 4 to 6' across with inconspicuous flowers.
- Summer watering will help maintain a more lush appearance.
- Prune annually.



▶PACHYSANDRA
PACHYSANDRA TERMINALIS

- Grows slowly but has a crisp, neat growth form.
- New foliage is bright green, changing to dark green with age.
- Small white flowers on 1 to 2" spikes.
- Withstands shade and is widely used under trees.

Note: The species listed are preferred for their dependability, relative low maintenance and drought resistance.

2.3.3.3 GROUNDCOVER & CLIMBING VINES – DESIGN PRINCIPLE

Groundcovers and vines provide functional and aesthetic benefits. Visual effects include consistent form, texture, color and seasonal color. Groundcovers define circulation routes when combined with trees and shrubs, can cover large areas and can facilitate the separation of pedestrians and automobiles. Vines can also function as groundcovers, however they are more effective on walls and / or structures, particularly as a component of a green wall system.

Groundcovers and vines are used to create a consistent carpet of plant material. Mixed species for ornament are not necessarily appropriate for urban design. For groundcovers to be successful they must create a tight, dense planting. Groundcovers require minimal water and maintenance once established, however, they will require adequate water and maintenance until they are established and will tolerate only minimal foot traffic.

Turf, if planted, should be planted on prepared soil from sod or seed using water conserving sod or seed. Seeding allows for greater turf selection but requires approximately six months of regular maintenance to become established. Newly seeded areas require protection from pedestrians and must be kept moist until the seed germinates.

For recommended groundcover and climbing vines, please see Fig. 16 (left).

FIG. 17

RECOMMENDED PERENNIAL GRASSES

▶SAN DIEGO SEDGE
CAREX SPISSA

- This large sedge has a form similar to that of an ornamental grass.
- Produces gray leaves to 5 feet tall and yellow, grass-like flowers in the spring.

▶CALIFORNIA FESCUE
FESTUCA CALIFORNICA

- Flowering stalks rise to 5' above large clumped grass (2-3' tall) in late spring, early summer.
- Striking appearance and good adaptability, with clumps holding their shape well throughout the year.

▶DEER GRASS
MUHLENBERGIA RIGENS

- This large, perennial, California native has dense clusters of narrow, bright green leaf blades and tall, slender flower stalks.
- Bold enough to be used as a focal point of the garden.
- Once established, is extremely drought tolerant.

▶GIANT WILD RYE
LEYMUS CONDENSATUS

- Large clumping grass 4-5' across and reaches 6-8' tall in bloom.
- Distinct silver-gray foliage.
- Prune annually to encourage new growth.

▶BLUE OAT GRASS
HELICTOTRICHON SEMPERVIRENS

- Evergreen, bright blue-gray, with narrow leaves in fountain-like clump.
- Grows 2-3' high and wide.
- Stems bear straw-colored flower clusters.

Note: The species listed are preferred for their dependability, relative low maintenance and drought resistance.

2.3.3.4 PERENNIAL GRASSES – DESIGN PRINCIPLE

Perennial grasses, like shrubs, are varied and versatile planting materials. Grasses provide numerous shapes, colors and textures. Grasses can be ornamental and / or massed to define space and can also frame and / or screen views, noise and wind. Grasses are also elemental in stormwater treatment and management and help to clean the air. Specific to urban design, grasses must be carefully selected and located to not create unsafe conditions (eg. define spaces that are not defensible and feel unsafe). Grasses can, however, help to unify districts visually and create continuous pedestrian-scale spaces that link commercial and non-commercial streets and neighborhoods. Grasses also make the urban environment more comfortable and safe by providing beauty and amenity. For recommended perennial grasses, please see Fig. 17 (left).

▶LOCATION

- Locate grasses to define focal point (eg. specimen planting).
- Locate masses or groups of grasses to be a focus, or for ornament.
- Locate grasses for screening of unsightly views, wind and noise.
- Locate grasses to provide fencing for safety.
- Locate grasses to define access and circulation routes.

▶SIZE

Anticipate full growth. However, the installed plant size should be large enough and in quantity to provide the intended effect.

2.3.3.5 ANNUALS – DESIGN PRINCIPLE

Annual and perennial flowers are not recommended except in planter pots and or in hanging baskets.

◀ Site furnishings can double as seating and planters.

◀ Seating with lighting.

◀ (Left) Banner pole; (Right) Green wall.

2.3.4 SITE FURNISHINGS

Site furnishings are functional, attractive and important components of the urban landscape. Site furnishings promote safety by defining circulation routes and activating spaces. Combinations of site furnishings vary with use and will contribute to the definition and potential unity of spaces. A thoughtful composition of furnishings will provide comfort and articulate an aesthetic identity. High quality materials and finishes should be specified to provide beauty, durability and minimize maintenance.

▶DESIGN GUIDELINES TYPICAL OF ALL SITE FURNISHINGS

- Design and selection should be complementary to the design intent of the project and vernacular, or other furnishings.
- Design and materials must be durable, high quality and low maintenance.
- Furnishings must be mounted securely to paving or structure and per manufactures specification unless otherwise specified.
- Refer to ADA standards, uniform building code and local code for minimum code requirements.

▶DESIGN PRINCIPLES & GUIDELINES SPECIFIC TO INDIVIDUAL URBAN DESIGN ELEMENTS

The following are design principles and guidelines specific to individual urban design elements and in addition to the Design Guidelines Typical of All Site Furnishings previously defined.

2.3.4.1 GATEWAY MARKERS & BANNER POLES

Gateway markers and banner poles should be designed as a component of a unified family of site furnishings that are designed to define a district or neighborhood. The unification of components embraces all furnishings. Vertical elements are commonly the most prominent and include but are not limited to gateway markers, lighting and signage. Design considerations include layout, proportion, selection of materials and detail design. Ultimately, the scale of a design is developed for the pedestrian. However, the mass transit and motor vehicles need to be considered in regard to design speeds and visibility. A variety of scales may also be considered in regard to the program of the space, the architecture and a hierarchy of entrances.

▶DESIGN GUIDELINES

- Locate to be unobtrusive yet visible and adjacent to primary circulation.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.2 WALLS

Walls primarily facilitate grade change (retaining walls) and definition of space, and they direct or screen views and / or weather. Walls further define circulation and depending on their height, can provide seating opportunities. Safety concerns focus on excessive height and the appropriate safeguards when grade transitions exceed 30". The design and layout of walls in a pedestrian-friendly urban landscape should never create indefensible or unsafe conditions. In addition to environmental benefits, green walls can add interest, ornament, reduce scale and provide continuity when transitioning from urban spaces to buildings.

▶DESIGN GUIDELINES

- See Design Guidelines Typical of All Site Furnishings.

◀ Seating on the side, facing activity.

◀ Paving defines scale, order and identity.

◀ Seating, surfacing and tree grates contribute to an area's identity.

2.3.4.3 SEATING

Perhaps more than any other furnishing, seating activates urban spaces. Seating is typically adjacent to pedestrian routes and may provide a place to rest, socialize and enjoy the urban landscape. Seating may be located in shady places, sunny places and oriented towards interesting or scenic vistas. Seating can also function as walls and planters. The dimensions of the following guidelines are included as they are recognized as standards. Creativity is encouraged as long as health, safety and welfare criteria are met.

▶DESIGN GUIDELINES

- Seating height: 16" – 18" high.
- Seating depth: 16" for seats without backs and 14" with backs.
- Walls or ledges may be 12" – 20" high and ideally 16" wide.
- Walls designed for seating on both sides should be 30" wide.
- Seating orientation should back to a wall or mass and not to major circulation routes. Additional orientations include back-to-back, face-to-face for conversation and if solitary, perpendicular to circulation routes.
- Locate seating 3' clear of circulation.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.4 SURFACING

Paving is an important element in urban design and a component of the framework for organization, articulation and the safe design of spaces. Permeable paving is an environmentally conscious consideration and applicable when site conditions are appropriate. Non-slip textures, colors and patterns that clearly define uses and circulation should be considered. The design concept may consider the paving as neutral background or may be ornate to create a focal point or a pattern to define order, scale and identity. The application may be designed to define a single space or perhaps add continuity to two or more spaces.

▶DESIGN GUIDELINES

- Emphasize circulation routes.
- Style (eg. formal, informal, organic).
- Cost and maintenance: material, installation, maintenance.
- Construction and strength / use: rigid or flexible pedestrian, vehicular.
- Bonding and jointing: visual, practical, structural.
- Material selection relative to context.

2.3.4.5 TREE GRATES

Tree grates are an appealing application for protecting trees and maintaining a continuous grade around trees. Their design can include artwork that expresses the local community and should be designed to complement other furnishings and ultimately unify the urban landscape. Special applications may include the articulation of green street planters with specially designed grates to accommodate pedestrian seating, bike racks and other site furnishings.

▶DESIGN GUIDELINES

- Tree grates should be at least 6' × 6' and fit the tree planter opening.
- Ideally, the design of the tree grate should relate to the paving pattern and site furnishings. Openings in the design of the tree grate pattern cannot exceed ¼".
- The design of the tree grate must allow for adequate tree growth.
- Tree grates should be securely attached, but designed for easy removal for maintenance.
- See also Design Guidelines Typical of All Site Furnishings.

◀ Typical handrail for stairs.

◀ Simple and elegant trash receptacle.

◀ Bollards help to separate cars from the pedestrian realm.

◀ Bike racks present an opportunity to reflect the character of the local community through their design. This bicycle rack is integrated with the metal grate / ventilation shaft.

2.3.4.6 FENCING & RAILINGS

Fencing and railings may protect people from unsafe conditions, further define circulation and separate uses. Fencing and railings also facilitate definition of space and may direct or screen views and / or weather. They also provide an opportunity for ornament and artistic expression and should relate to the vernacular of other furnishings. Rails may be used for leaning instead of seating to accommodate short-term respite.

▶DESIGN GUIDELINES

- Handrail height is typically 32".
- Guardrail height is typically 48".
- Guardrails adjacent to bike ramps are typically 52".
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.7 TRASH RECEPTACLES

Trash receptacles provide an opportunity for ornament and artistic expression and should relate to the vernacular of furnishings. Their location should be easily accessible for use and maintenance. Their functional design should facilitate effective storage of refuse and recycling.

▶DESIGN GUIDELINES

- Locate adjacent to activity nodes in sight of, but not adjacent to, seating areas.
- Trash receptacles should be securely constructed and anchored, but designed for easy removal of waste.
- Trash receptacles should be unobtrusive yet visible.
- Receptacles should include covered tops and sealed bottoms.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.8 BOLLARDS

Bollards may protect people from unsafe conditions, control circulation, separate uses and subtly facilitate definition of space. They also provide an opportunity for ornament, artistic expression and should relate to the vernacular of furnishings. Bollards may include lighting.

▶DESIGN GUIDELINES

- Locate 2½' from curb face.
- Locate 36" clear of each other and any other furnishings.
- Locate 60" clear of each other for primary circulation.
- Some bollards may be removable for maintenance and emergency access.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.9 BIKE RACKS

Bike racks are an efficient application for bike storage. Their design can include artwork that expresses the character of the local community and should be designed to complement other furnishings and ultimately unify the urban landscape. Special applications may include the articulation of green street planters with specially designed racks to accompany pedestrian seating and other site furnishings.

▶DESIGN GUIDELINES

- Locate in close proximity to mass transit stations, but do not allow bike racks to interfere with circulation.
- The rack must be designed to allow both the frame and one wheel to be simultaneously secured to the structure.
- See also Design Guidelines Typical of All Site Furnishings.

◀ Kiosks provide useful information and showcase advertisements about the city.

◀ Artwork encourages discussion about creativity and public space.

◀ (Left) Planting pots offer flexibility to a landscape; (Right) Parking meters should be efficiently placed and unobtrusive.

2.3.4.10 KIOSKS

Kiosks may be considered to be a part of wayfinding signage. However, they may also include temporary and / or seasonal information. Kiosks are located adjacent to pedestrian routes and should attract attention. Kiosks should be well lit and accessible from all sides. Their design can include artwork that expresses the local community character and should be designed to complement the other furnishings.

▶DESIGN GUIDELINES

- Kiosks are unique and should be used sparingly.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.11 PUBLIC ART

Public art is an engaging expression of community character. Applications are limitless.

DESIGN GUIDELINES

- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.12 FOUNTAINS

Fountains incorporate the design element of water into the landscape and provide an interesting opportunity to articulate reflected light and sound. Fountains may be for drinking and / or amenity and should be easy to locate along pedestrian routes. They may also be the focal point of an urban space.

2.3.4.13 VENDORS CARTS

Vendor carts provide an extraordinary opportunity to active the urban environment by providing a variety of food and goods. Their mobility allows them to operate regularly or intermittently and can facilitate a daily lunch routine or conversely, a seasonal event or festival.

▶DESIGN GUIDELINES

- Locate to be unobtrusive yet visible and adjacent to primary circulation routes for easy accessibility.
- Cluster and locate carts together and in an organized manner.
- Locate without any interference to the pedestrian circulation system.

2.3.4.14 NEWSPAPER RACKS

In addition to dispensing publications, newspaper racks may be located to control circulation, separate use, and subtly facilitate definition of space.

▶DESIGN GUIDELINES

- Locate to be unobtrusive yet visible and adjacent to primary circulation routes for easy accessibility.
- Cluster and locate newspaper racks with other elements in an organized manner 2½' from curb face or against a wall.
- Locate without any interference to the pedestrian circulation system.

2.3.4.15 PLANTING POTS & CONTAINERS

Planting pots and containers provide an opportunity to add greenery where the permanent location of plant material may not be feasible or desirable. They may protect people from unsafe conditions, control circulation, separate uses, and subtly facilitate definition of space. They also provide an opportunity for ornament and artistic expression, and should relate to the vernacular of furnishings.

▶DESIGN GUIDELINES

- Locate to be unobtrusive yet visible and adjacent to primary circulation routes to further define circulation and ornament.
- Cluster and locate planters / racks with other elements in an organized manner.
- See also Design Guidelines Typical of All Site Furnishings.

2.3.4.16 MAILBOXES, PARKING METERS, UTILITY BOXES, METERS & MANHOLES

Coordinate with the responsible entities to organize utility location and structures as effectively and efficiently as possible.

2.3.4.17 PERMITTING

Per jurisdictional requirements.

2.3.4.18 MAINTENANCE REQUIREMENTS

Per jurisdictional requirements.

APPENDIX

SPECIAL EVENTS SCHEDULE FOR DOWNTOWN LOS ANGELES 41

APPENDIX

SPECIAL EVENTS SCHEDULE FOR DOWNTOWN LOS ANGELES

The following listed events passed in 2008.
These events were held in the downtown Central Business Area, in the following locations:

- Flower Street from 7th Street to 2nd Street
- 2nd Street from Flower to Alameda
- Main Street and Los Angeles Street to 2nd Street and Temple

TITLE OF EVENT	EVENT DATE	START TIME	END TIME	CLOSED STREETS
Annual Golden Dragon Parade	2/9/2008			Along Broadway and Hill Street. Details?
LA Marathon	3/1/2008	evening		the area bounded by 3rd Street, Grand Avenue, 5th Street and Flower Street will be closed to install the Marathon Finish Line Stage
LA Marathon	3/2/2008	3:00 AM	11:59 PM	(1) Day of the Event Street Closures: On Sunday, March 2, 2008 starting at 2:00AM, the Los Angeles Department of Transportation (LADOT) will start closing streets along the Bike Tour, Marathon and 5k routes. The Bike Tour route will be secured by 5:30AM for a 5:50AM start. The Marathon route will be secured by 7:30AM for the 7:50AM wheelchair race and 8:17AM Marathon. To meet scheduling some streets may be closed earlier. (2) Freeway Off Ramp Closure: To meet scheduling some freeway off ramps may be closed earlier. The contractor for the LA Marathon will start closing freeway off-ramps beginning at 12:01 AM on Sunday, March 2, 2008 with the exception of the Harbor Freeway (I-110) Northbound 3rd Street (East) off-ramp which will be closed at 9:00PM on Saturday, March 1, 2008. The event does not require the closure of any freeway on-ramps. (3) Pre-Marathon Street Closures: Beginning on Saturday March 1st at 5AM, Flower Street bet 5th and 6th Streets and at 9:00PM, Flower St bet General Kosciuszko Way and 5th St and 3rd St tunnel bet Hill St and Figueroa St will be closed on in preparation for the end of the race. All streets will be re-opened by Midnight Sunday, March 2, 2008. Bike and 5K Assembly Area Closures: Figueroa Street between Exposition Boulevard and Martin Luther King Boulevard will be closed at 12:01AM on Sunday, March 2, 2008 and will be re-opened by noon on Sunday. Bike Tour Route Re-Opening: The segments of the Bike Tour route that do not overlap with the Marathon route will re-open by 8:30AM on Sunday, March 2, 2008. 5K Route Re-Opening: The segments of the 5K route that do not overlap with the Marathon route will reopen by 10:00AM on Sunday, March 2, 2008. *See map for course*
Womans' March Against the War	3/8/2008	10:30 AM	11:59 PM	Olympic and Broadway.
Saint Patrick Day Parade*	3/17/2008	8:30 AM	2:00 PM	2nd Street closed from Spring to Los Angeles Street *See map for parade route*
March Against Iraq War*	3/18/2008	7:00 AM	5:00 PM	
March Against HR 4437*	3/25/2008	9:00 AM	3:00 PM	
United Farm Workers Rally*	3/26/2008	10:30 AM	7:30 PM	
Annual Cherry Blossom Festival*	4/3/2008			Set-Up
Annual Cherry Blossom Festival*	4/4/2008			San Pedro Street between 1st & 3rd; Second Street between Los Angeles & Central
Annual Cherry Blossom Festival*	4/5/2008			San Pedro Street between 1st & 3rd; Second Street between Los Angeles & Central

Fiesta on Broadway/ Cinco de Mayo*	4/25/2008	7:00 PM	11:59 PM	Broadway between 1st and Temple Streets
Fiesta on Broadway/ Cinco de Mayo*	4/26/2008	12:00 AM	11:59 PM	North-South Streets: Broadway closed from Temple to 11th Street, Hill Street closed from 6th to Olympic Street, Main Street closed from 9th to 11th Street
Fiesta on Broadway/ Cinco de Mayo*	4/27/2008	12:00 AM	11:59 PM	East-West Streets: 1st, 2nd, 3rd, 4th, 5th, & 6th Streets closed between Spring and Hill Street. 7th, 8th, 9th, & Olympic Streets closed from Main to Olive
Fiesta on Broadway/ Cinco de Mayo*	4/28/2008	12:00 AM	5:00 AM	
May Day: May 1st Day of Action in Support of Worker's Rights	5/1/2008	11:00 AM	2:00 PM	Downtown Los Angeles traffic will be severely impacted during the pm peak hours within the quadrants of Broadway from Pico Boulevard to Temple Street and 5th Street between Alameda Street and Figueroa Street.
May Day: Immigrant Rights	5/1/2008	11:00 AM	3:00 PM	The Harbor Freeway (I-110) off ramps to 6th Street will be closed at 2:00pm
May Day: Full Rights for Immigrants	5/1/2008	11:00 AM	3:00 PM	Assembly area street closures are likely to begin at 10:30 am: Park View Street between 7th Street and Wilshire Boulevard and Broadway between 9th Street and Olympic Boulevard; Olympic Boulevard between Main Street and Hill Street. At approximately 1:30pm, LADOT engineers will gradually begin securing the march route.
May Day: Legalize LA	5/1/2008	12:30 PM	8:00 PM	*See map for route of participants*
Children Day Festival (Día del Niño)*	5/16/2008			
Children Day Festival (Día del Niño)*	5/18/2008			
Relay for Life Downtown*	8/1/2008	5:00 PM		Westside lane of Main Street between 1st Street and Temple; etc.
Relay for Life Downtown*	8/2/2008		8:00 AM	Westside lane of Main Street between 1st Street and Temple; etc.
National Night Out*	8/5/2008	6:00 PM	10:00 PM	1st Street, between San Pedro and Alameda (Little Tokyo)
Nisei Week	8/16/2008	11:00 AM	7:00 PM	San Pedro between 2nd and 3rd Streets (please see 2007 schedule of street closures for more detailed summary from LA City webite)
Downtown Film Festival's "green" programming	8/17/2008	12:00 PM	10:00 PM	along Grand Avenue between 2nd and 4th Street on Bunker Hill
Nisei Week	8/17/2008	11:00 AM	9:00 PM	11:00 AM - 4:00 PM San Pedro between 2nd and 3rd Streets. 5:00 PM - evening, Grand Parade
Nisei Week	8/24/2008	4:00 PM		1st Street between Central Avenue and San Pedro, Street Dancing
LA Triathlon	9/7/2009	3:30 AM	evening	In order to secure the cycle and run courses, street closures by the Department of Transportation will begin as early as 3:30am. Participants cross 2nd St via Grand Ave. Hollywood Freeway (US 101) Off-Ramps to Alvarado Street and Harbor Freeway (I-110) Off-Ramps to 6th Street shall be closed by 6:00AM and will be re-opened at approximately 12:00PM and 1:00PM, respectively. *See map for course*

60th Primetime Emmy Awards	9/21/2008	all day	all day	Council Motion: Street Closures are as follows: - Chick Hearn Ct bet Cherry and Figueroa Sts from 6:00 AM, Monday, Sept 15, 2008 thru 12:00 AM(midnight) on Wednesday, Sept 24, 2008. For the following closures, local and emergency access must be maintained at all times. - 11th St bet Figueroa and Flower Sts from 6:00 AM, Sunday, Sept 21, 2008 thru 12:00 AM, Monday, Sept 22, 2008. - 12th St bet Figueroa and Flower Sts from 6:00 AM, Sunday Sept 21, 2008 thru 12:00 AM, Monday, Sept 22, 2008. - Cherry St bet Pico and Olympic Bls from 6:00 AM, Sunday, Sept 21, 2008 thru 2:00 AM, Monday, Sept 22, 2008. - Figueroa St bet Venice and Olympic Bls from 6:00 AM, Sunday, Sept 21, 2008 thru 12:00 AM, Monday, Sept 22, 2008. - Flower St bet Pico Bl and 9th St from 6:00 AM, Sunday, Sept 21, 2008 thru 12:00 AM, Monday, Sept 22, 2008. - Pico Bl bet Flower and Cherry Sts from 6:00 AM, Sunday, Sept 21, 2008 thru 12:00 AM, Monday, Sept 22, 2008
Grand Avenue Festival	9/28/2008	11:00 AM	5:00 PM	Council Motion: Street Closures are as follows: -Grand Ave from First St to Hope Pl, from 1:30 PM, Saturday Sept 27, 2008 to 11:59 PM, Sunday, Sept 28, 2008, except for emergency vehicles. A twenty foot Fire Lane will be established and maintained on the west side of Grand Ave from First St south to Hope Pl. -Grand Ave East Sidewalk from First St to Second St, from 9:00 AM, Saturday Sept 27, 2008 to 11:59 PM, Sunday, Sept 28, 2008. -Grand Ave from Temple St to First St from 8:00 PM, Saturday, Sept 27, 2008 to 7:00 PM, Sunday, Sept 28, 2008 except for emergency vehicles. Local traffic will be allowed to access the Music Center and County Parking Lots. -First St bet Hope St and Olive St, from 9:00 AM , Sunday, Sept 28, 2008 to 7:00 PM, Sunday, Sept 28, 2008. -Second St bet Hope St and Grand Ave from 1:30 PM, Saturday, Sept 27, 2008 to 11:59 PM, Sunday, Sept 28, 2008. -Second St bet Olive St and Grand Ave from 9:00 AM, Saturday, Sept 27, 2008 to 11:59 PM, Sunday, Sept 28, 2008. -Third St bet Hope St and Grand Ave from 1:30 PM, Saturday, Sept 27, 2008 to 11:59 PM, Sunday, Sept 28, 2008
Detour Music Festival	10/4/2008	12:00 PM		Spring between Aliso and 2nd, Main between Aliso and 2nd, and Temple between Broadway and Los Angeles, 1st between Broadway and Los Angeles
Step Out: Walk to Fight Diabetes	10/26/2009	9:00 AM	11:59 PM	Walk starts and ends at City Hall
Old Bank District Holiday Block Party*	12/6/2008	2:15 PM	11:59 PM	The evening will see 4th street closed between Spring and Main, as well as Main street shut between 4th and 5th.
Weekly Farmer's Markets				
650 W. 5th Street	Wednesday	11:30 AM	2:00 PM	5th Street between Grand and Flower Streets
Little Tokyo	Thursday	10:00 AM	2:00 PM	1st Street between Main Street and Spring Street
7th and Figueroa	Saturday	10:00 PM	4:00 PM	In plaza or closing off a street?

* Listed Events are from Lieutenant Kenneth Hill Special Events Unit of the City of Los Angeles in his report for TTTA titled Special Event in Downtown Los Angeles, on April 10, 2009

6-29-07 - This day's Council session - Motion - Perry Mover 2007 / Garcetti - The Nisei Week Foundation is sponsoring the 67th Annual Festival during the week of August 18-26, 2007 in Little Tokyo. This oldest ethnic celebration in the country is a major event for the Japanese American community, and draws a large crowd from all over the City. The event will include a Nisei Week Grand Parade, Ondo Street Dancing, Street Arts Festival, Taiko Gathering, Car Show, and the 12th Annual Tofu Festival, and many art and cultural exhibits and demonstrations. Nisei Week, a non-profit corporation made up of volunteers from the community, is requesting City assistance in closing selected streets in the Little Tokyo area, providing traffic control, cleaning the streets, and using City parking lots during the Festival. Approval of this request will mean that an estimated $4,700 in fees and salary costs will be absorbed by the City. (Contact: Commander Terry Hara: 213/687-7193 fax 213/687-6510).

THEREFORE MOVE that the 2007 Nisei Week celebration, sponsored by the Nisei Week Japanese Festival, be declared a Special Event, and the involved City departments (and any unforeseen City agencies that may be involved) be requested to waive all fees, costs, and requirements, except insurance.

FURTHER MOVE that pursuant to Ordinance No. 150567 relating to temporary street closures, the following be made, subject to the supervision of the Director of the Bureau of Street Services:

Friday, August 17, 2007, 9:00 a.m. to Monday, August 20, 2007 12:30 p.m., for the Tofu Festival:

- San Pedro Street between First and Third Streets

Saturday, August 18, 2007, between 6:00 a.m. to Monday, August 20, 2007, 12:30 p.m., for the Tofu Festival:
* Second Street between Los Angeles Street and Central Avenue
* Astronaut Ellison Onizuka Street between First and Second Streets

Sunday, August 19, 2007, 2:00 p.m. to 10:00 p.m. for the Nisei Week Grand Parade:
* Astronaut Ellison Onizuka Street between First and Second Streets
* First Street between Alameda and Los Angeles Streets
* Los Angeles Street between First and Second Streets
* Second Street between Alameda and Los Angeles Streets
* Central Avenue between First and Fourth Streets
* Third Street between Alameda and San Pedro Streets
* San Pedro Street between Second and Third Streets

Friday, August 24, 2007 9:00 a.m. to Monday, August 27, 2007, 2:30 p.m., for the Street Arts Festival:
* San Pedro Street, between Second and Third Streets.

Sunday, August 26, 2007, 11:00 a.m. to 8:00 p.m., for Obon Street Dancing and Closing Ceremony:

- First Street, between Alameda and San Pedro Streets.

FURTHER MOVE that the Bureau of Street Services be directed to: (1) sweep the affected streets after the Tofu Festival, Parade, Street Arts, and Obon Street Dancing; (2) provide push brooms, trash cans and liner; and (3) furnish the necessary traffic control devices barricades, cones, and flashers for the street closures. Traffic control devices will be provided with the understanding that Nisei Week will pick-up and return them to the Bureau of Street Services.

FURTHER MOVE that the Police Commission be requested to issue a no-fee Special Event Permit Application for the Nisei Week Grand Parade, Car Show, and Street Arts Festival.

FURTHER MOVE that the Department of Transportation be directed to post "Temporary No Parking" signs with appropriate times and date designations on the affected streets and provide traffic control personnel and traffic cones, as required, and assist in closing the streets for the various events.

FURTHER MOVE that the Department of Transportation allow its Parking Lots A, B, C, Mangrove Lot A1753 (located at 414 E Temple Street) be used for the Car Show from Friday, August 17, 2007 at 6:00 p.m. to Saturday, August 18, 2007 at 10:00 p.m.; and allow its Cathedral Place Lot D1755 (located at 237 S Los Angeles Street) be used all day for the Tofu Festival, on Saturday and Sunday, August 18 and 19, 2007.

FURTHER MOVE that Department of General Services allow the employee parking Lot No. 7 located on Judge John Aiso Street, south of Temple Street be used by Nisei Week Festival participants, all day, Saturday and Sunday, August 18 and 19, 2007, and again on Saturday and Sunday, August 25 and 26, 2007; and allow the City Hall East parking P-3 and P-4 be used all day on Saturday and Sunday, August 18 and 19, 2007 and again Saturday and Sunday, August 25 and 26, 2007.
6-29-07 - File to Council and Legislative Processing Clerk for placement on next available Council agenda
7-6-07 - Council Action - Motion ADOPTED
7-13-07 - File in files

1.0 INTRODUCTION

This description of construction is based on information known to date about construction of the Regional Connector Transit Corridor project. Construction specifics are rarely known before design. For purposes of the Draft Environmental Impact Statement/Draft Environmental Impact Report DEIS/DEIR, maximum potential impact is analyzed using a reasonable worst case approach to describe the potential impacts. For example, several possible construction staging areas may be analyzed, even though not all of them would be used. This approach means that the environmental analysis can be relied on regardless of which sites are ultimately selected. Analyzing potential "maximum impact," also allows the environmental process to identify potential constraints and mitigation.

Four light rail transit (LRT) construction scenarios are analyzed: the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, and the Fully Underground LRT Alternatives – Variation 1 and Variation 2. A description of the construction activities and locations anticipated for each of these build alternatives is provided in Section 2, Construction Methods Overview.

2.0 CONSTRUCTION METHODS OVERVIEW

The construction of the Regional Connector Transit Corridor project would use conventional construction techniques and equipment currently used in the southern California region and the United States. Depending on the alternative (at-grade emphasis, underground emphasis, or fully underground alternative) more or less at-grade or underground construction would be employed. Major project elements include construction of guideway and trackwork, at-grade station platforms, underground stations, crossovers, tunnels, a grade separation at Alameda Street, pedestrian bridges, installation of specialty system work such as traction power, communications and signaling. These facilities would be constructed in existing geologic conditions ranging from siltstone to alluvium. Some of these facilities would be located in close proximity to existing structures and utilities. The equipment used in construction would include graders, drilling equipment, bulldozers, cranes, concrete trucks, pumping equipment, flat bed trucks, dump trucks to haul dirt, forklift, tunnel boring machines, and other types of excavators such as clamshell, and rail mounted cars to transport spoil material within the tunnels. Spoil materials would be hauled away from the work sites by dump trucks to disposal sites.

Much of the information presented in this section was included in the Conceptual Engineering Design Report prepared for the Regional Connector Alternatives Analysis dated September 2008.

The various work activities would be performed over an estimated four- to five-year construction period. The major elements associated with the build alternatives are anticipated to consist of the following:

At-Grade Emphasis LRT Alternative

- Construction of about 1,600 feet of cut and cover tunnel along Flower Street between the existing 7th Street/Metro Center Station and the open cut portal just south of the proposed station at 2nd and Hope Streets.
- Construction of a cut and cover underground station and crossover along Flower Street between 6th and 5th Streets (Flower/6th/5th Street Station).
- Construction of an open cut underground station at 2nd and Hope Streets.
- Construction of a pedestrian bridge connecting Grand Avenue to the 2nd/Hope Street Station.
- Construction of a connection into the existing 2nd Street tunnel from the 2nd/Hope Street Station area. This would require supporting the existing tunnel, breaking into

the tunnel, and construction of new supports for the openings into the tunnel. Installation of trackwork would be completed inside the existing tunnel to allow one lane of vehicular and two directions of LRT traffic.

- Construction of approximately one mile of at-grade trackwork, demolition of the roadway section being displaced by the LRT trackway, preparation of the track bed, construction of the supporting track slab, and laying of rail, along 2nd, Main, Los Angeles, and Temple Streets to the Little Tokyo/Arts District Station.
- Construction of overhead catenary systems including overhead catenary wire, support brackets, feeder cables, and other electrical components or alternative power distribution systems and street lighting where required.
- Construction of traction power substations (TPSS) adjacent to the right-of-way along at-grade segments, or as part of the station boxes along underground segments. The substations deliver electricity to the overhead catenary systems, and can fit in rooms or standalone buildings of 5,000 square feet or less.
- Construction of two at-grade, high floor station platforms using typical "cast-in-place" or precast concrete construction methods: one on Main Street and one on Los Angeles Street. Both stations would be located just north of 1st Street and would have single direction platforms.
- Construction of an underpass and pedestrian bridge at the intersection of Alameda Street and Temple Streets. The Pedestrian Bridge Type Selection Report will be prepared during the Preliminary Design phase and the type of bridge construction will be identified in that report.
- Modification of the existing Mechanically-Stabilized Earth (MSE) embankment north of the Little Tokyo/Arts District Station, east of Alameda Street.

Underground Emphasis LRT Alternative

- Construction of about 2,200 feet of cut and cover tunnel along Flower Street between the existing 7th Street/Metro Center Station and the proposed 2nd/Hope Street Station.
- Construction of a cut and cover underground station along Flower Street between 4th and 5th Streets (Flower/5th/6th Street Station) and reconstruction of the existing pedestrian bridge.
- Construction of the 2nd/Hope Street Station using either the Sequential Excavation Method (SEM) or the open cut method.

- Construction of a pedestrian bridge connecting Upper Grand Avenue to the 2nd/Hope Street Station.
- Demolition of existing structures at construction staging sites and station entrance areas including the Office Depot at the construction staging/ Tunnel Boring Machine (TBM) launch site north of 2nd Street from Alameda Street to approximately 300 feet west of Central Avenue.
- Construction of temporary retaining walls and portal structures on 2nd Street between Central Avenue and Alameda Street. The portal structure area would also be used for the TBM launch shaft.
- Construction of about 0.65 mile of (twin) tunnel by TBM along 2nd Street from the launch shaft at Central Avenue/2nd Street westward towards 2nd/Hope Street Station.
- Construction of a cut and cover underground station along 2nd Street either between Los Angeles and Main Streets (Los Angeles Street Option) or between Broadway and Spring Streets (Broadway Option).
- Construction of an underpass and pedestrian bridge at the intersection of Alameda and 1st Streets, and construction of a roadway bridge on 1st Street over Alameda Street. The construction would include retaining walls, a pedestrian bridge structure and utility relocations. The Pedestrian and Roadway Bridge Type Selection Report will be prepared during the Preliminary Design phase and the type of bridge construction will be identified in that report.
- Construction of emergency, ventilation, and entrance shafts for 2nd/Hope Street Station.
- Relocation or support-in-place of a major storm drain along 2nd Street.
- Construction of overhead catenary systems, including overhead catenary wire, support brackets, feeder cables, and other components or alternative power distribution systems, and street lighting where required.

Fully Underground LRT Alternative – Variation 1

- The proposed alignment is generally the same as the Underground Emphasis LRT Alternative, except as noted below. Trains would continue to travel underground northeast from under the intersection of 2nd Street and Central Avenue to just east of the intersection of Alameda and 1st Streets, making 1st and Alameda a fully grade separated intersection. Alameda Street would remain at-grade.

- A three-way junction would be constructed underground beneath the 1st and Alameda Streets intersection.

- Construction of two portals. One portal would be constructed along 1st Street east of Alameda (East Portal) to allow a connection to the Metro Gold Line to the east. 1st Street would be widened to the north to accommodate the portal. The widening would initiate at Alameda Street and continue east, tapering down significantly as it crosses Hewitt Street to join the existing 1st Street LRT tracks, just west of the 1st Street Bridge.

- The second portal would allow for a connection to the Metro Gold Line to the north (north portal to Pasadena). It would be constructed northeast of the existing Little Tokyo/Arts District Station. The portal would be connected to the 1st and Alameda junction by a new tunnel crossing beneath Temple Street and the property proposed for the Nikkei Development (the parcel on the northeast corner of 1st and Alameda Streets), running immediately east of the existing Little Tokyo/Arts District station and tracks.

- An additional underground station would be constructed within the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue, (2nd Street/Central Avenue Station).

- The 2nd Street Station/Los Angeles Street Option would not be part of this alternative. The 2nd Street Station/Broadway Option would be constructed.

- Reconstruction of the existing embankment from Little Tokyo/Arts District Station to the south US 101 bridge abutment is required for the earlier transition to all underground alternatives.

- Cut and cover section would begin west of Central Avenue to the Office Depot site (also referred to as "Block 6" by the CRS). A center platform station is constructed at this site, with tracks to the north and east proceeding at the same grade.

- North and East portals are wide enough to accommodate out-bound and in-bound trains in a single structure.

Fully Underground LRT Alternative – Variation 2

- This alternative is similar to Variation 1, except as noted below. The cut and cover section would begin west of Central Avenue to the Office Depot site – similar to Variation 1. However, in Variation 2, the tunnels transition to an "over and under" configuration to eliminate tracks crossing at the same elevation within the wye. The 2nd Street/Central Avenue Station would be a side platform station with the northbound platform above the eastbound. The portal structures along 1st Street

would be staggered to allow transition from the upper and lower platform grade to the street.

Elements Common to All Build Alternatives

- Use of building protection measures such as underpinning or ground improvement combined with a geotechnical monitoring program as required to monitor and protect structures identified for such measures.
- Relocation, modification, or protection in place of existing utilities in the path of the planned excavations for street level trackwork, tunnels, portals, and stations. The extent of utility relocation is generally greater for the Underground Emphasis LRT Alternative and Fully Underground LRT Alternative.
- Construction of underground duct banks for electrical power feeds and for signaling/communications systems.
- Removal or relocation of structures at construction staging sites and area around station entrances, where necessary.
- Construction of a connection to the existing 7th Street/Metro Center Station.
- Cut and cover construction on Flower Street between Wilshire Boulevard and 3rd Street.
- Construction of entrances to the underground stations.
- Construction of urban design enhancements within 1,000 feet around stations and portals.
- Construction of surface and subsurface drainage systems.
- Construction of traction power substations with electrical power feeds.
- Installation of traffic signals and train control improvements.
- Construction of trackwork complete with preparation of track bed, track slab, rail, fasteners, and infill concrete in street level areas.
- Installation of the overhead catenary system, which includes wires, poles, support brackets, feeders, and other components. Currently, catenary (two-wire configuration) is being assumed for all of the alternatives, but this may need to be changed during further design phases.

- Construction of station finishes, such as canopies, fare vending equipment, station furniture, ramps, elevators, escalators, landscaping, and all other amenities necessary for a functional station.
- Conducting system integration testing including existing operating lines.
- Conducting simulated revenue operation test runs and final commissioning of the system.

Maps of each build alternative are provided in Figure 3-1 through 3-3.

The tunnel and stations would be constructed with a number of tunneling techniques, depending on the geological and environmental conditions, cost, schedule, alignment, and other factors. The following sections describe the main methods that would be employed in construction of the major elements noted above.

2.1 Cut and Cover Construction and Open-Cut Construction

This is a very common construction method for underground facilities and it entails excavating down from the ground surface. A temporary excavation support is provided to stabilize the ground and excavation is carried out inside the supported area. Temporary concrete decking can be placed over the cut immediately following the first lift of excavation (at about 12 to 15 feet below ground surface) to allow traffic to pass above. Once the deck is in place, excavation and internal bracing would continue to the required depth. Once the desired construction is completed inside the excavated area, the excavation is backfilled and the surface is restored permanently. Temporary excavation support and retaining walls are installed before significant excavation commences. Depending on the depth of excavation and ground conditions, the excavation support could consist of reinforced concrete drilled-in-place piles (tangent pile wall), secant pile wall, sheet pile wall, soldier piles and lagging, or slurry walls. These wall systems are braced with internal struts or supported by tiebacks as the excavation progresses. Tiebacks consist of horizontal or inclined wire strands or steel rods installed in drilled holes in the ground behind the wall. One end of the tieback is secured to the wall and the other end is anchored to stable ground to provide sufficient resistance and to limit ground movement.

Figure 2-1 illustrates a schematic of the sequence associated with a cut and cover construction.

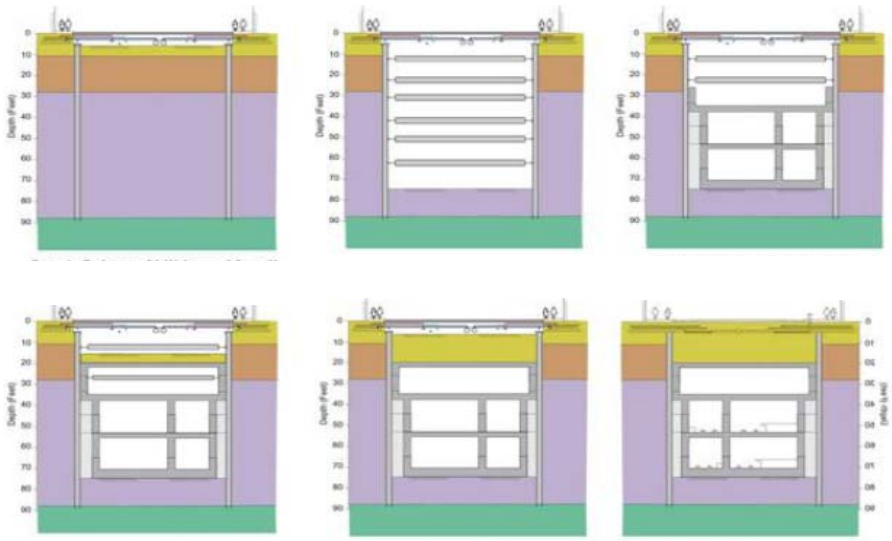

Figure 2-1: Typical Cut and Cover Construction

Open cut construction is similar to cut and cover construction, except temporary decking is not used.

All underground stations and some portions of the tunnel alignment would be constructed using the cut and cover technique, except the 2nd/Hope Street station under the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative, and the 2nd Street/Central Avenue station under the Fully Underground LRT Alternative. The 2nd/Hope Street Station may be constructed using the Sequential Excavation Method (SEM) as will be described in Section 2.3, or the open cut method. Also, the 2nd Street/Central Avenue Station on the Fully Underground LRT Alternative would be constructed using the open cut method.

Many of the existing structures adjacent to the alignment have underground basements that utilized temporary shoring and tieback systems during their original construction. The tiebacks were typically left in place and decommissioned after basement construction, in general accordance with local practice in the City of Los Angeles and southern California. These abandoned/decommissioned tiebacks could be encountered under many parts of Flower Street since the existing deep basement/parking garage used tiebacks to support the original excavations during construction. Steel tieback cables could pose a problem for tunnel

boring machines. The cut and cover method provides greater flexibility and the ability to overcome underground obstructions more easily than the TBM method. These obstructions would potentially be problematic for TBM excavation on Flower Street due to the shallow depths of the tunnels, which is partly why cut and cover construction is planned for this area. On 2nd Street, the TBM tunnel alignment would be deeper, and would pass beneath these underground obstructions. The presence of abandoned tiebacks in conjunction with the shorter length of the alignment between stations favors the cut and cover method along Flower Street for all build alternatives.

Typical cut and cover construction activities used on the Metro Gold Line Eastside Extension project from initial excavation through decking as viewed from the surface are shown on Figure 2-2.

Figure 2-2. Typical Cut and Cover Construction Activities

2.1.1 Construction of Retaining Walls

Cut and cover construction begins with the identification and relocation of utilities in the project area. Once the utilities are relocated, construction of temporary retaining walls would be required to support the soils laterally for excavation of the cut and cover tunnel, the underground stations, and the underpass to the required depths. Depending on the depth of excavation, the ground conditions, the proximity of adjacent structures to the proposed construction, building foundation type, and the potential for construction-induced ground movement, an appropriate temporary support method would be selected. Construction activities related to each potential temporary support method are described below.

2.1.1.1 Soldier Pile and Lagging

Soldier pile and lagging walls are a type of shoring system typically constructed along the perimeter of excavation areas to hold back the soil around the excavated pit. This support system consists of installing soldier beams (vertical steel beams) at regular intervals and placing precast panels or other lagging materials in between the beams to form the retaining wall. Pre-auguring would likely be necessary for installation of the soldier piles, to eliminate pile driving which would cause vibration and noise. Pre-auguring involves drilling holes for each pile from the street surface.

Figure 2-3. Typical Soldier Pile Installation

The construction sequence would start with the contractor occupying one side of the street to install one line of soldier piles while the other side would remain open for traffic. The equipment required for installation of the soldier piles would include drill rigs, concrete trucks, cranes, and dump trucks.

A soldier pile wall is generally used where groundwater is not a hazard or where grouting, or dewatering can be used to mitigate leakage between piles. A typical soldier pile installation and soldier pile and lagging with cross bracing for the Mariachi Station on the Metro Gold Line Eastside Extension project are shown in Figure 2-3.

2.1.1.2 Tangent Pile Walls

Tangent pile walls consist of contiguous drilled piles touching each other. This system can provide a temporary support which can then be converted into a permanent structure. The contiguous wall generally provides a better groundwater seal than the soldier pile and lagging system, but some grouting or dewatering could still be needed to control leakage between piles. Similar to the soldier pile installation described above, the contractor would occupy one side of the street and drill the piles sequentially to form the retaining wall. The equipment required for installation of the tangent pile wall includes drill rigs, concrete trucks, cranes, and dump trucks.

2.1.1.3 Secant Pile Walls

This system is similar to the tangent pile wall but the piles have some overlap, facilitating better water tightness and rigidity. The method consists of boring and concreting the primary piles at centers slightly less than twice the pile diameter. Secondary piles are then bored in between the primary piles, prior to the concrete achieving much of its strength. The completed secant pile wall for the Barnsdall

Figure 2-4. Secant Pile Wall for the Barnsdall Shaft in Hollywood

Shaft in Hollywood for the Red Line project is shown on Figure 2-4.

2.1.1.4 Diaphragm/Slurry Walls

Diaphragm/slurry walls are underground structural elements commonly used for retention systems and permanent foundation walls. Diaphragm walls are constructed inside trenches which are kept open by filling them with bentonite slurry. The structural elements are lowered into the slurry filled trench and concrete is pumped from the bottom of the trench, displacing the slurry. Construction is done in discontinuous sections such that no two adjacent panels are worked on simultaneously. Stop-end pipes are placed vertically at each end of the primary panel to form joints for adjacent secondary panels. Panels are usually 8 to 20 feet long, with widths varying from two to five feet

Slurry wall construction would occur in stages, working on one side of the street at a time. Once the excavation of a section is complete, a steel reinforcement cage is placed in the center of the panel. Concrete is poured in one continuous operation through one or more tremie pipes (pipes that inject concrete below the slurry) that extend to the bottom of the trench. The tremie pipes are extracted as the concrete rises; however, the discharge end of the tremie pipe always remains embedded in the fresh concrete. The slurry that is displaced by the concrete is saved and reused for subsequent panel excavations. As the concrete sets, the end pipes are withdrawn. Similarly, secondary panels are constructed between the primary panels to create a continuous wall.

Diaphragm walls have been constructed in virtually all soil types to provide a watertight support system in addition to greater wall stiffness to control ground movement. Diaphragm walls may in some cases be used as the permanent wall. However, diaphragm walls are generally not adaptable to utility crossings and all utilities crossed by the wall would require relocation. The equipment required for installation of the slurry wall includes clamshell excavator or rotary head, concrete trucks, slurry mixing equipments, cranes, slurry treatment plant, and dump trucks. The bentonite slurry would require disposal after a number of cycles.

2.1.2 Excavation and Decking

After installation of the temporary shoring support system and initial excavation, the contractor would proceed with installation of the deck beams, followed by multiple sequences of excavation and installation of cross bracing or tieback systems. Using pre-cast concrete panels (decking) allows traffic and pedestrian circulation to resume after the initial excavation since they would be installed flush with existing street or sidewalk levels. Deck installation would require lane and night street closures at the cut and cover areas. Concrete decking would be installed in progressive stages. Portal construction would follow similar construction methods as for the station excavations and retaining walls but the portal would remain permanently open and thus no decking would be used during construction.

2.2 Tunnel Boring Machine (TBM)

The portion of the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative to be bored with TBM along 2nd Street would consist of twin tunnels with outside diameters of up to about 22 feet. TBMs are large-diameter horizontal drills that continuously excavate predominantly circular tunnel sections. Different machine types are designed for different geological conditions. The excavated materials are removed through the tunnel using hopper type rail cars or by a conveyor system. As the machine advances, both the ground in front of the machine and the hole it creates are continually supported by the machine shield and pre-cast concrete tunnel liners. This method creates a tunnel with little or no disruption at the surface, and is especially suitable for creating a circular opening at greater depths that would not be practical for cut and cover construction. When the concrete tunnel liner segments have rubber gaskets between them, water is prevented from entering the tunnel and excavation can proceed below the ground water level.

The TBM requires a launching shaft to start the tunneling operation. The launching shaft for the TBM would be planned near the east end of the project, on 2nd Street between Central Avenue and Alameda Street. From there, the machine would bore westward along 2nd Street towards the 2nd/Hope Street Station site, passing through the proposed 2nd Street Station area at either Broadway or Los Angeles Streets. The TBM would be dismantled and retrieved through a vertical shaft created by cut and cover method adjacent to the 2nd/Hope Street Station. It would then be transported back to the launching shaft, reassembled, and repeat its journey for the second twin tunnel. Alternatively, two TBMs could be launched at the same time.

Tunnel driving operations consist of a series of activities. The TBM is advanced a small distance (typically 4 to 5 feet) by means of hydraulic jacks, which push against the previously installed tunnel lining ring. The jacks are retracted and another tunnel lining ring is erected. The machine is advanced and the process is repeated until the entire length of tunnel has been excavated. The pre-cast concrete liners are fabricated off-site and delivered by truck to the site. Segment loads are estimated to be 6 to 10 truck loads per day for the duration of tunneling based on an average excavation rate of 30 to 50 feet per day. Several days' production of segments is generally stored at the worksite to allow continuous tunneling. Tunneling operation is typically continuous, occurring seven days a week with two 10-hour shifts per day.

Excavated material (spoils) is taken to the rear of the TBM by a screw conveyor and deposited on a conveyor belt. The conveyor belt drops the spoils into mine cars, which are then taken back to the launching shaft by a locomotive operating on temporary rail tracks fastened to the bottom of the tunnel. At the shaft, the mine cars are lifted out by a crane or hoist and the material is loaded into trucks for off-site disposal or temporarily stockpiled at the site for later disposal. Alternatively, belt conveyor systems could be used to transport spoils, through the tunnel and/or from the shaft to the surface.

On the Metro Gold Line Eastside Extension project, Earth Pressure Balance (EPB) TBMs were successfully used to mine about 1.4 miles of tunnel, comparable in length and diameter to the proposed LRT build alternatives. The excavation method for EPB shield TBM is based on the principle that tunnel face support is provided by the excavated spoil itself. Tunneling for the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternatives would encounter both alluvial soils, where the profile is relatively shallow, and weathered siltstone/shale bedrock of the Fernando or Puente Formations. Groundwater may be perched on the Fernando Formation or other clay layers. Gassy tunneling conditions are also anticipated based on previous Metro studies for the Red Line and adjacent building investigations. EPB TBMs are generally well suited for mining in soft ground with these variable soil, groundwater, and methane conditions and may also be adapted for harder materials.

The excavated soil in an EPB TBM is contained in a chamber behind the cutting wheel by a bulkhead as shown in Figure 2-5. The "earth pressure" in this chamber balances the external soil and groundwater load which in turn minimizes movement of the ground in front of the TBM. The screw conveyor restricts the rate of soil removed from the chamber to maintain the earth pressure. Non-toxic, biodegradable conditioners added to the soils in the chamber improve material flow and handling characteristics.

For the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative, an alternative tunnel boring approach is possible that would use a single, larger diameter tunnel instead of two smaller diameter tunnels. A single large TBM could be used to bore one tunnel big enough to contain both tracks and possibly the station platforms. Further studies will determine if such an approach would be feasible for the Regional Connector.

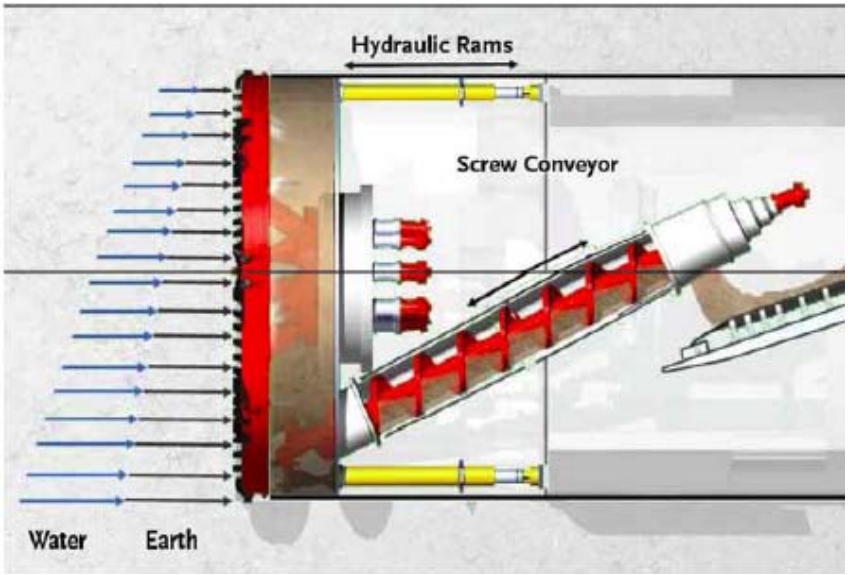

Figure 2-5: Schematic of EPB TBM

2.3 Sequential Excavation Method (SEM)

Because of the depth of the 2nd/Hope Street Station for the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternatives, Sequential Excavation Method (SEM) construction may be considered as an alternative to the open cut method. The open cut technique may be less cost effective than SEM due to the station depth. Application of the SEM would have less surface interruption since the excavation would be performed mostly underground and accessed via a vertical shaft. Sequential excavation and support methods call for the ground to be excavated incrementally in small areas and supported with steel supports advanced beyond the opening and shotcrete (sprayed concrete) as shown on the schematic diagram on Figure 2-6. Analysis of both open cut and SEM will be undertaken for the 2nd/Hope Street Station.

Generally, SEM is applied for large non-circular tunnels or short tunnels where TBMs are not economical or feasible. All operations would be conducted from an access shaft for spoils removal and future entrance(s). The sequence of excavation for the SEM method would be determined during design stage and controlled and modified as needed during construction based on actual conditions encountered. After all the predetermined sequence areas are excavated and supported as shown on Figure 2-6, the larger area of the station or tunnel would be completed. Whereas TBMs can only excavate a fixed (circular) shape, the sequential method permits a tunnel of horseshoe or sub-rounded shape. This construction technique is considered in special instances where the planned depth, shape, or length of the tunnel may not be cost effective using more traditional methods. In addition to the 2nd/Hope Street Station, SEM is also under consideration for approximately 350 feet of the curved portion of the alignment west of the station.

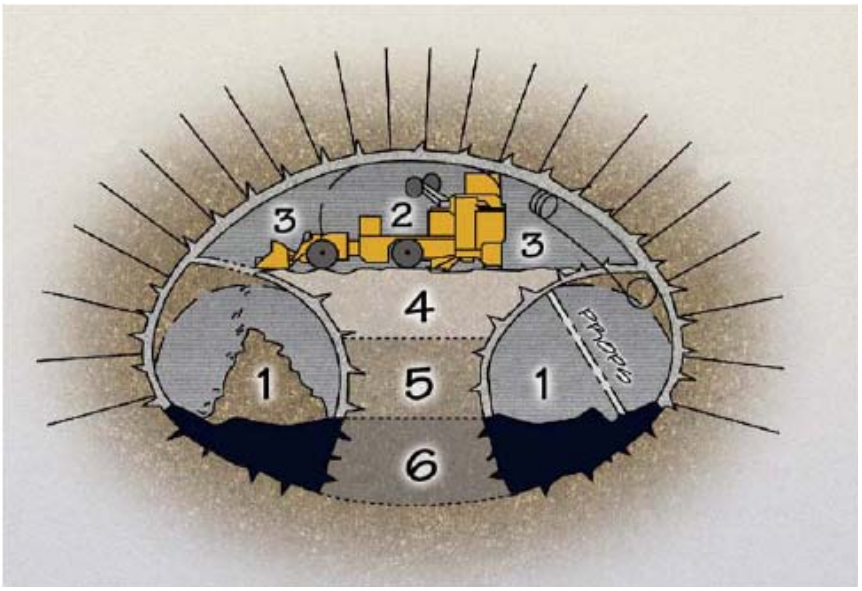

Figure 2-6: Typical SEM Excavation Sequence

3.0 CONSTRUCTION SCENARIOS

This section outlines the details of the preliminary construction scenario for the Build Alternatives. There would be no major construction activities under the No Build and TSM Alternatives, and no major adverse construction effects are anticipated. Accordingly, the focus of the construction impacts analysis is on the At-Grade Emphasis LRT, the Underground Emphasis LRT, and Fully Underground LRT Alternatives – Variations 1 and 2.

All alternatives include the construction of new facilities, operations, and maintenance. Key site conditions that would likely affect construction activities are also discussed. Conditions and elements common to both alternatives are described once in the general scenario below. Other elements unique to each alternative are addressed in the specific scenario description.

3.1 General Construction Scenario

The construction duration for either of the build alternatives would be approximately a four- to five-year period. Surface streets would be impacted for approximately 24 to 48 months.

LRT construction could begin simultaneously at several locations along the selected route to accommodate areas requiring lengthy construction times, such as tunnels, underground stations, and grade separation segments, so that the various segments can be brought to completion at approximately the same time.

Many contractors specializing in various methods of construction would be working on the project for the full duration of construction. Construction would involve the methods most suitable for each segment of the project including cut and cover/open cut excavation for tunnel and stations, potential use of SEM for the 2nd/Hope Street Station (and possibly a portion of the tunnel to the west) on the Underground Alternatives, and TBM tunneling for portions of the Underground Alternatives beneath 2nd Street.

In some areas, it may be necessary to use protective measures to support existing building foundations before tunnel or station excavation, to provide structures with adequate rigidity and support, and to reduce potential for damage caused by construction-induced movement. Protective measures are described in Section 4.3.

To provide an understanding of the likely steps involved, the anticipated construction activities are described below. This potential construction sequence does not imply that the construction activities would be performed in this order or in a linear sequence. Actual construction is a complex process with many simultaneous activities taking place. Some of the construction methods and sequences would be at the discretion of the construction contractor.

3.1.1 Utility Relocation and Street Closures

The first step in cut and cover construction would involve closing off approximately half of the street in the affected area using barriers and sidewalk sheds, or street and sidewalk protection. Approximately two to three blocks would be closed at a time and this would occur in stages, alternating between the opposite sides of the street.

After closure of portions of the streets, the contractor would relocate, modify, or protect in place all existing utilities and underground structures that could conflict with excavations for street level trackwork, tunnels, portals, station structures, and the grade separations. Shallow utilities, such as maintenance holes or pull boxes, which would interfere with guideway excavation work, would require relocation. Utilities would be modified and moved away from the proposed facilities. Temporary interruptions in services (several hours) could be experienced during re-location or re-routing of utilities. Depending on the extent of utility relocation work, the estimated construction durations are two to four months for a two-block segment of construction activities. Some of the major utilities (greater than 18-to 24-inch diameter) such as the storm drain on 2nd street and the 72-inch storm drain on Flower Street may have more complex construction sequences and schedules for relocations and/or utility supports.

The age of the downtown area and the existing narrow streets, in combination with the locations of the proposed stations, station entrances, and other appurtenant structures means that, in many instances, conflicting utilities would need to be relocated. Utilities, such as high pressure water mains and gas lines, which could pose a potential hazard during cut and cover and open cut station construction, and which are not to be permanently relocated away from the work site, would be re-routed temporarily to prevent accidental damage to the utilities, construction personnel, and the adjoining community.

3.1.2 Other Activities Prior to Major Construction

In addition to utilities, other potential obstructions along the proposed alignments have been identified. These include the former Pacific Electric tunnel perpendicular to the Flower Street alignment approximately 150 feet south of the intersection of Flower and 4th Streets, the pier columns for the 4th Street bridge and ramps, and the caisson foundations associated with Grand Avenue bridge. Further research is needed to determine whether these obstructions would need to be relocated, or whether the proposed alignments would need to be adjusted to avoid the obstructions. Any necessary relocations would need to be performed before tunnel construction begins.

Other preconstruction activities would also be carried out at each site prior to major excavation at stations and tunnels. Documentation of existing conditions prior to construction is common practice to establish a reference to measure ground movements. There are a variety of monitoring systems that could be installed. For the most part, these are

non-intrusive activities such as surveying and photo and video documentation. However, in some areas, more elaborate measurement systems involving drill rigs may be installed. Some activities like potholing or installation of geotechnical instrumentation may require temporary, partial street closures and the use of drilling equipment and excavators.

Site clearance and demolition of existing structures at the construction staging areas would also be necessary before major construction can begin.

Traffic detours and truck routes would be required during construction. When construction would affect existing streets, traffic control measures would be implemented to help mitigate the effects of construction activities while maintaining reasonable construction progress. This may involve temporary, partial or full street closures, full or partial sidewalk closures, and detour routes. Traffic management plans would be prepared during subsequent design phases in coordination with the agencies involved to minimize disruption to traffic during construction.

3.1.3 Construction Staging Areas

Temporary easements, typically a portion of the sidewalk, traffic lanes, and parking areas would be required at various locations for construction staging. Construction within the streets is also envisioned where no off-street area can be identified for worksites and/or access to underground excavations.

Prior to underground construction, work sites and staging areas may require clearing and building demolition in some areas. Demolition equipment typically includes bulldozers and loaders. The street alongside the stations and track areas, supplemented by adjacent off-street areas, would be used for construction staging and for equipment and material storage.

The following is a list of anticipated staging areas that may be used during At-Grade Emphasis LRT Alternative construction. The anticipated footprints of each area are delineated in the Draft Construction Staging Sites drawings and in
Figure 3-1:

- Flower/6th/5th Street Station
- 2nd/Hope Street Station
- Main/1st Street Station (southbound)
- Main/Los Angeles Street Station (northbound)
- Temple and Alameda Junction

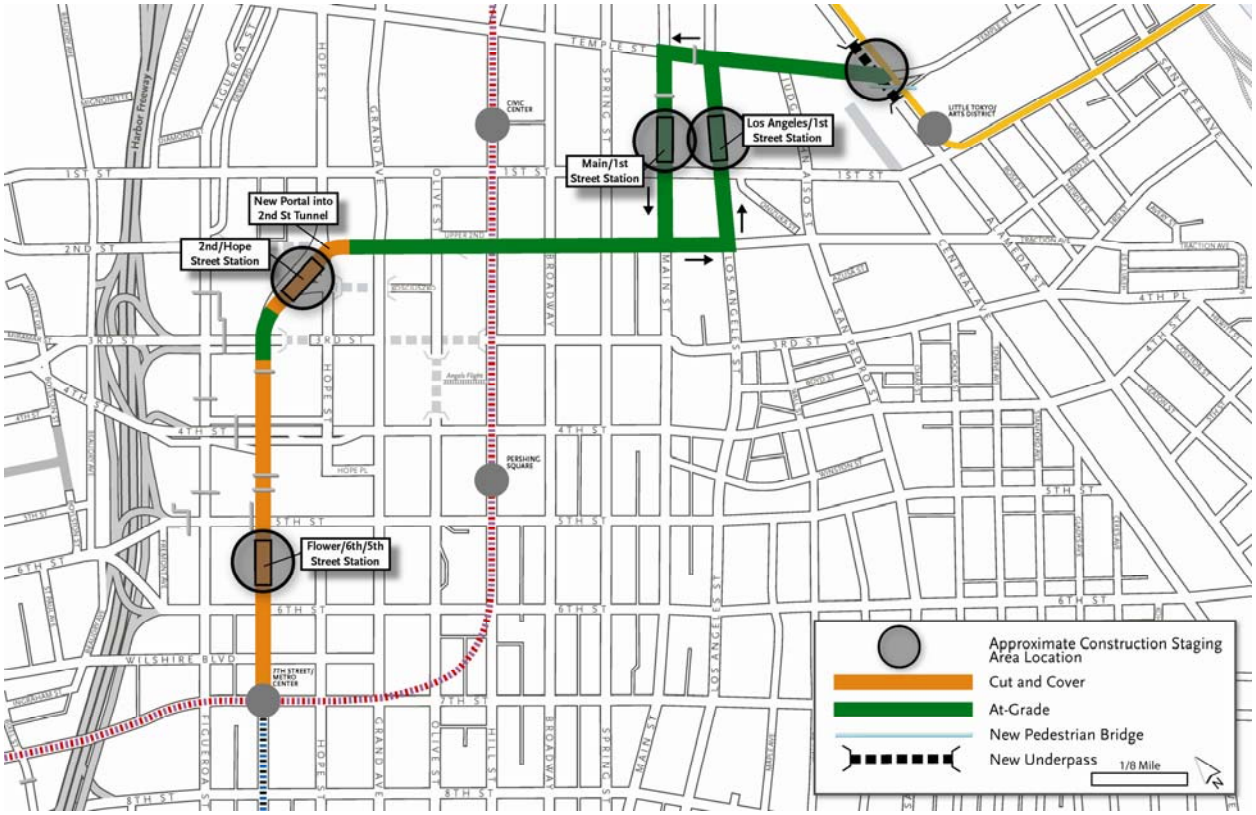

Figure 3-1. At-Grade Emphasis LRT Alternative – Construction Staging Site Locations and Construction Methods

For the Underground Emphasis and Fully Underground LRT Alternatives, the following is a list of possible staging areas. The footprints of the anticipated sites are shown in the Draft Construction Staging Sites drawings and in Figure 3-2 and Figure 3-3:

- Flower/5th/4th Street Station
- 2nd/Hope Street Station
- 2nd Street Station (Los Angeles Street Option, Underground Emphasis Alternative only)
- 2nd Street Station (Broadway Option)
- 1st and Alameda Junction

For excavated materials, haul routes to disposal sites would be predetermined by agreement with local authorities before construction. They would follow streets and highways forming the safest or shortest route with the least adverse effect on traffic, residences, and businesses.

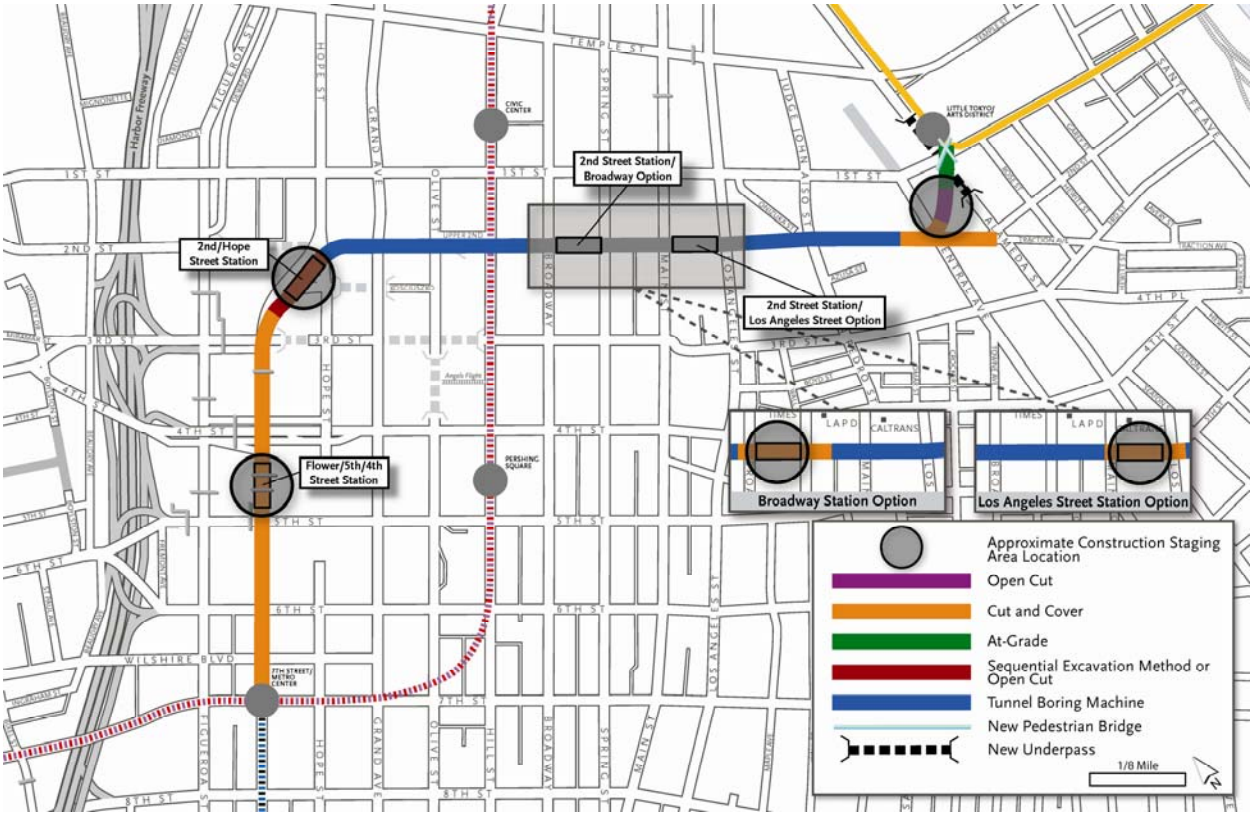

Figure 3-2. Underground Emphasis LRT Alternative –
Construction Staging Site Locations and Construction Methods

Figure 3-3. Fully Underground LRT Alternatives – Construction Staging Site Locations and Construction Methods

Table 3-1, Table 3-2 and Table 3-3 provide a summary of the construction activities for the At-Grade Emphasis Underground Emphasis, and Fully Underground LRT Alternatives, respectively. These tables summarize the type of activity, the estimated duration for each activity, the type of equipment anticipated, the quantities of earth removal that may be transported, the estimated truck trips per day, and the estimated number of workers for each activity.

3.2 At-Grade Emphasis LRT Alternative

Construction of the At-Grade Emphasis LRT Alternative is anticipated to consist of the following major activities:

- Relocation and protection of major utilities. The largest utility that would be encountered is the 72-inch storm drain between 4th and 5th Street. A list of the major utilities that could be affected and potential solutions is presented in Table 3-5.

Table 3-5. At-Grade Emphasis LRT Alternative – List of Affected Utilities

Utilities Affected	Feasible Alternatives
72-inch storm drain (SD) beneath Flower Street	Move SD to the west and reconnect with existing pipe
SD lateral that connects to the 72-inch SD across the intersection of 4th Street and Flower Street is assumed to be in conflict at the portal. Diameter of lateral is unknown	Being reviewed
18-inch SD lateral that connects a Catch Basin (CB) to the 72-inch SD is in conflict with the portal.	Reconnect this CB across 4th Street to the proposed 15-inch SD.

- Cut and cover construction of a connection to the existing 7th Street/Metro Center Station Blue Line tail tracks near the intersection of Flower/6th Streets.
- Construction of approximately 200 feet of cut and cover tunnel at 0.3 percent slope near the intersection of Flower and 6th Streets from the connection point to the existing 7th Street/Metro Center Station and the proposed Flower/6th/5th Station.
- Construction of a cut and cover station on Flower Street between 6th and 5th Streets. The station would be constructed in front of the City National Tower complex. Invert elevation at the station varies from 235 to 238 with a 0.95 percent slope.
- Construction of a cut and cover tunnel at 6 percent slope along Flower Street from the Flower/6th/5th Station to the portal just south of 3rd Street.
- At-grade track construction near the intersection of Flower and 3rd Street. Construction of a portal structure at the northeast corner of Flower and 3rd Streets and open cut

tunnel for approximately 200 feet to the 2nd/Hope Street Station. The portal structure would vary in height from approximately 10 feet to about 30 feet.

- Construction of an open cut station at 2nd and Hope Streets with an entrance to serve the Bunker Hill area. The station structure would be approximately 600 feet long and 42 feet high.

- Construction of a pedestrian bridge from Upper Grand Avenue to the 2nd/Hope Street Station.

- Cut and cover construction of a connection into the existing 2nd Street Tunnel. Connection to the existing tunnel would require major construction work, including installation of the shoring system for soil removal, removal of soil load above the 2nd Street tunnel crown (~ 45ft), reinforcement of the tunnel structure and installation of supporting elements at the location of the new openings. This could require full or partial tunnel closures and closures of the street above during the construction period.

- Installation of tracks and overhead catenary systems in the eastern 800 feet of the 2nd Street tunnel and cut and cover tunnel area. The construction of trackwork includes preparation of track bed, track slab, rail installation, fasteners, and infill concrete. The overhead systems include wires, support brackets, feeders, and other components or alternative power distribution systems, and street lighting where required.

- Construction of an at-grade alignment on the south side of 2nd Street between the 2nd Street tunnel and Main Street. At Main Street, northbound track continues on 2nd Street to Los Angeles Street, while the southbound track curves north onto Main Street. This segment would require the same installation of tracks and overhead catenary systems as described for the 2nd Street tunnel.

- Installation of a single track for the southbound traffic on Main Street. The southbound single track alignment would turn from the south side of 2nd Street to the east side of Main Street. It would continue north on Main Street and turn east onto East Temple Street. This segment would require installation of tracks and overhead catenary systems as described previously. In addition, the at-grade overhead system would be supported on poles, which are typically spaced approximately 100 to 200 feet apart. A typical pole installation for the Metro Gold Line Eastside Extension project is shown on Figure 3-4.

- Construction of the Main Street southbound station. A single platform station would be located on the east side of the Main Street north of 1st Street. Construction of high floor station platforms would be completed using typical “cast-in-place” or pre-cast concrete construction methods.

- Installation of a northbound single track on Los Angeles Street from 2nd Street to Temple Street. The northbound single track alignment would continue on south side of 2nd Street between Main Street and Los Angeles Street, before turning north onto the east side of Los Angeles Street. It would then continue on Los Angeles Street and turns east onto Temple Street. This stage would require installation of tracks and overhead catenary systems including poles, overhead catenary wires, support brackets, feeders, and other components as needed.

- Construction of the Los Angeles Street northbound station. A single platform station would be located on the east side of Los Angeles Street just north of 1st Street. Construction of high floor station platforms would be completed using typical "cast-in-place" or pre-cast concrete construction methods.

- Construction of a connection to the existing Metro Gold Line tracks at Temple and Alameda Streets. The southbound and northbound single tracks would meet at the corner of Temple and Los Angeles Streets. The double tracks would continue east on Temple Street to San Pedro Street, after which they continue to the south side of Temple Street for approximately 300 feet before reaching a 3-way (wye) junction just west of Alameda Street. Tracks would branch to the north and south at this point to meet the Metro Gold Line tracks just north of the little Tokyo Station. A portion of the Gold Line is supported on mechanically stabilized earth (MSE) embankment from north of Temple Street to the US 101 bridge. The embankment would require some modification and reconstruction to accommodate the Regional Connector at the junction with Alameda Street.
- Construction of an underpass at the intersection of Temple and Alameda Streets that would carry Alameda Street through traffic beneath Temple Street and the new rail junction.
- Construction of a pedestrian bridge above the Alameda underpass that spans the intersection of Alameda and Temple Streets. Due to its irregular shape, the bridge substructures would likely be constructed at several spots in and around the intersection and be integrated into the Alameda underpass structure. Bridge construction would involve heavy construction equipment including crane(s) for erection of the superstructure.
- Construction of urban design enhancements within 1,000 of the centerlines of the stations and portals.

Figure 3-4. Typical Drilling and Installation of Pole

3.3 Underground Emphasis and Fully Underground LRT Alternatives

Construction of the Underground Emphasis and Fully Underground Alternatives would be similar with the exception of the sections east of Central Avenue. The major similar activities are anticipated to consist of the following:

- Relocation and protection of major utilities including the 72-inch storm drain between 4th and 5th Street and the 11.5 feet by 13 feet rectangular reinforced concrete storm drain along 2nd Street. A list of major utilities that could be affected and potential solutions are presented in Table 3-6 and Table 3-7.
- Construction of the tunnel and portal access to the tunnels would require taking the property bounded by 1st and 2nd Streets between Central Avenue and Alameda Street. The existing Office Depot building would be demolished, cleared, and grubbed. Removal of any asbestos in the demolition debris would be addressed in accordance with local standards. Temporary construction trailers would be brought in for the work site offices. This activity would involve dozers and other equipment needed for demolition and site preparation.
- Site clearance and demolition of existing structures within the construction staging areas.
- Cut and cover construction of a connection to the existing 7th Street/Metro Center Station Blue Line tail tracks.

Table 3-6. Underground Emphasis LRT Alternative– List of Affected Utilities

Utilities Affected	Feasible Alternatives
72" SD beneath Flower Street is potentially in conflict with stair ways/elevators of proposed station.	Relocate to the west of the station and reconnect with existing line.
24" SD in conflict with Emergency Exit Shaft at 2nd/Hope Street Station shown on current proposed drawing	Move location of Emergency Shaft (being evaluated by design team)
Reinforced Concrete Box Culvert along 2nd Street at proposed station limits	The existing box culvert has dimension of 11.5 by 13 feet with an invert within 20 feet of the existing grade. The culvert would be in conflict with the Underground Emphasis LRT

Table 3-6. Underground Emphasis LRT Alternative– List of Affected Utilities	
Utilities Affected	**Feasible Alternatives**
and near the portal	Alternative. Methods consist of maintaining the culvert on 2nd Street and temporarily supporting the affected culvert within the cut and cover construction for the station and near the portal. The temporary support could consist of hanging/suspending the culvert at the top of the temporary decking during station construction. Another alternative would be to replace the concrete box culvert with temporary multiple HDPE pipes with equivalent capacity and suspending them at the temporary decking during station construction. Similarly, the affected portion near the portal could be temporarily suspended near the top of the open cut portal. The temporary measures would be replaced with a permanent box culvert at the end of tunnel construction. If relocation to 3rd Street is preferred, it could take 12 to 18 months. Either partial/full closure of 3rd Street and re-routing of traffic to adjacent streets would be required.
75 inch Storm Drain Alameda Street	TBD

Table 3-7. Fully Underground LRT Alternatives– List of Affected Utilities

	temporary support could consist of hanging/suspending the culvert at the top of the temporary decking during station construction. Another alternative would be to replace the concrete box culvert with temporary multiple HDPE pipes with equivalent capacity and suspending them at the temporary decking during station construction. Similarly, the affected portion near the portal could be temporarily suspended near the top of the open cut portal. The temporary measures would be replaced with a permanent box culvert at the end of tunnel construction. If relocation to 3rd Street is preferred, it could take 12 to 18 months. Either partial/full closure of 3rd Street and re-routing of traffic to adjacent streets would be required.

- Construction of approximately 760 feet of cut and cover tunnel along Flower Street between the existing 7th Street/Metro Center Station and the Flower/5th/4th Station. The invert of cut and cover tunnel is at approximately elevation +236 feet.

- Construction of the Flower/5th/4th Station between 5th and 4th Streets. The station would be constructed using the cut and cover method. The station invert is at approximate elevation of +232 feet with existing ground at approximately +292 feet. The station would be located adjacent to the underground parking structure of the Bonaventure Hotel as well as the parking structure to the east (CitiGroup Building). Construction of this station would require relocation of the existing 72-inch reinforced concrete storm drain pipe between 5th and 4th Streets.

- Reconstruction of the existing pedestrian bridge across Flower Street just north of 5th Street.

- Cut and cover construction along Flower Street from the 4th Street to north of 3rd Street to the 2nd/Hope Street Station. This segment of cut and cover would include both straight and curved segments. The construction of straight portion of the cut and cover may impact the 4th Street overpass bridge foundation and mitigation measurements could be required to reinforce this overpass bridge foundation. There is also a possibility that the curved tunnel section could be constructed by SEM. The invert of the cut and cover tunnel is at approximately elevation +236 feet.

- Construction of the 2nd/Hope Street Station with the open cut method. The station is approximately 405 feet long. Based on preliminary design drawings, the station is over 100 feet below grade with station invert elevation at 230 feet and the existing ground surface elevation between 335 and 360 feet. It is anticipated that a portion of the 2nd/Hope Street Station construction would likely be performed under groundwater. The station design would also include at least three shafts for entrance, emergency exit, and ventilation purposes. The station would be constructed in close proximity to a chilled water plant with a deep caisson foundation. Because of the depth of 2nd/Hope Street Station, SEM is being considered in addition to the cut and cover method. Excavation could have an impact on the stability of the caisson foundation and would be evaluated during design. Mitigation measures could require underpinning of the existing foundation.

- Construction of a pedestrian bridge from Upper Grand Avenue to the 2nd/Hope Street Station.

- Relocation of a large 11.5 feet x 13 feet reinforced box culvert storm drain that currently runs underneath 2nd Street. This box culvert would be in conflict with the proposed entry shaft and cut and cover section near Central Avenue. In addition, the culvert would also be in conflict with the proposed station construction on 2nd Street. The affected segment of the storm drain would need to be relocated or temporarily supported. Alternatives are being reviewed and coordinated with the County of Los Angeles Department of Public Works.

- Tunnel construction shaft by the cut and cover method: A tunnel construction shaft is necessary to assemble the TBM and to start construction of both the east and west bound tunnels along 2nd Street. The construction shaft to begin the TBM drive would be excavated on 2nd Street near Central Avenue. TBMs should start in a straight line and at adequate depth, so the proposed staging area to the north of 2nd Street and Central Avenue cannot be used for TBM mining due to the necessary depth and orientation for the TBMs. The construction shaft would extend along 2nd Street and be approximately 650 feet long and 65 feet wide. Once the TBM is advanced, a portion of construction shaft would be covered by a temporary deck to facilitate normal traffic along Central Avenue. The TBM would be lowered into the construction shaft by a crane and would mine from the shaft along 2nd Street westward from Central Avenue to the 2nd/Hope Street Station. The TBM would be retrieved west of Bunker Hill at the cut and cover section near the 2nd/Hope Street Station.

- An alternative to launching the TBMs from the 2nd and Central Streets area would be to launch them from the 2nd/Hope Street Station and mine towards the Central Avenue shaft. In this scenario, the excavated materials from the tunneling would be removed from the 2nd/Hope Street worksite.

- Once the construction shaft is completed, the TBM would be assembled in the shaft to start boring the tunnel. An EPB TBM would likely be used to construct two (twin) bored tunnels between the portal and the 2nd Street Station either near Los Angeles Street or Broadway. The tunnel invert elevations along this segment range between 200 to 220 feet and ground surface elevations range between approximately 268 to 282 feet. The bored tunnel along this segment would pass in close proximity to several buildings on both sides of the alignment. Major structures in this area include the Weller Court shopping mall basement, Union Bank building, and Japanese Village Plaza. If later evaluations determine that these could be impacted by tunnel construction activities, mitigation measures would be developed to reinforce and protect these buildings. Depending on further evaluation, the retail stores or multi-story buildings between San Pedro Street and Central Avenue could also require mitigation since they are supported on shallow foundations. Further evaluations in subsequent phases would help determine the level of protection required. An alternative tunnel boring approach is possible that would use a single, larger diameter tunnel instead of two smaller diameter tunnels. A single large TBM could be used to bore one tunnel big enough to contain both tracks and possible the station platforms. Further studies will determine if such an approach would be feasible for the Regional Connector.

- Cut and cover construction for the proposed station on 2nd Street. The proposed station would be located between Main and Los Angeles Streets (Los Angeles Street Option) with an alternate station between Broadway and Spring Streets (Broadway Option). The existing storm drain within the station excavation area would either be protected in-place or relocated. Construction of the cut and cover station would require installation of temporary shoring and installation of deck beams to allow support concrete deck panels to resume on 2nd Street. Excavation could continue under the cover deck to the required depth. The buildings in close proximity include: Kyoto Grand Hotel and Caltrans underground parking on the north side and the Little Tokyo Library and St. Vibiana Cathedral Annex on the south side. The excavation for the station entrance on the south side would likely require a more rigid shoring system (e.g. Tangent piles) for additional protection of adjacent structures. The TBM could be transported through the station. For the alternate station between Broadway and Spring Street, protection/relocation of the storm drain as well as installation of the temporary shoring system would also be required prior to excavation. The major building in the vicinity of this station is the LA Times basement to the north of 2nd Street.

- After being transported through the station excavation, the TBM would continue to mine the twin bored tunnels west of either Main or Broadway Streets towards the Bunker Hill area. The bored tunnel along this segment would be excavated underneath the existing Red Line Tunnels near the intersection with Hill Street. In

addition, a portion of the basement for the historic Thomas Higgins building (located at the southwest corner of Main and 2nd Streets) is anticipated to be above the tunnel alignment. Other major buildings in the vicinity of the alignment including the LA Times and the LA Police Department parking structures could be impacted by tunnel construction activities and may require mitigation measures to reinforce and protect them.

- Construction of urban design enhancements within 1,000 feet of the centerlines of the stations and portals.

3.3.1.1 At-Grade Emphasis only:

- Cut and cover construction of a section of the tunnel beneath 2nd Street west of Central Avenue: This section of portal would be finished after completion of bored tunnels to facilitate the emergence of the tracks to grade level (i.e. The portal).

- Grade separation of Alameda Street at 1st Street would allow uninterrupted vehicular traffic below the new tracks. This construction would consist of lowering of Alameda Street, construction of retaining walls to support above ground facilities and a pump house to pump storm water that could accumulate in the depressed roadway. A permanent bridge would be constructed over Alameda Street to facilitate traffic on 1st Street and to support the new tracks. Utilities to be relocated include a 75-inch storm drain running in Alameda Street.

- Construction of a pedestrian bridge over Alameda underpass. This bridge would span the intersection of Alameda and 1st Street to provide pedestrian access across the intersection and to the existing Little Tokyo/Arts District Station. Due to its irregular shape, the bridge substructures would likely be constructed at several spots in and around the intersection and likely be integrated into the Alameda underpass structure. Bridge construction would involve heavy construction equipment including crane(s) for erection of the superstructure.

- Construction of the curved U-section of the portal between 2nd and 1st Streets. This would be constructed using open cut technique. Since it is traversing the primary construction yard, it would likely be done in the later phases of construction. Work within the yard for this relatively shallower excavation would have limited impact on surrounding areas.

3.3.1.2 Fully Underground LRT Alternative – Variation 1:

- Cut and cover construction of a section of the tunnel beneath 2nd Street west of Central Avenue. This cut and cover section would continue into the Office Depot site where an open cut underground station with a center platform configuration would be built.

This station may be completely underground, or constructed as an open below-grade station with no roof.

- Grade separation of the LRT tracks from Alameda Street using a cut and cover structure for continuing the tracks underground from the station across Alameda Street with a wye or crossing diamond under Alameda Street to allow train movements either eastbound to 1st Street or northbound toward Union Station. Temporary decking (pre-cast concrete panels) would be used to support Alameda Street, 1st Street and the existing Gold Line tracks to the east.

- Construction of the underground sections from Alameda street and portal structures by cut and cover and open cut methods would occur along 1st Street from the east side of Alameda to about Hewitt street and on the Nikkei property along the east side of the Little Tokyo/Arts District Station to just north of Temple Street. U-shaped sections or retaining walls would be used for the transition structure to the surface.

- Prior to construction of the portal and retaining structures along 1st Street, the street would require permanent relocation to the north of its existing location between Alameda Street and about Garey Street.

- Existing Gold Line tracks would be relocated to north and south of the new portals.

- Reconstruction of the existing MSE Wall to slope more steeply to the portal entrance north of Temple Street. If trains between the Gold Line Eastside Extension and Union Station are to remain in service during construction, a temporary track or "shoofly" would be added for single track operations between the Little Tokyo/Arts District Station and the US-101 Bridge. It is estimated that existing traffic lanes along Alameda would have to be reduced to a total of 3-12 ft lanes during construction.

3.3.1.3 Fully Underground LRT Alternative – Variation 2

- As for Variation 1, requires cut and cover construction of a section of the tunnel beneath 2nd Street west of Central Avenue. This cut and cover section would continue into the Office Depot site where an open cut underground station with a split-level side platform configuration would be built. For Variation 2, the station would be deeper and narrower with side platforms on separate levels.

- Grade separation of the tracks from Alameda Street would use a cut and cover structure for continuing the tracks underground – in over and under configuration to avoid tracks crossing at the same elevation. Because the east and west bound tracks are at different elevations at the turnout (switch) location, they transition to the surface in a "staggard" location along 1st Street. The eastbound portal is further to the east – beginning at Hewett Street with the U section ending east of Garey Street. The

westbound portal begins between Alameda and Rose Street and ends just east of Hewett Street.

- Like Variation 1, construction of the portal and retaining structures along 1st Street, would require permanent relocation of 1st Street to the north of its existing location between Alameda Street and about Garey Street.

- Reconstruction of the existing MSE Wall to slope to portal entrance north of Temple Street is also required for Variation 2. If trains between the Gold Line Eastside Extension and Union Station are to remain in service during construction, a temporary track or "shoofly" would be added for single tracking operations between the Little Tokyo/Arts District Station and the US-101 Bridge. It is estimated that existing traffic lanes along Alameda would have to be reduced to a total of 3-12ft lanes during construction.

- Support in place of the existing Gold Line tracks were they cross the proposed underground sections along 1st street and just south of Little Tokyo/Arts District Station

4.0 CONSTRUCTION ACTIVITIES

4.1 Typical Cut and Cover and Open Cut Construction

Cut and cover methods will be common to all LRT alternatives. Once the staging area and the utility relocations have been completed, the contractor(s) can begin the major construction activities including cut and cover construction for the stations and the tunnels. The cut and cover construction described below is applicable to all LRT Alternatives.

All underground stations would be built with the cut and cover technique. A potential exception is the 2nd/Hope Street Station where the SEM method is considered an option for the construction due to its greater depth. A typical cut and cover construction would start with installation of a temporary shoring system with the methods described in Section 2.

Prior to installation of a temporary ground support system, dewatering may be required at underground stations and/or tunnel sites in alluvium to temporarily lower the groundwater level below the excavation depth or to an impermeable layer. This facilitates installation of soldier piles or other type of shoring systems which are not watertight, improves soil stability, and allows excavation in dry conditions. Groundwater would be pumped from wells installed around the perimeter of the excavation. If contaminated water is encountered, it would be treated at the site or hauled to a treatment facility. At the completion construction of the stations, pumping would be discontinued and groundwater levels would return to their natural level. The need for dewatering would be evaluated after geotechnical investigations have been completed. Although anticipated to be minor, the effect of dewatering on adjacent structures would be determined during design.

Once shoring is in place, excavation can begin. Concrete decking would be installed after the initial lift of excavation to restore traffic on the street above. The excavation and internal bracing/tieback installation would be performed within the excavation to the designed depth. Decking would require lane closures at the excavation area and is typically performed at night to minimize traffic impact. Once the deck is in place, the excavation and internal bracing continues below the decking to the required depth.

Open cut construction is similar to cut and cover construction, but does not include temporary decking.

Sequences described for underground station construction could be up to 48 months and is applicable to both alternatives. Based on the anticipated volume of excavation for the cut and cover tunnel and stations, it is estimated that an average of 20 to 30 dump trucks per day would be required to haul and dispose of the excavated soils during excavation cycles.

4.2 Ground Surface Settlement Resulting from Tunneling and Underground Excavation

During TBM tunneling some ground loss would occur in the alluvial soils potentially producing surface settlement. The amount of settlement measured at the surface would be a function of the tunnel depth, size, number of tunnels, distance between adjacent tunnels, TBM design and tunneling techniques, and geology. Ground movements possibly resulting in surface settlement could also occur during SEM for stations or tunnels. The amount of settlement would be a function of the sequence of excavation, amount of ground support, and thickness of shotcrete support, each of which are adjusted during mining to control ground settlement.

Underground excavation for stations and tunnel using the cut and cover technique would result in ground relaxation and deformation of the retained earth. The magnitude of ground movement depends on the strength of the alluvial soils/bedrock and the rigidity of the shoring system.

For TBM tunneling and SEM, the width of the potential settlement zone is approximately two times the depth of the tunnel invert. For cut and cover excavation, the zone potentially susceptible to ground movement generally extends a lateral distance approximately one to one-and-the-half times the depth of the excavation. Accordingly, structures located within these settlement/deformation zones would be further evaluated for potential impact and required mitigation measures.

4.3 Protection of Existing Structures

The alignment of the Regional Connector LRT project and stations have been planned to minimize construction near or beneath the existing structures. However, there are areas where this cannot be avoided such as adjacent to the basement of the Higgins building at the southwest corner with the intersection of 2nd and Main Streets for the Underground Emphasis LRT Alternative. In addition, a majority of the existing structures of either side of the alignment on Flower and 2nd Streets would be close to the excavation sites or the tunnel alignment. Building assessments would be necessary as part of the pre-construction evaluation of existing structures along the alignment. During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken to evaluate soil, groundwater, seismic, and environmental conditions along the alignment. The geologic conditions will influence design and construction methods specified for stations and tunnels as well as foundations, and protection of existing facilities.

Before any construction, a survey of structures within the anticipated zone of construction influence would be conducted in order to establish baseline conditions. A monitoring plan

would be developed and adhered to during construction to ensure appropriate measures are taken to address any construction-induced movement.

If assessments indicate the necessity to protect nearby structures, additional support for the structures by underpinning or other ground improvement techniques would be required prior to the underground construction. A preliminary list of the buildings along Flower and 2nd Streets potentially located within the influence zone is tabulated in Table 4-1.

Table 4-1. Preliminary List of Structures Potentially Affected by Tunneling, Cut and Cover, and Open Cut Operations

Address	Current Name	Nearby Construction

**Historic*

Some of the buildings along the alignment are considered historic (denoted by *). It should be noted that not all buildings on the list would require mitigation. For buildings adjacent to cut and cover construction, it is anticipated that the shoring system in conjunction with internal bracing could provide a relatively rigid temporary support for the proposed excavation that would result in deformation generally within the tolerable limits of the structures. Evaluations during future phases will help determine the appropriate levels of monitoring, protection, and mitigation measures required during construction.

To reduce surface settlement and the potential for ground loss and soil instability (sloughing, caving) at the tunnel face due to tunneling, pressure-face TBMs and pre-cast, bolted, gasketed lining systems would be employed. In combination with the face pressure, the grout would be placed immediately behind the TBM, in the annular space between the installed precast concrete liners (tunnel rings) and the excavated ground. The pressure-face TBM can tunnel below the groundwater table without requiring dewatering or lowering of the groundwater table.

Where conditions warrant, for example, shallow tunnels directly below sensitive structures or utilities, additional methods to reduce settlement would be specified. Following is brief summary of the various types of protective methods that could be employed along the alignment.

Permeation grouting to improve the ground prior to tunneling

Chemical (sodium silicate) or cement based grouts are injected into the ground to fill voids between soil particles – typically sandy soils - and provide greater strength and stand-up time for the soil. This grout can be placed through pipes from the surface before the tunnel reaches the grouted area, from pits or shafts adjacent to the grouted area, or in some instances from the tunnel face. In this latter case, the tunneling machine must be stopped for a period of time to drill grout placement pipes, pump grout, and allow the grout to set. The permeation grouting method has been used successfully for the Metro Red Line in instances where the tunnel passed under potentially sensitive or important structures such as the US 101 freeway (downtown, Hollywood and at Universal City).

Compaction grouting as the tunnel is excavated

This method involves injection of a stiff "grout," typically sand with small amounts of cement, above the tunnel crown as the tunnel advances. The grout densifies soil above the tunnel crown and replaces some of the lost ground, and thereby preventing settlement from propagating to the surface. This method was used in several instances for the Metro Red Line project in the Downtown Los Angeles area and along portions of Hollywood Boulevard.

Compensation Grouting

Compensation grouting involves carefully controlled injection of grout between underground excavations and structures requiring protection from settlement. For tunnel applications, the pipes for grouting are installed above the intended tunnel position, in advance of tunneling. A key component in controlling compensation grouting is careful monitoring of both structure and ground movements to allow the timing and quantities of grout injected to be optimized. Grout injection can take place before, during, and after tunneling activity by reusing the grout pipes.

For grouting methods, surface preparation would likely be required (removal of landscaping etc.) to allow space for drilling equipment, installation of grout pipes, and injection of grout. In cases where large structures are directly over the tunnel, access into the building or basements, where basements exist, could be required for grouting operations, and use of the building could be limited during the grouting operations. After grouting is completed, the area would be restored to its existing condition.

Underpinning

Underpinning involves supporting the foundations of an existing building by carrying its load bearing element to deeper levels than its previous configuration. This helps protect the building from settlement that may be caused by construction work in the soils near that foundation. It permanently extends the foundations of a structure to an appropriate level beyond the range of influence of the construction activity. This can be accomplished by providing deeper piles adjacent to or directly under the existing foundation and transferring the building foundation loads onto the new system.

4.4 At-Grade Emphasis LRT Alternative Construction Activities

4.4.1 Surface Trackwork

Trackwork construction involves demolition of the roadway section being displaced by the LRT trackway, preparation of the track bed, construction of the supporting track slab, and laying of rail. Foundations for overhead wires poles may be installed with the track installation. At this stage of construction, affected traffic lanes would be closed, which would effectively eliminate all mid block turns and street parking. Typical drilling of the shaft for the catenary pole and track installation are relatively shallow.

Given the urban context, approximately 2-block segments of the roadway are likely to be reserved for construction activities to achieve economies of scale and minimize the schedule. Rails would be brought to the site by trucks, stockpiled at designated storage areas, welded into rail strings and moved into place as work progresses. Construction durations for a 2-block segment are estimated to be two to four months to complete trackwork in each roadway segment. Periodic lane closures, typically on just one side of the work zone, would be required for delivery of materials and other construction activities such as concrete pours. Construction of station platform slabs would likely be included in line segment contracts and would be coordinated with trackwork installation within each segment.

During construction within a segment, cross streets and alleyways may also be temporarily closed. Major cross streets would require partial closure, usually half of the street at a time, while utilities are relocated, if necessary, for surface stations and constructing the light rail trackbed. Depending on allowable working hours, full blocks may require closures during excavation, preparation of subgrade, drilling for soldier pile installation, and track foundation placement. Closures would be staggered to facilitate traffic control. Where streets are not fully closed, two-way traffic would be allowed on half of the street. After the trackbed is constructed across a local street and the roadway is restored to its permanent condition, vehicles can resume planned traffic patterns (e.g. 2nd street would have single direction traffic).

Rails would be brought to the sites by truck, and local rail storage areas would be necessary for short-term storage and to facilitate placement of rails. Equipment used for construction of surface tracks (and surface stations) would be similar to what is required for relocation of utilities with the addition of track-laying equipment, paving machines, concrete mixers, and concrete finishers.

4.4.2 Grade Separation at Alameda and Temple Streets

As previously described in the construction scenarios, an underpass would be constructed near the intersection of Temple and Alameda Streets that would allow through traffic on Alameda Street to continue beneath Temple Street and the new rail junction. In addition, a pedestrian bridge would be constructed above the Alameda underpass that spans the

intersection of Alameda and Temple Streets. Bridge construction would involve heavy construction equipment including crane(s) for erection of the superstructure. The work would involve installation of an appropriate shoring system followed by excavation to the required depth of the underpass. Lane closures and traffic rerouting would be required for the duration of the construction.

Currently, an existing modular wall system provides support for the existing rails. Lowering Alameda Street in this area would require either underpinning the existing wall, or constructing a new, higher wall to replace the existing wall.

4.4.3 At-Grade Stations

The at-grade stations on Main and Los Angeles could be constructed simultaneously with other segments of the alternative, although the construction contractor may elect to construct them sequentially. Materials would be delivered to staging areas and station sites for the proposed construction via the shortest and safest route from the freeway. These stations would be constructed from standard building materials such as concrete, steel, aluminum, and heavy plastic, which are durable and resistant to vandalism. The stations would be similar to the existing Blue Line and Gold Line stations.

4.4.4 Underground Station

The underground station section in the At-Grade Emphasis LRT Alternative would be constructed using cut and cover methods as described in Section 4.5.1

4.4.5 Connection to the Existing 2nd Street Tunnel

Connection to the existing 2nd Street tunnel would require major construction work, including installation of a temporary shoring system, construction of retaining walls to support soil removal, reinforcement of the tunnel structure, and installation of supporting elements at the location of the new openings.

4.4.6 Operating Systems Installation

Operating systems for the LRT include traction power, an overhead catenary system, communications, and signal system. Catenary systems consist of poles connected to drilled shaft foundations with overhead wires to supply power to the trains. The power would include substations to provide direct power to the trains. These include ground systems and prefabricated units which are placed on foundation slabs by crane and connected to the system. Construction equipment would include highrail vehicles for installation of the wires from the guideway area. While wires are strung at cross streets, temporary street closures of a few hours during nighttime are anticipated. Traction power substation (TPSS) equipment would also need to be installed adjacent to the alignment along at-grade segments, or within station boxes along underground segments.

4.4.7 Permanent Constructed Features

The permanent constructed features of the At-Grade Emphasis LRT Alternative would include the following:

- Tunnel beneath Flower Street
- Station entrances near 5th Street between 6th and 5th Streets
- Portal on Flower Street south of 3rd Street
- At-grade tracks across the intersection of 3rd and Flower Streets
- Portal at the northeast corner of 3rd and Flower Streets
- Pedestrian bridge from Upper Grand Avenue to the 2nd/Hope Street Station
- New portals into the existing 2nd Street tunnel
- Tracks in 2nd Street tunnel
- At-grade tracks along 2nd Street from Hill to Los Angeles Streets, tracks on Main and Los Angeles Streets between 2nd and Temple Streets, and tracks on Temple between Main and Alameda Streets
- At-grade one-way stations at 1st and Main Streets and 1st and Los Angeles Streets
- Pedestrian Bridge landings near Temple and Alameda Streets.
- Underpass and 3-way (wye) junction at Temple and Alameda Streets
- Urban design enhancements within 1,000 feet of the centerlines of stations and portals

4.5 Underground Emphasis LRT and Fully Underground LRT Alternatives

The following methods apply to all of the underground alternatives. Table

4.5.1 Underground Station Construction

The underground stations as well as the portals would be constructed by cut and cover with decking for streets and open cut methods. A possible exception to the these methods would be the excavation for the 2nd/Hope Street Station and possibly the adjacent curved tunnel section between the station and Flower Street where mining with the SEM method is also under consideration due to its depth. The stations need to be deep to avoid utilities and

existing underground structures, including the existing Red Line tunnels, access to station platforms, structure thickness, and for cover over the tunnels extending from the stations. Station widths are about 60 feet to include trackways and center platforms. Portals are designed to accommodate the twin tracks, and traffic flow around the portal.

4.5.2 Construction of Station and Final Portal Structures

The construction sequence for the final station structure would include construction of the foundation base slab, followed by the installation of exterior walls and any interior column elements. Slabs are poured as the columns and intermediate floor and roof wall pours progress. Portal structures would use similar construction methods involving placement of concrete inverts, walls, and walkways. Station entrance locations are generally used as access points to the underground station during the construction process. Exterior entrances would be constructed after the station structure has been completed.

During station construction, approximately 5 to 10 concrete trucks per day should be anticipated for normal operation. Occasional large pours would be needed at the station depending on the construction sequencing and schedule, potentially requiring 30 to 40 trucks per day. The larger pours are expected to be performed at night to ensure supply of concrete and to minimize traffic impacts. Other support and delivery trucks, approximately up to 10 to 20 trucks per day, would also be anticipated during the duration of construction to bring materials such as rails, structural steel, and mechanical and electrical equipment. Approximately 25 to 50 workers are anticipated at each station site during construction. Once station structure work is complete, the station excavation will be backfilled and permanent roadway will be constructed.

Construction of 2nd/Hope Street Station using the SEM method would require construction of an access shaft to commence the excavation, remove the spoils, and to deliver shotcrete and other necessary construction materials. In addition, construction using the SEM method may require a variety of special measures, such as dewatering, forepoling, grouting (regular grouting or horizontal jet grouting), compressed air, and face bolts.

4.5.3 Grade Separation at Alameda and 1st Streets

Similar to the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative would require the construction of a grade separation at 1st and Alameda Streets. This construction would include the lowering of Alameda Street and allow uninterrupted traffic flow below 1st Street. The construction would include retaining walls, a pump station, and a 1st Street bridge across Alameda to allow traffic on 1st Street and support LRT trains.

In addition, the work would include the construction of a pedestrian bridge over the Alameda underpass. Related construction activities would be similar to those described in Section 4.4.2.

4.5.4 Operating Systems Installation

Construction equipment would include highrail vehicles for installation of overhead catenary system wires from the guideway area along the at-grade segment of the alignment. The wires would be suspended from poles installed within or adjacent to the right-of-way. While wires are strung at the intersection of 1st and Alameda Street, temporary street closures of a few hours during nighttimes are anticipated. TPSS equipment would also need to be installed within station boxes along the underground segments.

4.5.5 Permanent Constructed Features

The permanent constructed features of the Underground Alternatives are shown in Table 4-2.

Urban design enhancements within 1,000 of the centerlines of stations and portals	✓	✓	

4.6 Ventilation Shafts and Emergency Exits

The subway segments would include a number of ventilation and emergency exit areas for the below grade segment in the vicinity of the subway stations. The stations would house emergency ventilation fan shafts as well as separate emergency exit shafts at both ends of the stations. Ventilation fans are used for extracting smoke from tunnels and stairs for evacuation in the event of an emergency such as a fire in the underground areas. The exact location of these facilities would be determined during the final design. These shafts are constructed as extensions of the station excavation, using cut-and-cover construction methods.

4.7 Construction Personnel and Parking

The estimated number of construction personnel for different activities are as summarized in Tables 3-1 and 3-2. Arrangement for offsite parking locations would be required for the construction workers and transportation would be provided at the beginning and end of shifts to transport workers to work areas.

4.8 Hauling of Soil

With the decking installed and the utilities supported, the major excavation work for the station box can proceed. The method of removing material from the job site is usually a choice made by the contractor. A typical operation would be for bulldozers and/or overhead loaders to move material to a central pickup point or several such points, where a bucket from

a crane or a vertical or diagonal conveyor belt can hoist the material and place it into waiting trucks or a loading hopper. Spoils from station sites would be moved out from under the deck onto an off street work site or closed lane and loaded from there into hauling trucks. Occasionally spoils loading in the street during excavation and the initial drilling of soldier piles and deck installation could be required. Spoils from tunnel construction would be transported through the bored tunnels to the shaft site for loading onto trucks. An example of TBM spoils being removed from a tunnel at a construction staging site is depicted in Figure 4-1.

Excavated soils and excess material would be transported off-site to approved disposal sites along designated routes. Testing of materials would be required prior to transportation. Depending on the test results of the soils, disposal options could include the following sites:

California Hazardous (metals) Class I facilities:

- Waste Management Inc., Kettleman City, CA
- Clean Harbors Environmental Services, Buttonwillow, CA
- Veolia Environmental Services, Azusa, CA
- US Ecology Nevada, Inc., Beatty, NV

Non-hazardous, Total Petroleum hydrocarbon-containing wastes:

- Thermal Processing Systems Treatment, Adelanto, CA

Non-hazardous soil:

- Philadelphia Recycling, Mira Loma, CA
- Municipal landfills
- Other locations identified by the contractor

4.9 Street and Site Restoration

After the cut and cover underground station structures have been completed and the roof slab allowed to cure for a specified period, backfilling can begin. During backfilling operations, utilities would be restored to their permanent locations. Where sidewalks have been demolished due to cut and cover construction, they would be restored. After backfilling, the

permanent street would be constructed and the sidewalks and pavement restored to City standards. Contractor work sites would be restored for future use in a similar manner.

It is anticipated that partial street closures would be required during backfilling and site restoration.

1.0 SUMMARY

This technical memorandum addresses potential transportation impacts of the Regional Connector Transit Corridor project, and is one of a series of technical reports prepared in support of the Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) for the project. The project would directly link the 7th Street/Metro Center Station (the Metro Blue Line and future Metro Expo Line termini located at 7th and Figueroa Streets) to the Little Tokyo/Arts District Station (Metro Gold Line Station) at 1st and Alameda Streets. By linking the Metro Expo Line, Metro Gold Line and Metro Blue Line, Metro could provide continuous service across the region in two different directions: north-south between the Cities of Azusa and Long Beach and east-west between the City of Santa Monica and I-605 without the need for passengers to transfer.

The alternatives evaluated for the Regional Connector Transit Corridor project include:

- No Build Alternative
- Transportation System Management (TSM) Alternative
- At-Grade Emphasis Light Rail Transit (LRT) Alternative
- Underground Emphasis LRT Alternative
- Fully Underground LRT - Little Tokyo Variation 1
- Fully Underground LRT - Little Tokyo Variation 2

Section 2.0 of this report describes the history and background of the Regional Connector Transit Corridor Project in greater detail. This section also provides more detail on the proposed alternatives and describes the basis of this transportation evaluation.

The traffic analysis methodology used significance thresholds established by the City of Los Angeles Department of Transportation (LADOT). The alternatives are analyzed for the horizon year of 2035.

Traffic count data were collected at 85 intersection locations and 66 roadway segments. An existing conditions analysis was performed for each component of the transportation environment, which consists of transit, traffic circulation, parking and other non-motorized modes such as pedestrians and bicycles.

An on-street parking inventory was also performed for roadway segments that would be affected by the proposed alignment to identify the number of parking and loading spaces that

may potentially be displaced due to short-term construction activity and long-term project impacts.

Potential impacts for each alternative are detailed by each component of the transportation environment in Section 5.0. Future conditions were developed each project alternative to determine potential project-related impacts, potential mitigation measures, and any residual impacts after mitigation.

The At-Grade Emphasis LRT Alternative would have greater impacts on transit, traffic circulation, parking and other modes than for the other build alternatives (excluding the No Build and TSM Alternatives). With respect to traffic circulation, Table 1-1 summarizes the number of intersections with levels of service (LOS) E and F during the AM and PM peak hours in the horizon year of 2035.

Table 1-1. Number of Intersections with Levels of Service (LOS) E and F in 2035

Alternative Under Consideration	AM Peak Hour		PM Peak Hour	
	LOS E	LOS F	LOS E	LOS F
No Build	6	8	13	15
TSM	6	8	12	16
At-Grade Emphasis	7	13	12	25
Underground Emphasis	7	9	13	17
Fully Underground – Little Tokyo Variation 1	7	8	13	14
Fully Underground – Little Tokyo Variation 2	7	8	13	14

Intersections that exceed the significance threshold when compared to the No Build Alternative are considered to be impacted by the proposed project. The number of potentially impacted intersections for each alternative under consideration are summarized in Table 1-2. Potential mitigation measures are proposed in Section 6.0 and the number of intersections that remain impacted (residual impacts) after implementation of the proposed mitigation measures are also shown in Table 1-2.

In summary, no unavoidable significant adverse impacts have been identified if mitigation measures are implemented for transit, parking, pedestrians, and bicycles. Traffic circulation may experience impacts under all build alternatives—one or more intersections would

continue to be impacted to significant levels (residual impacts) after mitigation during one or both peak traffic hours (morning and afternoon).

Table 1-2. Number of Impacted Intersections With and Without Mitigation

Alternative Under Consideration	Impacted Intersections		Impacted After Mitigations	
	AM Peak	PM Peak	AM Peak	PM Peak
No Build	-----	-----	-----	-----
TSM	8	9	0	0
At-Grade Emphasis	18	26	11	15
Underground Emphasis	3	7	2	3
Fully Underground – Little Tokyo Variation 1	1	3	1	0
Fully Underground – Little Tokyo Variation 2	1	3	1	0

2.0 INTRODUCTION

2.1 Background

The Regional Connector Transit Corridor project is a vital core piece of public transit infrastructure that would enhance investments already made in the region's light rail system. It would link four distinct travel corridors covering over 50 miles across the County through the center of downtown Los Angeles.

The Los Angeles County Metropolitan Transportation Authority (Metro) has envisioned this connection for nearly two decades beginning in the late 1980s/early 1990s. At that time the Long Beach and Pasadena light rail branches were envisioned to connect in downtown Los Angeles and operate as a single line. However, the downtown segment was not built, and passengers must currently transfer to the Metro Red or Purple Lines to move between the two branches, or to reach many major central business district destinations.

Increased transit ridership, traffic congestion, and major regional developments occurring in downtown Los Angeles have created a need to tie the light rail system together. The recent opening of Metro's Gold Line to East Los Angeles and planned openings of the extension to Azusa and the Metro Expo Line to Santa Monica further emphasize this need.

The Regional Connector Transit Corridor project offers a direct high-capacity link to tie the regional branches of Metro's LRT system together through downtown. It would directly link 7th Street/Metro Center Station to the Little Tokyo/Arts District Station.

The Regional Connector project would include three to four new downtown stations and create direct light rail transit connections between the Cities of Long Beach and Azusa and I-605 and the City of Santa Monica without the need to transfer. It would also provide passengers with direct transit into the heart of the business and civic districts. Metrolink, Amtrak, and Metro Red and Purple Line passengers would have an option to transfer to the Long Beach-Azusa and I-605-Santa Monica trains and reach portions of the downtown area not presently served by Metro Rail.

The Regional Connector would provide transit benefits residents across the County, and can be accomplished by constructing just 1.8 miles of dual tracks. The proposed project would provide faster, more transit destinations by providing greater access to the downtown area and mobility region-wide.

2.2 Alternatives Considered

An Alternatives Analysis planning process was undertaken to identify and screen potential transportation alternatives in light of the project purpose and transportation need, goals, and objectives within the Regional Connector Transit Corridor project area. This process was

completed and approved by Metro in January 2009 and included community and public agency feedback at meetings and public workshops.

The alternatives analyzed in this technical memorandum emerged from this planning process, and were confirmed and refined based on public input from the scoping process. All of the approved alternatives were analyzed in this technical memorandum for the horizon year of 2035. Each of the alternatives is described in the following subsections.

2.2.1 No Build Alternative

The No Build Alternative, as defined by the Federal Transit Administration (FTA), represents the baseline case and consists of existing and committed elements of the region's transportation plan, excluding the proposed Regional Connector Transit Corridor project. Consequently, the No Build Alternative is focused on preservation of existing services. The No Build Alternative does not include any major service improvements or new transportation infrastructure beyond what is identified in Metro's 2009 Long Range Transportation Plan (LRTP).

By the projection year of 2035, the Metro Expo Line to Santa Monica, the Metro Crenshaw Line, the Metro Purple Line to Westwood, and the Metro Gold Line to Azusa will have opened and bus services will have been reorganized and expanded to provide connections with these new rail lines. Otherwise, the transit network within the project area would be largely the same as it is now except for potential improvements to frequency of service.

2.2.2 Transportation System Management (TSM) Alternative

The TSM Alternative includes all of the provisions of the No Build Alternative, plus two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours. The buses may also have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles.

Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. Each route would operate every 2.5 minutes during the peak hours and every 5 minutes during the off-peak hours. The proposed two routes are:

- *Upper Grand Route (Grand/Temple/Los Angeles Alignment)* - From the 7th Street/Metro Center Station, buses would proceed east on 7th Street, north on Olive Street, west on 5th Street, north on Grand Avenue, east on Temple Street, and then north on Los Angeles Street to Union Station. As a variation, buses could use Alameda Street between Temple Street and Union Station to allow a stop at Temple and Alameda Streets, near the Little Tokyo/Arts District Station. The alignment is assumed to follow the same route as part of the existing LADOT DASH Route B

service, proceeding from 7th Street/Metro Center Station to Union Station using Grand Avenue, Temple Street, and Los Angeles Street. Shuttle buses would run less than 8 minutes apart and cover the Bunker Hill and Civic Center areas.

- *Lower Grand Route (Figueroa/Flower/2nd/3rd/Alameda Alignment)* - This route would use the existing northbound bus-only lanes on Figueroa Street and mixed flow lanes on 2nd and 3rd Streets that are lightly used by other bus lines. From 7th Street/Metro Center Station, buses would proceed north on Figueroa Street, west on 2nd Street, and north on Alameda Street to Union Station. To return to the 7th Street/Metro Center Station, buses would travel south on Alameda Street, west on 3rd Street, and south on Flower Street. The alignment passes by both the Little Tokyo/Arts District Station and Union Station, and provides coverage of Little Tokyo and the southern edge of the Civic Center.

2.2.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would provide a direct connection from the existing underground 7th Street/Metro Center Station to the Metro Gold Line at Temple and Alameda Streets, including three new station locations. This alternative extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, surfaces to an at-grade alignment north of 4th Street, crosses 3rd Street at grade, enters Bunker Hill through a tunnel, and turns northeast, entering through a new entrance into the existing 2nd Street Tunnel.

The alignment continues at grade along 2nd Street and splits into a one-way at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). The tracks then head east on Temple Street, realign into a dual-track configuration just east of Los Angeles Street, and connect to the Metro Gold Line in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street. The three stations identified for this alternative include an underground station south of 5th Street under Flower; an underground station between 2nd/Hope and 3rd /Flower; and an at-grade southbound only station on Main Street and an at-grade northbound only station on Los Angeles Street – both are located on the eastern side of the streets between Temple and 1st Streets.

Due to the high volume of trains that would traverse the Regional Connector and high traffic volumes on Alameda Street, an automobile underpass and potential pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets. This would eliminate potential pedestrian-train and automobile-train conflicts. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill.

This alignment includes both underground and at-grade configurations, with 46 percent of the route underground, serving the Civic Center, Grand Avenue, and the Financial District. Conversion of 2nd Street between Hill Street and Los Angeles Street to a pedestrian-friendly transit mall is assumed. However, local access would be maintained to serve the adjacent businesses and office buildings.

To implement this alternative, the number of traffic lanes on 2nd Street would be reduced to one westbound lane between Hill Street and Main Street and on-street parking would be eliminated. As a result, traffic is likely to divert to adjacent parallel streets such as 1st Street, 3rd Street for westbound through traffic, and 4th Street for eastbound through traffic. The roadway capacity along these adjacent parallel streets would remain unchanged from current conditions. Vehicular traffic congestion along these streets would likely increase.

For the at-grade segments of this alternative, the two LRT tracks would typically occupy a 26-foot-wide surface right-of-way bordered by mountable curbs. It is expected that this width would increase at station areas. Vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections, with signal cycle length and phasing modified to provide adequate green time for LRT vehicles to safely cross.

For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted. Trains would operate on a north-south route between Azusa and Long Beach, running every five minutes during the peak hours. Trains would also operate on an east-west route between the vicinity of I-605 and Santa Monica, running every five minutes during the peak hours. This would yield trains running at every 2.5 minutes in each direction through the project area.

2.2.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would be completely underground, except for a single at-grade crossing at the intersection of 1st and Alameda Streets. The alignment would have three new station locations.

This alternative would connect directly to the tracks at the 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street Tunnel and the 2nd Street roadway to Central Avenue. There are three underground stations identified for this alternative. One underground station is located between 4th and 5th Streets under Flower; a second underground station is located between 2nd/Hope and 3rd/Flower Streets; and a third station can be located along 2nd Street either between Broadway and Spring or Los Angeles and Main Streets.

In the vicinity of Central Avenue the tracks would veer northeast into a new portal on private property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. It is expected

that a portion of this property would be acquired to construct the portal and is one of two sites that could potentially be used as a staging area for tunnel construction beneath 2nd Street with a Tunnel Boring Machine (TBM).

The tracks would then enter the intersection of 1st and Alameda Streets at-grade in the same type of three-way junction planned for the At-Grade Emphasis LRT Alternative. Due to the high volume of trains that would traverse the Regional Connector and the high traffic volumes on Alameda Street, an automobile underpass and potential pedestrian overpass would be constructed at the intersection of 1st and Alameda Streets. This would minimize pedestrian-train and automobile-train conflicts. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill.

Due to its mostly underground configuration, the Underground Emphasis LRT Alternative would not dramatically compromise existing roadway capacity. The alignment of this alternative could affect surface traffic and pedestrian circulation at the intersection of 1st and Alameda Streets, where the LRT alignment would operate in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns.

The only exceptions would be 1) at Hope Street in the vicinity of General Thaddeus Kosciuszko Way, where two adjacent intersections would be consolidated into one intersection at South Hope and 2nd Streets; and 2) a permanent roadway reconfiguration involving the removal of one traffic lane along Flower Street in the vicinity of the Flower/5th/4th Street station to accommodate the station pedestrian portal entrances along the sidewalk.

Trains would operate on a north-south route between Azusa and Long Beach, running every five minutes during the peak hours. Trains would also operate on an east-west route between the I-605 and Santa Monica, running every five minutes during the peak hours. This would yield trains running at every 2.5 minutes in each direction within the Regional Connector segment.

2.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would provide four new stations and a direct, entirely underground connection from the 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend from the 7th Street/Metro Center Station under Flower Street to 2nd Street and then proceed east underneath the 2nd Street Tunnel and 2nd Street roadway to Central Avenue. At 2nd Street and Central Avenue, the tracks would continue underground heading northeast under 1st and Alameda Streets.

The four underground stations identified for this alternative include the underground station between 4th and 5th Streets under Flower Street; the underground station between 2nd/Hope and 3rd/Flower Streets; the underground station under 2nd Street between Broadway and Spring; and an underground station within the property bounded by 1st, 2nd, Central and Alameda Streets.

A three-way junction would be constructed underground beneath the 1st and Alameda Streets intersection. To the north and east of the junction, trains would rise to the surface through two new portals to connect to the tracks heading north to Azusa and east towards I-605. One portal would be located northeast of the Little Tokyo/Arts District Station rising to the surface within the City of Los Angeles Department of Water and Power Maintenance Yard and connecting to the existing LRT bridge over the US-101 freeway.

The second portal would be located within 1st Street between Alameda and Vignes Streets. The tracks would rise to the east within this second portal and connect at-grade to the existing tracks to East Los Angeles.

Again, the Fully Underground Alternative – Little Tokyo Variation 1 would be operated entirely underground from east of the intersection of 1st and Alameda Streets to the 7th Street/Metro Center Station. A pedestrian bridge could be constructed between the 2nd/Hope Street Station and Upper Grand Avenue to enhance the connection to Bunker Hill.

Roadway reconfigurations would include:

- A permanent roadway reconfiguration consisting of the removal of one traffic lane and the parking on one side along Flower Street in the vicinity of the Flower/5th/4th Street station. Removal of this lane would accommodate the station pedestrian portal entrances along the sidewalk.
- Street widening and sidewalk modifications would be required on 1st Street in the vicinity of the portal.
- At Hope Street in the vicinity of General Thaddeus Kosciuszko Way, where two adjacent intersections would be consolidated into one at South Hope and 2nd Streets.
- The newly installed traffic signal at 1st and Hewitt Streets would be removed and therefore, through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possible.

Otherwise, the alignment would not affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street bridge and vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns.

Trains would operate on a north-south route between Azusa and Long Beach, running every five minutes during the peak hours. Trains would also operate on an east-west route between the I-605 and Santa Monica, running every five minutes during the peak hours. This would yield trains running at every 2.5 minutes in each direction.

2.2.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is similar to Variation 1 except two portals instead of one, each containing one track, would rise to the east within the widened median of 1st Street. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

The Fully Underground Alternative – Little Tokyo Variation 2 would be located entirely underground from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. The same alterations to the roadways and traffic circulation would occur for this alternative as was described for the Fully Underground LRT Alternative – Little Tokyo Variation 1.

The four underground stations identified for this alternative include the underground station between 4th and 5th Streets under Flower Street; the underground station between 2nd/Hope and 3rd/Flower Streets; the underground station under 2nd Street between Broadway and Spring; and an underground station within the property bounded by 1st, 2nd, Central and Alameda Streets.

Trains would operate on a north-south route between Azusa and Long Beach, running every five minutes during the peak hours. Trains would also operate on an east-west route between the I-605 and Santa Monica, running every five minutes during the peak hours. This would yield trains running at every 2.5 minutes in each direction.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section describes the methodology and assumptions used to evaluate and analyze potential impacts to the transportation environment due to the proposed Regional Connector Transit Corridor project. The analysis evaluated transportation impacts from the project on transit, traffic circulation, parking, and other modes such as pedestrians and bicycles.

3.1 Standards of Significance

CEQA guidelines define "significant effect" or "significant impact" as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project. The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. There are few quantitative standards of significance related to transportation effects. The measurement and prediction of level of service at potentially affected intersections is a standard that is used to evaluate the significance of potential traffic impacts. Predicted changes in level of service provide indications of how well road-based movements may function under the different alternatives, which may have implications for vehicular traffic, and certain types of transit and non-motorized transportation.

Significant impacts generated by the build alternatives were identified by comparing results of the level of service analyses. Each future build alternative evaluated was compared to the No Build Alternative, which is considered the baseline condition. The reason for this comparison is to determine potential significant impacts due to the proposed project.

The threshold of significance used to identify significant traffic impacts under both NEPA and CEQA are based upon guidelines set forth by LADOT in the LADOT Traffic Study Policies and Procedures revised in March 2002. The significance threshold at an intersection is based on the amount of change in overall delay between an action alternative and the No Build Alternative. An intersection is considered to be significantly impacted by the project if the change in overall delay from the No Build Alternative is equal to or greater than the criteria shown in Table 3-1.

3.2 Project Area Evaluated

The project area is bounded by Figueroa Street on the west, the Santa Ana Freeway (US-101) on the north, Alameda Street on the east, and 8th Street on the south. Most of the roadway segments and intersections evaluated are located along the alignments of the proposed shuttle bus service for the TSM Alternative and the light rail transit service for the At-Grade Emphasis and Underground Emphasis Alternatives. In addition, this evaluation included locations on parallel adjacent arterials potentially affected by a potential shift in traffic caused by reducing the number of travel lanes along 2nd Street.

Table 3-1. Intersection Significance Threshold	
Final Intersection LOS with Project	**Change in Delay (in seconds) from the No Build Alternative**
LOS A	-----
LOS B	-----
LOS C	6.0
LOS D	4.0
LOS E	2.5
LOS F	2.5

Source: LADOT 2002

3.2.1 Roadway Network

Based on the City of Los Angeles' General Plan Circulation Element, roadways have functional classifications that range from Major Highway, to Secondary Highway, to Collector Street. A brief description of these types of roadways is provided below.

- A Major Arterial (Class I) has three full-time through lanes in each direction, one part time parking lane in each direction and one median/left turn lane with 12-foot sidewalks on both sides.
- A Major Arterial (Class II) has two full-time through lanes in each direction, one part time parking lane in each direction, and one median/left turn lane with 12-foot sidewalks on both sides. Pedestrian priority segments include 17-foot sidewalks on both sides.
- A Secondary Arterial has two full-time through lanes in each direction, all-day permitted parking, and one median/left turn lane with ten-foot sidewalks on both sides. Pedestrian priority segments include 15-foot sidewalks on both sides.
- A Standard Collector Street has one full time lane in each direction, one full-time parking lane in each direction and ten-foot sidewalks on both sides.

3.3 Evaluation Methodology

A potential list of roadway segments and intersection locations to be studied was identified and presented to the affected agencies including Metro and LADOT for review and

concurrence. The initial list consisted of 70 intersection locations; however, after LADOT's review, an additional 15 intersection locations were included in the traffic analysis.

Initial information was collected from LADOT, but it was determined that most of the available count data were older than 2 or 3 years. Therefore, new counts were conducted at all 85 intersection locations and 66 roadway segments. Daily traffic volumes along the roadway segments and the morning (AM) and afternoon (PM) peak period turning movement counts at each intersection were collected by traffic surveyors on a typical weekday when schools were in session.

Existing transit services within the project area that parallel the Regional Connector alignment were identified and tabulated to show destinations, existing headways, service characteristics, and operating time periods. An on-street parking evaluation was conducted to assess the number of spaces that may be removed due to each one of alternatives. The analysis included a field inventory of the number of available on-street parking and loading spaces and identification of peak period parking restrictions, if applicable.

Existing traffic operating conditions were evaluated by performing a level of service (LOS) analysis for the roadway segments and intersections. LOS is a qualitative measure used to describe the condition of traffic flow, ranging from excellent conditions at LOS A to overloaded conditions at LOS F. LOS D is typically recognized as the minimum acceptable level of service in urban areas. Table 3-2 defines each level of service and is based on each roadway's specific volume-to-capacity ratio.

Each study intersection was analyzed using the Highway Capacity Manual delay methodology for signalized and un-signalized intersection. The LOS designation is based on an overall average vehicle delay in seconds per vehicle. The LOS criteria thresholds for un-signalized intersection are different than those used for signalized intersections. Table 3-3 provides LOS definitions for un-signalized intersections, including all-way and two-way stop-controlled intersections.

Table 3-4 provides LOS definitions and thresholds used to measure the performance of signalized intersections, where the intersection's LOS designation is also based on overall average vehicle delay in seconds per vehicle.

Traffic forecasts were developed for the horizon year of 2035 by obtaining the travel demand forecasts from the Metro Corridors Base Model and post-processing the information to reflect the anticipated growth within the project area. Forecasts for the No Build Alternative would account for background growth in traffic due to additional regional and sub-regional land use development (cumulative projects) and population growth. These forecasts were used to perform the operational analysis for each horizon year alternative under consideration.

For each potentially impacted location, proposed mitigation measures were developed.

Table 3-2. Roadway Segment Level of Service Definitions

LOS	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. Free flow, light volumes.
B	0.601 - 0.700	VERY GOOD. Free to stable flow, light to moderate volumes.
C	0.701 - 0.800	GOOD. Stable flow, moderate volumes, freedom to maneuver noticeably restricted.
D	0.801 - 0.900	FAIR. Approaches unstable flow, moderate to heavy volumes, limited freedom to maneuver.
E	0.901 - 1.000	POOR. Extremely unstable flow, heavy volumes, maneuverability, and psychological comfort extremely poor.
F	>1.000	FAILURE. Forced or breakdown conditions, slow speeds, tremendous delays with continuously increasing queue lengths.

Source: TRB 1980.

Table 3-3. Level of Service Definitions for Un-Signalized Intersections

LOS	Average Vehicle Delay (in seconds)
A	$\leq$ 10.0
B	> 10.0 and $\leq$ 15.0
C	> 15.0 and $\leq$ 25.0
D	> 25.0 and $\leq$ 35.0
E	> 35.0 and $\leq$ 50.0
F	> 50.0

Source: TRB 2005

Table 3-4. Level of Service Definitions for Signalized Intersections		
LOS	**Average Vehicle Delay (in seconds)**	**Definition**
A	≤ 10.0	EXCELLENT. No vehicle waits longer than one red light and no approach phase are fully used.
B	> 10.0 and ≤ 20.0	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	> 20.0 and ≤ 35.0	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	> 35.0 and ≤ 55.0	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	> 55.0 and ≤ 80.0	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 80.0	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Source: TRB 2005

4.0 AFFECTED ENVIRONMENT

This section identifies the existing conditions for each transportation component being evaluated. The transportation environment consists of transit, traffic circulation, parking, and other modes such as pedestrians and bicycles.

4.1 Transit

The Regional Connector is located within the central business district of downtown Los Angeles, which is characterized by the highest concentration of transit service in the county. Ten transit operators operate four existing rail lines (one rail line is under construction) and approximately 110 bus routes throughout the project area. Services vary considerably in speed, frequency and capacity.

The transit operators include Antelope Valley Transit Authority (AVTA), City of Gardena, City of Santa Clarita, City of Santa Monica (Big Blue Bus), Foothill Transit, LADOT, Metro, Montebello Transit, Orange County Transportation Authority (OCTA), and Torrance Transit. The type of service provided includes traditional line-haul bus service, peak-hour freeway express buses, and downtown circulator shuttles.

Although Metro and LADOT carry the majority of passengers, other operators provide peak-hour, peak direction commuter bus service as well. In addition to public transit services, several high-rise office tenants also offer shuttle bus service to Union Station for their employees.

Commuter rail service to downtown Los Angeles is provided primarily by Metrolink and Amtrak, with connections to Metro Rail service at Union Station, which is located 0.1 mile outside of the project area. Most passengers arriving at Union Station on Metrolink are bound for the central business district and presently use the Metro Red Line, LADOT DASH buses, or employer-provided shuttles to complete their trips.

Almost all streets in the downtown area are served during the peak hours, with bus service that has five minute or even higher frequency (headways). The bus service runs in a grid pattern with the predominant flow of passengers being in an east-west orientation, although there are also heavily utilized bus lines that run in the north-south direction. The most heavily-served streets are 1st Street, the 4th Street/5th Street couplet, Hill Street, Broadway, the Main Street/Spring Street couplet, and the Grand Street/Olive Street couplet.

Major bus routes paralleling the Metro LRT lines and providing connections between the project area and the region are shown in the following tables. Each table shows the limits of a bus routes' service, the operating period, and the peak hour frequency. Tables 4-1 and 4-2 summarize the bus routes paralleling the existing Pasadena Gold Line and the existing Gold Line to East Los Angeles service.

Table 4-1. Bus Routes Paralleling the Existing Pasadena Gold Line Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	78/79/ 378	Local/Limited Stop Bus	5AM-1AM	10 mins	Arcadia via Huntington Dr. and Las Tunas Dr.
Metro	94	Local/Limited Stop Bus	5AM-1AM	5 mins	Sylmar via San Fernando Rd. and Spring Street
Metro	485	Freeway Express Bus	5AM-12AM	20 mins	Altadena via El Monte Busway, Oak Knoll Av. and Lake Av.

Table 4-2. Bus Routes Paralleling the Existing Gold Line to East Los Angeles Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	18	Local Bus	24 Hours	3 mins	Wilshire Center - Montebello via 6th Street and Whittier Bl.
Metro	30/31/ 330	Local/Limited Stop Bus	24 Hours	4 mins	Pico-Rimpau - Monterey Park via Pico Bl. and E 1st Street
Metro	62	Local Bus	5AM-11PM	15 mins	Hawaiian Gardens via Telegraph Rd.
Metro	66/366	Local/Limited Stop Bus	4AM-1AM	2 mins	Wilshire Center - Montebello via 8th Street and Olympic Bl.
Metro	68/84	Local Bus	24 Hours	8 mins	West LA - Montebello via Washington Bl. and Cesar Chavez Av.
LADOT	Dash Boyle Heights/East LA	Dash	7AM-7PM	20 mins	Herbert & Whittier via Wabash, Gage Av. and Rowan

Table 4-2. Bus Routes Paralleling the Existing Gold Line to East Los Angeles Service					
Operator	**Line**	**Mode**	**Weekday Hours of Operation**	**Peak Hour Frequency**	**Route Description**
Montebello	40	Local Bus	5AM-10PM	8 mins	Montebello and Whittier via Beverly Bl.
Montebello	341	Limited Stop Bus	7AM-9AM 4PM-6PM	30 mins	Montebello and Whittier via Beverly Bl.
Montebello	342	Limited Stop Bus	7AM & 5PM	One Trip	Montebello and Whittier via Beverly Bl.
Montebello	343	Limited Stop Bus	7AM-8AM 5PM-6PM	30 mins	Montebello and Whittier via Beverly Bl.

Tables 4-3 and 4-4 summarize the bus routes paralleling the existing Blue Line service to Long Beach and the future Exposition Line service to Culver City.

Table 4-3. Bus Routes Paralleling the Existing Blue Line Service					
Operator	**Line**	**Mode**	**Weekday Hours of Operation**	**Peak Hour Frequency**	**Route Description**
Metro	48	Local Bus	5AM-11PM	7 mins	Avalon Green Line via Main Street and S. San Pedro Street
Metro	60	Local Bus	24 Hours	6 mins	Artesia Blue Line via Long Beach Bl.
Metro	760	Rapid Bus	5AM-8PM	8 mins	Long Beach Bl. Rapid Bus
Metro	445	Freeway Express Bus	5AM-7PM	30 mins	San Pedro via Harbor Transitway, 1st Street and Pacific Av.
Metro	446/447	Freeway Express Bus	5AM-12AM	15 mins	San Pedro via Harbor Transitway, Avalon Bl. and Pacific Av.

Table 4-4. Bus Routes Paralleling the Future Exposition Line Service

Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	4	Local Bus	24 Hours	7 mins	Santa Monica via Santa Monica Blvd.
Metro	10	Local Bus	5AM-12AM	7 mins	West Hollywood via Temple Street and Melrose Avenue
Metro	14	Local Bus	24 Hours	10 mins	Beverly Hills via Beverly Blvd./West LA via Adams Blvd.
Metro	20	Local Bus	24 Hours	4 mins	Santa Monica via Wilshire Blvd.
Metro	26/51/52/ 352	Local/ Limited Stop Bus	24 Hours	4 mins	Hollywood - Compton - Artesia Blue Line via Avalon Blvd.
Metro	28/83/84/ 328	Local Bus	5AM-1AM	8 mins	Century City via Olympic Blvd.
Metro	33/333	Local/ Limited Stop Bus	24 Hours	2 mins	Santa Monica via Venice Blvd.
Metro	35/335	Local/ Limited Stop Bus	4AM-12AM	10 mins	West LA via Washington Blvd.
Metro	37	Local Bus	4AM-1AM	10 mins	Beverly Hills via Beverly Blvd./West LA via Adams Blvd.
Metro	90/91	Local Bus	5AM-12AM	10 mins	Sunland via Foothill Blvd., Cañada Blvd., and Glendale Avenue
Metro	439	Freeway Express Bus	5AM-9PM	40-60 mins	Aviation Green Line via Culver City

Table 4-4. Bus Routes Paralleling the Future Exposition Line Service					
Operator	Line	Mode	Weekday Hours of Operation	Peak Hour Frequency	Route Description
Metro	487	Freeway Express Bus	6AM-9PM	30 mins	Sierra Madre Villa Gold Line via El Monte Busway
Metro	720	Rapid Bus	4AM-1AM	4 mins	Wilshire Blvd. - Whittier Blvd. Rapid
LADOT	CE437	Freeway Express Bus	7AM-9AM 4PM-6PM	15-30 mins	Venice/Marina del Rey/Culver City

4.2 Traffic Circulation

4.2.1 Roadway Network

The environment in which traffic was evaluated included the north-south major and secondary arterials between and including Arcadia Street and 8th Street, and the east-west major and secondary arterials between and including Figueroa Street and Alameda Street. This section describes the major arterials in the project area roadway network.

Figueroa Street – This is a major class II arterial according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a one-way northbound street south of 3rd Street and a two-way street north of 3rd Street. Figueroa Street currently carries about 19,300 to 32,100 vehicles per day (vpd).

Flower Street – This is a secondary roadway according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a one-way southbound street south of 4th Street and a two-way street north of 4th Street. The 7th Street/Metro Center Station is located at Flower and 7th Street. This roadway currently carries from 6,700 to 17,600 vehicles per day.

Grand Avenue – This is a major class II arterial according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a one-way southbound street south of 5th Street and a two-way street north of 5th Street. It currently carries about 12,300 to 22,500 vehicles per day.

Olive Street – This is a secondary roadway according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a one-way northbound street south of 5th Street and a two-way street north of 5th Street. It carries about 13,300 to 17,300 vehicles per day.

Main Street – This is a secondary roadway according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a one-way street running north in the project area and carries 11,000 to 12,200 vehicles per day.

Los Angeles Street – This is a secondary roadway according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a two-way street carrying 9,000 to 20,700 vehicles per day.

Alameda Street – This is a major class II arterial according to City of Los Angeles General Plan, and is oriented in a north-south direction. It is a two-way street carrying 26,800 to 34,000 vehicles per day.

Temple Street – This is a major class II arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a two-way street carrying 15,100 to 21,700 vehicles per day.

1st Street – This is a secondary arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a two-way street carrying 14,000 to 23,300 vehicles per day.

2nd Street – This is a secondary arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a two-way street carrying 11,700 to 17,100 vehicles per day.

3rd Street – This is a secondary arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a one-way westbound street east of Flower Street and a two-way street west of Flower Street. It carries about 17,800 to 20,800 vehicles per day.

5th Street – This is a secondary arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a one-way westbound street and carries about 21,200 to 22,200 vehicles per day.

7th Street – This is a secondary arterial according to City of Los Angeles General Plan, and is oriented in an east-west direction. It is a two-way street carrying 16,700 to 19,700 vehicles per day.

4.2.2 Traffic Count Locations

Traffic counts were conducted to determine existing traffic operating conditions in the project area and develop future traffic projections for the 2035 horizon year analysis. Twenty four-hour tube counts were taken at 66 roadway segments and AM and PM peak period manual turning movement counts were conducted at 85 intersections. The roadway segment analysis was performed using average daily traffic (ADT) volumes taken from the tube counts and compared to the roadway capacity based on the City's General Plan designations. The intersection analysis was performed using the Synchro software to develop AM and PM peak hour operating conditions. Data collection was conducted on representative weekdays (Tuesday, Wednesday, or Thursday) between April and May 2009.

4.2.3 Existing (2009) Roadway Segment Operating Conditions

In April and May of 2009, daily 24-hour machine counts were collected at 66 roadway segment locations along 13 streets within the downtown Los Angeles area. Each roadway segment was analyzed to determine daily traffic operations and level of service. Table 4-5 presents capacities, volumes, volume-to-capacity ratios and corresponding levels of service for each roadway segment location analyzed in the project area.

According to the analysis, two roadway segments experience an existing LOS F traffic operating condition. These segments are located on 3rd Street between Hill Street and Broadway, and Broadway and Spring Street. One roadway segment, Alameda Street between Temple Street and 1st Street, currently experiences an LOS E condition. The remaining roadway segments operate at levels of service D or better.

Table 4-5. Existing Daily Roadway Analysis

4.2.4 Existing (2009) Intersection Peak Hour Traffic Conditions

Turning movement counts were collected at 85 intersection locations in the Regional Connector project area in order to assess current peak hour traffic operating conditions. The selected intersections are located both along the proposed LRT alignment and along adjacent streets, where potential shifts in traffic patterns may take place due to the proposed project. All intersections are currently signalized except for the 1st Street and Dewap Street intersection. All traffic count data were taken on a representative weekday (Tuesday, Wednesday, or Thursday) when schools were in session, there was no public holiday, and there were no unusual or adverse weather conditions.

Each study intersection was analyzed to determine peak hour operations and level of service. The project area roadway network was developed using the Synchro version 7.0 software after physical and operational characteristics for each study intersection was input. The Synchro output provides the level of service for signalized and un-signalized intersections along with an associated overall average vehicle delay in seconds per vehicle.

The existing conditions intersection analysis shows that only the Figueroa Street and Wilshire Boulevard intersection is operating at LOS F in the PM peak hour. All other intersections currently operate at LOS D or better during both the AM and PM peak hours. The results of the existing AM and PM LOS analysis and delay at each of the study intersections are presented in Table 4-6.

4.3 Parking

A comprehensive field survey was performed to collect the number of on-street parking spaces, loading spaces, and driveways that may be affected due to the proposed Regional Connector project. The street segments within each proposed alignment were surveyed to identify the existing number of parking spaces and associated peak period parking restriction information. Along the alignments, parking regulations permit a number of on-street parking spaces in one or both directions during the AM and PM peak hours. Current on-street parking, loading, and driveway information are summarized in Table 4-7.

4.4 Other Modes

Depending on the alternative being considered, areas that may have potential impacts on pedestrians and bicyclists include streets and intersections where the proposed LRT has an at-grade profile. These areas include Flower Street between 4th and 3rd Streets, 2nd Street between Hill and Los Angeles Streets, Main and Los Angeles Streets between Temple and 2nd Streets, Temple Street between Main and Alameda Streets, and Alameda Street between Aliso and 2nd Streets.

4.4.1 Pedestrians

In urban settings, sidewalks are recommended to be 6 to 9.8 feet wide. The space closest to the curb allows for a buffer against moving traffic as well as space for street hardware, including light poles and street signs. The City of Los Angeles' guidelines recommend secondary arterial sidewalk widths of between 9 and 10.7 feet. In addition, all of the signalized intersections along the proposed LRT alignments currently have pedestrian call buttons. Crossing tracks at uncontrolled locations is prohibited and signs are placed to guide pedestrians to the nearest safe crossing at a signalized crosswalk location.

4.4.2 Bicycles

The Metro bicycle plan has designated 1st Street as a future Commuter Bikeway. This is defined as a hybrid of a Class II and Class III bikeway. Class II bikeways are designated striped lanes on surface streets, and Class III bikeways are unstriped bike routes that are designated by green "bike route" signage. Commuter Bikeways are unstriped routes that utilize a wide curb lane where parking is prohibited during peak hours. On 1st Street, the Commuter Bikeway would utilize the curb lane during peak periods when parking is prohibited. During off-peak hours, bicyclists ride in the traffic stream to avoid opening car doors.

5.0 IMPACTS

This section identifies operational and construction effects of the proposed project for each of the alternatives under consideration. The forecasts used to perform the operational analysis account for background growth in traffic due to cumulative projects, additional regional and sub-regional land use development, and population and employment growth.

5.1 Operational Impacts

The following sections describe future operational effects and conditions by alternative. The analysis was performed for the horizon year of 2035.

5.1.1 No Build Alternative

5.1.1.1 Transit

By horizon year 2035, several Metro Rail lines will be operating in the region. These transit services are included in the current adopted 2009 Metro Long Range Transportation Plan. As a result of the new rail lines, some bus services would be reorganized to minimize duplication of services. The Metro Corridors Base Model that was used to develop the travel demand forecasts takes these service changes into consideration. It also includes changes such as service cancelations based on the performance index, reducing service duplication by restructuring and truncating bus lines, and providing an efficient operational mix between Rapid and local bus service.

Transit service under the No Build Alternative would be focused on preserving existing services and projects. By horizon year 2035, the Metro Exposition Line to Santa Monica would be in service and some bus line service would have been reorganized and restructured to provide connections with the new rail lines. Otherwise, the transit network within the project area would be largely the same as it is now. The total daily system wide linked trips for the entire bus and rail system is projected to be about 1,717,100. A linked trip consists of one person making a one-way trip, which may include the use of multiple transit vehicles on the transit system. The daily urban rail boardings for this alternative would be 258,500 at the Metro Blue Line, Metro Gold Line, and Metro Expo Line stations combined. A single boarding is defined as one person getting on one transit vehicle. Consequently, a linked trip can be comprised of multiple boardings.

It is anticipated that the current bus service would predominantly remain the same through the year 2035 under the No Build Alternative in the project area. There would be increased headways for some of the heavily travelled lines. In addition, increases along the lines listed in Tables 4-1 through 4-4 would help feed more passengers into the downtown area and into the project area.

Transit patrons would continue to transfer twice to the Metro Red and Purple Lines through downtown to make a complete east-west or north-south trip. It is expected that transit service performance through the downtown area would likely decrease due to increased traffic congestion. This may make travel via transit a less attractive option for patrons traveling across downtown between Santa Monica and the I-605 vicinity or from Azusa to Long Beach. For those transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient. As a result, without significant improvements in transit service under the No Build Alternative, there would be a negative impact upon those that rely on the public transit system for east-west and north-south travel through the downtown area.

5.1.1.2 Traffic Circulation

Traffic forecasts were developed for horizon year 2035 by obtaining the Metro model projections for the no build condition and post-processing the information to reflect the anticipated growth within the project area. The resulting forecasts for the No Build Alternative account for background growth in traffic due to additional regional and sub-regional land use development (cumulative projects) and population growth. Using these year 2035 forecasts, an operational analysis was performed for the No Build Alternative. Based on the post-processed results of the long-range traffic projections, the growth factors at the 85 study intersections ranged from 1.30 to 1.57 over a 26-year period. This equates to a compounded average annual growth rate of 1 to 1.75 percent.

Future no build conditions (without the LRT) were analyzed; resulting traffic operating conditions and corresponding morning and afternoon peak hour LOS are presented in Table 5-1. This analysis assumed no improvements to the existing roadway system and the existing intersection lane configurations.

The results indicate that under no build conditions, 71 intersections would continue to operate at LOS D or better in the AM peak hour and 57 would continue to operate at LOS D or better in the PM peak hour. In the AM peak hour, six intersections would operate at LOS E and eight would operate at LOS F. In the PM peak hour, these numbers increase to 13 intersections operating at LOS E and 15 operating at LOS F. Intersections operating at LOS E or F are shown in bold.

5.1.1.3 Parking

The No Build Alternative would have no impact on the number of on-street parking and loading spaces in the project area. However, by 2035 increased growth in the area will lead to increased parking demand on the already strained parking resources. This may lead to increased and costly parking requirements for new developments in the area, potential changes in land-use choices that are not consistent with neighborhoods or communities in the project area, or increased parking prices to quell demand.

5.1.1.4 Other Modes

The No Build Alternative would have no impacts on bicycle or pedestrian facilities within the project area. However, increased traffic congestion and deterioration of LOS for traffic segments and intersections would result in performance deterioration of bicycle and pedestrians movements along the project corridor.

5.1.2 Transportation System Management (TSM) Alternative

5.1.2.1 Transit

The TSM Alternative proposes two express shuttle bus routes instead of light rail as a link between the 7th Street/Metro Center Station and Union Station. All provisions of the No Build Alternative would also be included.

The proposed shuttle buses would run every 2.5 minutes during peak hours and every 5 minutes during off-peak hours to move passengers efficiently between the two stations. They may have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles, to improve bus speeds. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. These shuttle routes would be operated by Metro.

For the TSM Alternative, the total daily system wide linked trips for the entire bus and rail system is projected to be about 1,722,400, which is a 5,300-trip increase over the No Build Alternative. A linked trip consists of one person making a one-way trip, which may include the use of multiple transit vehicles on the transit system. The daily urban rail boardings for this alternative is projected to be 258,000 at the Metro Blue Line, Metro Gold Line, and Metro Expo Line stations combined.

The TSM Alternative would improve the east-west and north-south connections between the stations, although transit patrons would still be required to transfer through downtown in order to make a complete trip.

This may make travel via transit a less attractive option for patrons traveling across downtown between Santa Monica and the I-605 vicinity or from Azusa to Long Beach. For those transit patrons that have no other travel options, travel times would increase and transit usage would be less convenient than projected under one of the LRT alternatives. As a result, there would be a negative impact upon those that rely on the public transit system for east-west and north-south travel through the downtown area.

Projections show a similar number of urban rail boardings as the No Build Alternative; however, the proposed shuttle bus service is projected to carry 42,700 daily boardings. It is expected that the theoretical carrying capacity would be approximately 3,400 passengers per hour in each direction using 30-foot shuttle buses; though 40-foot shuttle buses could also be used. This alternative would still result in a negative impact on transit-dependent users, though it would be a marginal improvement over the No Build Alternative.

The transit impacts identified under this alternative would be less than significant.

5.1.2.2 Traffic Circulation

The TSM Alternative would add two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. These buses would run frequently, operating at 2.5-minute headways during the AM and PM peak hours and every five minutes during the off-peak hours. The number of buses operating during the peak hour for each route was added to the no build traffic volume information of the affected intersections to yield a set of year 2035 intersection forecasts for the TSM Alternative. Intersection lane configurations for this alternative were assumed to be the same as for the No Build Alternative.

The results of the traffic analysis and corresponding AM and PM peak hour levels of service for this alternative are shown in Table 5-2. The table highlights in bold the intersections that exceed the significance threshold and are expected to be significantly impacted due to TSM Alternative.

The results indicate that under the TSM Alternative, 71 intersections would continue to operate at LOS D or better in the AM peak hour and 57 would continue to operate at LOS D or better in the PM peak hour. During the AM peak hour, six intersections would operate at LOS E and eight would operate at LOS F. In the PM peak hour, these numbers would increase to 12 intersections operating at LOS E and 16 operating at LOS F. Many of these intersections would operate at the same level of service as projected for the No Build Alternative.

Intersections that are considered to be impacted are those that have a significant negative change in LOS when compared to the No Build Alternative conditions. As defined in Section 3.1, the significance of an impact is related to the magnitude in the change in delay. Eight intersections would be impacted during the AM peak hour and nine intersections would be impacted during the PM peak hour. These impacts would be significant adverse effects of the TSM Alternative.

The traffic circulation impacts identified under this alternative would be significant.

5.1.2.3 Parking

The TSM Alternative would have no impact on the number of on-street parking and loading spaces within the project area where bus stops already exist. However, there is currently no bus service along portions of the Lower Grand route on 2nd Street, and up to 24 curb parking and loading spaces would need to be removed to accommodate new bus zones. The actual size of the bus zones would be determined pending further consultation with LADOT, and attempts would be made to minimize the number of parking spaces removed. However, the parking impacts identified for the TSM alternative would be significant.

5.1.2.4 Other Modes

The TSM Alternative has no impacts on bicycle or pedestrian facilities in the project area. Any impacts that could occur under this alternative would be less than significant.

5.1.3 At-Grade Emphasis LRT Alternative

5.1.3.1 Transit

The At-Grade Emphasis LRT Alternative includes a light rail alignment to provide a link between the 7th Street/Metro Center Station and Metro Gold Line at Temple and Alameda Streets. All of the provisions of the No Build Alternative would be included. The alignment east of 2nd and Hope Streets and the crossing at the 3rd and Flower Streets intersection would be at-grade and the remainder (Flower Street between 7th and 3rd Streets along with the station at 2nd and Hope Streets) would be underground.

The Regional Connector project would provide a direct east-west route between I-605 vicinity and Santa Monica and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. With this alternative, the existing Little Tokyo/Arts District Station would serve only east-west travel. Passengers originating in the communities of Little Tokyo and Arts District would need to board trains at the Main/Los Angeles couplet stations to make trips north and south, or board a train at Little Tokyo/Arts District Station and transfer after one stop.

For the At-Grade Emphasis LRT Alternative, the total daily system wide linked transit trips for the entire bus and rail system is projected to be about 1,729,400, which is a 12,300-trip increase over the No Build Alternative and a 7,000-trip increase over the TSM Alternative. Daily urban rail boardings for this alternative are projected to be 275,700 at the Metro Blue Line, Metro Gold Line, Metro Expo Line, and the proposed new Regional Connector stations combined. The projections show an increase of about 17,200 in urban rail boardings, which is a benefit of this alternative. It is also expected that the theoretical carrying capacity of the LRT system would be approximately 13,000 passengers per hour in each direction.

Bus operating speeds may decrease because of the proposed traffic lane reductions along Flower, 2nd, Main, Los Angeles, Temple, and Alameda Streets, which would negatively impact congestion on these streets. In addition, eastbound bus stops on 2nd Street would be displaced and buses traveling eastbound on 2nd Street would be shifted to adjacent roadways such as 1st or 4th Streets. Bus schedules would be adjusted to reflect modified traffic conditions and travel times. However, from an urban rail perspective, this alternative would have a significant benefit when compared to both the No Build and TSM Alternatives. In summary, the transit impacts identified under this alternative would be less than significant.

5.1.3.2 Traffic Circulation

The At-Grade Emphasis LRT Alternative consists of both at-grade segment and underground segments of the alignment. The primary at-grade segment runs along 2nd Street, splits to a one-way, one-track couplet on Main and Los Angeles Streets, then realigns into a dual-track configuration continuing on Temple Street and connecting with the existing Gold Line tracks

on Alameda Street. To accommodate at-grade operations, one traffic lane would be removed in each direction for the dual-track configuration on 2nd and Temple Streets and one traffic lane would be removed for the one-track couplet on Main and Los Angeles Streets. In addition, one traffic lane would be removed on Flower Street between 6th and 4th Streets to accommodate underground station pedestrian portals and two traffic lanes would be removed between 4th and 3rd Streets to accommodate the train portal.

Due to the narrow width of 2nd Street, only one westbound travel lane would be maintained to provide local business and driveway access and the two eastbound travel lanes between Hill and Main Streets would be eliminated. Consequently, eastbound through traffic would be diverted to 1st and 4th Streets and westbound through traffic would be diverted to 1st and 3rd Streets.

The proposed Alameda Street underpass at Temple Street would result in localized traffic shifts to adjacent intersections because some of the at-grade north-south turn movements from Alameda Street to Temple Street would be eliminated. These shifts in traffic patterns and roadway circulation are reflected in the year 2035 AM and PM peak hour traffic forecasts for the At-Grade Emphasis LRT Alternative and the reduction in traffic lanes is reflected in the intersection lane configurations.

The traffic signals along the LRT alignment would require modifications for at-grade operations to provide adequate time for the trains to safely clear an intersection. The intersection analysis accounts for this exclusive signal phase for LRT operations that would be necessary at most locations. The analysis incorporated an LRT green time phase ranging from 30 to 60 seconds, depending on the intersection and track configuration, to account for the safe movement of the trains through an intersection. The calculation of the LRT green time is based on the following assumptions:

- Operation of three-car trains at 5-minute headways per direction per route during peak hours, yielding trains every 2.5 minutes in each direction on the Regional Connector tracks.
- A three-car train length of approximately 270 feet.
- An average street running operating speed of 25 miles per hour with recognition that trains coming toward or leaving a station will be traveling at reduced speeds between 5 and ten miles per hour.
- An average cross-street width of 80 to 100 feet, depending on location.
- A safety clearance time of 20 seconds.

Future traffic operations were modeled with the Synchro software and the evaluation incorporated the AM and PM peak hour turn volumes, roadway geometrics, type of control, and signal phasing including the LRT component, where applicable. The results of the traffic analysis for this alternative and corresponding AM and PM peak hour levels of service are presented in Table 5-3. In addition, the table highlights in bold the intersections that exceed the significance threshold and would be significantly impacted due to the At-Grade Emphasis LRT Alternative.

The results indicate that under the At-Grade Emphasis LRT Alternative, 65 intersections would continue to operate at LOS D or better in the AM peak hour and 48 intersections would continue to operate at LOS D or better in the PM peak hour. In the AM peak hour, seven intersections would operate at LOS E and 13 intersections would operate at LOS F. In the PM peak hour, these numbers would increase to 12 intersections operating at LOS E and 25 operating at LOS F. Many of these intersections would operate at the same level of service as projected for the No Build Alternative.

Intersections that would be impacted include those that are projected to have a significant negative change in LOS when compared to the No Build Alternative conditions. As defined in Section 3.1, the significance of an impact is related to the magnitude in the change in delay. During the AM peak hour 18 intersections and during the PM peak hour 26 intersections would experience significant adverse impacts under the At-Grade LRT Alternative.

The table also shows that a number of intersections would improve from the No Build Alternative by virtue of a reduction in delays. During the AM peak hour, seven intersections show delay improvements and eight intersections show delay improvements during the PM peak hour.

In summary, the traffic circulation impacts identified under this alternative would be significant.

5.1.3.3 Parking

Portions of the At-Grade Emphasis LRT Alternative alignment would utilize existing roadway space for tracks, surface street stations, underground station pedestrian portals, and a roadway underpass on Alameda Street. There would be a reduction in traffic lanes and/or parking spaces along the street segments at these locations. The number of parking and loading spaces that would be removed was estimated based on the characteristics of each street segment and the proposed LRT street cross-sections. The expected impacts along each of the street segments that the alignment would traverse are discussed below.

Flower Street –Between 5th and 3rd Streets, seven of the 13 on-street parking spaces on the east side of the street and all five on-street parking spaces on the west side of the street would also be removed. Due to the relatively wide sidewalk, the loading spaces on both the east and west sides of the streets would be maintained by creating a loading bay area.

2nd Street – The LRT alignment would run on 2nd Street in an at-grade configuration between Hill and Los Angeles Streets. In this segment of the street there are no parking or loading spaces on the north side and parking and loading on the south side is prohibited during the AM and PM peak hours. Consequently, there would be no impacts to parking and loading during the peak hours. However, the 23 on-street parking spaces and five loading spaces on the south side of the street, which are currently available during the off-peak period (9 AM to 4 PM), would be eliminated to accommodate the LRT track configuration along with a travel lane to provide local business and driveway access.

Main Street – A single track would run on the east side of Main Street for southbound /westbound trains between 2nd and Temple Streets. The loading configuration on the west side of Main Street would be maintained; however, the 11 loading spaces on the east side of the street would be eliminated. In addition, there are two driveways on the east side of the street that provide access to the off-street parking for the Caltrans/LADOT building. These

could be maintained by providing adequate warning signage and other safety provisions to minimize potential train and vehicular conflicts.

Los Angeles Street – Similar to Main Street, a single track would run on the east side of Los Angeles Street for northbound/eastbound trains between 2nd and Temple Streets. The loading configuration on the west side of Los Angeles Street would be maintained; however, the 10 loading spaces on the east side of the street would be eliminated. In addition, two driveways on the east side of the street that provide access to adjacent businesses could be maintained by providing adequate warning signage and other safety provisions to minimize potential train and vehicular conflicts.

Temple Street – The LRT alignment would run at-grade in the center of Temple Street between Main and Judge John Aiso Streets and then shift to the south side of the street between Judge John Aiso and Alameda Streets. On the north side of the street, the four off-peak parking spaces between Main and Los Angeles Streets would be eliminated; however due to the shift of the tracks, the four loading spaces between Judge John Aiso and Alameda Streets would be maintained. On the south side of Temple Street, the 12 on-street parking spaces would be eliminated. In addition, the driveway on the south side of the street could be maintained by providing adequate warning signage and other safety provisions to minimize potential train and vehicular conflicts.

Alameda Street – The proposed Alameda Street underpass at Temple Street would impact the segment of the street between Aliso and 1st Streets. In this segment, the three bus tour loading spaces on the west side of the street adjacent to the Japanese American National Museum (JANM) would be eliminated. However, access to the JANM loading dock would be maintained.

The parking impacts identified under the At-Grade Emphasis LRT Alternative would not be considered adverse or significant.

5.1.3.4 Other Modes

For the At-Grade Emphasis LRT Alternative, the street and intersection locations where the LRT would have an at-grade profile include Flower Street between 4th and 3rd Streets, 2nd Street between Hill and Los Angeles Streets, Main and Los Angeles Streets between Temple and 2nd Streets, Temple Street between Main and Alameda Streets, and Alameda Street between Aliso and 2nd Streets. The alignment would utilize existing roadway space for tracks, surface street stations, underground station pedestrian portals, and a roadway underpass on Alameda Street. The reduction in travel lanes would impact bikeways and pedestrian crosswalks and sidewalks as it would traffic and transit.

The sidewalk along Flower Street between 6th and 3rd Streets and along 2nd Street between Hill and Los Angeles Streets would be maintained and could be widened. No pedestrian impacts

would be expected for the at-grade segments of the alignment. A station is proposed on each side of the one-way couplet on Main and Los Angeles Streets just north of 1st Street. At station areas, the LRT would be located near major signalized intersections, where pedestrian crosswalks are currently in place. The station layouts would be designed for pedestrian convenience and safety, leading to crosswalks at signalized intersections to guide pedestrians toward safe flow patterns.

The sidewalk and its associated width along Temple Street would be maintained. Where the tracks would cross Alameda Street, a pedestrian bridge is proposed to reduce potential conflicts between pedestrians, trains, and automobiles.

The possibility of conflicts between trains and pedestrians may also occur at the tunnel portal location on Flower Street south of 3rd Street where pedestrians could attempt to enter the tunnel during daytime operations or at night. Signing and surveillance would be utilized at tunnel portals to reduce the possibility of unauthorized tunnel entry. Potentially significant pedestrian safety issues associated with unauthorized pedestrian crossings of the tracks would be addressed during design and utilize Metro standards to minimize possible conflicts. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill.

The at-grade alignment would not directly impact designated bicycle routes. However, some of the through traffic currently on 2nd Street would be expected to shift onto 1st Street. Consequently, the flow of bicycle traffic could be impacted due to increased traffic volumes on 1st Street. Bicyclists could be traveling in a more congested environment due to the projected increase in traffic volumes on 1st Street.

Similarly, the proposed underpass at Alameda and Temple Streets would be expected to divert some local traffic to adjacent streets, such as Central Avenue, because of potential changes in traffic circulation patterns. Central Avenue is designated as a Class III bicycle route. Therefore, the flow of bicycle traffic could be impacted due to increased traffic volumes on Central Avenue as a result of this potential localized shift in traffic. Potential bicycle impacts identified under this alternative would be significant.

Transit stations would be provided with bike lockers and racks, increasing the bicycle facilities in the area and creating a positive impact. In addition, pedestrian level lighting at stations would improve the attractiveness and perception of safety, specifically in the evening hours, creating a positive effect for patrons and the community.

5.1.4 Underground Emphasis LRT Alternative

5.1.4.1 Transit

The Underground Emphasis LRT Alternative would include an underground light rail alignment to provide a link between the 7th Street/Metro Center Station and Metro Gold Line at 1st and Alameda Streets. All of the provisions of the No Build Alternative would be included.

The proposed alignment would surface to an at-grade configuration on Alameda Street at 1st Street. This alternative would provide a direct east-west route between Santa Monica and the I-605 vicinity and a direct north-south route between Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area.

The existing Little Tokyo/Arts District Station would serve only patrons traveling along the north-south route. Patrons from the Little Tokyo and Arts District communities would need to board a train at the proposed 2nd and Broadway station or the 2nd and Los Angeles station, whichever is selected, to travel east and west. Alternatively, patrons could board a train at the Little Tokyo/Arts District Station and transfer at the next stop.

For the Underground Emphasis LRT Alternative, the total daily system wide linked transit trips for the entire bus and rail system is projected to be about 1,732,000, which would be a 14,900-trip increase over the No Build Alternative and a 9,600-trip increase over the TSM Alternative. The daily urban rail boarding count for this alternative is projected to be 280,000 at the Metro Blue Line, Metro Gold Line, Metro Expo Line, and the proposed new Regional Connector stations combined. The projections show an increase of about 21,500 in urban rail boardings, which would be a positive impact of this alternative. The theoretical carrying capacity of the downtown LRT system would be approximately 13,000 passengers per hour in each direction under this alternative.

Bus operating speeds may increase due to proposed traffic lane reductions along Flower and Alameda Streets that would impact congestion on these streets. Bus schedules would be adjusted to reflect modified traffic conditions and travel times. However, from an urban rail perspective, this alternative shows a significant positive impact compared to both the No Build and TSM Alternatives. In summary, the transit impacts identified under this alternative would be less than significant.

5.1.4.2 Traffic Circulation

The Underground Emphasis LRT Alternative would be a predominantly underground alignment with one at-grade segment crossing Alameda Street to connect with the Gold Line tracks at the Little Tokyo/Arts District Station. To accommodate pedestrian portals to an underground station, one traffic lane would be removed on the east side of Flower Street

between 6th and 4th Streets. The proposed Alameda Street underpass at 1st Street would result in localized traffic shifts to adjacent intersections because some of the at-grade north-south turn movements from Alameda Street to 1st Street would be eliminated.

The at-grade segment of the Underground Emphasis LRT Alternative would require modifications to the traffic signal at 1st and Alameda Streets to provide adequate time for the trains to safely clear the intersection. In this area, some of the trains would be traveling at slow speeds because they would be approaching or leaving the Little Tokyo/Arts District Station.

These local shifts in traffic patterns and changes to the roadway circulation are reflected in the year 2035 AM and PM peak hour traffic forecasts for the Underground Emphasis LRT Alternative, and the proposed reduction in traffic lanes is reflected in the intersection lane configurations.

The results of the traffic analysis for this alternative and corresponding predicted AM and PM peak hour levels of service are presented in Table 5-4. In addition, the table highlights in bold the intersections that would exceed the significance threshold and that would be expected to be significantly impacted due to the Underground Emphasis LRT Alternative.

The results indicate that under the Underground Emphasis LRT Alternative, 69 intersections would continue to operate at LOS D or better in the AM peak hour and 55 would continue to operate at LOS D or better in the PM peak hour. In the AM peak hour, seven intersections would operate at LOS E and nine would operate at LOS F. In the PM peak hour, these numbers increase to 13 intersections operating at LOS E and 17 operating at LOS F. Many of these intersections would operate at the same level of service as projected for the No Build Alternative.

Intersections that would be impacted include those that are projected to have a significant negative change in LOS when compared to the No Build Alternative conditions. As defined in Section 3.1, the significance of an impact is related to the magnitude in the change in delay. Only three intersections during the AM peak hour and only seven intersections during the PM peak hour would experience significant adverse impacts of the Underground Emphasis LRT Alternative.

Table 5-4 also shows that a number of intersections would improve when compared to the No Build Alternative by virtue of a reduction in delays. During the AM peak hour, five intersections show delay improvements, while eight intersections show delay improvements in the PM peak hour. The Underground Emphasis LRT Alternative would increase the person-carrying capacity through the downtown transportation environment without adversely impacting overall traffic operations.

In summary, the traffic circulation impacts identified under this alternative would be significant.

5.1.4.3 Parking

Portions of the Underground Emphasis LRT Alternative alignment would use existing roadway space for underground station pedestrian portals and a roadway underpass on Alameda Street. At these locations, there would be a reduction in traffic lanes and/or parking spaces. The number of parking and loading spaces that would be removed was estimated based on the characteristics of each street segment and the proposed street cross-sections. The expected impacts along each of the street segments that the alignment would traverse are discussed below.

Flower Street –Between 5th and 3rd Streets, seven of the 13 on-street parking spaces on the east side of the street between 5th and 4th Streets would be removed. Due to the relatively wide sidewalk, loading spaces on both the east and west sides of the streets would be maintained by creating a loading bay area.

Alameda Street – The proposed Alameda Street underpass at 1st Street would impact the segment of the street between Temple and 2nd Streets. In this segment, the three bus tour loading spaces on the west side of the street adjacent to the Japanese American National Museum would be eliminated. However, access to the JANM loading dock would be maintained. The 10 on-street parking spaces on the east side of the street would also be removed.

The parking impacts identified under this alternative would not be considered adverse or significant.

5.1.4.4 Other Modes

For the Underground Emphasis LRT Alternative, the only street and intersection location where the LRT has an at-grade profile would be in the vicinity of Alameda Street at 1st Street. The alignment would utilize existing roadway space for tracks, underground station pedestrian portals, and a roadway underpass on Alameda Street. Urban design concepts may be incorporated at these locations to improve pedestrian and bicycle safety and flow.

The sidewalk along Flower Street between 6th and 3rd Streets and along 2nd Street at the underground station portals would be maintained or widened. No pedestrian impacts would be expected for these segments of the alignment. At station areas, portals would be located near major signalized intersections, where pedestrian crosswalks are currently in place. Where the tracks cross Alameda Street, a pedestrian bridge is proposed to reduce potential conflicts between pedestrians, trains, and automobiles.

The tunnel portal would be located in the lot bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. Signing and surveillance would be utilized at this tunnel portal to reduce the possibility of unauthorized tunnel entry. Potentially significant pedestrian safety issues associated with unauthorized pedestrian crossings of the tracks at 1st and Alameda Streets would be addressed during design and use Metro standards to minimize possible conflicts. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill.

The underground alignment would not directly impact designated bicycle routes. However, the proposed underpass on Alameda Street at 1st Street and potential changes in traffic circulation patterns may result in the diversion of local traffic to adjacent roadway segments such as Central Avenue. Central Avenue is designated as a Class III bicycle route. Consequently, the flow of bicycle traffic may be impacted by increased traffic volumes on Central Avenue resulting from a potential localized shift in traffic. The impacts identified under this alternative would be less than significant.

Proposed stations would include bike lockers and racks, increasing the bicycle facilities in the area and creating a positive impact. In addition, pedestrian level lighting at stations would

improve the attractiveness and perception of safety, specifically in the evening hours, creating a positive effect for patrons and the community.

5.1.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

5.1.5.1 Transit

The Fully Underground LRT Alternative - Little Tokyo Version 1 would include a complete underground light rail alignment linking the 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets. All of the provisions of the No Build Alternative would be included. This alternative is similar to the Underground Emphasis LRT Alternative except that an additional underground station would be located in the property to be acquired between 1st, 2nd, Central, and Alameda Streets; the rail lines would cross under the 1st and Alameda Streets intersection; and two portals would be constructed. The alignment would surface from one portal to the east of Alameda Street north of Temple Street, to connect to the Metro Gold Line bridge over the US 101 freeway to Union Station. The alignment also would surface from another portal to connect to the Metro Gold Line tracks to East Los Angeles on 1st Street east of Alameda Street.

This alternative would provide a direct east-west route between Santa Monica and the I-605 vicinity and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to make a transfer in the downtown area. The new underground station within the property bounded by 1st, 2nd, Central, and Alameda Streets would serve all operations.

For the Fully Underground LRT Alternative – Little Tokyo Variation 1, the total daily system wide linked transit trips for the entire bus and rail system are projected to be about 1,734,500, which would be a 17,400-trip increase over the No Build Alternative and a 12,100-trip increase over the TSM Alternative. The daily urban rail boarding count for this alternative is projected to be 282,700 at the Metro Blue Line, Metro Gold Line, Metro Expo Line, and the proposed Regional Connector stations combined. The projections show an increase of about 24,200 in urban rail boardings, which would be a positive impact of this alternative. The theoretical carrying capacity of the downtown LRT system would be approximately 13,000 passengers per hour in each direction.

Proposed traffic lane reductions along Flower Street, due to the underground station pedestrian portals, would impact bus operating speeds because of a potential increase in traffic congestion. Bus schedules would be adjusted to reflect modified traffic conditions and travel times. However, from an urban rail perspective, this alternative represents a significant positive impact when compared to both the No Build and TSM Alternatives. In summary, the potential transit impacts identified under this alternative would be less than significant.

5.1.5.2 Traffic Circulation

The Fully Underground Alternative - Little Tokyo Variation 1 would be completely below ground. To accommodate underground station pedestrian portals, one traffic lane would be removed on Flower Street between 6th and 4th Streets. After construction of the train portals east of Alameda Street and on 1st Street, existing traffic lanes would be maintained; however, the signalized intersection at 1st and Hewitt Streets would be removed, eliminating the ability to cross 1st Street at that location. No at-grade train operations would pass through the two intersections of 1st and Alameda Streets and 1st and Temple Streets and traffic signals would operate under that assumption.

The results of the traffic analysis for this alternative and resulting predicted AM and PM peak hour levels of service are presented in Table 5-5. In addition, the table highlights in bold the intersections that would exceed the significance threshold and would be expected to be significantly impacted by this alternative.

The results indicate that under the Fully Underground LRT Alternative – Little Tokyo Variation 1, 70 intersections would continue to operate at LOS D or better in the AM peak hour and 68 would continue to operate at LOS D or better in the PM peak hour. In the AM peak hour, seven intersections would operate at LOS E and eight would operate at LOS F. In the PM peak hour these numbers increase to 13 intersections operating at LOS E and 14 operating at LOS F. Many of these intersections would operate at the same level of service as projected for the No Build Alternative.

Intersections that would be impacted include those that are projected to have a significant negative change in LOS when compared to the No Build Alternative conditions. As defined in Section 3.1, the significance of an impact is related to the magnitude in the change in delay. Only one intersection during the AM peak hour and only three intersections during the PM peak hour would experience a significant adverse impact from the Fully Underground LRT Alternative – Little Tokyo Variation 1.

Table 5-5 also shows that a number of intersections would improve over the No Build Alternative by virtue of a reduction in delays. During the AM peak hour, four intersections would have delay improvements and seven intersections would experience improvements in delay during the PM peak hour. This alternative would increase the person-carrying capacity through the downtown transportation environment without adversely impacting traffic operations.

In summary, the traffic circulation impacts identified under this alternative would be significant.

5.1.5.3 Parking

The Fully Underground LRT Alternative - Little Tokyo Version 1 would be entirely underground; however, portions of the alignment would utilize existing roadway space for underground station pedestrian portals. At these locations, there would be a reduction in traffic lanes and/or parking spaces along the street segments. The number of parking and loading spaces that would be removed was estimated based on the characteristics of each street segment and the proposed street cross-sections. The potential impacts along each of the street segments that the alignment would traverse are discussed below.

Flower Street - Between 5th and 3rd Streets, seven of the 13 on-street parking spaces on the east side of the street between 5th and 4th Streets would be removed. Due to the relatively wide sidewalk, the loading spaces on both the east and west sides of the street would be maintained by creating a loading bay area.

The parking impacts identified under this alternative would not be considered adverse or significant. No NEPA, CEQA, or local thresholds for the significance of displaced parking are available. Only seven parking spaces would be displaced, in an area with multiple off-street garages. Also, the parking spaces would be replaced by a new underground light rail station, and the improved transit access would offset the effects of the lost parking. Therefore, the parking impacts would not be significant.

5.1.5.4 Other Modes

Although this alternative would be entirely underground, portions of the alignment would use existing roadway space for underground station pedestrian portals. At these locations, urban design concepts may be incorporated to improve pedestrian and bicycle safety and flow. This alternative would have no impacts on bicycle facilities located within the project area.

The sidewalk along Flower Street between 6th and 3rd Streets and along 2nd Street at the underground station portals would be maintained or widened. No pedestrian impacts would be expected for these segments of the alignment. At station areas, portals would be located near major signalized intersections where pedestrian crosswalks are currently in place. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill. Potential pedestrian impacts identified under this alternative would be less than significant.

Proposed stations would be equipped with bike lockers and racks, increasing the bicycle facilities in the area and creating a positive impact. In addition, pedestrian level lighting at stations would improve the attractiveness and perception of safety, specifically in the evening hours, potentially creating a positive effect for patrons and the community.

5.1.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

5.1.6.1 Transit

From an operational point of view, the Fully Underground LRT Alternative – Little Tokyo Variation 2 is similar to the Fully Underground LRT Alternative - Little Tokyo Variation 1 and would include a complete underground light rail alignment linking the 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets. All of the provisions of the No Build Alternative would be included. This alternative would also include four underground stations located near Flower/4th/5th Streets, 2nd/Hope Streets, 2nd Street/Broadway, and one in the property to be acquired between 1st, 2nd, Central, and Alameda Streets. The rail lines would cross under the intersection of 1st and Alameda Streets in a new two-level junction configuration.

Three new portals would be constructed under this alternative. The alignment would surface from one portal east of Alameda Street and north of Temple Street to connect to the Metro Gold Line bridge over the US 101 freeway to Union Station. The alignment would also surface in 1st Street to connect to the Metro Gold Line tract to East Los Angeles. The alignment would surfaces from two portals instead of one, each containing one track, within the widened median of 1st Street. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

This alternative would provide a direct east-west route between Santa Monica and the vicinity of I-605 and a direct north-south route between the Cities of Azusa and Long Beach. Consequently, transit patrons could travel from east-west or north-south without having to transfer in the downtown area. The new two-level underground station within the property bounded by 1st, 2nd, Central and Alameda Streets would serve all operations.

For the Fully Underground LRT Alternative – Little Tokyo Variation 2, the total daily system wide linked transit trips for the entire bus and rail system is projected to be about 1,734,500, which would be a 17,400-trip increase over the No Build Alternative and a 12,100-trip increase over the TSM Alternative. The daily urban rail boarding count for this alternative is projected to be 282,700 at the Metro Blue Line, Metro Gold Line, Metro Expo Line, and the proposed new Regional Connector stations combined. The projections show an increase of about 24,200 in urban rail boardings, which would be a positive impact of this alternative. The theoretical carrying capacity of the downtown LRT system would be approximately 13,000 passengers per hour in each direction.

Proposed traffic lane reductions along Flower Street would impact bus operating speeds because of the potential increase in traffic congestion. Bus schedules would be adjusted to reflect modified traffic conditions and travel times. However, from an urban rail perspective, this alternative would represent a significant positive impact when compared to both the No Build and TSM Alternatives. In summary, the transit impacts identified under this alternative would be less than significant.

5.1.6.2 Traffic Circulation

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would be completely below ground. One traffic lane would be removed on Flower Street between 6th and 4th Streets to accommodate the underground station pedestrian portals. After construction of the train portals on Alameda and 1st Streets, the existing traffic lanes would be maintained. However, the signalized intersection at 1st and Hewitt Streets would be removed, eliminating the ability to cross 1st Street at that location. Traffic signals at the intersections of 1st and Alameda Streets and 1st and Temple Streets would operate under the assumption that no at-grade train operations would pass through these two intersections.

From an operational perspective, the traffic analysis for this alternative results in the same effects as the Fully Underground LRT Alternative - Little Tokyo Variation 1. The predicted AM and PM peak hour levels of service are presented in Table 5-6. In addition, the table highlights in bold the intersections that would exceed the significance threshold and that would be significantly impacted due to the Fully Underground LRT Alternative – Little Tokyo Variation 2.

The results indicate that under the Fully Underground LRT Alternative – Little Tokyo Variation 2, 70 intersections would continue to operate at LOS D or better in the AM peak hour and 68

would continue to operate at LOS D or better during the PM peak hour. In the AM peak hour, seven intersections would operate at LOS E and eight would operate at LOS F. In the PM peak hour, these numbers increase to 13 intersections operating at LOS E and 14 operating at LOS F. Many of these intersections would operate at the same level of service as projected for the No Build Alternative.

Intersections that would be impacted include those that are projected to have a significant negative change in LOS when compared to the No Build Alternative conditions. As defined in Section 3.1, the significance of an impact is related to the magnitude in the change in delay. Only one intersection during the AM peak hour and only three intersections during the PM peak hour would experience a significant adverse impact under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Table 5-6 also shows that a number of intersections would improve over the No Build Alternative by virtue of a reduction in delays. Four intersections show delay improvements during the AM peak hour and seven show improvements in delays during the PM peak hour. This alternative would increase the person-carrying capacity through the downtown transportation environment without adversely impacting traffic operations.

In summary, the traffic circulation impacts identified under this alternative would be significant.

5.1.6.3 Parking

The Fully Underground LRT Alternative - Little Tokyo Version 2 would be entirely underground; however, portions of the alignment would use existing roadway space for underground station pedestrian portals. At these locations, traffic lanes and/or parking spaces may be reduced along the street segments. The number of parking and loading spaces that would be removed was estimated based on the characteristics of each street segment and the proposed street cross-sections. The expected impacts along each of the street segments that the alignment would traverse are discussed below.

Flower Street –Between 5th and 3rd Streets, seven of the 13 on-street parking spaces on the east side of the street between 5th and 4th Streets would be removed. Due to the relatively wide sidewalk, loading spaces on both the east and west sides of the streets would be maintained by creating a loading bay area.

The parking impacts identified under this alternative would not be considered adverse or significant. No NEPA, CEQA, or local thresholds for the significance of displaced parking or available. Only seven parking spaces would be displaced, in an area with multiple off-street garages. Also, the parking spaces would be replaced by a new underground light rail station, and the improved transit access would offset the effects of the lost parking. Therefore, the parking impacts would not be significant.

5.1.6.4 Other Modes

The Fully Underground LRT Alternative - Little Tokyo Version 2 would be entirely underground; however, portions of the alignment would utilize existing roadway space for underground station pedestrian portals. At these locations, urban design concepts may be incorporated to improve pedestrian and bicycle safety and flow. This alternative would have no impacts on bicycle facilities located within the project area.

The sidewalk along Flower Street between 6th and 3rd Streets and along 2nd Street at the underground station portals would be maintained or widened. No pedestrian impacts are expected for these segments of the alignment. At station areas, the portals would be located near major signalized intersections where pedestrian crosswalks are currently in place. A pedestrian bridge could also be constructed between the 2nd/Hope Street station and Upper Grand Avenue to enhance the connection to Bunker Hill. Potential pedestrian impacts from this alternative would be less than significant.

Proposed stations would be equipped with bike lockers and racks, increasing the bicycle facilities in the area and creating a positive impact. In addition, pedestrian level lighting at

stations would improve the attractiveness and perception of safety, specifically in the evening hours, creating a positive effect for patrons and the community.

5.2 Construction Impacts

Analysis of potential transportation-related construction impacts was based on proposed construction staging scenarios. Potential adverse impacts that may occur during construction of each alternative were evaluated. Implementation of the No Build or TSM Alternatives would not result in potential disruption to the roadway network and therefore are not evaluated as part of the construction impacts analysis.

Areas of a roadway where user conditions would be changed due to construction activities are called traffic control zones. Most of the potential traffic control zones would be divided into four areas: advance warning area, transition area, construction activity area, and termination area. A traffic control zone also includes the streets that would serve as detour routes on approved traffic control plans.

Maintenance of traffic lanes during construction would follow local agency requirements and standards with respect to minimum lane widths, number of lanes, and duration of temporary lane closures. During non-working construction time periods, existing traffic lanes (including turn lanes and two-way left turn lanes) generally would be restored to their pre-construction/original condition unless otherwise authorized by the local jurisdiction.

Street closures would generally be limited to nighttime, weekend, and/or off peak closures and must be authorized by the local jurisdiction. No closures are expected during morning and afternoon peak travel periods except for specific areas discussed in the following sections. Potential street closure locations would be identified in close coordination with the local agencies. Potential construction impacts to transit, traffic circulation, parking, and other modes of transportation for each build alternative are evaluated in the following sections.

5.2.1 At-Grade Emphasis LRT Alternative

5.2.1.1 Transit

Construction of the At-Grade Emphasis LRT Alternative may require temporary closure of traffic lanes over and above the lanes permanently removed to place the trackway planned for the street during the night, weekends, and/or off-peak hours. Closures of several blocks on certain streets may also be required. When traffic lanes are closed during the day, transit bus service would be maintained where feasible. Travel times may increase due to the potential for increased traffic congestion as a result of construction activities and proposed lane closures.

Relocation of utilities and construction of the trackway, stations, and the proposed Alameda Street underpass at Temple Street would require temporary closure of lanes on Flower Street,

Hope Street in the vicinity of General Thaddeus Kosciuszko Way, Main Street, Los Angeles Street, Temple Street, 2nd Street, and Alameda Street over and above the number of lanes permanently removed due to the planned trackway. This would reduce roadway capacity and potentially modify existing traffic patterns as drivers bypass congested areas. Travel times for both Metro and non-Metro bus services along these roadways would be impacted.

Track construction and permanent street re-configuration along 2nd Street would eliminate eastbound vehicular travel on the segment of roadway between Hill Street and Main Street and require permanent closure of one eastbound travel lane between Main Street and Los Angeles Street. A permanent lane closure would occur between Hill Street and Los Angeles Street on the westbound direction of 2nd Street.

During construction, it may be necessary to temporarily close 2nd Street for extended periods between Los Angeles Street and Figueroa Street. Travel times for buses traveling along the westbound direction of 2nd Street are expected to increase and eastbound buses would be re-routed on to 4th Street and/or 1st Street. New bus stop locations would be designated for each specific route that is impacted by this permanent change in traffic flow patterns.

Construction of the proposed Alameda Street underpass at Temple Street would also reduce roadway capacity for extended time periods. To maintain two through travel lanes in each direction, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches would be eliminated. The north and south intersection lane configurations would consist of a shared through and right lane and a shared through and left lane for the segment of Alameda Street between Aliso Street and 1st Street.

Existing signal phasing may be changed to split phasing to minimize conflicts between left turns and opposing through movements, and to minimize the formation of queues as a result of a vehicle waiting for a gap in the opposing traffic to conduct a left turn. Consequently, travel times for buses along this segment of Alameda Street would be expected to increase due to potential traffic congestion. Bus stops within the construction area may be temporarily relocated to minimize vehicular queues behind a bus stopped to pick up and/or drop off passengers.

Apart from changes to traffic flow patterns on 2nd Street and reduced roadway capacity due to construction of the Alameda Street underpass, it is expected that temporary peak period closures would be minimal. Temporary off-peak period closures would be intermittent, and most construction along the remaining alignment would occur during nighttime and weekend hours. Transit bus service may be affected by night closures of entire street blocks and buses would be re-routed. Construction may require temporary relocation of some bus stops.

Although most potential construction impacts of the At-Grade Emphasis LRT Alternative would be temporary, they would be considered significant and unavoidable.

5.2.1.2 Traffic Circulation

Construction of the At-Grade Emphasis LRT Alternative would temporarily interfere with the normal flow of traffic, causing some lanes and streets to be temporarily closed to vehicles. It is possible that block-long sections of streets would be closed temporarily for utility relocation, station construction, and installation of rail.

Construction of a typical underground station is estimated to take about 34 months using cut-and-cover construction methods. The primary impact to traffic, however, is usually associated with the time it takes to install decking over a station box. For stations constructed under existing streets, the top 2 to 3 feet of the roadway would be removed and decking would be installed over an approximately 2- to 3-month period. Assuming the construction methods used and conditions are similar to Metro's experience on the Metro Gold Line to East Los Angeles project, the roadway removal and decking could be minimized to several weekends. Construction of the station would continue while traffic travels on the decking. This procedure would require temporary off-peak, nighttime, and/or weekend street closures to install the decking. Traffic would be rerouted to adjacent intersections using clearly signed and marked detours when street closures are required.

For at-grade LRT sections, the street area within and alongside the station areas, supplemented by adjacent sidewalks and off-street areas, would be used for construction staging and equipment and material storage. Haul and delivery truck routes would affect residents and commuters along the alignment. Tunnel spoil hauling, rail and catenary deliveries, and general construction traffic would impact traffic flow patterns as well. In addition to affecting traffic movements, there may be slight physical damage to roads from hauling trucks.

Relocation of utilities and construction of the trackway, stations, and the proposed Alameda Street underpass would require temporary closure of lanes. This would reduce roadway capacity and potentially modify existing traffic patterns as drivers bypass congested areas. Vehicular travel times and intersection operations along these roadways would be impacted.

Track construction and permanent street re-configuration along 2nd Street would eliminate eastbound vehicular travel on the segment of roadway between Hill Street and Main Street and require permanent closure of one eastbound travel lane between Main and Los Angeles Streets. For the westbound direction of 2nd Street, a one lane permanent closure would occur between Hill Street and Los Angeles Street. It may be necessary to temporarily close 2nd Street for extended periods of time between Los Angeles Street and Figueroa Street during construction.

Travel times for vehicles traveling along the westbound direction of 2nd Street are expected to increase. Eastbound vehicular through traffic would be re-routed onto 4th Street and/or 1st Street, depending on their origin and destination. The shift in traffic onto both 4th and 1st Streets would increase delays at several intersections between Hill Street and Los Angeles Street.

Construction of the proposed Alameda Street underpass at Temple Street would reduce roadway capacity for extended periods of time. Maintaining two through travel lanes in each direction during construction would require elimination of the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches. The north and south intersection lane configurations would consist of a shared through and right lane and a shared through and left lane for the segment of Alameda Street between Aliso Street and 1st Street.

The existing signal phasing may be changed to split phasing to minimize conflicts between left turns and opposing through movements. This change would also minimize the formation of queues resulting from vehicles waiting for a gap in the opposing traffic to make a left turn. Consequently, travel times along this segment of Alameda Street would be expected to increase due to increased traffic congestion during peak periods and, to a lesser extent, during off-peak periods. Operating conditions for Alameda Street intersections between Aliso Street and 1st Street would also be expected to deteriorate.

Apart from traffic flow patterns, changes on 2nd Street, and reduced roadway capacity from construction of the Alameda Street underpass, temporary peak period closures would be minimal and temporary off-peak period closures would be intermittent. Most construction along the rest of the alignment would take place during the nighttime and weekend hours. Traffic would be re-routed and detours clearly signed and marked during night closures of entire street blocks.

Although the majority of the impacts identified under the At-Grade Emphasis LRT Alternative may be temporary, they would be significant and unavoidable.

5.2.1.3 Parking

It may be necessary to prohibit on-street curb parking when traffic lanes are closed or eliminated due to construction activities. Existing parking meters within the traffic control zone of influence that would be affected by construction would be removed or covered as directed by the agency with jurisdiction. To minimize the loss of crucial commercial parking, contractors would be required to have all employees park off-street at Metro-approved locations.

During construction, the At-Grade Emphasis LRT Alternative would require temporary closure of lanes. Consequently, existing on-street parking spaces and loading stalls would be

temporarily removed. This would impact parking spaces and loading areas on the east and west sides of Flower Street, the loading areas on the east side of Main Street and Los Angeles Street, and the parking spaces on the south side of Temple Street. In addition, the realigned intersection of Hope Street in the vicinity of General Thaddeus Kosciuszko Way may temporarily require removal of several parking spaces along both the east and west sides of that roadway segment.

Track construction and permanent street re-configuration along 2nd Street would temporarily remove several parking and loading stalls. In the vicinity of the Alameda Street underpass, the Japanese American National Museum tour bus loading zone on the west side of the street would be permanently removed and relocated.

Parking impacts identified during construction of the At-Grade Emphasis LRT Alternative would not be adverse or significant.

5.2.1.4 Other Modes

When construction encroaches into a sidewalk, walkway, or crosswalk area, special consideration would be given to pedestrian safety. Pedestrian access to adjoining properties and bicycle traffic movements would be maintained during construction; however, portions of sidewalks may be temporarily closed for decking construction at cut-and-cover station areas. Temporary nighttime closures of sidewalks and crosswalks may be necessary. Lane reductions and street closures could inhibit the flow of bicycle traffic during construction.

The At-Grade Emphasis LRT Alternative includes track construction and permanent street configuration changes along 2nd Street and construction of an underpass on Alameda Street. Both would require lane closures for extended periods of time, and may also require temporary sidewalk closures. Construction along 2nd Street would shift some of the through traffic movements onto 1st Street, which is designated as a Class III bicycle route. Consequently, the flow of bicycle traffic could be hampered due to increased traffic volumes on 1st Street.

Construction of the underpass on Alameda Street may result in localized shifts in traffic to adjacent roadway segments such as Central Avenue, which is also designated as a Class III bicycle route. Similarly, the increase in traffic volumes would impact the flow of bicycle traffic. Temporary sidewalk closures during construction of this alternative would also impact pedestrian flow.

Although temporary, the identified potential impacts during construction on pedestrian and bicycle movements would be significant and unavoidable.

5.2.2 Underground Emphasis LRT Alternative

5.2.2.1 Transit

Relocation of utilities and the construction of cut-and-cover stations and the proposed Alameda Street underpass at 1st Street would require temporary closure of lanes on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, and Alameda Street. This would reduce roadway capacity and potentially modify existing traffic patterns as drivers bypass congested areas.

Travel times for both Metro and non-Metro bus services along these roadways would be impacted. Temporary peak period closures would be minimal and temporary off-peak period closures would be intermittent, especially if most construction for station areas affecting surface lanes takes place during the nighttime and weekend hours similar to the methods used for the Metro Gold Line to East Los Angeles project. During night closures, transit bus service may be affected and buses would be re-routed. Accordingly, some bus stops may need to be temporarily relocated due to construction.

Construction of the proposed Alameda Street underpass at 1st Street would reduce roadway capacity for extended times during construction. To maintain two through travel lanes in each direction, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches would be eliminated. The north and south intersection lane configurations would consist of a shared through and right lane and a shared through and left lane for the segment of Alameda Street between Temple Street and 2nd Street.

Existing signal phasing may be changed to split phasing to minimize potential conflicts between left turns and opposing through movements and prevent formation of queues as a result of a vehicle waiting for a gap in the opposing traffic to conduct a left turn movement. Therefore, travel times for buses operating along this segment of Alameda Street would be expected to increase due to the potential for increased traffic congestion. Bus stops within the construction area may need to be temporarily relocated to minimize the formation of vehicular queues behind a bus stopped to pick up and/or drop off passengers.

Although most impacts identified under the Underground Emphasis LRT Alternative may be temporary, they would be significant and unavoidable.

5.2.2.2 Traffic Circulation

Construction activities for the Underground Emphasis LRT Alternative would require temporary closure of lanes on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, 2nd Street, and Alameda Street. This would reduce roadway capacity and potentially modify existing traffic patterns as drivers bypass congested areas. Vehicular travel times and intersection operations along these roadways would be impacted.

It is anticipated that temporary peak period closures would be minimal and temporary off-peak period closures would be intermittent, with most station area construction activities that affect surface streets taking place during the nighttime and weekend hours similar to the methods used for the Metro Gold Line to East Los Angeles project. During night closures, traffic flow patterns may be affected, but would be re-routed accordingly with clearly signed and marked detours.

Construction of a typical underground station is estimated to take about 34 months using cut-and-cover construction methods. However, the primary impact to traffic would be associated with the time it takes to install decking over the station box. At each potential station location this duration would be approximately several weekends, assuming that the construction methods used would be similar to those used on the Metro Gold Line to East Los Angeles.

For stations built under existing streets, the top 2 to 3 feet of the roadway would be removed and decking would be installed over an approximately 2- to 3-month period. Construction of the station would continue while traffic travels on the decking. This procedure would require temporary off-peak, nighttime, and/or weekend street closures to install the decking. As these street closures are identified, traffic would be rerouted to adjacent intersections with clearly signed and marked detours.

Roadway capacity would be reduced for extended time periods during construction of the proposed Alameda Street underpass at 1st Street. In order to maintain two through travel lanes in each direction, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches would be eliminated. The north and south intersection lane configurations would consist of a shared through and right lane and a shared through and left lane for the segment of Alameda Street between Temple Street and 2nd Street.

Existing signal phasing may be changed to split phasing to minimize conflicts between left turns and opposing through movements and prevent the formation of queues as a result of vehicles waiting for a gap in the opposing traffic to conduct a left turn movement. Therefore, travel times for vehicles traveling along this segment of Alameda Street would be expected to increase. In addition, operating conditions for the Alameda Street intersections between Temple Street and 2nd Street would be expected to deteriorate.

Although most impacts from this alternative may be temporary, they would be significant and unavoidable.

5.2.2.3 Parking

Parking impacts under the Underground Emphasis LRT Alternative include temporary closure of lanes. Consequently, existing on-street parking spaces and loading stalls would be temporarily removed.

This would impact parking spaces and loading areas on the east and west sides of Flower Street. The realigned intersection of Hope Street in the vicinity of General Thaddeus Kosciuszko Way may temporarily require removal of several parking spaces along both the east and west sides of the roadway segment. In the vicinity of the Alameda Street underpass, the Japanese American National Museum tour bus loading zone on the west side of the street would be permanently removed and relocated. In addition, several parking spaces would be temporarily displaced from the east side of the roadway segment between 1st and 2nd Streets.

Parking impacts of the Underground Emphasis LRT Alternative during construction would not be adverse or significant.

5.2.2.4 Other Modes

The Underground Emphasis LRT Alternative includes cut-and-cover station construction along segments of Flower Street and construction of an underpass on Alameda Street. Both may require temporary sidewalk closures, which would impact pedestrian flow. In addition, construction of the underpass on Alameda Street may result in localized shifts in traffic to adjacent roadway segments such as Central Avenue, which is designated as a Class III bicycle route. Therefore, the flow of bicycle traffic could be impacted due to increased traffic volumes on Central Avenue.

Although temporary, the potential impacts on pedestrian and bicycle movements during construction of the Underground Emphasis LRT Alternative would be significant and unavoidable.

5.2.3 Fully Underground LRT Alternative – Little Tokyo Variation 1

5.2.3.1 Transit

Construction for the Fully Underground LRT Alternative - Little Tokyo Variation 1 would include relocation of utilities and construction of cut-and-cover stations and the proposed portals east of Alameda Street. This would require temporary closure of lanes on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, Alameda Street, and 1st Street, reducing roadway capacity and potentially modifying existing traffic patterns as drivers bypass congested areas.

Travel times for both Metro and non-Metro buses along these roadways would be impacted. It is anticipated that temporary peak period closures would be minimal and temporary off-peak period closures would be intermittent because most construction for the station areas would take place during the nighttime and weekend hours. During night closures, transit bus service may be affected, and buses would be re-routed. Accordingly, bus stops may also need to be temporarily relocated due to construction in some areas.

For this alternative, the Alameda Street portal north of Temple Street would reduce roadway capacity for extended time periods during construction. One through travel lane in each direction would be maintained between Aliso Street and 2nd Street. Outside of this area, all three through travel lanes in both directions on Alameda Street would remain open, but would still be subject to shorter-term intermittent closures.

As a result of this configuration, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the southbound intersection approach with Temple Street would be temporarily removed. The southbound intersection lane configuration at Temple Street would consist of a shared through and right lane and a shared through and left lane. In addition, existing signal phasing may be changed to split phasing to minimize potential conflicts between southbound left turns and the opposing northbound through movements, and prevent the formation of queues resulting from vehicles waiting for a gap in the opposing traffic to conduct a left turn movement.

Travel times for buses operating along this segment of Alameda Street would be expected to increase due to the potential for increased traffic congestion. Additionally, one eastbound travel lane and one westbound travel lane on 1st Street between Alameda Street and Vignes Street would need to be closed during construction. This may cause queues, although two lanes of the 1st Street Bridge are currently closed for bridge widening and the roadway still typically operates without queuing.

Although most potential impacts under the Fully Underground LRT Alternative - Little Tokyo Variation 1 may be temporary, they would be significant and unavoidable.

5.2.3.2 Traffic Circulation

Construction west of Central Avenue under the Fully Underground LRT Alternative - Little Tokyo Variation 1 would be the same as described for the Underground Emphasis LRT Alternative. Construction would require temporary closure of lanes on Flower Street, 2nd Street, Alameda Street, 1st Street, and Hope Street in the vicinity of General Thaddeus Kosciuszko Way. This would temporarily reduce roadway capacity and potentially modify existing traffic patterns as drivers bypass congested areas.

Travel times and intersection operating conditions along these roadways would be impacted. It is anticipated that temporary peak period closures would be minimal and temporary off-peak period closures would be intermittent because most station area construction activities that affect surface streets taking place during the nighttime and weekend hours similar to the methods used for the Metro Gold Line to East Los Angeles project. During night closures, traffic flow patterns may be affected, but would be re-routed accordingly with clearly signed and marked detours.

Construction of a typical underground station is estimated to take about 34 months using cut-and-cover construction methods; however, the primary impact to traffic is usually associated with the time it takes to install decking over the station box. At each potential station location this duration would be approximately several weekends, assuming that the construction methods used would be similar to those used on the Metro Gold Line to East Los Angeles.

For stations constructed under existing streets, the top 2 to 3 feet of the roadway would be removed and decking would be installed over approximately a 2- to 3-month period. Construction of a station would continue while traffic travels on the decking. This procedure would require temporary off-peak, nighttime, and/or weekend street closures to install the decking. Where street closures are required, traffic would be rerouted to adjacent intersections with clearly signed and marked detours.

Construction of the proposed Alameda Street portal north of Temple Street would reduce roadway capacity for extended time periods. One through travel lane would be maintained in each direction on Alameda Street during construction between Aliso Street and 2nd Street. All three lanes in each direction on Alameda Street would remain open, although they would be subject to shorter-term intermittent closures as needed.

As a result of this configuration, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the southbound intersection approach with Temple Street would be temporarily removed. The southbound intersection lane configuration at Temple Street would consist of a shared through and right lane and a shared through and left lane. Existing signal phasing may be changed to split phasing to minimize conflicts between southbound left turns and the opposing northbound through movements and prevent the formation of queues resulting from vehicles waiting for a gap in the opposing traffic to conduct a left turn movement. Consequently, travel times for vehicles traveling along this segment of Alameda Street would be expected to increase and operating conditions for the Alameda Street intersection at Temple Street are expected to deteriorate with increased delays.

One eastbound travel lane and one westbound travel lane on 1st Street between Alameda Street and Vignes Street would also need to be closed during construction. Although this may cause formation of queues, two lanes of the 1st Street Bridge are currently closed near this location and the roadway still typically operates without queuing.

Although most potential impacts of construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 may be temporary, they would be significant and unavoidable.

5.2.3.3 Parking

Construction activities west of Central Avenue would be the same as described for the Underground Emphasis LRT Alternative. Therefore, parking impacts would be the same due

to temporary closure of lanes on Flower Street and Hope Street in the vicinity of General Thaddeus Kosciuszko Way. Existing on-street parking spaces and loading stalls would be temporarily removed, impacting parking spaces and loading areas on the east and west sides of Flower Street. In addition, the realigned intersection of Hope Street in the vicinity of General Thaddeus Kosciuszko Way may temporarily remove several parking spaces along both the east and west sides of the roadway segment. The proposed Alameda Street portal north of Temple Street may require loading areas to be displaced for extended times during construction.

Potential parking impacts during construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not be adverse or significant.

5.2.3.4 Other Modes

Construction activities and potential impacts to pedestrian and bicycle flow for this alternative would be the same as for the Underground Emphasis LRT Alternative west of Central Avenue. During construction of the proposed Alameda Street portal north of Temple Street, roadway capacity would be reduced for extended time periods and the sidewalk on the east side of Alameda Street would be eliminated, impacting both pedestrian and bicycle flow.

Although temporary, potential impacts on pedestrian and bicycle movements during construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would be significant and unavoidable.

5.2.4 Fully Underground LRT Alternative – Little Tokyo Variation 2

5.2.4.1 Transit

Transit impacts from construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be the same as for the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, Variation 2 would also include a proposed two-portal configuration on 1st Street east of Alameda Street. Construction of the eastbound portal would require temporary closure of one eastbound travel lane and one westbound travel lane along 1st Street, between Hewitt Street and Vignes Street, for extended periods. This would reduce the eastbound roadway capacity and may potentially modify existing traffic flow patterns for vehicles trying to bypass congestion during construction activities.

Travel times for Metro bus service along this roadway would be impacted and expected to increase due to the potential for increased traffic congestion. Bus stops within the construction area may need to be temporarily relocated to minimize the formation of vehicular queues behind a bus stopped to pick up and/or drop off passengers.

Although most potential impacts under the Fully Underground LRT Alternative - Little Tokyo Variation 2 may be temporary, they would be significant and unavoidable.

5.2.4.2 Traffic Circulation

Traffic impacts due to construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be the same as those described for the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, this alternative also includes a proposed two-portal configuration on 1st Street east of Alameda Street. Construction of the eastbound portal would require temporary closure of one eastbound travel lane and one westbound travel lane along 1st Street between Alameda Street and Vignes Street for extended periods. This would reduce eastbound roadway capacity and may potentially modify existing traffic flow patterns for vehicles trying to bypass congestion during construction activities. Travel times and intersection operations along this roadway segment would be impacted, and delays would be expected to increase due to the potential for increased traffic congestion during peak periods. However, two lanes of the 1st Street Bridge are currently closed near this location and the roadway typically operates without long queuing or delays.

Construction of a typical station is estimated to take about 34 months using cut-and-cover construction methods. However, the primary impact to traffic is usually associated with the time it takes to install decking over the station box. At each potential station location this duration would be approximately several weekends, assuming that the construction methods used would be similar to those used on the Metro Gold Line to East Los Angeles.

For stations built under existing streets, the top 2 to 3 feet of the roadway would be removed and decking would be installed over an approximately 2- to 3-month period. Construction of the station would continue while traffic travels on the decking. This procedure would require temporary off-peak, nighttime, and/or weekend street closures to install the decking. Traffic would be rerouted to adjacent intersections with clearly signed and marked detours as closures occur.

Although most potential impacts under the Fully Underground LRT Alternative - Little Tokyo Variation 2 may be temporary, they would be significant and unavoidable.

5.2.4.3 Parking

Parking and loading impacts from construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be the same as described for the Fully Underground LRT Alternative – Little Tokyo Variation 1. The proposed two-portal configuration on 1st Street east of Alameda Street would require temporary closure of one eastbound travel lane and one westbound travel lane along 1st Street between Hewitt and Vignes Streets for extended periods to accommodate the eastbound portal. Consequently, any parking spaces on the south side of the affected roadway segment would be temporarily removed.

Potential parking impacts during construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would not be adverse or significant.

5.2.4.4 Other Modes

West of Central Avenue, construction of the proposed Alameda Street portal under the Fully Underground LRT Alternative - Little Tokyo Variation 2 would have similar impacts to pedestrian and bicycle flow as described for the Underground Emphasis LRT Alternative. This alternative also includes a proposed two-portal configuration on 1st Street east of Alameda Street.

Construction of the eastbound portal would require temporary closure of one eastbound travel lane along 1st Street between Hewitt Street and Vignes Street for extended periods. 1st Street is designated as a Class III bicycle route, and the flow of bicycle traffic would be impacted due to reduced roadway capacity.

Although temporary, potential impacts on pedestrian and bicycle movements during construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be significant and unavoidable.

6.0 POTENTIAL MITIGATION MEASURES

This section identifies potential mitigation measures for both construction and operation of the proposed alternatives. As with Section 5, discussion is focused on the transportation components being evaluated. These include transit, traffic circulation, parking, and other modes such as pedestrians and bicycles.

6.1 Potential Mitigation Measures Due to Operational Impacts

6.1.1 Transit

No mitigation measures are required for transit because no significant impacts have been identified. Displacement of bus stops or shifts in bus routes to adjacent roadways caused by at-grade configuration of the LRT alignment would require schedules to be adjusted and bus patrons notified of these changes. If an at-grade LRT alignment displaces existing bus stops, a replacement bus stop would be designated within one-eighth of a mile of the original stop. Bus stops would be relocated to the adjacent corner of the same intersection, if possible, to maintain service access for bus passengers.

Local bus service schedules would be reviewed and adjusted, if required, to reflect the modified traffic conditions and travel times with at-grade LRT operations. Stations would include a kiosk for displaying bus and rail system maps. These measures would reduce any potential transit-related impacts to a level that is less than significant.

6.1.2 Traffic Circulation

Impacted intersection locations for the TSM Alternative and each build alternative were evaluated to identify potential mitigation measures that would reduce the impact to a less than significant level. Potential measures may include converting or modifying current lane designations, optimizing the signal phasing splits, or providing limited widening if right-of-way is available.

Potential mitigation measures are identified in the following sections. Additional traffic mitigation measures, including potential street widening would be analyzed prior to the final design phase of the selected alternative.

6.1.2.1 TSM Alternative

Proposed mitigation measures for potentially impacted intersection locations under the TSM Alternative are summarized below.

- Grand Avenue/1st Street –Signal phasing in the westbound direction would accommodate a protected and permitted left turn.

- Alameda Street/1st Street – Restripe the southbound Alameda approach to provide one shared left-turn/through lane, two through lanes, and an exclusive right-turn lane.
- Figueroa Street/2nd Street –Signal phasing in the northbound direction would accommodate a protected and permitted left turn.
- Hill Street/3rd Street – Restripe the northbound Hill approach to provide one shared left-turn/through lane and two through lanes.
- Broadway/3rd Street – Restripe the westbound 3rd approach to provide one shared left-turn/through lane, two through lanes, and an exclusive right-turn lane.
- Spring Street/3rd Street – Restripe the southbound Spring approach to provide three through lanes and an exclusive right-turn lane, and optimize the signal splits.
- Los Angeles Street/3rd Street – Restripe the southbound Los Angeles approach to provide two through lanes and one shared through/right-turn lane.
- Grand Avenue/5th Street – Restripe the southbound approach on Grand Avenue to accommodate two through lanes, one shared through/right-turn lane, and an exclusive right-turn lane.
- Figueroa Street/Wilshire Boulevard – Restripe the northbound approach on Figueroa Street to accommodate one shared left-turn/through lane, four through lanes, and a shared through/right-turn lane.
- Flower Street/Wilshire Boulevard – Restripe the southbound Flower approach to provide one shared left-turn/through lane, three through lanes, and an exclusive right-turn lane.
- Figueroa Street/8th Street – Restripe the northbound Figueroa approach to provide one shared left-turn/through lane and six through lanes, and optimize the signal splits in the PM peak hour.
- Hill Street/Temple Street – Restripe the westbound Temple approach to provide one shared left-turn/through lane, one through lane, and one shared through/right-turn lane.
- Broadway/Temple Street – Restripe the northbound Broadway approach to provide one left-turn lane, two through lanes, and one shared through/right-turn lane.
- Alameda Street/Aliso Street – The eastbound phase would accommodate a free right-turn.

- Alameda Street / Los Angeles Street North – Restripe the southbound Alameda approach to provide three through lanes and an exclusive right-turn lane.

Table 6-1 shows LOS results after mitigation and identifies intersection locations where a residual significant impact would occur. For the TSM Alternative, all impacts could be mitigated to a less than significant level.

Table 6-1. Year 2035 TSM Alternative with Mitigation: Intersection LOS and Residual Impacts

No.	Intersection	No Build		TSM w/ Mitigation		Change in Delay	Residual Impact
		LOS	Delay	LOS	Delay

6.1.2.2 At-Grade Emphasis LRT Alternative

Proposed mitigation measures for potentially impacted intersection locations under the At-Grade Emphasis LRT Alternative are summarized below.

- Hill Street/1st Street – Restripe the eastbound 1st approach to provide one left-turn lane, one shared left-turn/through lane, one through lane, and one shared through/right-turn lane.
- Broadway/1st Street – No mitigation measures would be feasible at this location.
- Main Street/1st Street – Restripe the eastbound 1st approach to provide one shared left-turn/through lane, and three through lanes.
- Los Angeles Street/1st Street – No mitigation measures would be feasible at this location.
- Alameda Street/1st Street – Restripe the northbound Alameda approach to provide one left-turn lane, two through lanes, and one shared through/right-turn lane.
- Hill Street/2nd Street – Convert signal phasing in the eastbound and westbound directions to permit left turns, and the northbound direction to protected left turns. Adjust signal splits to maintain and optimize the same cycle length.
- Broadway/2nd Street – Restripe the northbound Broadway approach to provide one shared left-turn/through lane and three through lanes.
- Los Angeles Street/2nd Street – Restripe the northbound Los Angeles approach to provide one shared left-turn/through lane, one through lane, and one shared through/right-turn lane. Then optimize the signal splits in the AM peak hour.
- Flower Street/3rd Street – There would be no feasible mitigation measures at this location.
- Hill Street/3rd Street – Restripe the westbound 3rd Street approach to provide one shared left-turn/through lane, two through lanes, and one exclusive right-turn lane.
- Broadway/3rd Street – Restripe the westbound 3rd Street approach to provide one shared left-turn/through lane, two through lanes, and one exclusive right-turn lane.
- Spring Street/3rd Street – Restripe the westbound 3rd Street approach to provide one shared left-turn/through lane, two through lanes, and optimize the signal splits.

- Main Street/3rd Street – Restripe the westbound 3rd Street approach to provide three through lanes and one shared through/right-turn lane, and optimize the signal splits.
- Los Angeles Street/3rd Street – Restripe the westbound 3rd Street approach to provide one left-turn lane, three through lanes, one shared through/right-turn lane, and optimize the signal splits.
- Flower Street/4th Street – There would be no feasible mitigation measures at this location.
- Flower Street/5th Street – Convert signal phasing in the westbound direction to a protected left turn; the cycle length would remain unchanged.
- Flower Street/6th Street – Restripe the southbound Flower Street approach to provide two left-turn lanes and three through lanes.
- Main Street/Temple Street – Restripe the eastbound Temple Street approach to provide one shared left-turn/through lane and two through lanes.
- Los Angeles Street/Temple Street – Restripe the eastbound approach on Temple Street to accommodate one shared left-turn/through lane and one shared through/right-turn lane. The northbound approach on Los Angeles Street would accommodate one shared left-turn/through lane, one through lane, and one shared through/right-turn lane.
- Judge John Aiso Street/Temple Street – Restripe the westbound Temple approach to provide one shared left-turn/through lane and one through lane.
- Los Angeles Street/Aliso Street – Restripe the northbound Los Angeles approach to provide one through lane, one shared through/right-turn lane, and one exclusive right-turn lane. Then optimize the signal splits.
- Alameda Street/Aliso Street – Restripe the southbound Alameda approach to provide one shared left-turn/through lane and three through lanes. Then optimize the signal splits.
- Hill Street/4th Street – Restripe the eastbound 4th Street approach to provide one shared left-turn/through lane, three through lanes, and one shared through/right-turn lane. The southbound approach on Hill Street would provide one left-turn lane, one shared left-turn/through lane, and two through lanes.
- Broadway/4th Street – Restripe the southbound Broadway approach to provide one shared left-turn/through lane and two through lanes. Then optimize splits.

- Spring Street/4th Street – Restripe the eastbound 4th Street approach to provide three through lanes and one exclusive right-turn lane.
- Main Street/4th Street – There would be no feasible mitigation measures at this location.

Table 6-2 shows the level of service results after mitigation and identifies intersection locations where residual significant impacts would occur. After mitigation measures are implemented for the At-Grade Emphasis LRT Alternative, 11 of the 18 impacted intersection locations would continue to be impacted to significant levels during the AM peak hour. Similarly, in the PM peak hour, 15 of the 26 impacted intersection locations would continue to be impacted to significant levels.

Table 6-2. Year 2035 At-Grade Emphasis LRT Alternative with Mitigation: Intersection LOS and Residual Impacts

No.	Intersection	No Build		At-Grade w/ Mitigation		Change in Delay	Residual Impact

6.1.2.3 Underground Emphasis LRT Alternative

Proposed mitigation measures for potentially impacted intersection locations under the Underground Emphasis LRT Alternative are summarized below.

- Judge John Aiso Street/1st Street – Restripe the eastbound 1st Street approach to provide one left-turn lane, one shared left-turn/through lane, one through lane, and one exclusive right-turn lane. Restripe the westbound 1st Street approach to provide one shared left-turn/through lane, one through lane, and one exclusive right-turn lane. Then optimize the signal splits.

- Alameda Street/2nd Street – Restripe the eastbound 2nd Street approach to provide one shared left-turn/through lane, one shared through/right-turn lane, and one exclusive right-turn lane. Restripe the westbound 2nd Street approach to provide one shared left-turn/through lane and one shared through/right-turn lane. Signal phasing in the westbound direction would be converted to a permitted left turn. Restripe the northbound Alameda approach to provide one left-turn lane, one shared left-turn/through lane, and one shared through/right-turn lane. Then optimize the signal splits.

- Flower Street/4th Street – Restripe the southbound Flower Street approach to provide one shared left-turn/through lane and two through lanes. Then optimize the signal splits.

- Flower Street/5th Street – Restripe the southbound Flower Street approach to provide three through lanes and one exclusive right-turn lane. Then optimize the signal splits.
- Flower Street/6th Street – Restripe the eastbound 6th Street approach to provide three through lanes and two exclusive right-turn lanes. Then optimize the signal splits.
- Judge John Aiso Street/Temple Street – Restripe the northbound Judge John Aiso Street approach to provide one left-turn lane, one shared left-turn/right-turn lane, and one exclusive right-turn lane. Then optimize the signal splits.
- Alameda Street/Aliso Street – Restripe the southbound Alameda Street approach to provide one shared left-turn/through lane and three through lanes. Then optimize the signal splits.

Table 6-3 shows the level of service results after mitigation and identifies intersection locations where residual significant impacts would occur. After mitigation measures are implemented for the Underground Emphasis LRT Alternative, two of the three impacted intersection locations would continue to be impacted to significant levels during the AM peak hour. Similarly, three of the seven impacted intersection locations would continue to be impacted to significant levels during the PM peak hour.

Table 6-3. Year 2035 Underground Emphasis LRT Alternative with Mitigation: Intersection LOS and Residual Impacts

No.	Intersection	No Build		Underground w/ Mitigation		Change in Delay	Residual Impact
		LOS	Delay	LOS	Delay

62	Alameda Street / Aliso Street	D	48.9	C	26.2	-22.7	No

6.1.2.4 Fully Underground LRT Alternative – Little Tokyo Variation 1

Proposed mitigation measures for potentially impacted intersection locations under the Fully Underground LRT Alternative - Little Tokyo Variation 1 are discussed below.

- Flower Street/4th Street – Restripe the southbound Flower Street approach to provide one shared left-turn/through lane and two through lanes. Then optimize the signal splits.
- Flower Street/5th Street – Restripe the southbound Flower Street approach to provide three through lanes and one exclusive right-turn lane. Then optimize the signal splits.
- Flower Street/6th Street – Restripe the eastbound 6th Street approach to provide three through lanes and two exclusive right-turn lanes. Then optimize the signal splits.

Table 6-4 shows the level of service results after mitigation and identifies one intersection where a residual significant impact would occur. After mitigation measures are implemented for the Fully Underground LRT Alternative – Little Tokyo Variation 1, this intersection continues to be impacted to significant levels during the AM peak hour. In the PM peak hour, none of the three impacted intersections would continue to be impacted to significant levels. These locations can be mitigated to a less than significant level.

Table 6-4. Year 2035 Fully Underground LRT Alternative – Little Tokyo Variation 1 with Mitigation: Intersection LOS and Residual Impacts

No.	Intersection	No Build		Fully Underground w/ Mitigation		Change in Delay	Residual Impact
		LOS	Delay	LOS	Delay		
AM Peak Hour							
32	Flower Street / 4th Street	D	39.6	E	64.8	**25.2**	**Yes**
35	Flower Street / 5th Street	C	22.3	C	24.9	2.6	No
39	Flower Street / 6th Street	C	32.6	C	28.9	-3.7	No
PM Peak Hour							
32	Flower Street / 4th Street	F	91.5	F	92.1	0.6	No
35	Flower Street / 5th Street	C	20.8	C	25.3	4.5	No
39	Flower Street / 6th Street	C	31.9	C	33.1	1.2	No

6.1.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 2

Proposed mitigation measures for potentially impacted intersections under the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be the same as discussed for Little Tokyo Variation 1, and are summarized below.

- Flower Street/4th Street – Restripe the southbound Flower Street approach to provide one shared left-turn/through lane and two through lanes. Then optimize the signal splits.
- Flower Street/5th Street – Restripe the southbound Flower Street approach to provide three through lanes and one exclusive right-turn lane. Then optimize the signal splits.

- Flower Street/6th Street – Restripe the eastbound 6th Street approach to provide three through lanes and two exclusive right-turn lanes. Then optimize the signal splits.

Table 6-5 shows the level of service results after mitigation and identifies one intersection where a residual significant impact would occur. After mitigation measures are implemented for the Fully Underground LRT Alternative – Little Tokyo Variation 2, this intersection continues to be impacted to significant levels during the AM peak hour. In the PM peak hour, none of the three impacted intersections would continue to be impacted to significant levels. These locations can be mitigated to a less then significant level.

Table 6-5. Year 2035 Fully Underground LRT Alternative – Little Tokyo Variation 2 with Mitigation: Intersection LOS and Residual Impacts

No.	Intersection	No Build		Fully Underground w/ Mitigation		Change in Delay	Residual Impact
		LOS	Delay	LOS	Delay		
AM Peak Hour							
32	Flower Street / 4th Street	D	39.6	E	64.8	**25.2**	**Yes**
35	Flower Street / 5th Street	C	22.3	C	24.9	2.6	No
39	Flower Street / 6th Street	C	32.6	C	28.9	-3.7	No
PM Peak Hour							
32	Flower Street / 4th Street	F	91.5	F	92.1	0.6	No
35	Flower Street / 5th Street	C	20.8	C	25.3	4.5	No
39	Flower Street / 6th Street	C	31.9	C	33.1	1.2	No

6.1.3 Parking

The number of on-street parking and loading spaces eliminated by the proposed project would be minimal for the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2. The number of parking spaces removed would increase for the At-Grade Emphasis LRT Alternative due to the at-grade configuration on 2nd Street. Spaces would also potentially need to be removed on 2nd Street to create bus zones for the TSM Alternative.

Depending on the current use of the affected spaces, replacement in the form of off-street parking at adjacent locations may be considered. Potential parking replacement locations and/or strategies would be identified to mitigate parking impacts.

For the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative, the three tour bus loading spaces adjacent to JANM would be relocated to either an acceptable location on 1st Street or to the Nikkei Center site, with an understanding that a pedestrian crossing would be installed to provide safe movement from the tour bus loading area to the museum. Metro is committed to implementing a feasible parking replacement plan to reduce parking impacts to a less than significant level.

6.1.4 Other Modes

One major mitigation measure for other modes of transportation would be to implement a Metro-funded Community Linkages Study for the downtown area. The purpose of this study would be to develop pedestrian plans to link major activity centers with stations along the Regional Connector alignment.

Other mitigation measures would include the use of well-defined pedestrian paths, signage, and barriers, where appropriate, to reduce the potential for unsafe LRT track crossings by pedestrians. Distinctive crosswalk treatments such as textured paving and eye-catching designs can capture the attention of pedestrians and encourage the use of crosswalks. Using pedestrian-oriented signal phasing can decrease crossing wait times and reduce the chances of impatient pedestrians crossing against the light.

Train operations would be coordinated with traffic signal phasing to address potential safety issues and minimize delays. In addition, other techniques to increase pedestrian safety, including educational programs for local businesses, marketing and advertisement campaigns, and cohesive signage, may also be used. Similar at-grade LRT lines currently operating within the region could serve as examples of how to address pedestrian safety issues associated with at-grade portions of the proposed project.

To address the issue of bicycle use on 1st Street potentially coming into conflict with shifting traffic patterns under the At-Grade Emphasis LRT Alternative, the designation of 1st Street as a commuter bicycle facility in the downtown area between Hill and Alameda Streets could be removed. In addition, the designation of Central Avenue as Class III bicycle route between 1st and 2nd Streets could also be removed. However, in order to maintain network continuity for the regional bikeway plan at these specific segments of the system, parallel streets would need to be designated as bicycle routes.

Bicycle commuter route alternatives would be studied as part of a future Community Linkages Study that could be funded by Metro. No bicycle route mitigation is required for the

remaining downtown roadway segments potentially affected by the proposed project because the streets are not designated bikeway facilities.

6.2 Potential Mitigation Measures Due to Construction Impacts

6.2.1 Transit

Mitigation plans would be developed by Metro working closely with the City of Los Angeles and potentially affected transit operators. Bus lines that would be affected by lane closures due to construction activities would continue to operate where feasible in the remaining traffic lanes. Bus stops that would be affected by sidewalk construction would be temporarily relocated, and construction activities would be phased to consider the maintenance of bus service and minimize disruption.

During nighttime periods when entire blocks may be closed to traffic, bus lines would be re-routed to adjacent streets in a manner that minimizes inconvenience to bus passengers. If a block is closed that includes a bus stop, the bus stop would be temporarily relocated to the portion of the street segment that is still open to bus service.

After these mitigation measures are implemented, temporary relocation of bus stops would continue to cause potentially significant impacts during construction due to the possibility of increased travel times and longer walking distances by transit users.

6.2.2 Traffic Circulation

During the final design phase of the project, site- and street-specific Worksite Traffic Control Plans would be developed in cooperation with LADOT to accommodate the required traffic movements. To the extent practical, traffic lanes would be maintained in both directions, particularly during the morning and afternoon peak traffic hours. Access to adjacent businesses via existing or temporary driveways would be maintained throughout the construction period. In addition, Metro would implement a Construction Mitigation Program to coordinate preparation of traffic control plans with community reviews and approvals.

In some cases, specific construction techniques may be used to minimize construction duration, including segmental construction, which would help minimize the need for extensive falsework on the ground. Apart from the proposed elimination of eastbound travel between Hill Street and Main Street on 2nd Street in the At-Grade Emphasis LRT Alternative, at least one traffic lane in each direction and pedestrian access would be maintained during construction.

Designated haul routes for trucks would be identified during the final design phase of the project. These routes would be located to minimize noise, vibration, and other possible impacts to adjacent businesses and neighborhoods. If slight physical damage to the haul route roads is found after the project is complete, the roads would be repaired accordingly.

Driveway access for residences would be maintained at all times. Driveway access to business would be maintained for normal business operating hours.

After these mitigation measures are implemented, construction-related traffic impacts would be potentially significant and unavoidable.

6.2.3 Parking

Prior to construction, a parking mitigation and circulation plan would be developed by the contractor in coordination with Metro and the City. The purpose of this plan would be to minimize impacts on curb parking.

It may be possible to sequence construction activities so that multiple blocks of on-street parking are not temporarily removed at one time. This would make various on-street parking spaces available in an area under construction.

Some wider streets may be restriped to allow diagonal parking, which would provide a greater number of parking spaces in the area. Some of the parking mitigation measures previously outlined could be developed early so that they may be utilized during the period of construction. Metro would not allow contractor employees to park on unauthorized street parking locations or in private parking lots. Metro may use construction staging areas, lease parking lots, and/or provide construction employees with transit passes (if necessary) to avoid impacts to local parking.

After implementation of these proposed mitigation measures, construction-period parking impacts would not be adverse or significant.

6.2.4 Other Modes

Pedestrian movements would not conflict with work site vehicles, equipment, and operations. Special facilities such as handrails, fences, and walkways would be provided for the safety of pedestrians in areas where construction activities would impact sidewalk areas.

When pedestrians are diverted into the street or adjacent to an open trench, Type K-rail concrete barriers would be used as a barricade between pedestrian and vehicular traffic. Sidewalk closures would be approved by the affected agency having jurisdiction and only one side of the street would be closed at a time. If crosswalks are temporarily closed, pedestrians would be directed to use one that is in close proximity to closed one. Adjacent crosswalks would not be closed at the same time so pedestrians could cross streets. Bicyclists would be encouraged through signage to ride with caution in the streets, ride with caution on sidewalks, or choose other routes during construction activities.

During the final design phase of the project, site- and street-specific Worksite Traffic Control Plans would be developed in cooperation with LADOT to accommodate the required

pedestrian and bicycle movements. Access to businesses would be maintained for normal business operating hours. Access to residences would be maintained at all times throughout construction.

After implementation of these mitigation measures, pedestrian and bicycle impacts during construction would be potentially significant and unavoidable.

7.0 CONCLUSIONS

This section identifies the conclusions of the traffic study. In summary, there would be two impact categories: those found to be adverse after mitigation and those found to be not adverse after mitigation.

7.1 Transit

No unavoidable adverse impacts to transit operations would occur after mitigation measures have been implemented. Any potential impacts resulting from the displacement of bus stops or shifts in bus routes due to street design changes would no longer be adverse after mitigation. This would be accomplished by adjusting bus schedules and notifying bus patrons so they are aware of any route and time changes.

Proposed developments, either under construction or planned, along the Regional Connector alignment and station areas would benefit from increased transit service. In addition, the transit trips generated by these new development projects would contribute to the operational success of the overall regional LRT system. These beneficial impacts would increase system wide ridership and use of the overall transit system. The No Build and TSM Alternatives, however, would allow continued traffic degradation and provide no reduction in downtown area transfers, decreasing the overall utility of the transit system and resulting in deteriorated service.

Temporary transit route detours during construction could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of detours, impacts may remain adverse after mitigation.

7.2 Traffic Circulation

7.2.1 No Build Alternative

Potential impacts due to overall growth in the project area are reflected in the No Build Alternative traffic forecasts and associated AM and PM peak hour level of service estimates.

7.2.2 TSM Alternative

A total of 15 intersection locations would be impacted under the TSM Alternative. After implementation of the proposed mitigation measures, traffic circulation impacts at all 15 locations would be mitigated to a less than significant level. There would be no residual impacts for this alternative.

7.2.3 At-Grade Emphasis LRT Alternative

Under the At-Grade Emphasis LRT Alternative, 26 intersections would be impacted in one or both peak hours. After implementation of the proposed mitigation measures, 11 of the 26

impacted intersections would continue to be impacted in the AM peak hour and 15 would continue to be impacted in the PM peak hour. During the AM peak hour, traffic circulation impacts at seven intersections would no longer be adverse after mitigation. During the PM peak hour, traffic circulation impacts at 11 intersections would no longer be adverse after mitigation. In summary, there would 11 intersections with residual impacts in the AM peak hour and 15 with residual impacts in the PM peak hour.

During construction, the additional temporary roadway and lane closures could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of closures, impacts may remain adverse after mitigation.

7.2.4 Underground Emphasis LRT Alternative

Seven intersection locations would be potentially impacted in one or both peak hours. After the implementation of the proposed mitigation measures, two of the seven impacted intersections would continue to be impacted in the AM peak hour and three would continue to be impacted in the PM peak hour. During the AM peak hour, traffic circulation impacts at one intersection could be mitigated to a level where they would no longer be adverse. During the PM peak hour, four intersections could be mitigated to a level where they would no longer be adverse. In summary, there would be two intersections with residual impacts in the AM peak hour and three with residual impacts in the PM peak hour.

During construction, additional temporary roadway and lane closures could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of closures, impacts may remain adverse after mitigation.

7.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Under the Fully Underground LRT Alternative - Little Tokyo Variation 1, three intersection locations would be impacted in one or both peak hours. After the implementation of the proposed mitigation measures, traffic circulation impacts at one of the three impacted intersections would continue to be adverse in the AM peak hour and traffic circulation impacts at all three would be mitigated to a level where they would no longer be adverse in the PM peak hour. During the AM peak hour, the one impacted intersection would continue to experience adverse impacts. During the PM peak hour, traffic circulation impacts at all three intersections could be mitigated to a level where they would no longer be adverse. In summary, there would be one intersection with residual impacts in the AM peak hour and no residual impacts in the PM peak hour.

During construction, additional temporary roadway and lane closures could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of closures, impacts may remain adverse after mitigation.

7.2.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The operational results and conclusions of this alternative are the same as for the Fully Underground LRT Alternative - Little Tokyo Variation 1. Three intersections would be impacted in one or both peak hours. After the implementation of the proposed mitigation measures, one of the three impacted intersections would continue to experience adverse traffic circulation impacts in the AM peak hour, and none would experience adverse impacts in the PM peak hour. In summary, there would be one intersection location with residual impacts in the AM peak hour and no residual impacts in the PM peak hour.

During construction, additional temporary roadway and lane closures could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of closures, impacts may remain adverse after mitigation.

Table 7-1 summarizes the conclusions of this traffic evaluation. The table compares the number of impacted intersections for each build alternative to no build conditions both with and without mitigation. It also identifies the number of intersections that would continue to be impacted after implementation of feasible mitigation measures.

Table 7-1. Number of Impacted Intersections With and Without Mitigation

Alternative Under Consideration	Impacted Intersections		Impacted After Mitigation	
	AM Peak	PM Peak	AM Peak	PM Peak
No Build	-----	-----	-----	-----
TSM	8	9	0	0
At-Grade Emphasis	18	26	11	15
Underground Emphasis	3	7	2	3
Fully Underground – Little Tokyo Variation 1	1	3	1	0
Fully Underground – Little Tokyo Variation 2	1	3	1	0

7.3 Parking

No unavoidable significant adverse impacts would occur after mitigation measures have been implemented for any of the alternatives. Replacement parking such as off-street parking at

adjacent existing locations may be required. Potential parking replacement locations and/or strategies would be identified to mitigate parking impacts. Metro is committed to implementing a feasible parking replacement plan to reduce parking impacts to a less than significant level.

During construction, additional temporary curb parking restrictions could potentially result in short-term loss of parking. Efforts would be made to provide nearby replacement parking and minimize the extent and duration of restrictions, and impacts would not be adverse or significant after mitigation.

7.4 Other Modes

No unavoidable significant adverse impacts to other modes of transportation would occur after implementation of proposed mitigation measures. For potential impacts to pedestrians, Metro could fund a Community Linkages Study for the downtown area. The purpose of this study would be development of pedestrian plans to link major activity centers with stations along the Regional Connector alignment. For bicycles, a parallel street would be identified and designated as a bikeway facility to mitigate removal of the Commuter Bikeway classification on 1st Street. An alternative route would be developed during the Community Linkages Study.

During construction, temporary pedestrian and bicycle detours could potentially result in adverse impacts. Although efforts would be made to minimize the extent and duration of detours, impacts may remain adverse after mitigation.

1.0 SUMMARY

The Regional Connector Transit Corridor project area is one of Los Angeles County's major employment centers and encompasses retail, entertainment, and residential districts. Income levels of residents vary greatly, and residential units vary widely in cost from new luxury condominium developments in the western half of the project area to single-room occupancy hotels and homeless shelters in the eastern portion.

The land use patterns in the project area consist of mostly commercial office buildings in the southwestern portion, public office buildings in the northern portion, and commercial manufacturing buildings in the southeast. There are pockets of residential uses, including adaptive reuse of older non-residential buildings, scattered through the project area.

The No Build and Transportation System Management (TSM) Alternatives would result in no direct or indirect impacts to land use in the project area. Nor would they result in any cumulative impacts to land use in the project area. However, these two alternatives would not provide new opportunities for transit hub and land use connections, transit-oriented development, compact development patterns, progress toward more walkable communities, and compliance with the federal mandate for transportation investments that have important economic development, environmental and social benefits. Both of these alternatives would be inconsistent with local land use plans that promote sustainable travel patterns.

Construction and operation of any one of the four build alternatives would result in no significant direct or indirect impacts to land use in the project area. Construction of any one of the build alternatives could generate pedestrian and vehicle detours that may inhibit, but would not prevent, access to existing land uses along the alignment.

Construction of the Underground Emphasis Light Rail Transit (LRT) Alternative, Fully Underground LRT Alternative – Little Tokyo Variation 1, and Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in the taking of several existing commercial parcels and, in some cases, the permanent conversion of this land use. These takings would require compensation for the displaced land and business owners at fair market value, but would not be considered a significant land use impact given that the new land use would not conflict with existing adjacent land uses or result in any conflicts or inconsistencies with any existing land use plan, policy, or regulation of any agency with jurisdiction over the project area.

Overall, implementation of any of the build alternatives would not result in significant impacts to land use, nor would any require implementation of mitigation measures to reduce any impacts to a less than significant level. However, the beneficial land use effects of this transit investment have the potential to be significant.

2.0 INTRODUCTION

This technical memorandum discusses the Regional Connector Transit Corridor project area setting in relation to land use. The memo describes existing conditions for these resources, current applicable regulatory setting, and potential impacts from construction and operation of the proposed alternatives.

As the second largest metropolitan region in the United States, Los Angeles is home to approximately 15 million people and contains a variety of diverse cultures, world-renowned entertainment venues, and unique industries. At the heart of Los Angeles is the central downtown, considered the industrial, governmental, and financial core of the City.

The downtown Los Angeles financial district is one of the most job-dense areas in the City. Downtown Los Angeles also encompasses several retail, entertainment, and residential districts. Potential changes to existing land uses with construction of new transit stations or introduction of at-grade transit alignments could affect adjacent land uses. This technical memorandum evaluates the potential for impacts from construction and operation of the proposed Regional Connector project on land uses in the project area.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Standards of Significance

The standards of significance presented below were developed to gauge potential project effects relative to the requirements of the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA). The standards were formulated using impact assessment guidance prepared by the Federal Transit Administration, the Federal Highway Administration, similar analyses presented in other transit project Environmental Impact Statements (EIS)/Environmental Impact Reports (EIR), and the significance thresholds within the *Los Angeles CEQA Thresholds Guide* (Section H). Based on these guidance documents, a significant adverse impact on land use would occur if an alternative would:

- Conflict or be incompatible with adjacent and surrounding land uses caused by degradation or disturbances that diminish the quality of a particular land use; or
- Result in conflict or inconsistency with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project.

3.2 Area of Potential Impact

From a land use perspective, the area of potential impact for this project includes current land use designations for parcels directly adjacent to the build alternatives for the full length of the alignments and the parcels within a one-block radius of any new at-grade or underground transit stations proposed. It also includes the areas that would be crossed by the TSM Alternative. The proposed project was analyzed for potential direct and indirect effects on land use type, density, and character resulting from project construction and operation.

3.3 Analysis Methodology

Potential land use impacts associated with each alternative were analyzed within the components outlined below and structured around the standards of significance identified above:

- Analysis of the potential for short- and long-term conflicts with, or disruption of access to, land uses adjacent to the alternative alignments
- Identification of potential conflicts with applicable local land use plans, policies, or regulations
- Identification of potential land use benefits of the proposed alternatives, such as opportunities for transit-oriented developments and land uses

3.3.1 Land Use Incompatibility and Conflicts

The analysis of potential short- and long-term conflicts with and potential disruption of access to land uses adjacent to the alternative alignments began with an inventory of the existing land uses adjacent to each alternative alignment. The inventory helped characterize land uses along the full length of each alignment for the TSM Alternative and aboveground sections of the At-Grade Emphasis LRT Alternative. The analysis describes qualitative, and where possible, quantitative impacts associated with the project.

Cataloguing land uses along the underground sections of the Underground Emphasis LRT Alternative, Fully Underground LRT Alternative – Little Tokyo Variation 1, and Fully Underground LRT Alternative – Little Tokyo Variation 2 focused on the land uses surrounding new underground stations and other aboveground construction locations with the potential to generate land use conflicts. Cataloguing use relied on General Plan land use designations, Zoning Ordinance designations, and observations made during site reconnaissance.

This land use catalogue is discussed in more detail in Section 4. Section 4 also compares existing and expected land uses of the TSM Alternative and each build alternative to identify potential incompatibility or disruption of existing land uses. Potential for incompatibility could include, but is not limited to, noise, security, lighting, traffic, and pedestrian safety. These are discussed further in other technical memoranda.

3.3.2 Policy Consistency

This technical memorandum focuses on the proposed project's consistency with the goals and policies presented in local land use plans, policies, and regulations. The analysis is to determine if different alternatives have different levels of policy consistency. The land use plans, policies, and regulations that were reviewed include: the City of Los Angeles' General Plan (including the transportation element), the City of Los Angeles Planning and Zoning Code, the Central City Community Plan, the Civic Center Shared Facilities and Enhancement Plan, the Downtown Adaptive Reuse Incentive Ordinance, the Greater Downtown Housing Incentive Ordinance, the Central City North Community Plan, and the redevelopment plans established by the Community Redevelopment Agency (CRA) of the City of Los Angeles.

4.0 AFFECTED ENVIRONMENT

4.1 Existing Conditions

The project area is one of Los Angeles County's major employment centers and encompasses several retail, entertainment, and residential districts. Income levels of the residents vary greatly, and the residential units vary widely in cost from new luxury condominium developments in the western half of the project area to single-room occupancy hotels and homeless shelters in the eastern portion.

Land use patterns in the project area consist mostly of commercial office buildings in the southwestern portion, public office buildings in the northern portion, and commercial manufacturing buildings in the southeast. There are pockets of residential uses, including adaptive reuse of older non-residential buildings, scattered through the project area. The project area falls within the Central City Community Area as indicated in Figure 4-1, which shows the General Plan Land Use Designations along the alternative alignments. Figure 4-2, shows the zoning designations.

The highest floor-area ratios, about 6.0, can be found in the westernmost part of the project area, which is roughly bounded by 1st Street, Hill Street, 7th Street, and the SR 110 freeway. These boundaries are approximately similar to those of the Bunker Hill Urban Renewal Project Area. An older office district dating from the early part of the twentieth century is found to the east of the Bunker Hill Urban Renewal Project Area.

Nearly all of the businesses in this district contain ground-floor retail establishments, resulting in a busy streetscape. The buildings in this area are substantially shorter than those on Bunker Hill due to the City's 12-story height limit at the time of their construction.

Land use patterns in the eastern portion of the project area have been shifting from commercial and manufacturing toward residential over the past several years. New multi-family residential developments have recently opened along 2nd and 3rd Streets in Little Tokyo and the Arts District, stretching from approximately Los Angeles Street to Santa Fe Avenue. Most of these developments are comprised of four to six stories of apartments or condominiums. Some parcels in this area have been cleared for construction including residential buildings up to 20 stories in height.

As such, a large influx of new residents is expected in this area. In a dense area like downtown Los Angeles, this new residential population will likely increase pedestrian activity and spur demand for transit service outside of traditional commute hours, especially if development continues.

One of the oldest industrial areas in the region is in the easternmost part of the project area. The buildings are much lower than buildings elsewhere in the project area, usually only one to

three stories, and vacant lots are more prevalent. Many of the empty lots are used as storage yards or surface parking lots.

Though zoned for industrial manufacturing, some of the buildings have recently been reused as loft condominiums and rental housing units, particularly in the area north of 7th Street between Alameda Street and the Los Angeles River. Other new multi-family residential developments have recently been completed in the area, reflecting a changing trend in downtown land uses. These new residential developments may help to create nodes where transit demand would be higher than the past.

The project area is currently served by four rail lines and over 100 bus lines.

4.2 Regulatory Framework

The following are the land use plans, community plans, and redevelopment plans and projects affecting the project area, as well as brief assessments of their compatibility with the Regional Connector Transit Corridor alternatives.

4.2.1 General Plan Framework

The Los Angeles General Plan Framework, adopted in December 1996, is the Citywide portion of the City's General Plan, which is intended to guide the City's long-range growth and development. The General Plan Framework anticipates fast-paced population growth and outlines methods for directing growth toward selected high-density areas where infrastructure is readily available, rather than allow all areas of the City to grow in an uncontrolled fashion. The study identifies downtown as one of the key growth areas, and calls for enhancements to Los Angeles County's rail system, including extensions and feeder bus service.

4.2.2 Central City Community Plan

The Land Use Element of the General Plan splits the City into 35 community plan areas, each with detailed programs targeted at local growth and neighborhood improvements. All of the alternative alignments lie entirely within the Central City Community Plan area and the Central City North Community Plan area (City of Los Angeles 2003).

The Central City Community Plan calls for creating dense residential neighborhoods with a variety of housing types, improving the functionality of the area's commercial districts, encouraging the development of additional rail transit, retaining the scale and appearance of existing areas, and encouraging job-rich land uses. The Central City Community Plan area is bounded by Cesar Chavez Avenue on the north, the Santa Monica Freeway (I-10) on the south, the Harbor Freeway (SR 110) on the west, and Alameda Street on the east. More detailed land use maps are provided in Appendix A.

In response to the recent increase in housing units downtown, the plan seeks to develop neighborhood-supporting businesses and enhance the safety and cleanliness of the area. The plan heavily promotes transit-supportive land uses such as high-density residential developments, regional entertainment and cultural centers, space for small start-up businesses, retail plazas, nighttime entertainment venues, hotels, and dense industrial and wholesale districts. Of particular importance to the project, the plan notes that most of the traffic in the area is generated by pass-through travel between areas outside of downtown.

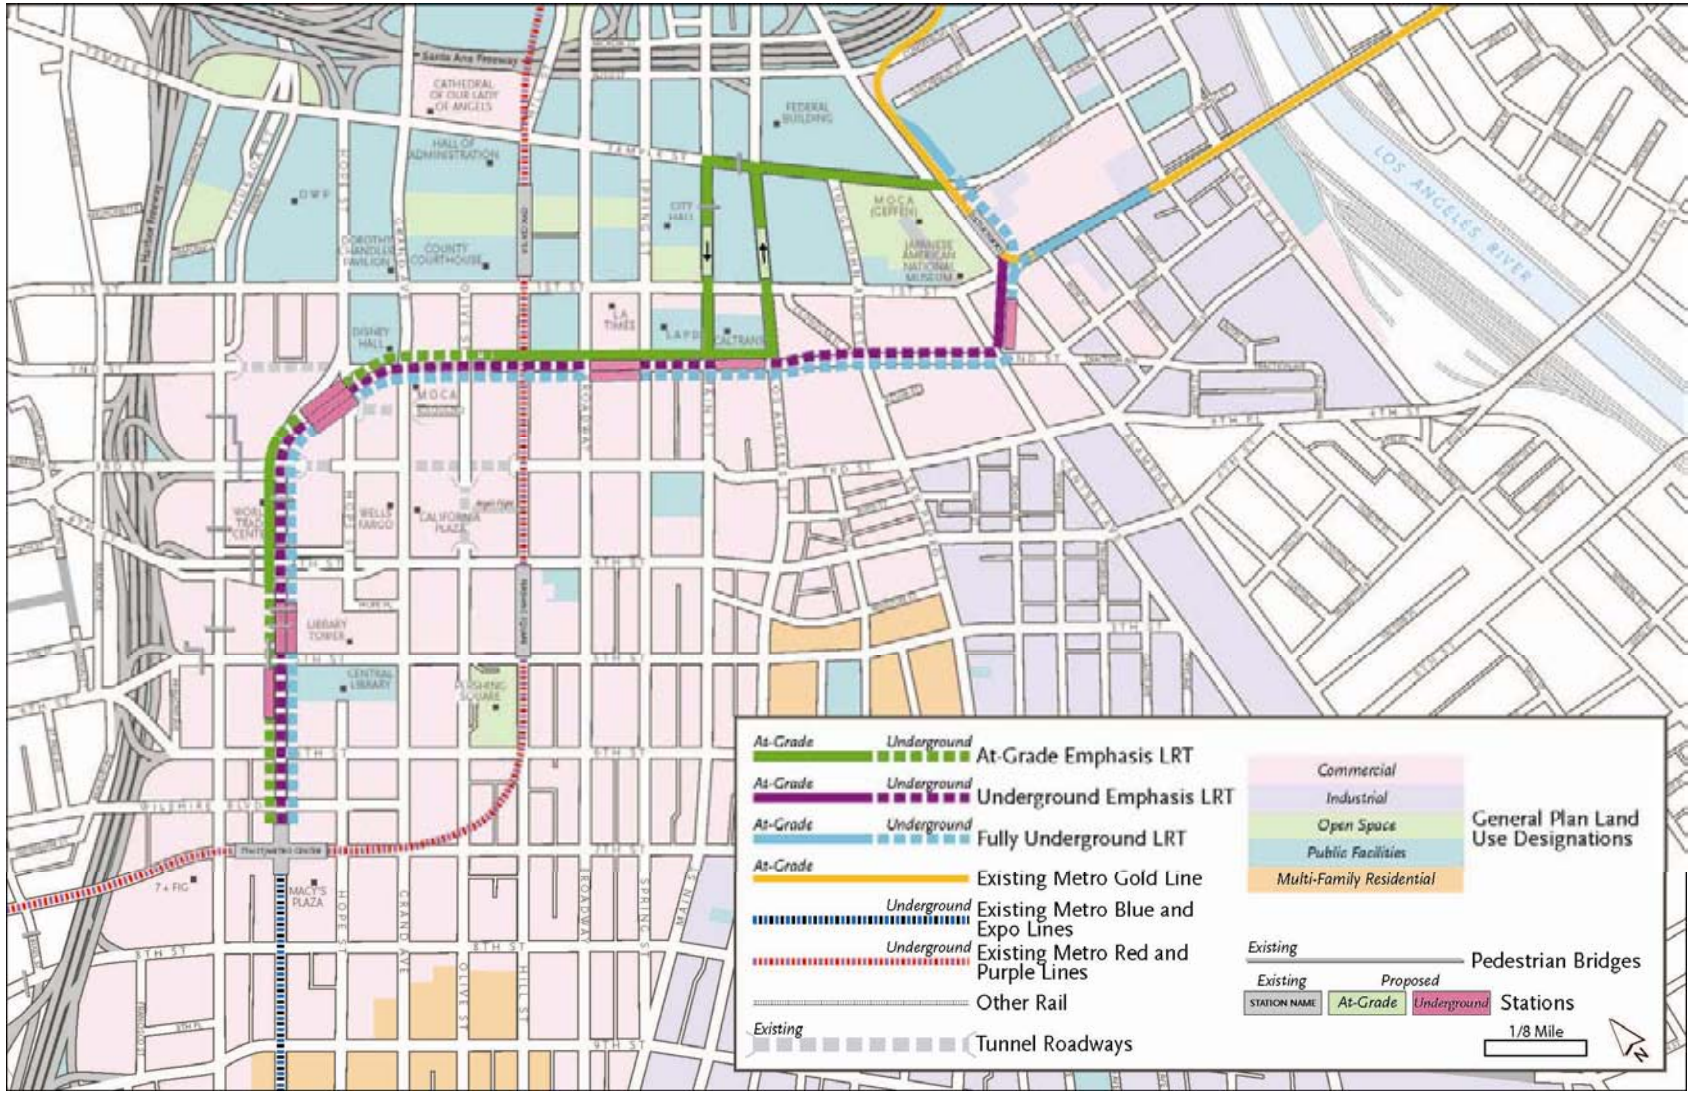

Figure 4-1 General Plan Land Use Designations

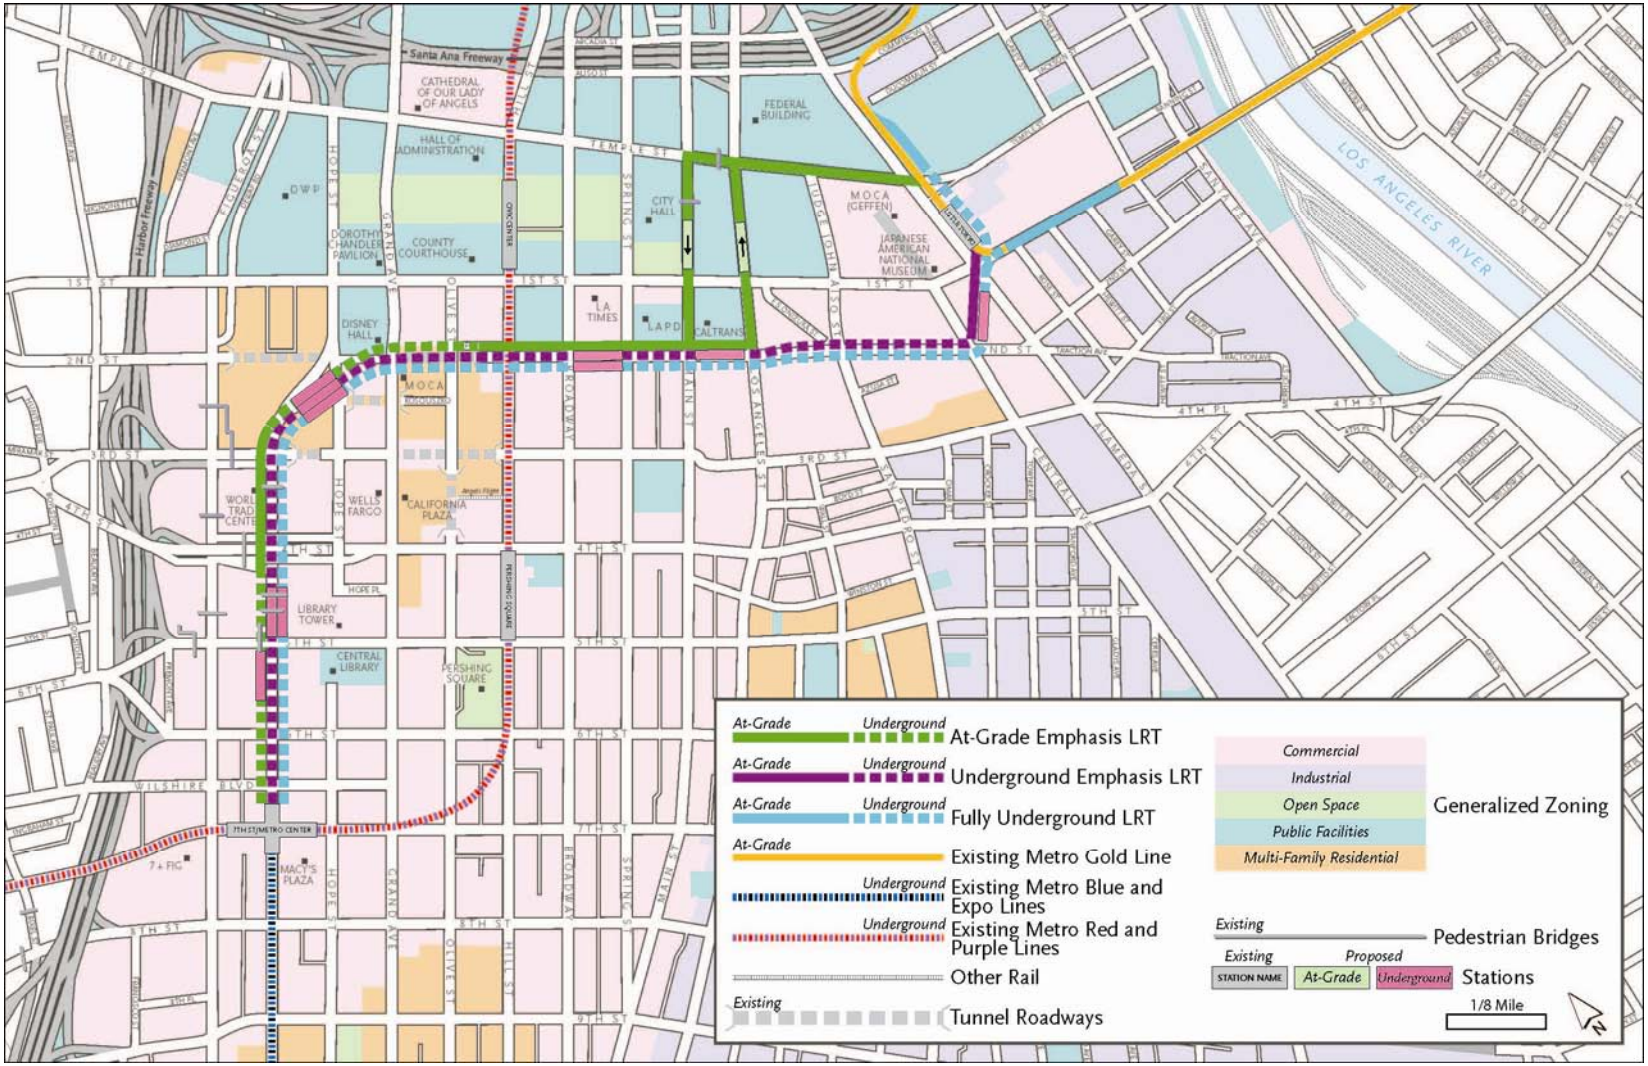

Figure 4-2. Zoning Designations

As such, the plan expressly recommends providing better connections through downtown from the SR 110 corridor, including a light rail extension from 7th Street/Metro Center Station to Union Station via Flower Street, Bunker Hill, and Little Tokyo.

4.2.3 Transportation Element

The Transportation Element of the General Plan lists objectives and programs aimed at improving accessibility and long-term mobility within the City (City of Los Angeles 1999). In the document, the City encourages development of high-capacity transit service along several corridors, including a "Downtown Connector" from either the San Pedro or Washington Stations to Union Station.

4.2.4 Zoning Code Provisions Encouraging Density Around Transit Stations

The City of Los Angeles Planning and Zoning Code includes provisions for development incentives within 1,500 feet of transit station entrances. For example, the City may permit developments in these areas to include more square footage and fewer off-street parking spaces than the zoning would otherwise allow (Los Angeles, California, Planning and Zoning Code art. II, § 12-24 (2000)).

By adding new rail stations to downtown Los Angeles, the Regional Connector would expand the number of parcels eligible for density and parking incentives. This could enhance economic activity in the downtown area, encourage growth in locations served by the rail system, and provide new opportunities for increased transit use.

4.2.5 Downtown Adaptive Reuse Incentive Area

The Regional Connector build alternative alignments are located in the Downtown Adaptive Reuse Incentive Area. Non-residential buildings in this area may be converted to residential dwelling units, contingent upon limited zoning restrictions. The stated goals of the incentive area are to rehabilitate economically distressed and historic buildings, improve the balance between jobs and housing in the downtown area, and encourage mixed use projects.

Developers of adaptive reuse projects within the incentive area may expand converted residential units with additional mezzanine loft space, which does not count toward floor area limits. Developers may also exceed the maximum number of residential units allowed by the existing zoning. In addition, no new off-street parking spaces are required, though existing spaces must be maintained (Los Angeles, California, Planning and Zoning Code, art. II, §12.22 (2001)). Transit improvements like the Regional Connector provide additional transportation capacity and alternatives to automobile use, and are thus compatible with increased densities and reduced off-street parking requirements.

4.2.6 Greater Downtown Housing Incentive Area

Regional Connector build alternatives are entirely located within the Greater Downtown Housing Incentive Area. The enabling zoning ordinance allows density and parking incentives for residential project developers who reserve a portion of their units for low-income residents. Depending on how many units are reserved, incentives can include up to 35 percent more floor area and up to 50 percent fewer required off-street parking spaces than zoning currently specifies (Los Angeles, California, Planning and Zoning Code, art. II, §12.22 (2007)). By improving transit service in the downtown area, the Regional Connector would support the housing incentive program, especially because low-income people are less likely to have automobile access and more likely to rely on transit.

4.2.7 Central City North Community Plan

Almost all of the new trackwork required for the Regional Connector build alternatives would be located within the Central City Community Plan area. However, the eastern boundary of the Central City Community Plan area is Alameda Street, so a small portion of each build alternative's trackwork and construction staging areas near the existing Metro Gold Line's Little Tokyo/Arts District Station would be located in the adjacent Central City North Community Plan area. The two community plans are consistent in their treatment of this location as a commercial area. As such, any land use impacts to the Central City North Community Plan area would be similar to those described for the Central City Community Plan area.

4.2.8 Civic Center Shared Facilities and Enhancement Plan

In 1997, the Civic Center Shared Facilities and Enhancement Plan established goals for creating a cohesive concentration of public office buildings linked by visually enhanced streets (Los Angeles Civic Center Authority 1997). The plan outlines a public services and business district that pedestrians could traverse in ten minutes or less. Central to the plan are linkages to other parts of downtown, including Union Station, the Historic Core, and the Music Center.

4.2.9 Feasibility Study for the Resurrection of the Red Car Trolley Services

The Community Redevelopment Agency of the City of Los Angeles published the Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Downtown Area in July 2006. This study examines the agency's proposal to introduce a historic streetcar line running in a northeast-southwest direction from Chinatown to the Fashion District. The study indicates the usefulness of additional rail transit coverage within downtown, and emphasizes the importance of connectivity with other Metro rail lines.

4.2.10 Business Improvement Districts (BIDs)

The project area contains portions of six BIDs: Fashion BID, Downtown Industrial BID, Toytown BID, Historic Downtown BID, Downtown Center BID, and Little Tokyo BID. These

organizations are funded by property assessments and seek to improve commerce in their areas by providing services such as security patrols, street and sidewalk cleaning, and promotional advertising.

Stimulating business growth increases the number of jobs and shopping opportunities, which translates to higher volumes of trips to the district. As such, BIDs are generally supportive of better transit connections to their areas because high quality transit service makes it easier for potential customers to travel to the area.

4.2.11 Bunker Hill Urban Renewal Project

The Bunker Hill Urban Renewal Project was initiated by the CRA in 1959 and has undergone several amendments since. Key elements of the project include re-subdivision of existing residential parcels into 25 large development sites for high-rise buildings, a new network of tunnels and viaducts to allow smooth traffic flow despite the area's steep terrain, and development incentives for new commercial and residential developments. CRA's plans for the area include open space and pedestrian linkage improvements near Metro Rail stations. All of the build alternative alignments travel through the Bunker Hill Urban Renewal Project area from 5th Street and Hill Street. The project is currently projected to end in 2012.

4.2.12 Central Business District Redevelopment Project

The Central Business District Redevelopment Project was adopted by the CRA in 1975. Project activities include providing decent housing for the Skid Row homeless population in Central City East, spurring development in the Financial District to match the level of development occurring in the Bunker Hill Urban Renewal Project area, revitalizing the Broadway retail district in the Historic Core, and providing crime reduction and rehabilitation of South Park.

Major projects completed in the area include Staples Center, the Los Angeles Convention Center, Cathedral of Our Lady of Angels, new parking structures, and multiple residential buildings. The redevelopment project is set to expire in 2010, though the tax increment revenue cap has already been reached.

The entire At-Grade Emphasis LRT Alternative alignment is located within the Central Business District Redevelopment Project area except the portion from 5th Street to Hill Street. The Underground Emphasis LRT Alternative and Fully Underground LRT Alternatives include Flower Street between 7th Street/Metro Center Station and 5th Street, and 2nd Street between Hill and Los Angeles Streets.

4.2.13 City Center Redevelopment Project

The City Center Redevelopment Project was established in 2002 by the CRA. It includes much of the area covered by the Central Business District Redevelopment Project, though parts of

the Civic Center are excluded. The key goal of the project is to allow the CRA to continue to generate tax increment revenue and address blight in the area despite the revenue limits placed on the Central Business District Redevelopment Project. The City Center Redevelopment Project is set to expire in 2032. All of the Regional Connector build alternative alignments pass along the northern edge of the City Center Redevelopment Project area on 2nd Street between Hill and Los Angeles Streets.

4.2.14 Little Tokyo Redevelopment Project

The Little Tokyo Redevelopment Project was adopted by the CRA in 1970. Key project activities include removing or rehabilitating substandard buildings, reconfiguring obsolete street and railroad patterns to remove irregularly shaped parcels and improve mobility, providing security improvements, encouraging residential development, and alleviating conflicts between adjoining residential and industrial land uses.

Project developments include the Japanese American Cultural and Community Center, the Japan America Theater, the Japanese American National Museum, the Union Center for the Arts, adaptive reuse of a former church, luxury hotels, specialty shopping centers, and several residential buildings. The redevelopment project is presently set to expire in 2013.

The At-Grade Emphasis LRT Alternative traverses the western edge of the Little Tokyo Redevelopment Project area on Los Angeles Street between 2nd and 1st Streets. The alignments of the Underground Emphasis LRT Alternative and Fully Underground LRT Alternative Variations 1 and 2 travel in the redevelopment area from Los Angeles Street to the junction with the Metro Gold Line to East Los Angeles at 1st and Alameda Streets.

5.0 IMPACTS

5.1 No Build Alternative

The No Build Alternative is focused on preserving existing transit services and projects currently in use or planned for completion by 2035. The No Build Alternative does not include any major service improvements or new transportation infrastructure beyond what is presented in the 2009 Metro Long Range Transportation Plan (LRTP). The potential land use impacts associated with projects as outlined in the 2009 LRTP would be reviewed as a part of environmental analyses specific to those projects.

The No Build Alternative would not provide the land use benefits typical of high-capacity transit projects, including encouragement of compact development. Because the LRTP predicts that traffic will continually worsen in the absence of additional capacity, the No Build Alternative would contribute to deteriorating access and mobility within the Los Angeles region.

The No Build Alternative is also inconsistent with the goals of the Central City Community Plan, which call for a light rail connector between 7th Street/Metro Center Station and Union Station. Overall, the No Build Alternative is expected to generate less than significant direct and indirect impacts to land uses in the project area and would generate a less than significant contribution to cumulative direct land use impacts. This alternative would conflict with the FTA guidance (January 13, 2010) that directs consideration of the benefits of transit investments that encourage and support land uses that are environmentally sustainable, and foster livable communities including economic vitality.

5.2 Transportation System Management (TSM) Alternative

The TSM Alternative includes all of the provisions of the No Build Alternative, plus two new express shuttle bus lines linking 7th Street/Metro Center Station and Union Station. Two potential bus routes are under consideration in the TSM Alternative – an Upper and a Lower Grand Route.

Peak hour bus-only lanes would be created on the routes where they do not currently exist. Any new peak hour bus-only lanes would be placed in lanes that are currently closed to parking during peak hours. The TSM Alternative would develop enhanced bus stops every two to three blocks along the route to maximize coverage of the area surrounding the routes. On 2nd Street, where bus stops do not currently exist, six new stops (three in each direction) would need to be added, necessitating the removal of up to 24 curb parking spaces. This could cause increased parking demand on surrounding streets.

Like the No Build Alternative, the TSM Alternative would not provide any new transit-related land use benefits, nor would it preserve regional access and mobility in light of continually

worsening traffic congestion. It is also inconsistent with the Central City Community Plan's goal of building a light rail connector between 7th Street/Metro Center Station and Union Station. This alternative would conflict with the FTA guidance (January 13, 2010) that directs consideration of the benefits of transit investments that encourage and support land uses that are environmentally sustainable, and foster livable communities including economic vitality.

The TSM alternative would generate less than significant direct and indirect impacts than the build alternatives. The TSM Alternative would displace fewer existing on-street parking spaces, and development of the alternative's enhanced bus stops on sidewalks adjacent to the bus lanes would not disrupt access to existing land uses along the alignment.

The TSM Alternative is consistent with existing and planned projects within the project area. Potential construction impacts would be less than significant and this alternative would generate a less than significant contribution to cumulative land use impacts. However, this alternative would not contribute to the land use benefits that the build alternatives would, including encouragement of compact development.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative develops a connection between the underground 7th Street/Metro Center Station and the Metro Gold Line at Temple and Alameda Streets with a mix of at-grade and underground sections. This alternative would develop a mix of at-grade and underground transit stations. The alignment and station locations are shown in Figure 4-1.

5.3.1 Potential Land Use Conflicts

As shown in Figure 4-1, the General Plan land use designations of the parcels adjacent to the at-grade sections of the At-Grade Emphasis LRT Alternative's proposed route include public facilities, open space, and commercial. The zoning designations indicated in Figure 4-2 for at-grade sections of the alternative include public facilities, commercial, and residential. The at-grade sections of the alignment run adjacent to public facility and commercial parcels.

5.3.1.1 General Potential Construction Effects

Construction of the tunnels and underground stations for the At-Grade Emphasis LRT Alternative would rely on the cut-and-cover method. Excavation would occur beneath a temporary roadway deck. The bulk of surface impacts would be limited to the beginning and end of the tunneling process, when temporary roadway and decking removal would be necessary.

The at-grade portions of the alignment would be constructed in existing roadways. Lane closures and temporary detours would be required for the entire time the trackway is being

constructed. Shorter-term intersection closures would be needed after the trackway is complete so that overhead wires could be installed. Construction activities would be intensified in the vicinity of at-grade stations.

5.3.1.2 Financial District

The alignment would begin at the northern end of the existing light rail tracks at 7th Street/Metro Center Station. The tracks would extend northward beneath Flower Street to a new underground station between 6th and 5th Streets. The alignment would then continue north under Flower Street and rise to the surface through a new portal between 4th and 3rd Streets. The tracks would then cross 3rd Street at grade and enter a new portal into the hillside just northeast of the intersection of 3rd and Flower Streets.

The existing land uses along the underground portion of the alignment through the Financial District include office towers, public open space, hotels, and other commercial and retail establishments. Notable buildings include the Citigroup Center, Paul Hastings Tower, Maguire Gardens public open space, City National Plaza and Tower, the California Club, the Standard Hotel, the Pegasus apartment building, and Macy's Plaza.

Construction of this underground portion of the At-Grade Emphasis LRT Alternative alignment would use cut-and-cover techniques for the tunnel and new station at Flower and 5th Streets. This construction technique could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment.

A traffic lane and 12 on-street parking spaces would need to be removed permanently to accommodate the portal, at-grade tracks, and underground station entrances. This could potentially shift parking and traffic demand to nearby streets.

The portal and at-grade portion of this section of the alignment would run adjacent to the World Trade Center, Bank of America Plaza, the Westin Bonaventure Hotel, and a parking structure underneath the Ketchum YMCA. Constructing the at-grade tracks in this section of the alignment could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment. As such, the proposed alignment through the Financial District is not expected to generate any instances of land use incompatibility, given its routing in and below a major existing roadway.

5.3.1.3 Bunker Hill

From the new portal into the hillside just northeast of the intersection of 3rd and Flower Streets, the alignment would proceed into a new underground station just southwest of 2nd and Hope Streets. The alignment would then pass through new entrances into the middle section of the existing 2nd Street tunnel and turn east to run inside the tunnel toward its eastern portal near Hill Street.

Existing land uses that this alignment would travel near include education buildings, parking lots, large auditoriums, and large residential developments. Notable sites include the Colburn School of Performing Arts, parcels currently used as parking lots that are proposed for redevelopment as a part of the Grand Avenue Redevelopment Project, the Walt Disney Concert Hall, and high-rise residential developments.

The proposed 2nd/Hope Street station construction would be focused in an existing landscaped traffic control median and on streets closed during construction. Construction and operation of the proposed 2nd/Hope Street station could potentially require some reconfiguration of the surrounding roadways, though this would not limit access to surrounding land uses. If an underground passageway were constructed from the station box to an entrance on the west side of Flower Streets, one or both of the existing private tennis courts may be displaced. However, a midblock crosswalk would be a potential at-grade solution that could create the same pedestrian connection.

Construction and operation of tracks in the existing 2nd Street tunnel and the proposed new rail portals into the tunnel from the 2nd/Hope Street station would not be incompatible with existing land use or affect land uses above the alignment.

5.3.1.4 Historic Core

The proposed At-Grade Emphasis LRT Alternative at-grade alignment would travel through the Historic Core along 2nd Street from the eastern portal of the 2nd Street tunnel near Hill Street to Los Angeles Street. At Main Street, the southbound track would branch off and head north into the Civic Center, while the northbound track would continue eastward on 2nd Street and turn north on Los Angeles Street. As such, the portion of 2nd Street between Main and Los Angeles Streets would have only one track, while the rest of 2nd Street from the 2nd Street tunnel to Main Street would have two tracks. A traction power substation would be constructed on a portion of the parking lot on the south side of 2nd Street between Broadway and Spring Street.

Existing land uses adjacent to this section of 2nd Street include public buildings, offices, parking, and retail. Buildings along the alignment include the Little Tokyo Library, the old Saint Vibiana Cathedral and site of the proposed Vibiana Place Mixed Use Project, the Higgins Building, the Los Angeles Times Building, office buildings with ground floor retail establishments, the Los Angeles Law Center, the City of Los Angeles Parking Violations Bureau, and the Kawada Hotel. Construction of the alignment on 2nd Street could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along the alignment. Some turning movements may be restricted permanently, and sections of 2nd Street along the alignment may be converted to one-way vehicle traffic only, but vehicular access to all properties would be maintained. As indicated by the Noise and Vibration Technical Memorandum, noise impacts at the residential Higgins Building and Kawada Hotel would not be significant.

Development of at-grade tracks along 2nd Street and the need for adequate street widths to provide local access lanes would require that on-street parking and loading zones along 2nd Street be eliminated. Approximately 23 on-street parking spaces, including five loading spaces, would be removed from 2nd Street, which could potentially shift parking demand to other nearby streets. Operation of the alignment after construction would not generate any permanent access disruptions to existing land uses on either side of the right-of-way.

Temporary interruptions to traffic flow as trains pass would be similar to existing interruptions by red lights at intersections. The proposed alignment through the Historic Core would be compatible with existing land use along this segment given its development as an existing roadway.

5.3.1.5 Civic Center

The proposed alignment would enter the Civic Center at grade from the south along Main and Los Angeles Streets. The southbound track would run along the east side of Main Street and the northbound track would run along the east side of Los Angeles Street. Each track would serve a one-way station just north of 1st Street before continuing north to Temple Street. Both tracks would turn east on Temple Street and rejoin just east of the intersection of Temple and Los Angeles Streets.

Most of the buildings along the Civic Center portion of the alignment are occupied by public offices. There are also hotel, restaurant, and other commercial uses along the alignment. Notable buildings include City Hall, City Hall East, Caltrans District 7 Headquarters, and the new LAPD Administration Building scheduled for completion in the fall of 2009. The Kyoto Grand Hotel is also located adjacent to the alignment at 1st and Los Angeles Streets.

The proposed at-grade stations near City Hall along Main and Los Angeles Streets would be constructed along the existing roadway lanes and widened sidewalks. Construction of the at-grade alignment along Temple Street could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along the alignment.

Operation of the alignment after construction is not expected to generate any permanent access disruptions to existing land uses on either side of the alignment. The proposed at-grade stations on Los Angeles and Main Streets would be developed in existing traffic lanes away from the intersections at Temple and 1st Streets. The proposed at-grade stations are not expected to impede access to existing land uses on either side of the alignment given their placement away from the intersections and crosswalks.

The proposed alignment would be compatible with existing land use along this segment given its development as an existing roadway.

5.3.1.6 Little Tokyo

The at-grade alignment would enter Little Tokyo from the Civic Center traveling east along Temple Street from Los Angeles Street. The tracks would reduce the existing automobile lanes on Temple Street from two lanes in each direction to one lane in either direction. At Alameda Street, the alignment would connect to the Metro Gold Line to East Los Angeles in a three-way junction at the intersection of Temple and Alameda Streets.

A new auto underpass and pedestrian overpass would be constructed at the intersection of Alameda and Temple Streets. The existing land uses along this section of Temple Street include a Veterans Affairs outpatient clinic and hospital, a federal building, the Los Angeles Mall public open space, and City Hall East.

Construction along Temple Street could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along the alignment. Operation of the alignment would create permanent access to the Go 4 Broke development site on the south side of Temple Street.

Temporary interruptions as trains pass would be similar to existing interruptions to vehicle traffic on the roadway. The alignment would be compatible with existing land use along this segment given its development as an existing roadway. This section of the proposed alignment could shift traffic and parking demand to other streets near the alignment caused by the reduction of automobile lanes on Temple Street and elimination of 12 parking spaces on the south side of Temple Street west of Alameda Street due to the proposed underpass.

5.3.1.7 Potential Land Use Conflict Conclusions

Land use conflicts caused by construction and operation of the At-Grade Emphasis LRT Alternative would be less than significant. The alternative would not introduce new land uses that are inconsistent with existing land uses.

Construction of the alternative could generate temporary pedestrian and vehicle detours that inhibit, but not prevent, access to existing land uses along the alignment. The Transportation Technical Memorandum traffic section analyzes this potential effect on circulation in the project area and concludes it would be a less than significant effect on land use.

5.3.2 Policy Consistency

The At-Grade Emphasis LRT Alternative is proposed within the Central City Community Plan area and would be subject to numerous plans and development regulations. The At-Grade Emphasis LRT Alternative is consistent with the stated General Plan goal of focusing growth toward existing high density areas, including downtown Los Angeles, by enhancing the County's rail system. It is also consistent with the Transportation Element's support of high-capacity transit service between Union Station and the Metro Blue Line.

The Central City Community Plan encourages high-density transit-oriented land uses and recommends improvements to transit connections through downtown from the 7th Street/Metro Center Station to Union Station to address pass-through traffic congestion. The Civic Center Shared Facilities and Enhancement Plan and Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Area identified goals of improving transit connectivity between other existing and planned Metro rail lines, and the value of better linkages between Union Station and downtown.

Redevelopment projects along the proposed At-Grade Emphasis LRT Alternative alignment stress density and pedestrian activity, both of which would be encouraged by the addition of new rail service to the area. The density and parking bonuses created by the City to encourage growth would also support new transit service by expanding the base of potential riders and adding less parking than would normally be required. Because these bonuses are contingent upon proximity to transit stations, the At-Grade Emphasis LRT Alternative would make more parcels eligible by adding new stations to the area. Transit service improvements complement relaxed parking requirements by providing alternate means of access.

The At-Grade Emphasis LRT Alternative is consistent with the goals and policies of local land use plans, policies, and regulations. This alternative would not convert any existing land uses from construction and operation of the alignment and stations, which are primarily in and below existing roadways. In addition, implementation of the alternative could potentially generate land use benefits by supporting high-density, transit-oriented developments identified in the goals and policies of multiple local land use plans, policies, and regulations. These benefits would result from improved transit connections through downtown and increased accessibility for local residents to the Metro service area.

5.3.3 Cumulative Impacts

Implementation of the At-Grade Emphasis LRT Alternative would not contribute to any adverse cumulative land use effects within the project area[1]. The alternative would not convert any existing land uses or create any new land uses that could, in combination with any current and reasonably foreseeable related actions, generate conflicts with land uses adjacent to the alignment, or result in inconsistency or conflict with local land use plans, policies, and regulations. Therefore, the alternative's contribution to cumulative land use impacts would be less than significant.

It is anticipated that the At-Grade Emphasis LRT Alternative and other transit projects currently underway or planned in the future would support increases in transit ridership, which would be a beneficial effect. The improved regional accessibility created by the proposed Regional Connector project and other transit projects currently underway or

[1] Based on the list of anticipated developments provided in the Cumulative Impacts Methodology Memorandum

planned in the future could also support increased residential development within the project area, which would be a beneficial effect.

There are numerous commercial and residential developments planned and underway in the vicinity of the At-Grade Emphasis LRT Alternative alignment, many of which are being built on sites currently occupied by surface parking lots. The new transit service would help offset the impacts of these land use changes by providing alternatives to driving. However, with a substantial portion of the At-Grade Emphasis LRT Alternative alignment running in former traffic lanes on city streets, the transportation benefits to the surrounding developments may be tempered by impaired automobile and pedestrian access.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would provide a connection between the underground 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets with a predominantly underground alignment. The alternative would develop multiple underground transit stations. The alignment and station locations are shown in Figure 4-1.

5.4.1 Potential Land Use Conflicts

As shown in Figure 4-1, the Underground Emphasis LRT Alternative would develop a twin tunnel underground alignment from 7th Street/Metro Center Station to a new tunnel portal southwest of the intersection of 1st and Alameda Streets. The route mirrors the At-Grade Emphasis LRT Alternative with the exception of the segment along 2nd Street between Main Street and the Metro Gold Line at 1st and Alameda Streets.

The General Plan land use designations of the parcels adjacent to the underground sections of this alternative's proposed route include public facilities, open space, and commercial. The zoning designations shown in Figure 4-2 for the underground sections of the alternative include public facilities, commercial, and residential.

5.4.1.1 General Potential Construction Effects

Construction of the tunnels beneath Flower Street would be performed using the cut-and-cover method, where excavation would be carried out beneath a temporary roadway deck. The bulk of surface impacts would be limited to the beginning and end of the tunneling process, when temporary roadway and decking removal would be necessary. All stations would be constructed using this method except possibly the 2nd/Hope Street station, which may be constructed using the Sequential Excavation Method (mining).

The twin tunnels under 2nd Street would be constructed using the Tunnel Boring Machine (TBM) method. They would be bored from east to west from an access point excavated along 2nd Street between Central Avenue and Alameda Street to a mined or cut-and-cover section west of Bunker Hill, where the TBMs would be removed. Alternatively, the twin tunnels could

be bored in the opposite direction with the TBMs inserted near Bunker Hill and removed from 2nd between Central and Alameda.

Tunnel boring operations would not directly affect land uses that overlay the alignment, but could potentially generate ground surface settlement and indirectly affect the overlying land uses. Construction techniques minimizing the potential for ground settlement would be incorporated during operation of the TBMs. Shoring measures would be applied to foundations of structures susceptible to damage from land settlement to prevent impacts on existing land uses.

Construction techniques that could potentially be implemented to limit ground settlement include, but are not limited to, the use of pressure face TBMs. These machines maintain pressure on the new tunnel wall behind the cutting face, prior to injecting grout into the new tunnel wall, which is immediately followed by installation of concrete liners (tunnel rings). These measures limit the time that any portion of the newly cut tunnel is left unsupported and would help to prevent surface settlement. Additional grouting and foundation underpinning techniques could also be used where the alignment travels beneath or adjacent to sensitive structures and the tunnels would be close to the ground surface.

5.4.1.2 Financial District

The Underground Emphasis LRT Alternative alignment begins at the northern end of the existing light rail tracks at 7th Street/Metro Center Station. The alignment would proceed northward beneath Flower Street to a new station between 5th and 4th Streets, adjacent to Citigroup Center and Paul Hastings Tower.

The existing land uses along the underground portion of the alignment through the Financial District include office towers, public open space, hotels, and other commercial and retail establishments. Notable buildings include Citigroup Center, Paul Hastings Tower, World Trade Center, Bank of America Plaza, Maguire Gardens public open space, City National Plaza and Tower, the California Club, the Standard Hotel, the Westin Bonaventure Hotel, the Pegasus apartment building, Macy's Plaza, and the parking structure beneath the Ketchum YMCA.

Construction of this underground portion of the alignment would use cut-and-cover techniques for the tunnel and new station at Flower and 5th Streets. This construction technique could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment.

Station entrances would be located within widened sidewalks, necessitating removal of seven curb parking spaces and a lane of traffic. This could shift parking and traffic demand to nearby streets. There would be no significant land use impacts to the Financial District

because the alignment would be entirely underground within the right-of-way along this portion of the alignment and would not pass directly beneath any existing buildings.

5.4.1.3 Bunker Hill

From the Financial District, the underground alignment would extend into the Bunker Hill area along Flower Street from the Flower/5th/4th Street station to 3rd Street. The tunnels would then curve northeast into the proposed 2nd/Hope Street station. From the station, the tunnels would turn eastward underneath the existing 2nd Street tunnel.

Existing land uses that this alignment would travel near include education buildings, parking lots, large auditoriums, and large residential developments. Notable sites include the Colburn School of Performing Arts, parcels currently used as parking lots that are proposed for redevelopment as a part of the Grand Avenue Redevelopment Project, the Walt Disney Concert Hall, and high-rise residential developments. It would, therefore, generate the same potential effects as construction and operation of the 2nd/Hope Street station described for the At-Grade Emphasis LRT Alternative.

Construction and operation of the proposed 2nd/Hope Street station could potentially require some reconfiguration of the surrounding roadways, though this would not limit access to surrounding land uses. If an underground passageway were to be constructed from the station box to an entrance on the west side of Flower Streets, one or both of the existing private tennis courts may be displaced. However, a midblock crosswalk would be a potential at-grade solution that could create the same pedestrian connection.

The tunnels in this area would be constructed using the cut-and-cover method, thus necessitating temporary pedestrian and vehicle detours. The 2nd/Hope Street station may alternatively be constructed using the sequential excavation method, thereby reducing surface disruption. There would be no significant land use impacts to Bunker Hill because the alignment would be entirely underground along this portion of the alignment and would not pass directly beneath any existing buildings.

5.4.1.4 Historic Core

From the Bunker Hill area, the underground alignment would continue east beneath the 2nd Street tunnel and 2nd Street through the Historic Core community. A new underground station would be constructed beneath 2nd Street, either between Broadway and Spring Street or between Main and Los Angeles Streets.

Existing land uses adjacent to the Historic Core section of 2nd Street include public buildings, offices, parking, and retail. Buildings along the alignment include the Little Tokyo Library, the old Saint Vibiana Cathedral and site of the proposed Vibiana Place Mixed Use Project, the Los Angeles Times Building, the Los Angeles Law Center, the City of Los Angeles Parking Violations Bureau, and the Kawada Hotel.

The 2nd Street station - Broadway Option would be adjacent to the Los Angeles Times Building. The 2nd Street station - Los Angeles Option would be developed adjacent to the "Block 8" residential and retail development currently under construction and the Kyoto Grand Hotel. Construction of a new station on 2nd Street in either location is expected to use cut-and-cover techniques. This construction technique could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment.

The tunnels in the Historic Core area would be constructed using the TBM method, which would result in few noticeable surface impacts aside from those associated with the cut-and-cover station. There would be no significant land use impacts to the Historic Core because the alignment would be entirely underground along this portion and would not pass directly beneath any existing buildings.

5.4.1.5 Little Tokyo

From the Historic Core, the tunnels would continue east under 2nd Street into Little Tokyo. Upon reaching Central Avenue, the tunnels would curve to the northeast into the parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. The tracks would then rise to the surface through a new portal constructed on this parcel. The alignment would then enter the intersection of 1st and Alameda Streets at grade, where it would connect to the existing Metro Gold Line in a three-way junction.

The parcels where the portal would be located have commercial land use and zoning designations, as shown in Figures 4-1 and 4-2. Existing land uses on these parcels include a large warehouse-style retail establishment (Office Depot) and associated parking lot, multiple other retail establishments and restaurants, and a large parking lot at the corner of 1st Street and Central Avenue. Only the Office Depot, Starbucks, and Senor Fish businesses would need to be removed. All other businesses on the block would remain.

Ten street parking spaces would also need to be removed to accommodate the new three-way junction, which could potentially shift parking demand to nearby streets.

Construction of the portal and at-grade facilities across the parcels bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue would require the taking of multiple retail establishments for both development of the alignment and construction staging. As required by law, affected land and business owners would be compensated for this taking with a fair market value for their land and establishments.

These commercial land uses serve adjacent residential developments and commercial developments in the neighborhood, but other existing commercial businesses in the neighborhood and available commercial space are expected to offset this loss. Permanent conversion of the Office Depot parcel to public use would be needed to accommodate the

portal. Portions of the parcels taken to support construction staging but not utilized as a part of the final alignment for operation could potentially be redeveloped after construction is completed. The tunnel portal would be considered a change in land use type, but would not conflict with adjacent land uses given the urbanized nature of the project area.

Construction of this section of the alignment would require the temporary closure of 2nd Street from Alameda Street to Central Avenue. Here, the street would be excavated in order to insert TBMs. The tunnel portal and Alameda Street underpass would be constructed using methods similar to cut-and-cover techniques.

Construction could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment. The remainder of the tunnel alignment in Little Tokyo would be constructed using the TBM method, which would cause few noticeable surface impacts. Alternatively, TBMs could be inserted at the 2nd/Hope Street station site, thus reducing construction-related impacts on 2nd Street between Alameda Street and Central Avenue.

5.4.2. Potential Land Use Conflict Conclusions

Potential land use conflicts generated by construction and operation of the Underground Emphasis LRT Alternative would be less than significant. As indicated by the noise analysis, there would be no significant noise impact associated with this alternative at the Savoy residential property near 1st and Alameda.

The alternative would not introduce new land uses that are inconsistent with existing land uses. Construction of the tunnel portal on the parcels between the corner of 1st and Alameda Streets and the corner of 2nd Street and Central Avenue would result in a few partial and full takings. Not all of the block would be acquired. With just compensation to affected landowners and business owners, the direct effect of development of the portal on land use would be less than significant. The indirect effect of these land use conversions would be less than significant given the presence of other similar commercial establishments in and around the neighborhood, and the availability of local commercial real estate for these establishments to potentially relocate.

Construction of the alternative could generate temporary pedestrian and vehicle detours that inhibit, but not prevent, access to existing land uses along the alignment. The Transportation Technical Memorandum traffic section analyzes this potential effect on circulation in the project area and concludes it would be a less than significant effect on land use.

5.4.3 Policy Consistency

The Underground Emphasis LRT Alternative is proposed within the Central City Community Plan area and would be subject to numerous plans and development regulations. The

Underground Emphasis LRT Alternative is consistent with the stated General Plan goal of focusing growth toward existing high density areas, including downtown Los Angeles, by enhancing Los Angeles County's rail system. It is also consistent with the Transportation Element's support of high-capacity transit service between Union Station and the Metro Blue Line.

The Central City Community Plan encourages high-density, transit-oriented land uses and recommends improvements to transit connections through downtown from the 7th Street/Metro Center Station to Union Station to address pass-through traffic congestion. The Civic Center Shared Facilities and Enhancement Plan and the Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Area identified goals of improving transit connectivity between other existing and planned Metro Rail lines and the value of better linkages between Union Station and downtown. Additionally, the redevelopment projects along the proposed alignment stress density and pedestrian activity, both of which would be encouraged by the addition of new rail service to the area.

The density and parking bonuses created by the City to encourage growth would also be supportive of new transit service by expanding the base of potential riders while adding less parking than would normally be required. Because these bonuses are contingent upon proximity to transit stations, the Underground Emphasis LRT Alternative would make more parcels eligible by adding new stations to the area. Transit service improvements complement relaxed parking requirements by providing alternative means of access.

The Underground Emphasis LRT Alternative is not inconsistent with the goals and policies of local land use plans, policies, and regulations. The alternative would result in the conversion of existing land uses at the new tunnel portal on parcels between the corner of 1st and Alameda Streets and the corner of 2nd Street and Central Avenue.

Some of the parcels will be utilized for construction staging and could potentially, after completion of the alignment, be redeveloped with the same land use types as the establishments being displaced. Land uses permanently converted during the development of the alignment could be offset by the abundance of underutilized similar land uses in the neighborhood adjacent to the tunnel portal and throughout the project area.

Implementation of the Underground Emphasis LRT Alternative has the potential to generate land use benefits by supporting high-density, transit-oriented development as identified in the goals and policies of multiple local land use plans, policies, and regulations. These benefits could occur by improved transit connections through downtown and increased accessibility for local residents to the Metro service area. As a result, land use impacts associated with this alternative would be less than significant.

5.4.4 Cumulative Impacts

Implementation of the Underground Emphasis LRT Alternative would not contribute to any adverse cumulative land use effects within the project area. The alternative would not create any new land uses that could, in combination with any current and reasonably foreseeable related actions, generate conflicts with land uses adjacent to the alignment, or result in inconsistency or conflict with local land use plans, policies, and regulations.

Some land uses would be converted, but not in ways that are inconsistent with current land use plans or incompatible with the surrounding areas. Future developments on these parcels could also integrate with nearby rail stations to encourage transit supportive land uses, community growth, and increased transit ridership. Therefore, the alternative's contribution to cumulative land use impacts would be less than significant.

It is anticipated that the Underground Emphasis LRT Alternative and other transit projects currently underway or planned in the future would support increases in transit ridership, which would be a beneficial effect. The alignment passes near several potential development sites, and plans for these sites include high-density employment and residential facilities. The Underground Emphasis LRT Alternative—combined with other projects—could also support increases in residential development within the project area, which would also be a beneficial effect.

There are numerous commercial and residential developments planned and underway in the vicinity of the Underground Emphasis LRT Alternative alignment, many of which are being built on sites currently occupied by surface parking lots. The new transit service would help to offset the impacts of these land use changes by providing alternatives to driving to access these sites.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Fully Underground LRT Alternative – Little Tokyo Variation 1 would provide a connection between the underground 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets with an all-underground alignment. West of Central Avenue, the alternative would be identical to the Underground Emphasis LRT Alternative – 2nd Street station - Broadway Option (The 2nd Street Station - Los Angeles Street option is not included in Fully Underground LRT Alternative – Little Tokyo Variation 1). The alignment and station locations of Fully Underground LRT Alternative - Little Tokyo Variation 1 are shown in Figure 4-1.

5.5.1 Potential Land Use Conflicts

As shown in Figure 4-1, Fully Underground LRT Alternative – Little Tokyo Variation 1 would develop a twin tunnel underground alignment from 7th Street/Metro Center Station to two new tunnel portals: one northeast of the intersection of Temple and Alameda Streets, and one on 1st Street between Alameda and Garey Streets. The route differs from the Underground

Emphasis LRT Alternative at 1st and Alameda Streets, where a junction would be built underground instead of at grade. An additional underground station on the block bounded by 2nd Street, Central Avenue, 1st Street, and Alameda Street would also be added with Fully Underground LRT Alternative – Little Tokyo Variation 1.

The General Plan land use designations of the parcels adjacent to the underground sections of this alternative's proposed route include public facilities, open space, industrial manufacturing, and commercial. The zoning designations shown in Figure 4-2 for the underground sections of the alternative include public facilities, industrial manufacturing, commercial, and residential.

5.5.1.1 General Potential Construction Effects

The tunnels beneath Flower Street would be constructed using the cut-and-cover method, where excavation would occur beneath a temporary roadway deck. The bulk of surface impacts would be limited to the beginning and end of the tunneling process, when temporary roadway and decking removal would be necessary. All stations would be constructed using this method except possibly the 2nd/Hope Street station, which may be constructed using the Sequential Excavation Method (mining).

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 1 would generally be the same as the Underground Emphasis LRT Alternative, with the following exceptions. The 2nd/Central Avenue Station, due to its off-street location, would be constructed using the open-cut method, which is similar to cut-and-cover, but does not include the temporary roadway deck.

The junction beneath the intersection of 1st and Alameda Streets, as well as the tunnels beneath 1st and Temple Streets, would be constructed using the cut-and-cover method. The tunnel on the Nikkei parcel northeast of 1st and Alameda Streets, as well as the portal near Temple and Alameda Streets, would be constructed using the open-cut method. The portal in the median of 1st Street would be constructed using either the open-cut or cut-and-cover method.

5.5.1.2 Financial District

The effects and alignment of Fully Underground LRT Alternative – Little Tokyo Variation 1 in the Financial District would be identical to those for the Underground Emphasis LRT Alternative.

5.5.1.3 Bunker Hill

The effects and alignment of Fully Underground LRT Alternative – Little Tokyo Variation 1 in the Bunker Hill area would be identical to those for the Underground Emphasis LRT Alternative.

5.5.1.4 Historic Core

The effects and alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 1 in the Historic Core area would be identical to those for the Underground Emphasis LRT Alternative with the 2nd Street station - Broadway Station Option. The 2nd Street station - Los Angeles Street Station Option is not part of Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.1.5 Little Tokyo and Arts District

From the Historic Core, the alignment tunnels would continue east under 2nd Street into Little Tokyo. Upon reaching Central Avenue, the alignment tunnels would curve to the northeast, with tracks arriving at a new underground station located beneath the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. The alignment would then continue into a new underground junction beneath the intersection of 1st and Alameda Streets. The alignment would then split and trains would rise to the surface through one of two portals:

1. A portal northeast of Temple and Alameda Streets connecting to the existing LRT bridge over US 101, which would allow trains to continue along the Metro Gold Line tracks to Azusa via Pasadena

2. A portal in the median of 1st Street between Alameda and Garey Streets, which would connect to the existing Metro Gold Line tracks heading east over the 1st Street Bridge.

A small structure on the southwest corner of 1st and Alameda Streets may need to be constructed to house station ventilation equipment. However, this structure could potentially be incorporated into a future development and would not be large enough to disrupt the surrounding land uses.

The existing land uses where the 2nd/Central Avenue station would be located include a large warehouse-style retail establishment (Office Depot) and associated parking lot, multiple other retail establishments and restaurants, and a large parking lot at the corner of 1st Street and Central Avenue. Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities, and could potentially utilize the site for launching tunnel boring machines and transporting material from the tunnels.

Metro intends to maintain some of the existing business acquired on Central Avenue between 1st and 2nd Streets that are not directly impacted by construction activities. Acquisition of the entire block would represent a worst-case scenario. Potential reductions in acquisition may occur based on further engineering analysis during the preliminary engineering and final design stages. Because these acquisitions are primarily for construction staging purposes, some of the displaced land uses may potentially be returned after construction is finished.

This alternative would not necessarily cause permanent conversion of all of the land uses on this block.

Construction of the portal on 1st Street would require a portion of the vacant Nikkei parcel, located on the northeast corner of the intersection, to be acquired for street widening. Construction of the portal near Temple and Alameda Streets would require part of the Department of Water and Power facility located east of and adjacent to Alameda Street between Temple and Commercial Streets. However, these acquisitions would not affect enough of either parcel to alter or diminish the quality of the current and planned land uses. Sidewalks in the area may be narrowed slightly, but not enough to affect pedestrian access to any of the surrounding parcels.

As required by law and discussed in the Displacement and Relocation Technical Memorandum, affected land and business owners would be compensated for this taking with a fair market value for their land and establishments. These commercial land uses serve adjacent residential developments and commercial developments in the neighborhood, but other existing commercial businesses in the neighborhood and available commercial space are expected to offset this loss.

Permanent conversion of the Office Depot parcel to public transit use would be needed to accommodate the new 2nd/Central Avenue station. Portions of the parcels taken to support construction staging but not utilized as a part of the final alignment for operation could potentially be redeveloped after completion of construction. The tunnel portals and underground stations would be considered a change in land use type, but would not conflict with adjacent land uses given the urbanized nature of the project area.

Construction of this section of the alignment would require temporary closure of 2nd Street from Alameda Street to Central Avenue, where the street would be excavated to insert TBMs. The rail junction beneath Alameda Street would be constructed using the cut-and-cover method. The tunnel crossing beneath Temple Street just east of Alameda Street would also be constructed using the cut-and-cover method.

These construction actions could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment. The tunnel alignment beneath the Nikkei parcel would be constructed using the open-cut method because it is in an off-street location where a temporary deck is not needed to maintain street traffic flow. The remainder of the tunnel alignment in Little Tokyo would be constructed using the TBM method, which would cause few noticeable surface impacts. Alternatively, the TBMs could be inserted at the 2nd/Hope Street station site, thus reducing construction-related impacts on 2nd Street between Alameda Street and Central Avenue.

5.5.2. Potential Land Use Conflict Conclusions

Potential land use conflicts generated by construction and operation of Fully Underground LRT Alternative – Little Tokyo Variation 1 are expected to be less than significant. As indicated by the noise analysis, there would be no noticeable noise impact associated with this alternative at the Savoy residential property near 1st and Alameda. The alternative would not introduce new land uses that are inconsistent with existing land uses.

Attempts will be made to reduce the number of acquisitions. The entire block between the intersections of 1st Street, Alameda Street, 2nd Street, and Central Avenue would be acquired, though Metro intends to maintain some of the existing business acquired on Central Avenue between 1st and 2nd Streets. Portions of the Nikkei and Department of Water and Power sites would need to be acquired to accommodate new portals and tunnels.

With just compensation to affected landowners and business owners, the direct effect of development of the new portals and stations on land use would be less than significant. The indirect effect of these land use conversions would also be less than significant given the presence of other similar commercial establishments in and around the neighborhood and the availability of local commercial real estate for these establishments to potentially relocate.

Land use conversion may not be permanent because portions of the acquired land would be available for development after underground construction is complete, and existing land uses could potentially be restored. Construction of Fully Underground LRT Alternative – Little Tokyo Variation 1could generate temporary pedestrian and vehicle detours that inhibit, but not prevent, access to existing land uses along the alignment. The Transportation Technical Memorandum traffic section analyzes this potential effect on circulation in the project area and concludes it would be a less than significant effect on land use.

The portal in the widened median of 1st Street would be near several parcels with sensitive land uses, including multi-unit residential buildings and the Nishi Hongwanji Buddhist Temple. However, there are already at-grade light rail tracks in the median of 1st Street, and reconfiguration of these tracks into a portal would not introduce any new inconsistency or incompatibility with the surrounding land uses.

5.5.3 Policy Consistency

The Fully Underground LRT Alternative – Little Tokyo Variation 1 is proposed within the Central City Community Plan area and the Central City North Community Plan Area, and would be subject to numerous plans and development regulations. This alternative is consistent with the stated General Plan goal of focusing growth toward existing high density areas, including downtown Los Angeles, by enhancing Los Angeles County's rail system.

Fully Underground LRT Alternative – Little Tokyo Variation 1 is also consistent with the Transportation Element's support of high-capacity transit service between Union Station and the Metro Blue Line. The Central City Community Plan encourages high-density, transit-oriented land uses and recommends improvements to transit connections through downtown from the 7th Street/Metro Center Station to Union Station to address pass-through traffic congestion.

The Civic Center Shared Facilities and Enhancement Plan and Feasibility Study for the Resurrection of the Red Car Trolley Services in the Los Angeles Area identified goals of improving transit connectivity between other existing and planned Metro Rail lines and the value of better linkages between Union Station and downtown. Additionally, the redevelopment projects along the proposed alignment stress density and pedestrian activity, both of which would be encouraged by the addition of new rail service to the area.

The density and parking bonuses created by the City to encourage growth would also be supportive of new transit service by expanding the base of potential riders while adding less parking than would normally be required. Because these bonuses are contingent upon proximity to transit stations, Fully Underground LRT Alternative – Little Tokyo Variation 1 would make more parcels eligible by adding new stations to the area. Transit service improvements complement relaxed parking requirements by providing alternate means of access.

Fully Underground LRT Alternative – Little Tokyo Variation 1 is not inconsistent with goals and policies of local land use plans, policies, and regulations. The alternative would convert existing land uses at the new underground station on the parcels between the corner of 1st and Alameda Streets and the corner of 2nd Street and Central Avenue, as well as the new portals and tunnels on and around the Nikkei site and the Department of Water and Power facility. Some of the parcels will be utilized for construction staging and could potentially, after completion of the alignment, be redeveloped with the same land use types as the establishments being displaced.

Land uses permanently converted during construction of the alignment could be offset by the abundance of underutilized similar land uses in the neighborhood adjacent to the tunnel portal and throughout the project area. In addition, implementing this alternative has the potential to generate land use benefits by supporting high-density, transit-oriented development as identified in goals and policies of multiple local land use plans, policies, and regulations. These benefits would occur by improved transit connections through downtown and increased accessibility for local residents to the Metro service area.

The 2nd/Central Avenue station would be located across from the proposed Nikkei development, a multi-story project that will potentially include retail stores, offices, community services, and residential units. The collocation of the station and the Nikkei

development around the intersection of 1st and Alameda Streets creates the potential for a transit-oriented development that would enhance pedestrian activity in the neighborhood and foster transit ridership. This effect is strengthened by the possibility of placing a station entrance on the Nikkei property.

The 2nd/Central Avenue station would also enhance the connection between both sides of Alameda Street, where the wide roadway and heavy traffic currently impedes pedestrian connectivity. This is consistent with the goals of the Little Tokyo Redevelopment Plan, the Central City Community Plan, and the Central City North Community Plan, all of which encourage greater transit and pedestrian use of the neighborhood, as well as economic growth.

The 2nd/Central Avenue station would also support the Community Redevelopment Agency (goal of increasing pedestrian use of Alameda Street, which was expressed during the project scoping period. Given the above, this alternative would not result in a significant effect to land uses.

5.5.4 Cumulative Impacts

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not contribute to any adverse cumulative land use effects within the project area. The alternative would not create any new land uses that could, in combination with any current and reasonably foreseeable related actions, generate conflicts with land uses adjacent to the alignment, or result in inconsistency or conflict with local land use plans, policies, and regulations.

Some land uses would be converted, but not in ways that are inconsistent with current land use plans or incompatible with the surrounding areas. Future developments on these parcels could also integrate with nearby rail stations to encourage transit supportive land uses, transit-oriented development, community growth, and increased transit ridership. Therefore, the alternative's contribution to cumulative land use impacts would be less than significant.

It is anticipated that the Fully Underground LRT Alternative – Little Tokyo Variation 1 and other transit projects currently underway or planned in the future would support increases in transit ridership, which is considered a beneficial effect. The alignment passes near several potential development sites, and plans for these sites include high-density employment and residential facilities. The Fully Underground LRT Alternative – Little Tokyo Variation 1—combined with other projects—could also support increases in residential development within the project area, which would also be a beneficial effect.

There are numerous commercial and residential developments planned and underway in the vicinity of the Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment, many of which are being built on sites currently occupied by surface parking lots. The new transit

service would help offset the impacts of these land use changes by providing alternatives to driving to access these sites.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would provide a connection between the underground 7th Street/Metro Center Station and the Metro Gold Line at 1st and Alameda Streets with an all-underground alignment. West of Central Avenue, this alternative would be identical to the Underground Emphasis LRT Alternative 2nd Street station – Broadway Station Option (The 2nd Street Station - Los Angeles Option is not included in the Fully Underground LRT Alternative – Little Tokyo Variation 2). The alignment and station locations of the Fully Underground LRT Alternative – Little Tokyo Variation 2 are shown in Figure 4-1.

5.6.1 Potential Land Use Conflicts

As indicated in Figure 4-1, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would develop a twin tunnel underground alignment from 7th Street/Metro Center Station to three new tunnel portals: one double-track portal northeast of the intersection of Temple and Alameda Streets, and two narrower single-track portals on 1st Street between Alameda and Vignes Streets.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment differs from the Underground Emphasis LRT Alternative at 1st and Alameda Streets, where a two-level junction would be built entirely underground instead of a single-level junction at-grade. An additional two-level underground station on the block bounded by 2nd Street, Central Avenue, 1st Street, and Alameda Street would also be added.

The General Plan land use designations of the parcels adjacent to the underground sections of Fully Underground LRT Alternative – Little Tokyo Variation 2 proposed route include public facilities, open space, industrial manufacturing, and commercial. The zoning designations shown in Figure 4-2 for the underground sections of the alternative include public facilities, industrial manufacturing, commercial, and residential.

5.6.1.1 General Potential Construction Effects

The tunnels beneath Flower Street would be constructed using the cut-and-cover method, where excavation would occur beneath a temporary roadway deck. The bulk of surface impacts would be limited to the beginning and end of the tunneling process, when temporary roadway and decking removal would be necessary.

All stations would be constructed using the cut-and-cover method except possibly the 2nd/Hope Street station, which may be constructed using the Sequential Excavation Method (mining). Construction of this alternative would generally be the same as the Underground

Emphasis LRT Alternative, with the following exceptions. The two-level underground 2nd Street/Central Avenue station, due to its off-street location, would be constructed using the open-cut method, which is similar to cut-and-cover but does not include the temporary roadway deck.

The two-level junction beneath the intersection of 1st and Alameda Streets, as well as the tunnels beneath 1st and Temple Streets, would be constructed using the cut-and-cover method. The tunnel on the parcel northeast of 1st and Alameda Streets, as well as the portal near Temple and Alameda Streets, would be constructed using the open-cut method. The two single-track portals in the median of 1st Street would be constructed using either the open-cut or cut-and-cover method.

5.6.1.2 Financial District

Effects and alignment of Fully Underground LRT Alternative – Little Tokyo Variation 2 in the Financial District would be identical to those for the Underground Emphasis LRT Alternative.

5.6.1.3 Bunker Hill

Effects and alignment of Fully Underground LRT Alternative – Little Tokyo Variation 2 in the Bunker Hill area would be identical to those for the Underground Emphasis LRT Alternative.

5.6.1.4 Historic Core

Effects and alignment of Fully Underground LRT Alternative – Little Tokyo Variation 2 in the Historic Core area would be identical to those for the Underground Emphasis LRT Alternative with the Broadway Station Option selected. The Los Angeles Street Station Option is not part of the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.1.5 Little Tokyo and Arts District

From the Historic Core, the alignment tunnels would continue east under 2nd Street into Little Tokyo. Upon reaching Central Avenue, the alignment tunnels would curve, with tracks arriving at a new station to the northeast into the parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. The tracks would then enter a new two-level 2nd/Central Avenue underground station located beneath this parcel. The alignment would then continue into a new two-level underground junction beneath the intersection of 1st and Alameda Streets. The alignment would then split and trains would rise to the surface through one of three portals:

1. A double-track portal northeast of Temple and Alameda Streets connecting to the existing LRT bridge over US 101 to allow trains to continue along the Metro Gold Line tracks to Azusa via Pasadena

2. Narrower single-track portals in the median of 1st Street between Alameda and Vignes Streets connecting to the existing Metro Gold Line tracks heading east over the 1st Street Bridge toward I-605 via East Los Angeles

A small structure on the southwest corner of 1st and Alameda Streets intersection may need to be constructed for station ventilation equipment. However, this structure could potentially be incorporated into a future development and would not be large enough to disrupt the surrounding land uses.

Figures 4-1 and 4-2 show commercial land use and zoning designations for the parcels where the 2nd/Central Avenue station would be located. Existing land uses on these parcels include a large warehouse-style retail establishment (Office Depot) and associated parking lot, multiple other retail establishments and restaurants, and a large parking lot at the corner of 1st Street and Central Avenue.

Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities, and may potentially utilize the site for launching tunnel boring machines and transporting material from the tunnels. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd that are not directly impacted by construction activities. Acquiring the entire block would represent a worst-case scenario.

Potential reductions in acquisition may occur based on further engineering analysis during preliminary engineering and final design stages. Some of the displaced land uses may potentially be returned after construction is finished because they would be primarily for construction staging purposes. Thus, this alternative would not necessarily cause permanent conversion of all of the land uses on this block.

Construction of the portal on 1st Street would require a portion of the vacant Nikkei parcel located on the northeast corner of the intersection to be acquired for street widening. Construction of the portal near Temple and Alameda Streets would require a partial take of the Department of Water and Power facility located east of Alameda Street between Temple and Commercial Streets. However, these acquisitions would not affect either parcel enough to alter or diminish the quality of the current and planned land uses. Sidewalks in the area may be narrowed slightly, but not enough to affect pedestrian access to any of the surrounding parcels.

As required by law and discussed in the Displacement and Relocation Technical Memorandum, affected land and business owners would be compensated for this taking with a fair market value for their land and establishments. These commercial land uses serve adjacent residential developments and commercial developments in the neighborhood, but

other existing commercial businesses and available local commercial space are expected to offset this loss.

Permanent conversion of the Office Depot parcel to public transit use would be needed to accommodate the new 2nd/Central Avenue station. Portions of the parcels taken to support construction staging, but not utilized as a part of the final alignment for operation, could potentially be redeveloped after construction is completed. The tunnel portals and underground stations would be considered a change in land use type, but would not conflict with adjacent land uses given the urbanized nature of the project area. Therefore, land use impacts with respect to this alternative would be less than significant.

Construction of this section of the alignment would require temporary closure of 2nd Street from Alameda Street to Central Avenue, where the street would be excavated to insert TBMs. The rail junction beneath Alameda Street would be constructed using the cut-and-cover method. The tunnel crossing beneath Temple Street just east of Alameda Street would also be constructed using the cut-and-cover method. This construction could generate temporary pedestrian and vehicle detours that may inhibit, but not prevent, access to existing land uses along this section of the alignment.

Tunnel alignment beneath the Nikkei parcel would be constructed using the open-cut method because it is in an off-street location where a temporary deck is not needed to maintain street traffic flow. The remainder of the tunnel alignment in Little Tokyo would be constructed using the TBM method, which would cause few noticeable surface impacts. Alternately, the TBMs could be inserted at the proposed 2nd/Hope Street station site, thus reducing construction-related impacts on 2nd Street between Alameda Street and Central Avenue.

5.6.2. Potential Land Use Conflict Conclusions

Potential land use conflicts generated by construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less than significant. As indicated by the noise analysis, there would be no noticeable noise impact associated with this alternative at the Savoy residential property near 1st and Alameda.

This alternative would not introduce new land uses that are inconsistent with existing land uses. Attempts would be made to reduce the number of acquisitions during design stages of the project.

The entire block between the intersections of 1st and Alameda and 2nd and Central Avenue could be acquired, though not all businesses would be displaced. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd that are not directly impacted by construction activities. Acquisition of the entire block would represent a worst-case scenario.

Portions of the Nikkei and Department of Water and Power sites would need to be acquired to accommodate new portals and tunnels. With just compensation to affected landowners and business owners, the direct effect of developing new portals and stations on land use would be less than significant.

The indirect effect of these land use conversions would also be less than significant given the presence of other similar commercial establishments in and around the neighborhood and the availability of local commercial real estate for these establishments to potentially relocate. Land use conversion may not be permanent because portions of the acquired land would be available for development after underground construction is complete, and existing land uses could potentially be restored.

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 2 could generate temporary pedestrian and vehicle detours that inhibit, but not prevent, access to existing land uses along the alignment. The Transportation Technical Memorandum traffic section analyzes this potential effect on circulation in the project area and concludes it would be a less than significant effect on land use.

The portal in the widened median of 1st Street would be near several parcels with sensitive land uses, including multi-unit residential buildings and the Nishi Hongwanji Buddhist Temple. However, there are already at-grade light rail tracks in the median of 1st Street, and reconfiguration of these tracks into a portal would not introduce any inconsistency or incompatibility with the surrounding land uses.

Portions of two privately owned parcels on the south side of 1st Street between Hewitt and Garey Streets would need to be acquired to accommodate roadway relocation. These parcels are developed, but the area to be acquired is currently used for parking or vacant space. Therefore, no significant land use change or incompatibility would occur.

5.6.3 Policy Consistency

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is proposed within the Central City Community Plan area and Central City North Community Plan Area, and would be subject to numerous plans and development regulations. This alternative is consistent with the stated General Plan goal of focusing growth toward existing high density areas, including downtown Los Angeles, by enhancing Los Angeles County's rail system. It is also consistent with the Transportation Element's support of high-capacity transit service between Union Station and the Metro Blue Line.

The Central City Community Plan encourages high-density, transit-oriented land uses and recommends improvements to transit connections through downtown from the 7th Street/Metro Center Station to Union Station to address pass-through traffic congestion. The Civic Center Shared Facilities and Enhancement Plan and Feasibility Study for the

Resurrection of the Red Car Trolley Services in the Los Angeles Area identified goals of improving transit connectivity between other existing and planned Metro Rail lines and the value of better linkages between Union Station and downtown. Additionally, the redevelopment projects along the proposed alignment stress density and pedestrian activity, both of which would be encouraged by the addition of new rail service to the area.

The density and parking bonuses created by the City to encourage growth would also be supportive of new transit service by expanding the base of potential riders while adding less parking than would normally be required. Because these bonuses are contingent upon proximity to transit stations, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would make more parcels eligible by adding new stations to the area. Transit service improvements complement relaxed parking requirements by providing alternative means of access.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is not inconsistent with the goals and policies of local land use plans, policies, and regulations. This alternative would convert existing land uses at the new underground station on the parcels between the corner of 1st and Alameda Streets and the corner of 2nd Street and Central Avenue, as well as the new portals and tunnels on and around the Nikkei site and the Department of Water and Power facility.

Some of the parcels will be utilized for construction staging and could potentially, after completion of the alignment, be redeveloped with the same land use types as the establishments being displaced. Land uses permanently converted during the development of the alignment could be offset by the abundance of underutilized similar land uses in the neighborhood adjacent to the tunnel portal and throughout the project area.

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 has the potential to generate beneficial land use impacts by supporting the high-density, transit-oriented development identified in the goals and policies of multiple local land use plans, policies, and regulations. These benefits would occur by improved transit connections through downtown and increased accessibility for local residents to the Metro service area.

The 2nd/Central Avenue station would be located across from the proposed Nikkei development, a multi-story project that will potentially include retail stores, offices, community services, and residential units. The collocation of the station and the Nikkei development around the intersection of 1st and Alameda Streets creates the potential for a transit-oriented development that would enhance pedestrian activity in the neighborhood and foster transit ridership. This effect is strengthened by the possibility of placing a station entrance on the Nikkei property. This would enhance the connection between both sides of Alameda Street, where the wide roadway and heavy traffic currently impede pedestrian activity.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is consistent with the goals of the Little Tokyo Redevelopment Plan, the Central City Community Plan, and the Central City North Community Plan, all of which encourage greater transit and pedestrian use of the neighborhood, as well as economic growth. This alternative is also consistent with the CRA goal expressed during scoping to increase pedestrian use of Alameda Street.

5.6.4 Cumulative Impacts

Implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not contribute to any adverse cumulative land use effects within the project area. This alternative would not create any new land uses that could, in combination with any current and reasonably foreseeable related actions, generate conflicts with land uses adjacent to the alignment, or result in inconsistency or conflict with local land use plans, policies, and regulations.

Some land uses would be converted, but not in ways that are inconsistent with current land use plans or incompatible with the surrounding areas. Future developments on these parcels could also integrate with nearby rail stations to encourage transit-supportive land uses, transit-oriented development, community growth, and increased transit ridership. Therefore, the alternative's contribution to cumulative land use impacts would be less than significant.

It is anticipated that the Fully Underground LRT Alternative – Little Tokyo Variation 2 and other transit projects currently underway or planned in the future would support increases in transit ridership, which is considered a beneficial effect. The alignment passes near several potential development sites, and plans for these sites include high-density employment and residential facilities.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 combined with other projects could also support increases in residential development within the project area, which would also be a beneficial effect.

There are numerous commercial and residential developments planned and underway in the vicinity of the Fully Underground LRT Alternative – Little Tokyo Variation 2, many of which are being built on sites currently occupied by surface parking lots. The new transit service would help offset the impacts of these land use changes by providing alternatives to driving to access these sites.

6.0 POTENTIAL MITIGATION MEASURES

No significant land use impacts in the project vicinity would occur from implementing any of the six Regional Connector Transit Corridor project alternatives. As such, mitigation measures are not required.

The only mitigation available for the adverse land use impacts associated with the No Build and TSM alternatives is construction of one of the build alternatives.

Any property acquired during the course of the Regional Connector Transit Corridor project that is retained after completion of construction would be developed in accordance with Metro's joint development program and consistent with community input.

7.0 CONCLUSIONS

7.1 No Build Alternative

There would be no potential adverse impacts to land use in the project area from the No Build Alternative.

7.2 TSM Alternative

There would be no potential adverse impacts to land use in the project area from the TSM Alternative.

7.3 At-Grade Emphasis LRT Alternative

There would be no potential adverse impacts to land use in the project area from the At-Grade Emphasis LRT Alternative.

7.4 Underground Emphasis LRT Alternative

There would be no potential adverse impacts to land use in the project area from the Underground Emphasis LRT Alternative.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

There would be no potential adverse impacts to land use in the project area from the Fully Underground LRT Alternative – Little Tokyo Variation 1.

7.4 Fully Underground LRT Alternative – Little Tokyo Variation 2

There would be no potential adverse impacts to land use in the project area from the Fully Underground LRT Alternative – Little Tokyo Variation 2.

1.0 SUMMARY

The project area surrounding the potential Regional Connector alternatives is essentially built-out. Therefore, there is a possibility that displacement as a result of the construction and operation of the proposed project would occur. Displacement could result from temporary or permanent easements, partial takes, and full takes.

Displacement of a business or residence is regulated at the federal level (Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970) and state level (California Relocation Act). These regulations guide how fair compensation and relocation assistance is applied to displacements.

The alternatives under consideration for the Regional Connector include the No Build Alternative, the Transportation Systems Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground Alternative – Little Tokyo Variation 1, and the Fully Underground Alternative – Little Tokyo Variation 2.

The No Build Alternative would include the transit investments already planned as described in the Metro 2009 Long-Range Transportation Plan. The No Build Alternative would not result in direct or indirect displacement of housing, people, or employment. Furthermore, the No Build Alternative would not have cumulatively adverse impacts.

The TSM Alternative would include the same transit improvements as the No Build Alternative, but would also include two new shuttles to serve as a connection between Union Station and the existing 7th Street/Metro Center Station. The TSM Alternative would not result in direct or indirect displacement of housing, people, or employment, although approximately 24 curb parking spaces would need to be removed from 2nd Street between Hill Street and Central Avenue to accommodate new bus stops.

Construction and operation of the At-Grade Emphasis LRT Alternative is expected to require the partial take of 11 parcels. Additionally, temporary easements that would affect two parcels would be required.

Construction and operation of the At-Grade Emphasis LRT Alternative is expected to permanently displace approximately 51 on-street parking spaces, 29 on-street loading spaces, 77 off-street parking spaces in a pay-to-park lot, and 33 off-street spaces in a publicly operated lot. Mitigation measures have been identified for potential adverse impacts associated with access to businesses and bus stops.

After mitigation measures are implemented, impacts would not be considered significant adverse effects under the National Environmental Policy Act (NEPA) and would be less than significant under the California Environmental Quality Act (CEQA).

Construction and operation of the Underground Emphasis LRT Alternative is expected to displace 11 parcels that include 9 businesses, and require the partial take of ten parcels. Additionally, it is expected that temporary easements affecting eight parcels and permanent easements affecting four parcels would be required.

Construction and operation of the Underground Emphasis LRT Alternative would permanently displace approximately 148 to 281 off-street parking spaces in privately operated lots, depending which 2nd Street station option is selected (Broadway Option or the Los Angeles Street Option). This range includes 139 off-street parking spaces in privately operated lots in Little Tokyo that would be displaced. The Little Tokyo community has identified these parking spaces as important resources.

The Regional Connector as a transportation project enhances non-auto access to downtown, including Little Tokyo, and will help offset the cumulative loss of parking spaces. In addition, potential mitigation measures have been developed to offset potential impacts related to access to businesses and bus stops and loss of public parking in Little Tokyo. These potential mitigation measures may include replacement parking to address potential environmental justice issues. Once these mitigation measures have been implemented, impacts would not be considered significant adverse effects under NEPA and would be less-than-significant under CEQA.

Construction and operation of the Fully Underground Alternative – Little Tokyo Variation 1 would require up to five more full takes, possibly one less partial take, two more permanent underground easements, and three less temporary construction easements than the Underground Emphasis LRT Alternative.

Impacts of the Fully Underground Alternative – Little Tokyo Variation 1 would be similar to the Underground Emphasis LRT Alternative and the same mitigation measures would apply. Mitigation has been identified for the additional displacements. Impacts would not be considered significant adverse effects under NEPA and would be less than significant under CEQA.

Construction and operation of the Fully Underground Alternative – Little Tokyo Variation 2 would require the same number of full takes, permanent underground easements, and temporary construction easements as the Fully Underground Alternative – Little Tokyo Variation 1. The Fully Underground Alternative – Little Tokyo Variation 2 would have one to two additional partial takes. Impacts would be similar to the Fully Underground Alternative – Little Tokyo Variation 1 and the same mitigation measures would apply. Mitigation has been identified for the additional displacements. Impacts would not be considered significant adverse effects under NEPA and would be less than significant under CEQA.

2.0 INTRODUCTION

The Regional Connector Transit Corridor project maximizes the use of publicly owned rights-of-way. However, given that the project area is densely urbanized, displacement may occur for construction and operation of each of the proposed build alternatives. This technical memorandum addresses potential displacements - including temporary and permanent easements, partial takes, and full takes of real property - that would occur under each alternative. This impact analysis evaluates potential impacts to persons and businesses on private property within the project area.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

3.1.1 Federal

According to the Federal Transit Administration (FTA) NEPA guidelines, the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 as amended (Uniform Act) must be implemented if there are any displacements as a direct cause of the project. The Uniform Act mandates that certain relocation services and payments be made available to eligible residents, businesses, and nonprofit organizations displaced as a direct result of projects undertaken by a federal agency or with federal financial assistance. The Uniform Act provides for uniform and equitable treatment of persons displaced from their homes and businesses and establishes uniform and equitable land acquisition policies.

Owners of private property have federal constitutional guarantees that their property will not be taken or damaged for public use unless they first receive just compensation. Just compensation is measured by the "fair market value" of the property taken, where "fair market value" is considered to be the:

> "highest price on the date of valuation that would be agreed to by a seller, being willing to sell, but under no particular or urgent necessity for so doing, nor obliged to sell; and a buyer, being ready, willing and able to buy but under no particular necessity for so doing, each dealing with the other with the full knowledge of all the uses and purposes for which the property is reasonably adaptable and available." (Code of Civil Procedure Section 1263.320a)

Other than compliance with the Uniform Act, there are no specific thresholds under NEPA for displacement impacts.

3.1.2 State

The provisions of the California Relocation Act (California Act) apply in the absence of federal funds and/or involvement if a public entity undertakes a project and consequently must provide relocation assistance and benefits. The California Act, which is consistent with the intent and guidelines of the federal Uniform Act, seeks to (1) ensure consistent and fair treatment of owners of real property, (2) encourage and expedite acquisition by agreement to avoid litigation and relieve congestion in the courts, and (3) promote confidence in the public land acquisitions process. Similar to the federal regulations, owners of private property have state constitutional guarantees regarding property takes, damages, and just compensation.

3.2 Standards of Significance

According to the CEQA Guidelines, a project would have a significant impact if it would:

- Displace substantial numbers of existing housing units, particularly affordable housing units, necessitating the construction of replacement housing elsewhere; and/or
- Displace substantial numbers of people, necessitating construction of replacement housing elsewhere.

CEQA does not have specific thresholds for displacement impacts on employment. However, given the character of the project area, it is expected that the proposed project could impact businesses. Therefore, a similar threshold for employment displacement is used in this analysis as is used for population and housing.

3.3 Methodology

Conceptual engineering plans for the proposed alignment, station options, staging areas, and rights-of-way were reviewed to assess the types of potential displacement due to any of the project build alternatives. Site reconnaissance of the project area, particularly of the parcels that would potentially be taken fully or partially, was undertaken and existing businesses were documented. Appropriate scale satellite photography was used to determine parking space information and location of parcels. The California Assessor's Office parcel information was utilized in this analysis as well. The impact analyses contained in other technical memoranda including Cultural Resources and Economic and Fiscal Impacts were also reviewed.

4.0 AFFECTED ENVIRONMENT

For purposes of this evaluation of potential land acquisition impacts, the affected environment is limited to the areas within and directly adjacent to the proposed alternative alignments. Property acquisition may be phased over time, depending on project funding and schedule.

4.1 Typical Causes of Displacement

Table 4-1 shows typical causes of land acquisition and displacement that could potentially occur with a project. When an acquisition occurs, it typically results in either a full or partial take of a parcel.

A partial take would occur if only a portion of the entire parcel was required to accommodate the project. This would occur if, for example, a portion of a commercial parking lot fronting the alignment is required, but not the adjacent commercial building located away from the alignment.

Partial property takes may result from widening a street or intersection due to inadequate right-of-way widths, limited cross-sections, and vertical circulation needs adjacent to subway stations. Widening intersections is often required to add left-turn lanes that have been relocated by station platforms installed within a street median, adjacent to transit tracks. Street widening may be necessary when the existing horizontal alignment contains insufficient right-of-way. Vertical circulation is necessary near subway stations to bring passengers to the surface and additional land may be needed.

A full take could occur when the majority of the property is required for the horizontal alignment because of insufficient right-of-way or the need to construct storage or maintenance facilities. A full take could also result from a severe loss of access that reduces the useful operation (e.g., driveway access to a property is eliminated), though there are no instances where this occurs for any of the Regional Connector alternatives.

An easement is the right to use another person's land for a stated purpose. An easement can involve a general or specific portion of the property and can be either at the surface level or beneath the property. Easements can be temporary, during construction for example, or permanent. Temporary construction easements are utilized when there is a need to utilize a portion of a property for construction staging or equipment use. Permanent underground easements are utilized when tunneling for a subway and during its operation.

Using these criteria for the types of acquisitions that may be required for the proposed project (Table 4-1), a list of properties that could be affected was compiled for each alternative (listed in Section 5).

Table 4-1. Causes of Displacement		
Reason	**Type of Acquisition**	**Cause/Process**
Horizontal alignment	Full/Partial	Not enough right-of-way for construction and operation of alignment and stations
Vertical circulation above subway station	Partial	Additional area needed adjacent to subway station to bring passengers to surface
Street widening	Partial	At-grade trackway and stations
Illegal encroachment	Full	Unauthorized use of private property
Access to a businesses (driveway or road)	Full	Damages resulting from reduced or restricted access
Storage Yards	Full	Additional area required to perform maintenance, for ancillary Facilities, and TPSS sites
Widening of intersections	Partial	Additional area to maintain traffic volumes, turn lanes, or platforms
Tunneling easement	Easement	Subway travels off public right-of-way

4.2 Existing Land Uses

The current land uses adjacent to the proposed project alignments are presented in detail in the Land Use Technical Memorandum. Overall, the project area is characterized by a dense downtown urban environment.

Tall skyscrapers with offices and hotels dominate the western end of the project area; these include the City National Towers, Bonaventure Hotel, CitiGroup Tower, US Bank Tower, and the Standard Hotel.

Civic institutions dominate the central portion of the project area. These include City Hall, City Hall East, the California Department of Transportation District 7 Headquarters, Parker Center, and the new Los Angeles Police Department Building under construction.

Little Tokyo, located on the eastern portion of the project area, contains a mix of commercial, residential, civic, and light industrial mid- to low-scale development. Little Tokyo includes the Japanese Village Plaza, the Go For Broke Monument, and the Japanese American National Museum, which are of particular significance to the City of Los Angeles.

5.0 IMPACTS

5.1 No Build Alternative

Under the No Build Alternative, transit infrastructure investment would be limited to improvements planned for and funded in the 2009 Metro Long-Range Transportation Plan (LRTP). By 2035, the Metro Expo Line to Santa Monica, Metro Purple Line to Westwood, Metro Crenshaw Line, Metro Green Line to the South Bay and LAX, and Metro Gold Line to Azusa and the San Gabriel Valley will have opened, and a number of bus services will have been reorganized and expanded to provide connections with these new rail lines. The transit network within the project area will otherwise be largely the same as it is now.

5.1.1 Direct Impacts

Under the No Build Alternative, there would be no construction in the project area associated with transit infrastructure investments. As such, displacement of properties for transit infrastructure would not occur. Therefore, no direct adverse impacts associated with displacements and relocations are expected under the No Build Alternative.

5.1.2 Indirect Impacts

There would be no indirect impacts under the No Build Alternative.

5.1.3 Cumulative Impacts

There would be no cumulative impacts under the No Build Alternative.

5.2 Transportation Systems Management (TSM) Alternative

Under the TSM Alternative, transit infrastructure investment would occur, including but not limited to, two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours in future traffic conditions projected in the Transportation Technical Memorandum. The buses may also have traffic signal priority similar to the Metro Rapid system to help bus mobility in projected future traffic conditions, where the traffic signal control system grants longer green lights to oncoming transit vehicles.

Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. These new shuttles would also have associated structures (bus stops and signage). The same infrastructure investments that would occur under the No Build Alternative would occur under the TSM Alternative.

5.2.1 Direct Impacts

Under the TSM Alternative, the transit infrastructure investment (a new bus route and associated structures) would utilize the existing street and sidewalk networks and would not require the displacement or relocation of properties, residents, or employees. However, up to 24 on-street parking spaces would need to be removed to install new bus stops on 2nd Street between Hill Street and Central Avenue. This assumes that each of the six new bus stops on 2nd Street would be 90 feet in length and displace up to four curb parking spaces.

Transit projects tend to offset the impacts of decreased parking by providing alternatives to driving. In the case of the TSM Alternative, parking impacts would not be considered adverse or significant. However, the TSM Alternative would also be less effective in offsetting these impacts than the build alternatives because it provides poorer connections with the regional rail network.

5.2.2 Indirect Impacts

There would be no indirect impacts under the TSM Alternative.

5.2.3 Cumulative Impacts

Many of the development projects identified in the Cumulative Impacts Technical Memorandum are planned to be built on parcels currently occupied by surface parking lots. The City of Los Angeles typically requires that these displaced parking spaces be replaced at a one-to-one ratio, but they do not necessarily need to be open to the public.

Many of these developments will also qualify for reduced off-street parking quotas due to their proximity to transit facilities and their location in the downtown area. The TSM Alternative's permanent displacement of up to 24 on-street parking spaces (six to 12 in Little Tokyo, where the community has expressed concern over the potential loss of parking) would thus not result in a cumulative impact.

Surface parking lots in downtown Los Angeles are an important community resource because many of the older, historical businesses and civic buildings do not provide the amount of on-site, off-street parking required under current planning code, resulting in an overall parking deficit. The loss of publicly accessible surface parking in Little Tokyo and in other downtown Los Angeles areas due to the proposed project would not represent a cumulative loss.

Typically, transit projects themselves serve as mitigation for the loss of parking because they would remove vehicles on the road, thereby reducing the demand for parking.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would extend from the underground 7th Street/Metro Center Station in a cut-and-cover tunnel north under Flower Street. It resurfaces to at-grade

north of 4th Street, crosses 3rd Street at-grade, enters a cut-and-cover tunnel into the side of Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The alignment continues at-grade along 2nd Street and splits into a couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). The alignment then heads east on Temple Street, realigns into a dual-track configuration just east of Los Angeles Street, and connects to the Metro Gold Line tracks in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street.

Due to the high volume of trains that would traverse the Regional Connector Transit Corridor, an automobile underpass and potential pedestrian overpass would be constructed at Temple and Alameda Streets to eliminate potential pedestrian-train and automobile-train conflicts. To implement this alternative, the number of traffic lanes and on-street parking on portions of 2nd, Temple, Los Angeles, Flower, and Main Streets would be reduced.

5.3.1 Direct Impacts

To construct the At-Grade Emphasis LRT Alternative, 11 parcels would require partial takes. In addition, temporary easements required during construction would affect two parcels. These properties would be utilized for traction power substation (TPSS) site locations, construction staging, below-grade tunneling, and station locations.

Some station plans have multiple entrance options, though not all of them would be constructed. In these cases, all potential takings and easements for station entrances would be evaluated.

Table 5-1 lists the Assessor's Parcel Numbers (APNs), addresses, and the current and intended uses of the properties that could be impacted by displacement to construct the At-Grade Emphasis LRT Alternative. Table 5-1 also references the parcels' locations in Figure 5-1.

For all of the property acquisitions, relocation assistance to residential and business tenants and compensation to property owners would be provided by Metro as required by the Uniform Act and the California Act. The details of these laws regarding relocation assistance and compensation for property acquisitions are described in Sections 3.1.1 and 3.1.2.

Where acquisitions and relocations are unavoidable with the At-Grade Emphasis LRT Alternative, Metro would follow the provisions of the Uniform Act. Procedures that would be used would follow the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs adopted by the U.S. Department of Transportation (USDOT), dated February 3, 2005. Metro would apply acquisition and relocation policies to assure compliance with the Uniform Act.

All real property acquired by Metro would be appraised to determine its fair market value. Just compensation, which would not be less than the approved appraisal made to each property owner, would be offered by Metro. Each homeowner, renter, business, or nonprofit organization displaced as a result of the project would be given advanced written notice and informed of their eligibility for relocation assistance and payments.

Source: TAHA, 2010.

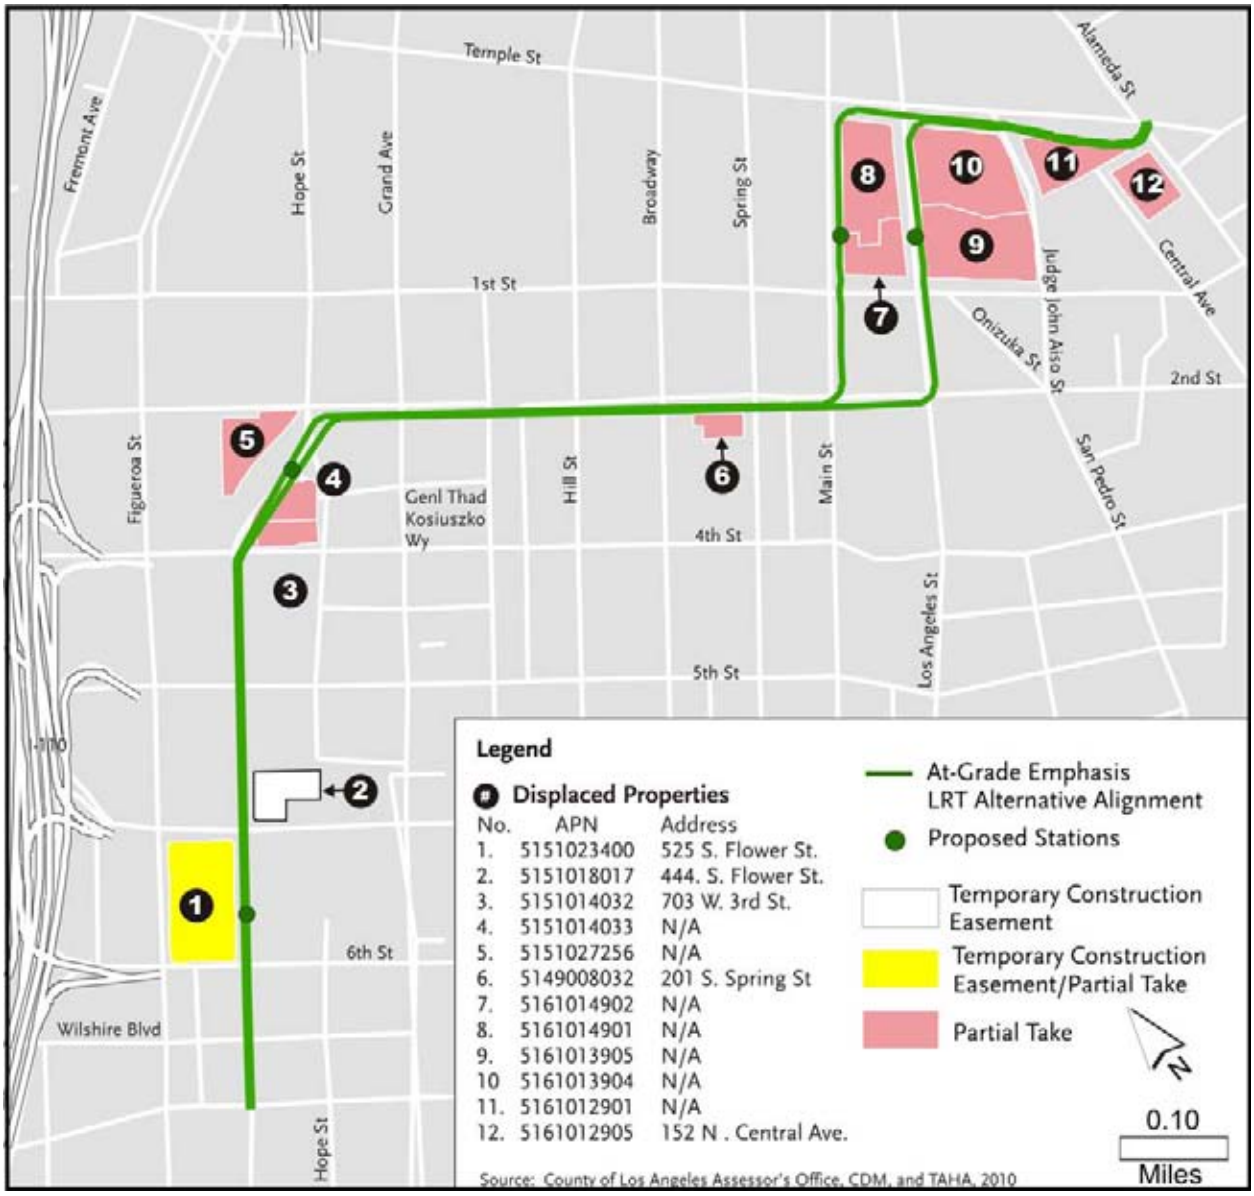

Figure 5-1. At-Grade Emphasis LRT Alternative Potential Displacement

5.3.1.1 Easements

Construction of the At-Grade Emphasis LRT Alternative would require temporary easements that would affect two parcels (Figure 5-1). The easements would include:

- APN 5151023400 (525 S. Flower Street; Figure 5-1 #1) – This parcel contains the City National Plaza and towers. Construction of the At-Grade Emphasis LRT Alternative is expected to utilize a portion of the Plaza for equipment and/or material staging and for construction of a proposed below-grade station. Part of the City National Plaza serves as a bus stop for various bus lines from several transit service providers. During construction, access to this bus stop would be maintained or relocated. In addition, part of the public sidewalk would be utilized as an entrance to the proposed below-grade station, but this would not encroach onto the private property. This easement would be temporary; however, potential adverse impacts could result if access to the bus stop is not maintained. Proposed mitigation measures in Section 6.3 have been developed to reduce this potential impact to a less than significant level.

- APN 5151018017 (444 S. Flower Street; Figure 5-1 #2) – This parcel contains the Citigroup Center, which includes the Citigroup Building and retail shops and restaurants. Construction of the At-Grade Emphasis LRT Alternative is expected to utilize the plaza at the northeast corner of the 5th Street/ Flower Street intersection for construction staging, which is only a portion of the site (. Several mature palm trees are located in the plaza. It is not expected that the palm trees would be removed during construction. Palm trees are not considered heritage trees and are not a protected species in the City of Los Angeles. This easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed. No significant adverse impacts associated with this easement are expected.

5.3.1.2 Partial Takes

There are 11 parcels which would be partially taken for the construction and operation of the At-Grade Emphasis LRT Alternative (Figure 5-1). These parcels would include:

- APN 5151023400 (525 S. Flower Street; Figure 5-1 #1) – This parcel contains the City National Plaza and towers. Construction of the At-Grade Emphasis LRT Alternative is expected to require a partial take for locating an entrance to a proposed below-grade station. Part of the City National Plaza serves as a bus stop for bus lines from several transit service providers. During construction, access to this bus stop would be maintained or relocated. Potential adverse impacts could result if access to the bus stop is not maintained. Proposed mitigation measures in Section 6.3 have been developed to reduce this potential impact to a less than significant level.

- APN 5151014032 (703 W. 3rd Street; Figure 5-1 #3) – This parcel contains the Central Plant, which is a heating and ventilation plant for some buildings in Bunker Hill. This parcel is located within the Bunker Hill Redevelopment Area as designated by the City of Los Angeles Community Redevelopment Agency (CRA) (Parcel H, Central Plant). Construction of the At-Grade Emphasis LRT Alternative is expected to result in a partial take of this site for construction staging and the proposed station. The part of the parcel that would be utilized for construction staging is currently used for parking and is the primary access point to the Central Plant. During construction, this access point would remain available and replacement parking would be required. Potential adverse impacts could result if no replacement parking were provided or if access was restricted or eliminated to the Central Plant. Proposed mitigation measures described in Section 6.3 have been developed to reduce this potential impact to a less than significant level.

- APN 5151014033 (Parcel bounded by 3rd Street, Hope Street, Flower Street, and General Kosciuszko Way; Figure 5-1 #4) – This 1.2-acre parcel is currently vacant but landscaped. This parcel is located within the Bunker Hill Redevelopment Area designated by the CRA (Parcel H, Central Plant). The parcel is expected to be partially acquired for construction staging and to construct the proposed 2nd/Hope Street station. The partial take of this parcel would not displace housing, people, or jobs. No adverse impacts associated with this displacement are expected.

- APN 5151027256 (Parcel bounded by Figueroa Street, 3rd Street, Flower Street, and 2nd Street; Figure 5-1 #5) – This parcel contains a pool, tennis courts, and landscaping associated with the multi-family housing on parcel with APN 5151016013. Construction of the At-Grade Emphasis LRT Alternative is expected to take a portion of the site along Flower Street for a station entrance and underground passageway beneath Flower Street. One or both of the privately owned tennis courts may be removed. An at-grade midblock crosswalk across Flower Street would be an alternative means of creating the same pedestrian connection. No significant adverse impacts associated with this displacement are expected.

- APN 5149008032 (201 S. Spring Street, respectively; Figure 5-1 #6) – This parcel is currently used as a privately operated parking lot with approximately 88 parking spaces (this is estimated because most of the spaces are unmarked). Construction and operation of the At-Grade Emphasis LRT Alternative are expected to take part of the parcel to stage materials and serve as a TPSS substation. An estimated 44 parking spaces are expected to be displaced. Typically, privately operated parking lots are considered transitional land uses that could be developed by the owners for higher and better uses. Additionally, there are several other privately operated parking lots and structures in the vicinity of the area. Although loss of the current parking lot may cause an inconvenience for users, it would not represent a significant adverse impact.

This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. No significant adverse impacts associated with this displacement are expected.

- APN 5161014902 (Parcel bounded by Main Street, 1st Street, Los Angeles Street, and Parcel #5161014901; Figure 5-1 #7) – This parcel contains the City Hall East grounds and associated buildings. Construction of the At-Grade Emphasis LRT Alternative is expected to result in partial take of the western edge along Main Street to accommodate a new station. The partial take would permanently remove a portion of existing landscape and some hardscape features. It is not expected that any plazas or buildings would be impacted by this partial take. No significant adverse impacts associated with this displacement are expected.

- APN 5161014901 (Parcel bounded by Main Street, Temple Street, Los Angeles Street, and Parcel #6161014902; Figure 5-1 #8) – This parcel contains the City Hall East building and grounds. Construction of the At-Grade Emphasis LRT Alternative is expected to result in partial take of the southeast corner of the Main Street/Temple Street intersection to accommodate the turning radius of the rail track. This partial take would permanently remove a portion of existing landscape and some hardscape features, including part of a landscape retaining wall. It is not expected that the plaza would be impacted by this partial take. No significant adverse impacts associated with this displacement are expected.

- APN 5161013905 (Parcel bounded by Judge John Aiso Street, 1st Street, Los Angeles Street, and Parcel #5161013904; Figure 5-1 #9) – This parcel contains the former Los Angeles Police Department Headquarters building (Parker Center) and grounds. However, the building may be demolished as a result of other proposed projects. Construction of the At-Grade Emphasis LRT Alternative is expected to result in a partial take of the western edge along Los Angeles Street to accommodate a station. No adverse impacts associated with this displacement are anticipated because the site has been vacated.

- APN 5161013904 (Parcel bounded by Judge John Aiso Street, Temple Street, Los Angeles Street, and Parcel #5161013905; Figure 5-1 #10) – This parcel contains the new downtown Metropolitan Detention Center building and grounds currently under construction. Construction of the At-Grade Emphasis LRT Alternative is expected to result in a partial take of the southeast corner of the Los Angeles Street/Temple Street intersection to accommodate the turning radius of the rail track. This partial take would permanently remove a portion of existing landscape and the sidewalk, but is not expected to impact the building or its plaza. No significant adverse impacts associated with this displacement are expected.

- APN 5161012901 (Parcel located on southwestern corner of the Temple Street/ Alameda Street intersection; Figure 5-1 #11) – This parcel is currently used as a publicly owned, pay-to-park, surface parking lot. Part of this lot is anticipated to be developed (Bureau of Engineering 2009). Construction of the At-Grade Emphasis LRT Alternative is expected to result in a partial take of several parking spaces (approximately 26 standard spaces and 7 handicapped spaces) for part of its alignment to accommodate the turning radius required to join the existing Gold Line Extension tracks. In addition, since driveway access would be limited, coordination of design would need to occur between Metro and the development, and CPUC, city, and other regulatory safety requirements would need to be met. Although loss of the current parking lot may cause an inconvenience for users, it would not normally represent a significant adverse impact. There are additional privately operated parking lots and structures located in the vicinity.

- APN 5161012905 (Parcel located on southwestern corner of the Temple Street/Alameda Street intersection; Figure 5-1 #12) – This parcel, which is currently used as a publicly owned, pay-to-park, surface parking lot, also contains the Geffen Contemporary at the Museum of Contemporary Art (MOCA). Part of this lot is anticipated to be developed (Bureau of Engineering 2009). Construction of the At-Grade Emphasis LRT Alternative is expected to result in a partial take of five parking spaces to locate the footing of a proposed pedestrian bridge across Alameda Street. Although loss of the current parking lot may cause an inconvenience for users, it would not normally represent a significant adverse impact. There are additional privately operated parking lots and structures located in the vicinity.

5.3.1.43 On-Street Parking

To construct and operate the At-Grade Emphasis LRT Alternative, approximately 51 on-street parking spaces and 29 on-street loading spaces would be permanently eliminated. This includes removing 23 on-street parking spaces and five loading spaces on 2nd Street in and near Little Tokyo. The loss of on-street parking would result from placing tracks along streets. This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. Little Tokyo residents and business owners have indicated that parking spaces are important community resources and that losing this parking could negatively impact the adjacent small businesses and the Japanese American National Museum, located along Alameda Street. The community is concerned that this could, in turn, affect the economic stability and ultimately the character of the community. Therefore, Metro would conduct a parking capacity study of the Little Tokyo area to determine if there is sufficient parking availability without these parking spaces or if replacement parking would be needed and to what extent.

5.3.2 Indirect Impacts

There are no indirect impacts under the At-Grade Emphasis LRT Alternative.

5.3.3 Cumulative Impacts

There are approximately 12 new construction projects anticipated by 2014 and an additional 54 new construction projects between 2014 and 2018 identified within one-quarter mile of the proposed project alignments. Also, there are approximately 12 major renovation projects anticipated by 2014 and eight between 2014 and 2018. More detail about these projects is provided in the Cumulative Impacts Technical Memorandum.

A project may have cumulatively considerable impacts associated with displacement, even when mitigated, if it would contribute cumulatively to displacement of the same land uses or important resources. Construction of the At-Grade Emphasis LRT Alternative is expected to displace a parcel that is currently vacant. No cumulatively considerable impacts are anticipated as a result of this displacement.

The At-Grade Emphasis LRT Alternative would displace parking on three parcels (APNs 5161012901, 5161012905, and 5149008032). According to the Bureau of Engineering, a Children's Museum and Art Park is anticipated to be constructed in the lot with APN 5161012901 by 2018. Therefore, all the parking spaces would be displaced, and the new building would be required to provide its own spaces per the City of Los Angeles Zoning Code.

By the year 2018, planned future developments would displace several existing parking lots. These new developments, mostly residential, would provide the required parking for their residents, but the stock of publicly accessible parking would be greatly reduced. The At-Grade Emphasis LRT Alternative would result in permanent displacement of 170 parking spaces (including 51 on-street parking spaces), 23 of them in Little Tokyo, where the community has expressed concern over the potential loss of parking. Surface parking lots in downtown Los Angeles are an important community resource because many of the older, historical businesses and civic buildings do not provide the amount of on-site, off-street parking required under current planning code, resulting in an overall parking deficit. The loss of publicly accessible surface parking in Little Tokyo due to the proposed project in conjunction with other planned developments would represent a cumulative loss.

Typically, transit projects themselves serve as mitigation for the loss of parking because they would remove vehicles on the road, thereby reducing the demand for parking. The Regional Connector will provide new non-auto access to downtown, including Little Tokyo. Therefore, the proposed At-Grade Emphasis LRT Alternative would partially offset potential adverse impacts due to loss of parking. Some cumulative impacts due to parking loss could remain but they would not be significant.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would extend from the 7th Street/Metro Center Station north in a cut-and-cover tunnel below Flower Street, with a new underground station north of 5th Street. At 3rd Street, the underground tunnel would extend northeast, with a new underground station constructed just south of 2nd and Hope Streets to provide access to Bunker Hill.

This station would be constructed using either the cut-and-cover method or the sequential excavation method. From there, a tunnel excavated by tunnel boring machine would continue east beneath 2nd Street. A second underground station would be located either between Broadway and Spring Street or between Main and Los Angeles Streets. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a potential overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets.

5.4.1 Direct Impacts

Construction of the Underground Emphasis LRT Alternative would require ten partial takes and acquisition of 11 parcels (full takes). In addition, temporary construction easements affecting eight parcels and permanent underground easements affecting four parcels would be required.

Some station plans have multiple entrance options, though not all of them would be constructed. In these cases, all potential takings and easements for station entrances were evaluated. These properties would be utilized for TPSS site locations, construction staging, below-grade tunneling, and station locations.

Table 5-2 lists the APNs, addresses, and current and intended uses of the properties that could be impacted by displacement to construct the Underground Emphasis LRT Alternative. Table 5-2 also references the parcel's location in Figures 5-2 through 5-4.

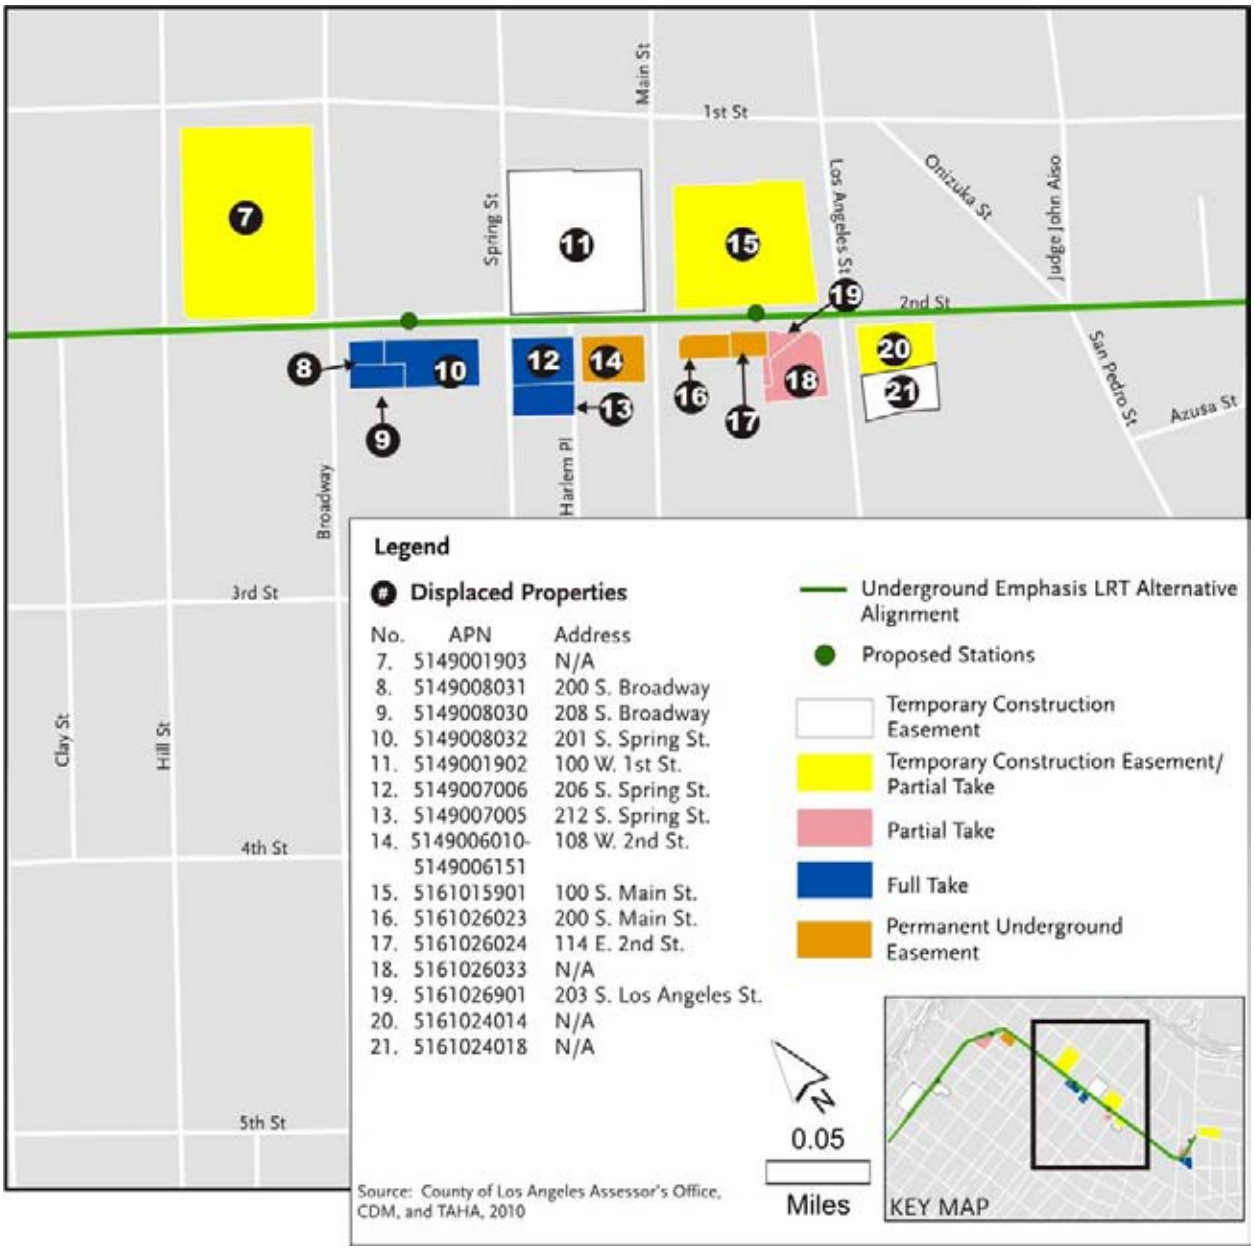

Figure 5-3. Underground Emphasis LRT Alternative Potential Displacement – 2nd Street Station - Broadway or Los Angeles Street Options

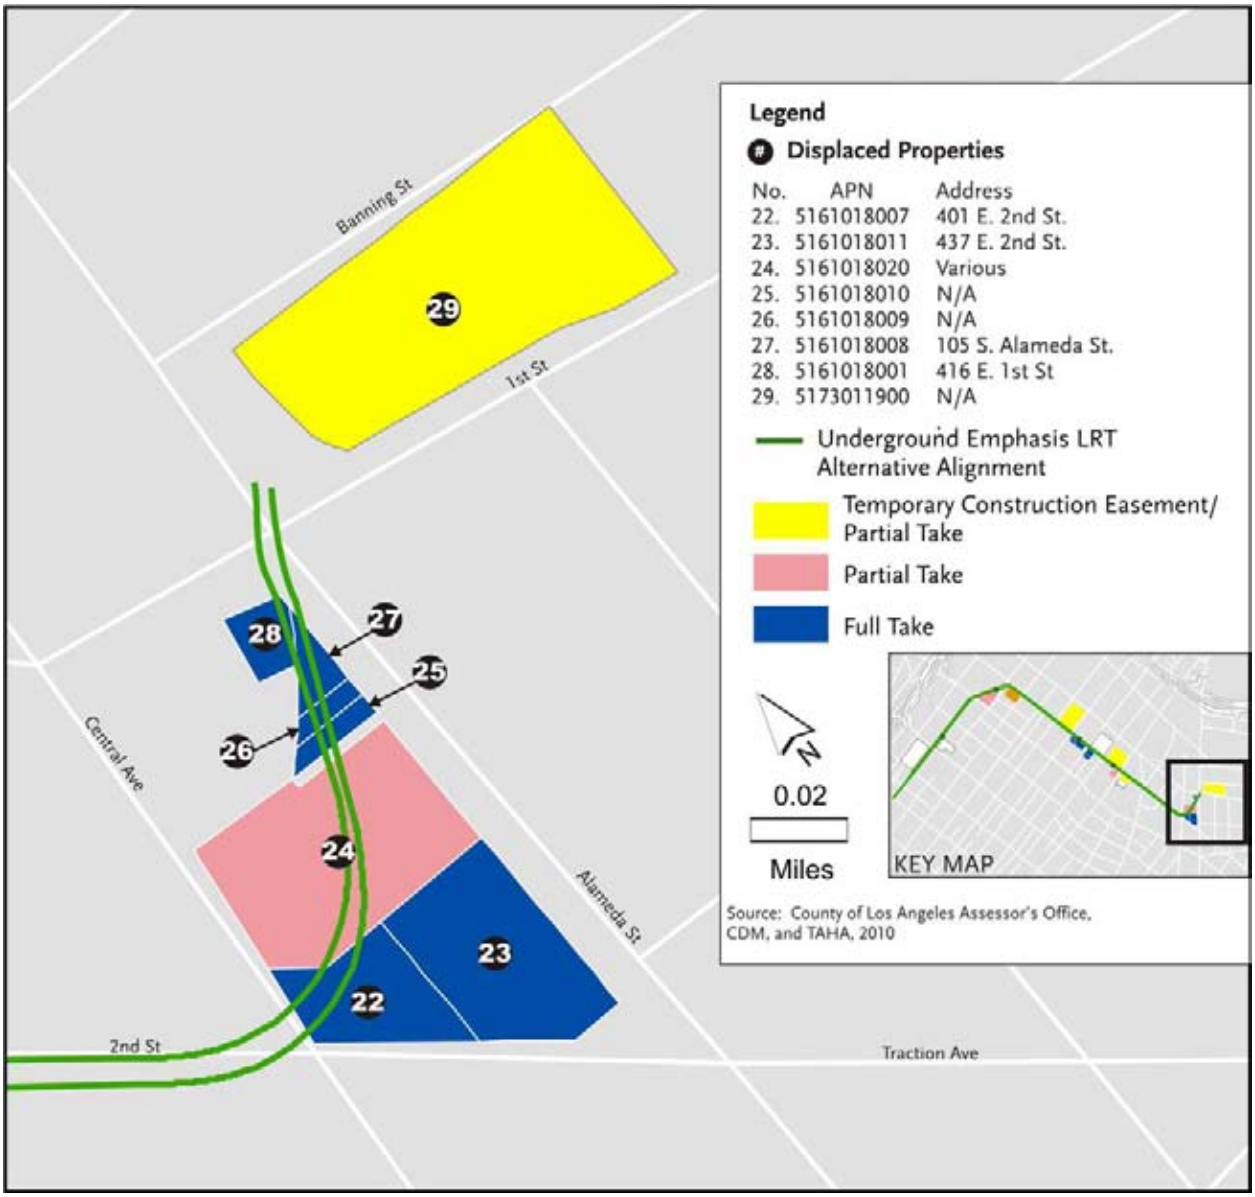

Figure 5-4. Underground Emphasis LRT Alternative Potential Displacement – Portal Area

5.4.1.1 Easements

The proposed Underground Emphasis LRT Alternative would require temporary construction easements affecting eight parcels and four permanent underground easement that would affect five parcels (one parcel, the Higgins Building, contains several APNs, but is considered one parcel for this discussion) (Figures 5-2 through 5-4).

Temporary Construction Easements

- APN 5151023400 (525 S. Flower Street; Figure 5-2 #1) – This parcel contains the City National Plaza and towers. Construction of the Underground Emphasis LRT Alternative is expected to utilize a portion of the plaza for equipment and/or material staging and to construct a proposed below-grade station. Part of the City National Plaza serves as a bus stop for bus lines from several transit service providers. During construction, access to this bus stop would need to be maintained or relocated. In addition, part of the public sidewalk would be utilized as an entrance to the proposed below-grade station, but would not encroach onto private property. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed. Adverse impacts could result if access to the bus stop is not maintained. Proposed mitigation measures described in Section 6.4 have been developed to reduce potential impacts to a less than significant level.

- APN 5151018017 (444 S. Flower Street; Figure 5-2 #2) – This parcel contains the Citigroup Center, which includes the Citigroup Building and retail shops and restaurants. Construction of the Underground Emphasis LRT Alternative is expected to utilize a portion of the plaza at the northeast corner of the 5th Street/ Flower Street intersection for construction staging. Several mature palm trees are located in the plaza. It is not expected that the palm trees would be removed during construction. Palm trees are not considered heritage trees and are not protected species in the City of Los Angeles. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed. No significant adverse impacts associated with this easement are expected.

- APN 5149001903 (Parcel bounded by 1st Street, 2nd Street, Hill Street, and Broadway; Figure 5-3 #7) – This parcel contains an empty lot located at the parcel bounded by 1st Street, 2nd Street, Hill Street, and Broadway. It is a federally owned parcel that is anticipated to house a future federal courthouse. Construction of the Underground Emphasis LRT Alternative is expected to use a portion of the site for construction staging for the proposed 2nd Street station (Broadway Option). The area that would be utilized for construction staging is uneven and would require grading. The easement would be temporary and the site would be returned to pre-construction conditions, with the exception of grading. A portion of the site will be taken for placement of

ancillary structures associated with the Underground Emphasis LRT Alternative. No significant adverse impacts associated with this easement are expected.

- APN 5149001902 (Parcel bounded by 1st Street, 2nd Street, Spring Street, and Main Street; Figure 5-3 #11) – This parcel contains the new Los Angeles Police Department Headquarters building. Construction of the Underground Emphasis LRT Alternative is expected to utilize a portion of the site, a plaza, for construction staging for the proposed 2nd Street station (Los Angeles Street Option). Access for police vehicles would be maintained. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed. No significant adverse impacts associated with this easement are expected.

- APN 5161015901 (100 S. Main Street; Figure 5-3 #15) – This parcel currently contains the California Department of Transportation (Caltrans) District 7 Headquarters building. Construction and operation of the Underground Emphasis LRT Alternative is expected to use part of the parcel for construction staging for the proposed 2nd Street station (Los Angeles Street Option). The portion of the parcel potentially impacted is landscaped and all of the existing trees would be removed. However, as a potential station entrance, additional landscaping may be incorporated into the station design. No part of the Caltrans building would be taken for the Underground Emphasis LRT Alternative. Therefore, no significant adverse impacts associated with this easement are expected.

- APN 5161024014 (Parcel at the southeast corner of the Los Angeles Street/2nd Street intersection; Figure 5-3 #20) – This parcel is currently used as a parking lot. Construction of the Underground Emphasis LRT Alternative is expected to use a portion of the parcel for construction staging for the potential 2nd Street station (Los Angeles Street Option). (A portion of this parcel will also be taken for the entrance to this station.) Therefore, a portion of the current 296 parking spaces on the site would be temporarily displaced. There are several additional surface parking lots and parking garages located within close proximity of this parcel. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed, including restoration of the parking spaces (except for those permanently removed due to the partial take). No significant or adverse impacts associated with this easement are expected.

- APN 5161024018 (Parcel at the southeast corner of the Los Angeles Street/2nd Street intersection; Figure 5-3 #21) – This parcel is currently used as a parking lot. Construction of the Underground Emphasis LRT Alternative is expected to use the entire parcel for construction staging for the potential 2nd Street station (Los Angeles Street Option). As such, the 153 parking spaces currently on the site would be temporarily displaced. There are several additional surface parking lots and parking

garages located within close proximity of this parcel. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed, including restoration of parking spaces. No significant or adverse impacts associated with this easement are expected.

- APN 5173011900 (Parcel at the northeast corner at the 1st Street/Alameda Street intersection; Figure 5-4 #29) – This parcel is currently vacant, but is anticipated to become the Nikkei Center, a mixed-use development (commercial and multi-family housing). Construction of the Underground Emphasis LRT Alternative would use a portion of the site for construction staging for the portal section. (A portion of this parcel would also be taken for construction of the potential pedestrian bridge footing.) None of the multi-family housing proposed on site would be displaced during construction. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed (except for the portion taken for the proposed pedestrian bridge footing). No significant adverse impacts associated with this easement are expected.

Permanent Underground Easements

- APN 5151004911/5151004912/5151004913 (Parcel bounded by 2nd Street, Hope Street, Grand Avenue, and General Kosciuszko Way; Figure 5-2 #6) – This parcel is currently used as a parking lot. The alignment of the Underground Emphasis LRT Alternative would traverse beneath this lot as it transitions from Flower Street to 2nd Street, past the Bunker Hill Station. No surface impacts, and therefore no loss of parking, are expected. Standard shoring practices would be used to avoid subsidence. No adverse impacts associated with this permanent underground easement are expected.

- APNs 5149006010-028, 031-054, 056-059, 061-095, 097, 099-108, 110, 112-149, 151 (108 W. 2nd Street, various units; Figure 5-3 #14) – This parcel is currently occupied by the Higgins Building. The Higgins Building contains residential uses and commercial uses, including restaurants and offices. The basement of the Higgins Building, which is used as a bar, extends into the ROW. The alignment of the Underground Emphasis LRT Alternative would traverse beneath this portion of the basement. No impacts to the basement or the condominiums are anticipated. Standard shoring practices would be used to avoid subsidence. No adverse impacts associated with this permanent underground easement are expected.

- APNs 5161026023 and 5161026024 (200 S. Main Street and 114 E. 2nd Street; Figure 5-3 #s 16 and 17) – This parcel is currently occupied by St. Vibiana's Church and accessory buildings. The 2nd Street/Los Angeles Optional Station of the Underground Emphasis LRT Alternative would have its footprint beneath part of these parcels. No impacts to the church or its associated structures are anticipated. However, as the church is a historic resource, appropriate standard shoring practices would be used to

avoid subsidence and damage to the structure during construction and operation. With mitigation no adverse impacts associated with this permanent underground easement are expected.

5.4.1.2 Partial Takes

There are ten parcels that would be partially taken for construction of the Underground Emphasis LRT Alternative (Figures 5-2 through 5-4). These parcels are:

- APN 5151014032 (703 W. 3rd Street; Figure 5-2 #3) – This parcel contains the Central Plant, a heating and ventilation plant for several buildings in the Bunker Hill area. The parcel is located within the Bunker Hill Redevelopment Area designated by the City of Los Angeles Community Redevelopment Agency (CRA) (Parcel H, Central Plant). Construction of the Underground Emphasis LRT Alternative is expected to result in a partial take of the site for construction staging and for the proposed station. The partial take area is currently used for parking and is the primary access point to the Central Plant. During construction, this access point would remain available and replacement parking would be required. Potential adverse impacts would result if no replacement parking was provided or if access was restricted or eliminated to the Central Plant.

- APN 5151014033 (Parcel bounded by 3rd Street, Hope Street, Flower Street, and General Kosciuszko Way; Figure 5-2 #4) – This 1.2-acre parcel is currently vacant, but is landscaped. The parcel is located within the Bunker Hill Redevelopment Area designated by the CRA (Parcel H, Central Plant). The parcel is expected to be partially acquired for construction staging and to construct the 2nd/Hope Street station of the Underground Emphasis LRT Alternative. The partial take of this parcel would not displace housing, people, or jobs. No significant adverse impacts associated with this displacement are expected.

- APN 5151027256 (Parcel bounded by Figueroa Street, 3rd Street, Flower Street, and 2nd Street; Figure 5-1 #5) – This parcel contains a pool, tennis courts, and landscape associated with multi-family housing on the parcel with APN 5151016013. Construction of the Underground Emphasis LRT Alternative is expected to take a portion of the site along Flower Street for placing a station entrance and underground passageway beneath Flower Street. One or both of the privately owned tennis courts may be removed. An at-grade midblock crosswalk across Flower Street would be an alternative means of creating the same pedestrian connection. No significant adverse impacts associated with this displacement are expected.

- APN 5149001903 (Parcel bounded by 1st Street, 2nd Street, Hill Street, and Broadway; Figure 5-3 #7) – This parcel contains an empty lot bounded by 1st Street, 2nd Street, Hill Street, and Broadway. It is a federally owned parcel that is anticipated to house a

future federal courthouse. Construction and operation of the Underground Emphasis LRT Alternative is expected to take a portion of the site for ancillary structures associated with the proposed 2nd Street station (Broadway Option). No structures would be displaced due to this partial take, and therefore no significant adverse impacts associated with this partial take are expected.

- APN 5161015901 (100 S. Main Street; Figure 5-3 #15) – This parcel currently contains the Caltrans District 7 Headquarters building. Construction and operation of the Underground Emphasis LRT Alternative is expected to take part of the parcel and use it as an entrance to the potential 2nd Street station (Los Angeles Street Option). The portion of the parcel potentially impacted contains some landscaping, and all of the existing trees would be removed. However, as a potential station entrance, additional landscaping may be incorporated into the station design. No part of the Caltrans building would be taken for the Underground Emphasis LRT Alternative. Therefore, no significant adverse impacts associated with displacements or relocations from this partial take are expected.

- APNs 5161026033 and 5161026901 (203 S. Los Angeles Street; Figure 5-3 #s18 and 19) – These parcels are currently occupied by the City of Los Angeles Public Library Little Tokyo Branch. The Underground Emphasis LRT Alternative would use portions of these parcels as a plaza and entrance to the potential underground 2nd Street station (Los Angeles Street Option). These parcels contain a public resource. It is anticipated that during operations, the plaza would be a shared resource, serving as the main entrance to the library and the underground station. During construction, potential adverse impacts may occur if access to the Little Tokyo Library Branch were removed or restricted.

- APN 5161024014 (Parcel at the southeast corner of the Los Angeles Street/2nd Street intersection; Figure 5-3 #20) – This parcel is currently used as a parking lot. Construction and operation of the Underground Emphasis LRT Alternative is expected to take part of the parcel and utilize it as an entrance to the proposed underground 2nd Street station (Los Angeles Street Option). Approximately nine parking spaces would be permanently lost, including three spaces for persons with disabilities. Privately operated parking lots are typically considered transitional land uses that could be developed by the owners for higher and better uses. There are several other privately operated parking lots and structures in the vicinity of the area. This potential impact to parking would also be partially offset by the increased public transit access provided by the proposed project. Therefore, no significant or adverse impacts associated with this partial take are expected.

- APN 5161018020 (437 E. 2nd Street; Figure 5-4 # 24) – This parcel is currently occupied by several commercial buildings containing restaurants and retail uses. The largest

portion of this parcel is occupied by an Office Depot. There are five smaller commercial businesses occupying the site, including three fast food chain outlets and two local restaurants. Construction and operation of the Underground Emphasis LRT Alternative would displace two businesses (85 jobs) on this parcel for the train portal. Each business displaced as a result of the project would be given advance written notice and would be informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs would be potentially displaced but would be retained with the relocation. Therefore, there would be no net loss of jobs overall and no significant adverse impacts related to job loss.

- APN 5173011900 (Parcel at the northeast corner at the 1st Street/Alameda Street intersection; Figure 5-4 #29) – This parcel is anticipated to become the Nikkei Center, a mixed-use development (commercial and multi-family housing). Construction and operation of the Underground Emphasis LRT Alternative is expected to take part of the parcel for a footing of a potential pedestrian bridge spanning the intersection of 1st and Alameda Streets. The part of the parcel that would be taken is not expected to reduce the amount of housing or commercial space that could be developed on site. Therefore, no significant adverse impacts associated with this partial take are expected.

5.4.1.3 Full Takes

There are 11 parcels which would be fully taken to construct the Underground Emphasis LRT Alternative (Figures 5-2 through 5-4). Relocation assistance and compensation would be provided by FTA and Metro as required by the federal Uniform Act and the California Act. These laws for relocation assistance and compensation for property acquisitions are described in Sections 3.1.1 and 3.1.2.

Where acquisition and relocation are unavoidable, FTA and Metro would follow the provisions of both acts. All real property acquired by Metro would be appraised to determine its fair market value. Just compensation, which would not be less than the approved appraisal, would be made to each property owner. Each business displaced as a result of the project would be given advance written notice and informed of their eligibility requirements for relocation assistance and payments.

While the potential loss of parking spaces would be partially offset by the increased public transit access provided by the proposed project, Little Tokyo businesses and residents have expressed concerns about the potential loss of parking.

The parcels potentially affected by displacement are:

- APNs 5149008031, 5149008030, and 5149008032 (200, 208, and 201 South Spring Street, respectively; Figure 5-3 #s 8, 9, and 10, respectively) – These parcel are currently used as a privately operated parking lot with approximately 142 parking spaces (this is an estimate because about half of the spaces are unmarked). Construction and operation of the Underground Emphasis LRT Alternative is expected to take all of the parcels and utilize them to stage materials and to serve as the entrance plaza for the proposed 2nd Street station (Broadway Option). Privately operated parking lots are typically considered transitional land uses that could be developed by the owners for higher and better uses. There are several other privately operated parking lots and structures in the vicinity of the area. Although loss of the current parking lot may cause an inconvenience for users, it would not represent a significant or adverse impact. This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. No significant or adverse impacts associated with this displacement are expected.

- APN 5149007006 (206 S. Spring Street; Figure 5-3 #12) – This parcel is occupied by a commercial building that includes five businesses. The businesses located in this parcel include two restaurants, a cigar shop, a credit union, and the City Employees Club. The entire parcel would be taken and utilized for staging materials and equipment for the Underground Emphasis LRT Alternative (for the entire alignment, not just the adjacent station options). Optional station entrance locations are also located on this site, though not all of the optional station entrances would be constructed. Displacement of these five businesses would displace approximately 40 employees. Each business displaced as a result of the project would be given advance written notice and would be informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs that would be potentially displaced would be retained with the relocation. Therefore, there would be no net loss of jobs overall. This would result in no significant adverse impacts related to job loss.

- APN 5149007005 (212 S. Spring Street; Figure 5-3 #13) – This parcel is currently occupied by a vacant commercial building. The Underground Emphasis LRT Alternative would take the entire parcel and use it for staging materials and equipment for construction of the entire alignment, not just the adjacent station options. Optional station entrance locations are also located on this site, though not all of the optional station entrances would be constructed. No significant adverse impacts related to job loss would occur because the parcel is occupied only by a vacant building. However, should businesses exist when the project starts, each business displaced as a result of the project would be given advance written notice and would be informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs potentially displaced would

be retained with relocation. Therefore, there would be no net loss of jobs overall. This would result in no significant adverse impacts related to job loss.

- APNs 5161018010, 5161018009, and 5161018008 (portion) (402 E. 1st Street; Figure 5-4 #25, 26, and 27, respectively) – These parcels are currently used as a privately operated parking lot. All of these parcels are expected to be taken in order to stage materials during construction and serve as a train egress/ingress portal for the Underground Emphasis LRT Alternative. These parcels have approximately 30 parking spaces (this is an estimate because some of the spaces are unmarked). Typically, privately operated parking lots are considered transitional land uses that could be developed by the owners for higher and better uses. There are several other privately operated parking lots and structures in the vicinity. Although loss of the current parking lot may cause an inconvenience for users, it would not normally represent a significant adverse impact. Potential impacts to parking would be partially offset by the increased public transit access provided by the proposed project. Little Tokyo residents and business owners have indicated that parking spaces are important community resources and that the loss of this parking could negatively impact the adjacent small businesses and the Japanese American National Museum located across the street. The community is concerned that this could, in turn, affect the economic stability and ultimately the character of the community. Therefore, Metro would conduct a parking capacity study of the Little Tokyo area to determine if there is sufficient parking availability without these parcels or identify the amount of replacement parking that would be needed.

- APNs 5161018008 (portion) and 5161018001 (105 S. Alameda Street and 416 E. 1st Street; Figure 5-4 #s 27 and 28) – These parcels are currently occupied by a commercial building and associated patio (part of 5161018008). The current business is a Señor Fish Restaurant. The entire parcel is expected to be taken to serve as the train egress/ingress portal during operation of the Underground Emphasis LRT Alternative. Displacement of this property would result in the loss of approximately six jobs and in the loss of a possible historical structure. The Cultural Resources Technical Memorandum discusses in detail the potential impacts of the loss of this structure. Each business displaced as a result of the project would be given advance written notice and would be informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs would be retained with the relocation. Therefore, there would be no net loss of jobs overall. This would result in no significant adverse impacts related to job loss.

- APNs 5161018007 and 5161018011 (437 E. 2nd Street; Figure 5-4 #s22 and 23) – These parcels are currently used as parking lots. Construction and operation of the Underground Emphasis LRT Alternative would displace 109 parking spaces on these parcels by the train egress/ingress portal. The parking lot is associated with

businesses in the adjacent parcels and normally would not be considered separately from its complementary use. However, this parking lot is also used in the evenings for public, paid parking after the Office Depot has closed for the day. This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. Little Tokyo residents and business owners have indicated that parking spaces are important community resources and that losing this parking could negatively impact the adjacent small businesses and the Japanese American National Museum, located across the street. The community is concerned that this could, in turn, affect the economic stability and ultimately the character of the community. Therefore, Metro would conduct a parking capacity study of the Little Tokyo area to determine if there is sufficient parking availability without these parcels or if replacement parking would be needed and to what extent.

5.4.1.4 On-Street Parking

To construct and operate the Underground Emphasis LRT Alternative, approximately 26 on-street parking spaces and three on-street loading spaces would be permanently eliminated. This includes removing 13 on-street parking spaces and three loading spaces on Alameda Street in Little Tokyo. The loss of on-street parking would result from constructing the underpass at the 1st Street/Alameda Street intersection. This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. Little Tokyo residents and business owners have indicated that parking spaces are important community resources and that losing this parking could negatively impact the adjacent small businesses and the Japanese American National Museum, located along Alameda Street. The community is concerned that this could, in turn, affect the economic stability and ultimately the character of the community. Therefore, Metro would conduct a parking capacity study of the Little Tokyo area to determine if there is sufficient parking availability without these parking spaces or if replacement parking would be needed and to what extent.

5.4.2 Indirect Impacts

There would be no potential indirect impacts from the Underground Emphasis LRT Alternative.

5.4.3 Cumulative Impacts

There are approximately 12 new construction projects anticipated by 2014 and an additional 54 new construction projects between 2014 and 2018. Also, there are 12 major renovation projects anticipated by 2014 and eight between 2014 and 2018. A project may have cumulatively considerable impacts associated with displacement, even when mitigated, if it would contribute cumulatively to displacement of the same land uses or important resources.

The Underground Emphasis LRT Alternative would take several parcels, displacing the existing businesses and parking lots, and resulting in a loss of commercial space and parking in the downtown area. However, not all of the parcels acquired would be needed for operation of the project. After construction of the Regional Connector, additional remaining land near Bunker Hill and in Little Tokyo could be available for commercial use, offsetting any decrease in commercial space.

Most of the related projects anticipated by 2018 would not displace existing commercial businesses. Instead, they would displace existing parking lots or underutilized parcels. Therefore, minimal loss of the commercial building stock in the project area is expected.

It is anticipated that where these related projects remove commercial businesses, the business or job loss would be offset by the continued commercial growth within the downtown area. No cumulative adverse impact associated with displacement of commercial businesses is expected.

By the year 2018, the majority of related projects would displace several current parking lots. These new developments, mostly residential, would provide the required parking for their tenants, but the stock of public-accessible parking would be reduced.

The Underground Emphasis LRT Alternative could permanently displace between 148 and 281 parking spaces—139 of them in Little Tokyo, where the community has expressed concern over the potential loss of parking. The displaced parking spaces may be replaced in an existing lot.

Surface parking lots in downtown Los Angeles are an important community resource because many of the older, historical businesses and civic buildings do not have the amount of on-site, off-street parking required under the current planning code, which results in an overall parking deficit. The loss of publicly accessible surface parking in Little Tokyo and other downtown Los Angeles areas due to the proposed project would represent a cumulative loss. Transit projects themselves typically serve as mitigation for the loss of parking because they reduce dependence on vehicles on the road, thereby reducing the demand for parking. The Regional Connector would provide new non-auto access to downtown, including Little Tokyo. Therefore, the proposed project would partially offset potential adverse impacts due to loss of parking. Remaining cumulative impacts due to parking loss would not be significant.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would follow the same alignment and be constructed in the same manner as the Underground Emphasis LRT Alternative from the 7th Street/Metro Center Station to 2nd Street and Central Avenue. In this portion of the alignment, there would be three proposed underground stations; at Flower/5th/6th Streets, at 2nd/Hope Streets, and at 2nd Street and Broadway. A fourth

underground station within the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets would be constructed. The alignment would emerge to at-grade connections with the existing Gold Line tracks via two portals: north of Temple and Alameda Streets for the north-south line and on 1st Street east of Alameda Street for the east-west line.

Metro has identified the entire block for acquisition under the Fully Underground LRT Alternative - Little Tokyo Variation 1 in order to accommodate the new underground station. This acquisition is needed to stage construction and build a new underground station, station entrances, and ancillary facilities. Metro may also use the site to launch tunnel boring machines and transport material from the tunnels. Alternately, this may also be done near the proposed 2nd/Hope Street station site. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not be directly impacted by construction activities. Metro would, to the extent possible, promote and encourage businesses so that they remain open during construction, but Weilands Brewery, Café Cuba, Señor Fish, and Office Depot would need to be removed. Acquisition of the entire block would represent a worst-case scenario. Potential reductions in the total acquisition may occur based on further engineering analysis during the preliminary engineering and final design stages.

5.5.1 Direct Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would potentially require partial takes of ten parcels and full takes of 16 parcels. In addition, temporary construction easements required would affect five parcels and permanent underground easements would affect six parcels. Some station plans have multiple entrance options, though not all of them would be constructed. In these cases, all potential takings and easements for station entrances would be evaluated. These properties would be utilized for TPSS site locations, construction staging, below-grade tunneling, and station locations. The Fully Underground LRT Alternative – Little Tokyo Variation 1 has a similar alignment as, and shares most of the potential stations with, the Underground Emphasis LRT Alternative.. Only three parcels that would be fully or partially acquired as part of the Underground Emphasis LRT Alternative would not be impacted by any type of displacement as part of the Fully Underground LRT Alternative – Little Tokyo Variation 1. These parcels are:

- Parcel #5149001902 (Figure 5-3 #10)
- Parcel #5161024014 (Figure 5-3 #20)
- Parcel #5161024018 (Figure 5-3 #21)

The Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Underground Emphasis LRT Alternative share similar displacement impacts. The following discussion focuses only on the area east of 2nd Street and Central Avenue where the two alternatives

follow different alignments. Table 5-3 identifies parcels in the eastern end of the project area that could be impacted by displacement under the Fully Underground LRT Alternative – Little Tokyo Variation 1 that would not be impacted by the Underground Emphasis LRT Alternative. Table 5-3 also references the parcel's location as shown in Figure 5-5.

In addition, additional engineering analysis may result in full take of three more parcels in the block bounded by Central Avenue, 1st Street, 2nd Street, and Alameda Street, one of which is already characterized as a partial take.

Table 5-3. Additional Parcels Potentially Affected by Displacement –Fully Underground LRT Alternative – Little Tokyo Variation 1

Fig.	#	APN	Address	Type of Displacement	Current Use	Intended Use
5.5	30	5173011901	Parcel bounded by Alameda Street, 1st Street, Temple Street, and Parcel 5173011900	Full Take	Metro Gold Line Alignment/ Station	Road Widening
5.5	31	5173012900	Parcel bounded by 1st Street, Temple Street, and Parcels 5173011900 and 5173012031	TCE & Partial Take	Empty Lot	Construction Staging, Station Entrance, and Road Widening
5.5	32	5173012901	Parcel bounded by 1st Street and Parcel 5173012900	Full Take	Parking lot	Road Widening
5.5	33	5173008908	432 E. Temple Street	Permanent Underground Easement	Warehouse and grounds	Alignment
5.5	34	5173008901	432 E. Temple Street	Permanent Underground Easement	Warehouse and grounds	Alignment
5.5	35	5173007901	433 E. Temple Street	Partial Take	LA Dept of Water and Power (DWP) Station	Portal

Table 5-3. Additional Parcels Potentially Affected by Displacement –Fully Underground LRT Alternative – Little Tokyo Variation 1						
Fig.	**#**	**APN**	**Address**	**Type of Displacement**	**Current Use**	**Intended Use**
5.5	36	5173006900	433 E. Temple Street	Partial Take	DWP Station	Portal/Aerial Structure

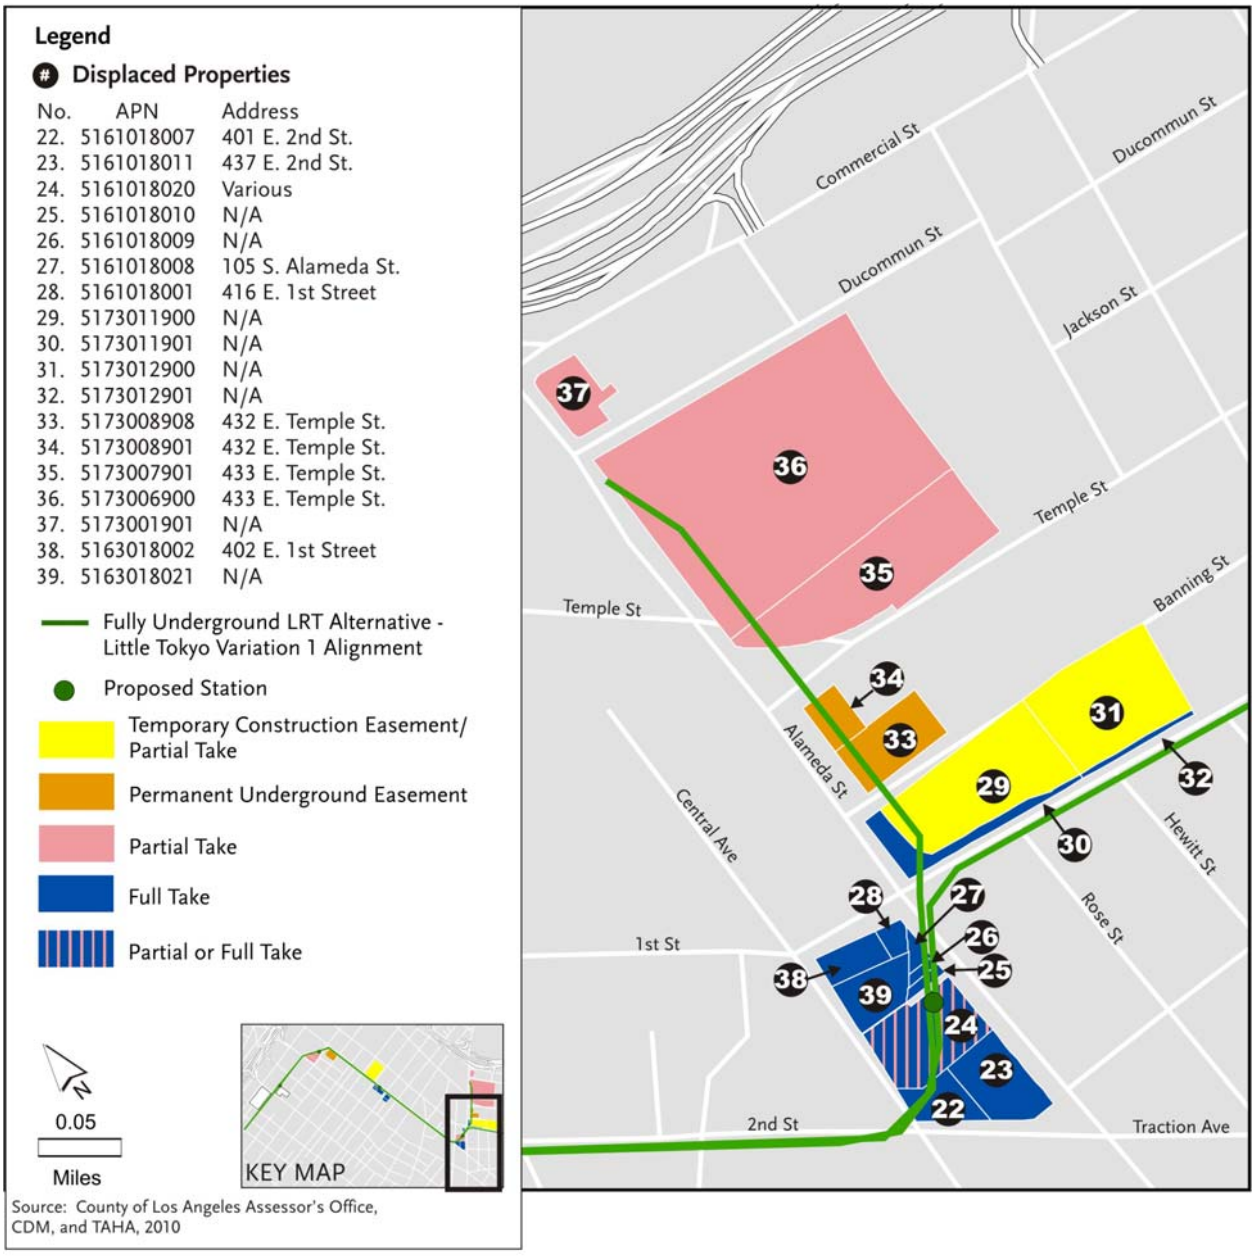

Figure 5-5. Fully Underground LRT Alternative – Little Tokyo Variation 1 - Potential Displacement in Little Tokyo

5.5.1.1 Easements

Temporary Construction Easements

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require temporary construction easements that would affect five parcels, four of which are the same parcels that would be affected by the Underground Emphasis LRT Alternative:

- Parcel # 5151023400 (Figure 5-2 #1)
- Parcel #5151018017 (Figure 5-2 #2)
- Parcel #5149001903 (Figure 5-3 #7)
- Parcel #5173011900 (Figures 5-4/5-5 #29)

For the impact analysis of these four parcels, refer to section 5.4.1.1. The following additional parcel would be impacted by the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- APN 5173012900 (Parcel bounded by 1st Street, Temple Street, and Parcels 5173011900 and 5173012031; Figure 5-5 #31) – This parcel is currently vacant, but is anticipated to become the Nikkei Center, a mixed-use development (commercial and multi-family housing). Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would use a portion of the site for construction staging. No part of the mixed-use development that is proposed would be displaced during construction. The easement would be temporary, and the site would be returned to pre-construction conditions once construction is completed (except for the portion taken for road widening and a potential station entrance). No significant adverse impacts associated with this easement are expected.

Permanent Underground Easements

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require permanent underground easements affecting six parcels, four of which would also be affected by the Underground Emphasis LRT Alternative:

- Parcel # 5151004911/5151004912/5151004913 (Figure 5-2 #6)
- Parcels #5149006010-5149006151/5161026023/5161026024 (Figure 5-3 #s14, 16, 17)

For the impact analysis of these parcels, refer to section 5.4.1.1. The following additional parcel would be impacted by Fully Underground LRT Alternative – Little Tokyo Variation 1:

- APNs 5173008908 and 5173008901 (432 E. Temple Street; Figure 5-5 #s 33 and 34) – These parcels are currently occupied by a warehouse and its associated parking lot.

The alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would traverse beneath these lots as it travels parallel to the existing Metro Gold Line at-grade alignment to join the north/southbound tracks. No surface impacts are expected and, therefore, no loss of parking or the warehouse would occur. Standard shoring practices would be used to avoid subsidence. No adverse impacts associated with this permanent underground easement are expected

5.5.1.2 Partial Takes

There are ten parcels that would be partially taken for construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 (Figures 5-2 through 5-5). Six of these parcels would also be partially taken under the Underground Emphasis LRT Alternative:

- Parcel #5151014032 (Figure 5-2 #3)
- Parcel #5151014033 (Figure 5-2 #4)
- Parcel #5151027256 (Figure 5-2 #5)
- Parcel #5149001903 (Figure 5-3 #7)
- Parcel #5161018020 (Figures 5-4/5-5 #24)
- Parcel #5173011900 (Figures 5-4/5-5 #29)

For the impact analysis of these parcels, refer to section 5.4.1.2. The following additional parcels would be impacted by the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- APN 5173012900 (Parcel bounded by 1st Street, Temple Street, and Parcels 5173011900 and 5173012031; Figure 5-5 #31) – This parcel is currently vacant, but is anticipated to become the Nikkei Center, a mixed-use development (commercial and multi-family housing). Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would take a portion of the site for road widening to accommodate realignment of 1st Street. The partial taking of this parcel could result in a change in design of the proposed development. As the parking would be removed regardless of the project, no significant adverse impacts associated with this partial take are expected.
- APNs 5173007901 and 5173006900 (433 E. Temple Street; Figure 5-5 #35 and 36) – This parcel contains the Central District Headquarters for the City of Los Angeles Department of Water and Power (LADWP). A portion of the parcel would be taken to accommodate a portal that would allow the transition from the underground alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 1 to join

the existing at-grade alignment of the Metro Gold Line. This partial take could remove some parking spaces and building structures on a portion of the lot. The LADWP would be given advance written notice and would be informed of its eligibility for relocation assistance and payments. In addition, the LADWP would be consulted during the design phase to ensure its operational needs are met during construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1. After mitigation, no significant adverse impacts associated with this partial take are expected.

- APN 5173001901 (Parcel on southeast corner of Alameda Street/Commercial Street intersection; Figure 5-5 #37) – This parcel contains a vacant lot. A portion of the parcel would be taken to accommodate a portal and associated structures that would allow the Fully Underground LRT Alternative – Little Tokyo Variation 1 underground alignment to join the existing at-grade Metro Gold Line. No significant adverse impacts associated with this partial take are expected because the lot is vacant.

5.5.1.3 Full Takes

There are 13 parcels that would be fully taken for construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 (Figures 5-2 through 5-5). Ten of these parcels would also be fully taken under the Underground Emphasis LRT Alternative:

- Parcel #5149008031 (Figure 5-3 #8)
- Parcel #5149008030 (Figure 5-3 #9)
- Parcel #5149008032 (Figure 5-3 #10)
- Parcel #5149007006 (Figure 5-3 #12)
- Parcel #5149007005 (Figure 5-3 #13)
- Parcel #5161018007 (Figures 5-4/5-5 #22)
- Parcel #5161018011 (Figures 5-4/5-5 #23)
- Parcel #5161018010 (Figures 5-4/5-5 #25)
- Parcel #5161018009 (Figures 5-4/5-5 #26)
- Parcel #5161018008 (Figures 5-4/5-5 #27)
- Parcel #5161018001 (Figures 5-4/5-5 #28)

For the impact analysis of these parcels, refer to section 5.4.1.3. The following additional parcels would be impacted by the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- APN 5173011901 (Parcel bounded by Alameda Street, 1st Street, Temple Street, and Parcel 5173011900; Figure 5-5 #30) – This parcel contains the existing Metro Gold Line alignment and Little Tokyo/Arts District Station. A portion of the parcel would be taken to widen 1st Street to accommodate the portals on 1st Street and allow the underground Fully Underground LRT Alternative – Little Tokyo Variation 1 to join the existing at-grade Metro Gold Line alignment. No significant adverse impacts associated with this full take are expected because the parcel is already owned by Metro.

- APN 5173012901 (Parcel bounded by 1st Street and Parcel 5173012900; Figure 5-5 #32) – This parcel contains a sidewalk and a portion of the parking lot associated with the proposed Nikkei development. The parcel would be taken in full to widen 1st Street to accommodate the portals on 1st Street and allow the Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment to join the existing at-grade Metro Gold Line alignment. No significant adverse impacts associated with this full take are expected because the parcel for the most part contains a sidewalk, and the Nikkei development would remove all existing parking.

- APN 5161018002 (402 E. 1st Street; Figure 5-5 #38) – This parcel is currently occupied by a privately owned, pay-to-park lot used primarily by customers of the restaurants in the vicinity of the lot and patrons of the Japanese American National Museum (JANM). If engineering analysis indicates that a full take is required on this parcel, construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would displace all parking spaces (approximately 70; however, this is an estimate because not all spaces are marked) for construction of an underground station and construction staging. Privately operated parking lots are typically considered transitional land uses that could be developed by the owners for higher and better uses. There are several other privately operated parking lots and structures in the vicinity. Although loss of the current parking lot may cause an inconvenience for users, it would not normally represent a significant adverse impact. This potential impact to parking would be partially offset by the increased public transit access provided by the proposed project. Little Tokyo residents and business owners have indicated that parking spaces are important community resources and that the loss of this parking could negatively impact the adjacent small businesses and the JANM located across the street. The community is concerned that this could, in turn, affect economic stability and ultimately the character of the community. Therefore, Metro would conduct a parking capacity study of the Little Tokyo area to determine if there is sufficient parking availability without these parcels or identify if replacement parking is

needed and to what extent. Adverse impacts to parking associated with this displacement would not occur.

- APN 5161018020 (437 E. 2nd Street; Figure 5-5 # 24) –If a full take of this parcel is required, Metro shall allow the existing businesses to remain operational, with the exception of the Office Depot and potentially Starbucks Coffee. The Office Depot would be given advance written notice and informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs that would be potentially displaced would be retained with the relocation. Therefore, there would be no net loss of jobs overall and no adverse impacts related to job loss. Additionally, displaced parking would be replaced by restriping Central Avenue with diagonal parking to accommodate more vehicles and by using the Nikkei parcel for parking.

- APN 5161018021 (Figure 5-5 # 39) – This parcel is currently occupied partly by a commercial building containing two restaurants and partly by a privately operated parking lot that is also part of APN 5161018002. If engineering analysis indicates that a full take is required, construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would displace the two restaurants (25 jobs) on this parcel to construct an underground station and for construction staging. Each business displaced as a result of the project would be given advance written notice and informed of its eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs potentially displaced would be retained with the relocation. Therefore, there would be no net loss of jobs overall and no adverse impact related to job loss. Although the commercial building on this parcel is an older structure, it is not considered to be historically significant.

5.5.2 Indirect Impacts

There are no potential indirect impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.3 Cumulative Impacts

Cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those under the Underground Emphasis LRT Alternative. Approximately the same amount of job loss and parking space loss is expected. The same mitigation measures would apply to the Fully Underground LRT Alternative – Little Tokyo Variation 1 as the Underground Emphasis LRT Alternative.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would follow the same alignment and be constructed in the same manner as the Underground Emphasis LRT

Alternative from the 7th Street/Metro Center Station to 2nd Street and Central Avenue. In this portion of the alignment, there would be three proposed underground stations; at Flower/5th/6th Streets, at 2nd/Hope Streets, and at 2nd Street and Broadway. A fourth underground stacked station in the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets would be constructed. The alignment would emerge to at-grade connections with the existing Gold Line tracks via three portals: north of Temple and Alameda Streets for the north-south line and staggered portals on 1st Street east of Alameda Street for the east-west line.

Metro has identified the entire block for acquisition under the Fully Underground LRT Alternative - Little Tokyo Variation 2. This acquisition is needed to stage construction and build a new underground station, station entrances, and ancillary facilities. Metro may also use the site to launch tunnel boring machines and transport material from the tunnels. Alternately, this may also be done near the proposed 2nd/Hope Street station site. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not be directly impacted by construction activities. Metro would, to the extent possible, promote and encourage businesses so that they remain open during construction, but Weilands Brewery, Café Cuba, Señor Fish, and Office Depot would need to be removed. This would represent a worst-case scenario. Potential reductions in the total acquisition may occur based on further engineering analysis during the preliminary engineering and final design stages.

5.6.1 Direct Impacts

A total of 12 parcels would potentially be acquired in part and 16 parcels as full takes to construct the Fully Underground LRT Alternative – Little Tokyo Variation 2. In addition, temporary construction easements that would affect five parcels and permanent underground easements that would affect six parcels would be required for this alternative.

Some station plans have multiple entrance options, though not all of them would be constructed. In these cases, all potential takings and easements for station entrances were evaluated. These properties would be utilized for TPSS site locations, construction staging, below-grade tunneling, and station locations. The Fully Underground LRT Alternative – Little Tokyo Variation 2 has a similar alignment as the Underground Emphasis LRT Alternative and Fully Underground LRT Alternative – Little Tokyo Variation 1, and shares most of the proposed stations with these two alternatives as well. The only parcels that would be fully or partially acquired as part of the Underground Emphasis LRT Alternative that would not be acquired as part of the Fully Underground LRT Alternative – Little Tokyo Variation 2 are:

- Parcel #5149001902 (Figure 5-3 #11)
- Parcel #5161024014 (Figure 5-3 #20)

- Parcel #5161024018 (Figure 5-3 #21)

Therefore, all three of these alternatives share similar displacement impacts. Table 5-4 identifies parcels in the project area that could be impacted by displacement by the Fully Underground LRT Alternative – Little Tokyo Variation 2 that would not be impacted by either the Underground Emphasis LRT Alternative or the Fully Underground LRT Alternative – Little Tokyo Variation 1. Table 5-4 also references the parcel's location as shown in Figure 5-6.

Additional engineering analysis may indicate that acquisition of two more parcels in the block bounded by Central Avenue, 1st Street, 2nd Street, and Alameda Street would be required.

Table 5-4. Additional Parcels Potentially Affected by Displacement –Fully Underground LRT Alternative – Little Tokyo Variation 2

Fig.	#	APN	Address	Type of Displacement	Current Use	Intended Use
5.6	40	5163003002	710 E. 1st Street	Partial Take	Vacant lot (associated with adjacent office bldg)	Road Widening
5.6	41	5163003003	712 E. 1st Street	Partial Take	Offices	Road Widening

Source: TAHA, 2010.

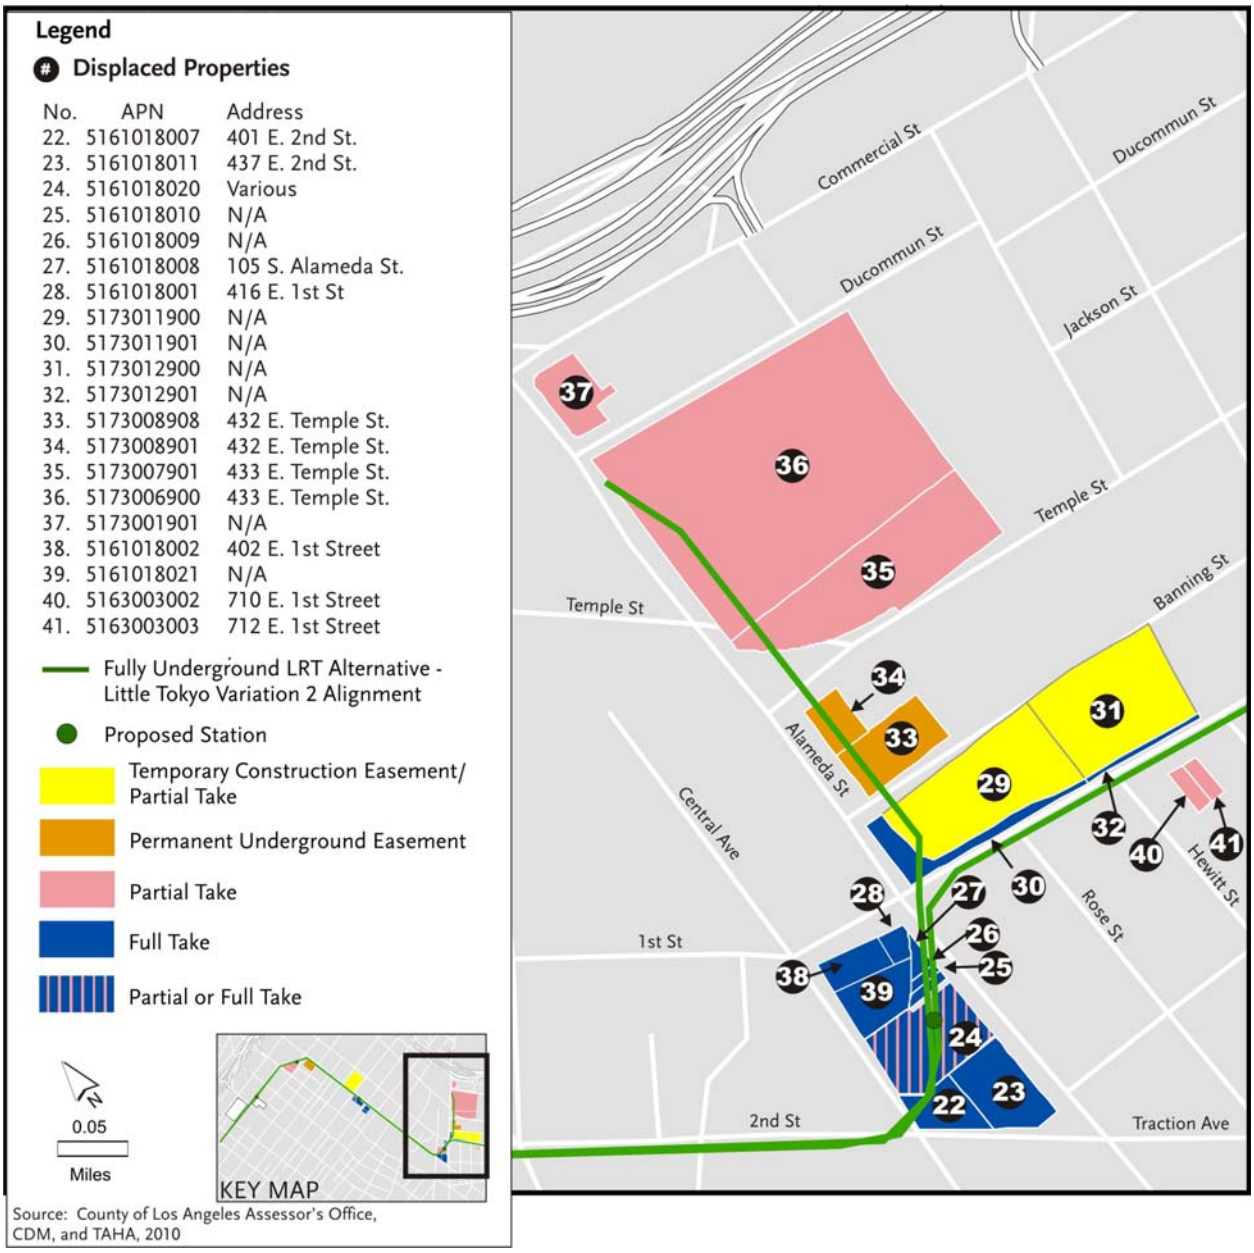

Figure 5-6. Fully Underground LRT Alternative – Little Tokyo Variation 2 - Potential Displacement in Little Tokyo

5.6.1.1 Easements

Temporary Construction Easements

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would require temporary construction easements affecting five parcels, all of which would also be affected by either the Underground Emphasis LRT Alternative or the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- Parcel #5151023400 (Figure 5-2 #1)
- Parcel #5151018017 (Figure 5-2 #2)
- Parcel #5149001903 (Figure 5-3 #7)
- Parcel #5173011900 (Figures 5-4/5-5/5-6 #29)
- Parcel #5173012900 (Figures 5-5/5-6 #31)

For the impact analysis of these parcels, refer to sections 5.4.1.1 and 5.5.1.1.

Permanent Underground Easements

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would require permanent underground easements affecting six parcels, all of which would also be affected by either the Underground Emphasis LRT Alternative or the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- Parcel # 5151004911/5151004912/5151004913 (Figure 5-2 #6)
- Parcels #5149006010-5149006151/5161026023/5161026024 (Figure 5-3 #s14, 16, 17)
- Parcels #5173008908 and #5173008901 (Figures 5-5/5-6 #s 33 and 34)

For the impact analysis of these parcels, refer to sections 5.4.1.1 and 5.5.1.1.

5.6.1.2 Partial Takes

There are 12 parcels that would be partially taken to construct the Fully Underground LRT Alternative – Little Tokyo Variation 2 (Figures 5-2 through 5-5). Ten of these parcels would also be partially taken under either the Underground Emphasis LRT Alternative or the Fully Underground LRT Alternative – Little Tokyo Variation 1:

- Parcel #5151014032 (Figure 5-2 #3)
- Parcel #5151014033 (Figure 5-2 #4)

- Parcel #5151027256 (Figure 5-2 #5)
- Parcel #5149001903 (Figure 5-3 #7)
- Parcel #5161018020 (Figures 5-4/5-5/5-6 #24)
- Parcel #5173011900 (Figures 5-4/5-5/5-6 #29)
- Parcel #5173012900 (Figures 5-5/5-6 #30)
- Parcels #5173007901 and #5173006900 (Figures 5-5/5-6 #s 35 and 36)
- Parcel #5173001901 (Figures 5-5/5-6 #37)

For the impact analysis of these parcels, refer to sections 5.4.1.2 and 5.5.1.2. The following additional parcels would be impacted by the Fully Underground LRT Alternative – Little Tokyo Variation 2:

- APN 5163003002 (710 E. 1st Street; Figure 5-6 #40) – This parcel is currently vacant. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would take a portion of the site for road widening to accommodate a realignment of 1st Street. This would be required to accommodate the train portals on 1st Street that would allow the Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment to join the existing at-grade portion of the Metro Gold Line alignment. No adverse impacts associated with this partial take are expected because the parcel is vacant.

- APN 5163003003 (712 E. 1st Street; Figure 5-6 #41) – This parcel is currently occupied by an office and associated parking lot. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would take a portion of the site for road widening to accommodate a realignment of 1st Street. This would be required to accommodate portals on 1st Street that would allow the Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment to join the existing at-grade portion of the Metro Gold Line alignment. A portion of the parking lot would be displaced, resulting in a loss of one to two parking spaces. The business to be relocated would be given advance written notice and informed of its eligibility for relocation assistance and payments. Provisions for replacement parking during construction and operation would be made for the business. In addition, further refinement of the alignment design would try to minimize the taking of parking for this business. With mitigation, no significant adverse impacts associated with this partial take are expected.

5.6.1.3 Full Takes

There are 13 parcels which would be fully taken to construct the Fully Underground LRT Alternative – Little Tokyo Variation 2 (Figures 5-2 through 5-5). These parcels would also be

fully taken under either the Underground Emphasis LRT Alternative or the Fully Underground LRT Alternative – Little Tokyo Variation 1, and include:

- Parcel #5149008031 (Figure 5-3 #8)
- Parcel #5149008030 (Figure 5-3 #9)
- Parcel #5149008032 (Figure 5-3 #10)
- Parcel #5149007006 (Figure 5-3 #12)
- Parcel #5149007005 (Figure 5.3 #13)
- Parcel #5161018007 (Figures 5-4/5-5/5-6 #22)
- Parcel #5161018011 (Figures 5-4/5-5/5-6 #23)
- Parcel #5161018010 (Figures 5-4/5-5/5-6 #25)
- Parcel #5161018009 (Figures 5-4/5-5/5-6 #26)
- Parcel #5161018008 (Figures 5-4/5-5/5-6 #27)
- Parcel #5161018001 (Figures 5-4/5-5/5-6 #28)
- Parcel #5173011901 (Figures 5-5/5-6 #30)
- Parcel #5173012901 (Figures 5-5/5-6 #32)
- Parcel #5161018002 (Figures 5-5/5-6 #38)
- Parcel #5161018020 (Figures 5-4/5-5/5-6 #24)
- Parcel #5161018021 (Figures 5-5/5-6 #39)

For the impact analysis of these parcels, refer to sections 5.4.1.3 and 5.5.1.3.

5.6.2 Indirect Impacts

There are no potential indirect impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.3 Cumulative Impacts

Cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those under either the Underground Emphasis LRT Alternative or the Fully

Underground LRT Alternative – Little Tokyo Variation 1. Therefore, approximately the same amount of job loss and parking space loss is expected. The same mitigation measures would apply to the Fully Underground LRT Alternative – Little Tokyo Variation 2 as apply to the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative – Little Tokyo Variation 1.

6.0 POTENTIAL MITIGATION MEASURES

6.1 No Build Alternative

6.1.1 Direct Impacts

No direct adverse impacts associated with displacements and relocations are expected under the No Build Alternative. Therefore, no mitigation measures are required.

6.1.2 Indirect Impacts

There are no indirect impacts associated with the No Build Alternative. Therefore, no mitigation measures are required.

6.1.3 Cumulative Impacts

There are no cumulative impacts associated with the No Build Alternative. Therefore, no mitigation measures are required.

6.2 Transportation Systems Management (TSM) Alternative

6.2.1 Direct Impacts

No direct adverse impacts associated with displacements and relocations of property are expected under the TSM Alternative. Therefore, no mitigation measures are required.

Up to 24 on-street parking spaces would need to be removed to install new bus stops on 2nd Street between Hill Street and Central Avenue. This assumes that each of the six new bus stops on 2nd Street would be 90 feet in length and displace up to four curb parking spaces.

Transit projects tend to offset the impacts of decreased parking by providing alternatives to driving. In the case of the TSM Alternative, parking impacts would be considered insignificant. Replacement parking may be required in the form of off-street parking at adjacent existing locations. Potential parking replacement locations and/or strategies would be identified to mitigate parking impacts.

6.2.2 Indirect Impacts

There are no indirect impacts associated with the TSM Alternative. Therefore, no mitigation measures are required.

6.2.3 Cumulative Impacts

There are no cumulative impacts associated with the TSM Alternative; therefore, no mitigation measures are required.

6.3 At-Grade Emphasis LRT Alternative

6.3.1 Direct Impacts

Potential adverse impacts associated with displacement are expected due to construction and operation of the At-Grade Emphasis LRT Alternative. The following mitigation measures would reduce potential impacts to below the thresholds of significance. Implementation of the proposed mitigation measures would result in a conclusion of no significant adverse impacts from the proposed alternative.

- Regarding APN 5151014032, where a potential adverse impact is expected due to the partial take of parking and primary access to the Central Plant, one-for-one replacement parking would be provided at the parcel or a nearby parcel. In addition, access to the Central Plant would be maintained at all times during construction of the At-Grade Emphasis LRT Alternative.

- Regarding APN 5161012901, where a potential adverse impact is expected due to the loss of 33 publicly operated parking spaces, replacement parking would be considered at a nearby parcel to ensure public parking continues to be available.

- Access would be maintained and adequate signage indicating the location and accessibility of a bus stop would be posted where access to bus stops are restricted (such as APN 5151023400).

- Adequate bus stop relocation to a nearby alternative location based on the re-routing of bus service would be implemented where bus stops would be displaced due to street closures (such as APN 5151016013). Adequate signage and notices indicating the relocated bus stop would be placed at strategic locations, as determined by Metro Operations.

- Metro would conduct a parking analysis of the Little Tokyo area to determine current parking capacity and how temporary or permanent displacement of parking would affect this capacity. Metro could possibly replace public (but paid) parking spaces displaced on APNs #s 6161012905 and 5161012901. During construction, access to other public parking lots would be maintained. Refer to the Traffic and Transportation Technical Memorandum for detailed mitigation measures regarding parking.

- Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure or necessary for access would be included in Metro Joint Development Program for possible development. A development would be environmentally cleared separately from this project and would undergo its own community input process. Until a development is approved, the remaining underutilized property may be used to house surface public parking spaces or at the

very least be graded and fenced to a higher standard that reflects the community's identity and character more than typical gravel and chainlink.

- During construction, Metro would work with the City to evaluate potential parking mitigation options to increase the number of public parking spaces in the area of Little Tokyo. This could include, but would not be limited to, restriping the existing street to allow for diagonal parking, reducing the number of restricted parking areas, increase number of hours of parking for on-street parking.

6.3.2 Indirect Impacts

There are no indirect impacts associated with the At-Grade Emphasis LRT Alternative. Therefore, no mitigation measures are required.

6.3.3 Cumulative Impacts

The proposed At-Grade Emphasis LRT Alternative would provide three new stations and greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset some of the loss of parking in the downtown area. Therefore, the project would be partly self-mitigating and the potential impact would not be significant.

6.4 Underground Emphasis LRT Alternative

6.4.1 Direct Impacts

Potential adverse impacts associated with displacement are expected due to construction and operation of the Underground Emphasis LRT Alternative. The following mitigation measures would result in no significant adverse impacts:

- Access would be maintained and adequate signage indicating the location and accessibility of a bus stop would be posted where access to bus stops are expected to be restricted (such as APN 5151023400).

- For APN 5151014032, the potential adverse impact is due to the partial take of parking and primary access to the Central Plant. Replacement parking would be provided at the parcel or a nearby parcel. In addition, access to the Central Plant would be maintained at all times during construction of the Underground Emphasis LRT Alternative.

- Access to the Little Tokyo Library Branch would be maintained at all times during construction of the Underground Emphasis LRT Alternative (APN 5161026033). Notification of construction activities would be defined in a Construction Mitigation Program developed by Metro upon approval of the project. This program would include identification of communication protocol with the community during final design and construction.

- Regarding all displaced businesses (APNs 5149007006, 5161018001, 5161018020, and 5161018021), Metro would provide relocation assistance and compensation as required by both the Uniform Act and the California Act. The details of these laws are described in Sections 3.1.1 and 3.1.2. Where acquisitions and relocations are unavoidable, FTA and Metro would follow the provisions of both acts and their amendments. All real property acquired by Metro would be appraised to determine its fair market value. Just compensation, which would not be less than the approved appraisal, would be made to each property owner. Each business displaced as a result of the project would be given advance written notice and informed of their eligibility for relocation assistance and payments. It is anticipated that where relocation would be required, most of the jobs potentially displaced would be retained with the relocation. This would result in no significant adverse impacts related to job loss.

- Regarding APN 5161018001, refer to the Historical Resources Technical Memorandum for detailed mitigation measures regarding historical properties. Regarding the privately operated parking lot spaces in Little Tokyo (parcels bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street), Metro would conduct a parking capacity study in Little Tokyo to evaluate the need for replacing these parking spaces.

- Bus stops would be relocated to a nearby alternative location based on re-routed bus service due to street closures (such as APN 5151016013). Adequate signage and notices indicating the relocated bus stop would be placed at strategic locations, as determined by Metro Operations.

- Metro would conduct a parking analysis of the Little Tokyo area to determine parking capacity and if temporary or permanent displacement of parking would affect this capacity. During construction and operation of this alternative, Metro would consider replacing displaced parking on the block bounded by Central Avenue, 1st Street, 2nd Street, and Central Avenue. During construction, access to other public parking lots would be maintained. Refer to the Traffic and Transportation Technical Memorandum for detailed mitigation measures regarding parking.

- Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure or necessary for access would be included in Metro Joint Development Program for possible development. A development would be environmentally cleared separately from this project and would undergo its own community input process. Until a development is approved, the remaining underutilized property may be used to house surface public parking spaces or at the very least be graded and fenced to a higher standard that reflects the community's identity and character than typical gravel and chainlink.

- During construction, Metro would work with the City to evaluate potential parking mitigation options to increase the number of public parking spaces in the area of Little Tokyo. This could include, but would not be limited to, restriping the existing street to allow for diagonal parking, reducing the number of restricted parking areas, increase number of hours of parking for on-street parking.

6.4.2 Indirect Impacts

There are no indirect impacts associated with the Underground Emphasis LRT Alternative. Therefore, no mitigation measures are required.

6.4.3 Cumulative Impacts

The proposed Underground Emphasis LRT Alternative would provide three new stations and greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset some of the loss of parking in the downtown area. Therefore, the project would be partly self-mitigating and the potential impact would not be significant.

6.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

6.5.1 Direct Impacts

The impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 are similar to those expected for the Underground Emphasis LRT Alternative. Therefore, the same mitigation measures proposed in Section 6.4.1 would apply to the Fully Underground LRT Alternative – Little Tokyo Variation 1. In addition, the following mitigation would result in no significant adverse impacts associated with this alternative:

- For APNs 5173007901 and 5173006900, the LADWP will be consulted during the design phase to accommodate its operational needs during construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

Area reduction of impacts would occur as engineering analysis continues, should properties be removed from the list of properties identify to be fully taken for construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1. Similar mitigation as the Underground Emphasis LRT Alternative for displaced businesses and parking would be utilized to reduce potential impacts to a less than significant level.

Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure or necessary for access would be included in Metro Joint Development Program for possible development. A development would be environmentally cleared separately from this project and would undergo its own community input process. Until a development is approved, the remaining underutilized property may be used to house

surface public parking spaces or at the very least be graded and fenced to a higher standard that reflects the community's identity and character more than typical gravel and chainlink.

During construction, Metro would work with the City to evaluate potential parking mitigation options to increase the number of public parking spaces in the area of Little Tokyo. This could include, but would not be limited to, restriping the existing street to allow for diagonal parking, reducing the number of restricted parking areas, increasing the number of hours of parking for on-street parking.

6.5.2 Indirect Impacts

There are no indirect impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1. Therefore, no mitigation measures are required.

6.5.3 Cumulative Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would provide four new stations and greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset the parking loss in the downtown area. Therefore, the project would be partly self-mitigating and the potential impact would not be significant.

6.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

6.6.1 Direct Impacts

The impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 are similar to those anticipated for both the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative – Little Tokyo Variation 1. Therefore, the same mitigation measures proposed in sections 6.4.1 and 6.5.1 would apply to the Fully Underground LRT Alternative – Little Tokyo Variation 2. In addition, the following mitigation would result in no significant adverse impacts associated with this alternative:

- For APN 5163003003, further refinement of the alignment design would minimize the taking of parking.

If additional parcels are fully taken to construct and operate the Fully Underground LRT Alternative – Little Tokyo Variation 2, similar mitigation as the Underground Emphasis LRT Alternative for displaced businesses and parking would be utilized to result in no significant or adverse impacts.

Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure or necessary for access would be included in Metro Joint Development Program for possible development. A development would be environmentally cleared separately from this project and will undergo its own community input process. Until a development is approved, the remaining underutilized property may be used to house

surface public parking spaces or at the very least be graded and fenced to a higher standard that reflects the community's identity and character more than typical gravel and chainlink.

During construction, Metro would work with the City to evaluate potential parking mitigation options to increase the number of public parking spaces in the area of Little Tokyo. This could include, but would not be limited to, restriping the existing street to allow for diagonal parking, reducing the number of restricted parking areas, increase number of hours of parking for on-street parking.

6.6.2 Indirect Impacts

There are no indirect impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2. Therefore, no mitigation measures are required.

6.6.3 Cumulative Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would provide four new stations and greatly enhance non-auto access by rail to downtown and Little Tokyo. This would partly offset some of the loss of parking in the downtown area. Therefore, the project would be partly self-mitigating and would not result in significant or adverse impacts.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

The No Build Alternative would include the transit investments already planned as described in the Metro 2009 LRTP. Accordingly, under the No Build Alternative there would be little to no construction in the project area associated with additional transit infrastructure investment. The No Build Alternative would not result in displacement of housing, people, or employment. Therefore, no significant adverse impacts are expected, and no mitigation measures are required.

7.1.2 CEQA Determinations

Based on the CEQA thresholds of significance (Section 3.2), the No Build Alternative would not have a significant impact associated with displacement or relocation because it would not displace or relocate persons or housing, including affordable housing. Additionally, it would not displace employment. No cumulatively considerable impacts are anticipated. No adverse impacts are anticipated and no mitigation measures are required.

7.2 Transportation Systems Management (TSM) Alternative

7.2.1 NEPA Findings

Under the TSM Alternative, transit infrastructure investment would occur, including (but not limited to) two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. This would be in addition to the same infrastructure investment that would occur under the No Build Alternative.

The TSM Alternative would utilize existing street and sidewalk networks wherever possible; however, approximately 24 curb parking spaces would need to be removed from 2nd Street between Hill Street and Central Avenue to accommodate the new bus stops. No displacement or relocation of properties, residents, or employees would be required. Therefore, no significant adverse impacts associated with displacements and relocations are expected under the TSM Alternative, and no mitigation measures are required. Cumulative adverse impacts would not occur with respect to parking displacement of 24 on-street parking spaces. In addition, potential impacts to parking would be partially offset by the increased public transit access provided by the proposed TSM Alternative and therefore, would not be significant.

7.2.2 CEQA Determinations

Based on the CEQA thresholds of significance (see Section 3.2), the TSM Alternative would not have a significant impact associated with displacement or relocation because it would not

displace or relocate persons or housing, including affordable housing. Additionally, it would not displace employment. No cumulatively considerable impacts are expected. No significant adverse impacts are expected and no mitigation measures are required.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would extend the light rail tracks from the underground 7th Street/Metro Center Station and connect to the Metro Gold Line tracks in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street at Temple Street. To implement this alternative, the number of traffic lanes and on-street parking on 2nd Street would be reduced.

It is expected that 11 parcels would be acquired as partial takes to construct the At-Grade Emphasis LRT Alternative. In addition, temporary easements during construction affecting two parcels would be required. These parcels would be utilized for TPSS site locations, construction staging, below grade tunneling, and proposed station locations.

Construction and operation of the At-Grade Emphasis LRT Alternative would result in potentially adverse impacts associated with displacement of 51 on-street spaces, 29 on-street loading spaces and 77 pay-to-park parking spaces, restriction to the Central Plant access and associated parking, and restriction or relocation of bus stops. Mitigation measures have been identified that would reduce potential impacts to a less than significant level. Cumulative adverse impacts would not occur with parking displacement of 33 parking spaces. In addition, potential impacts to parking would be partially offset by the increased public transit access provided by the proposed project and potential effects would be less than significant.

7.3.2 CEQA Determinations

Based on the CEQA thresholds of significance (see Section 3.2), the At-Grade Emphasis LRT Alternative would not have a significant impact associated with displacement or relocation because it would not displace or relocate persons or housing, including affordable housing. Also, no employment would be lost due to displacement under the At-Grade Emphasis LRT Alternative. No mitigation measures are required.

Adverse cumulative impacts would not occur due to loss of parking. In addition, impacts to parking would be partially offset by the increased public transit access provided by the proposed project and potential effects would be less than significant.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

The Underground Emphasis LRT Alternative would extend from the 7th Street/Metro Center Station north along Flower Street, east under 2nd Street, and emerge at an at-grade connection just southwest of the 1st/Alameda Streets intersection.

To construct the Underground Emphasis LRT Alternative, it is expected that ten parcels would be acquired as partial takes and 11 parcels as in full takes. In addition, temporary easements during construction affecting eight parcels and permanent easements affecting four parcels would be required for this alternative. These parcels would be used for TPSS site locations, construction staging, below-grade tunneling, and station locations.

Construction and operation of the Underground Emphasis LRT Alternative would result in potential adverse impacts associated with:

- Displacement of approximately nine businesses, including approximately 90 jobs;
- Permanent displacement of between 148 and 281 parking spaces on privately operated lots, with approximately 139 of those spaces located in Little Tokyo;
- Permanent displacement of 17 on-street parking spaces and three on-street loading spaces;
- Potential restriction of access to the Central Plant (and associated parking) and the Little Tokyo Library Branch during construction; and
- Potential restriction of access or relocation of bus stops.

Mitigation measures have been identified that would reduce potential impacts to a less than significant level. Cumulative adverse impacts would not occur with respect to parking displacement. In addition, parking loss would be offset by increased transit access and replacement parking.

7.4.2 CEQA Determinations

Based on the CEQA thresholds of significance (see Section 3.2), the Underground Emphasis LRT Alternative would not have a significant impact associated with displacement or relocation because it would not displace or relocate persons or housing, including affordable housing.

Although no thresholds of significance exist under CEQA for employment displacement, the net loss of employment would be considered an adverse impact. However, mitigation measures have been identified that would mitigate this impact to a less-than-significant level.

Adverse cumulative impacts would not occur due to the loss of parking. In addition, parking losses would be partially offset by increased access provided by rail transit and replacement parking. Therefore, potential impacts would be less than significant.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would extend from the 7th Street/Metro Center Station north along Flower Street, east under 2nd Street, and emerge at an at-grade connection north of Temple Street parallel to Alameda Street and along 1st Street, east of Alameda Street.

To construct the Fully Underground LRT Alternative – Little Tokyo Variation 1, it is expected that nine to ten parcels would be acquired as partial takes and 13 to 16 parcels as full takes. In addition, temporary easements during construction affecting five parcels and permanent easements affecting six parcels would be required for this alternative. These parcels would be utilized for TPSS site locations, construction staging, below grade tunneling, and station locations. Additionally, if further engineering analysis indicates, three additional parcels may be fully taken on the block bounded by Central Avenue, 1st Street, 2nd Street, and Alameda Street.

Construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in similar potential adverse impacts as the Underground Emphasis LRT Alternative and, as a result, would require the same mitigation measures to reduce potential impacts to a less than significant level. In addition, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would have an additional impact by potentially displacing parking and structures in the LADWP site located at the northeast corner of the Alameda Street/Temple Street intersection. Mitigation measures have been identified that would result in no adverse impacts. Cumulative adverse impacts would not occur with respect to parking displacement. In addition, parking loss would be partially offset by increased transit access and replacement parking. Therefore, potential impacts would be less than significant.

7.5.2 CEQA Determinations

Based on the CEQA thresholds of significance (see Section 3.2), the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not have a significant impact associated with displacement or relocation because it would not displace or relocate persons or housing, including affordable housing.

Although no thresholds of significance exist under CEQA for employment displacement, the net loss of employment is considered an adverse impact. However, mitigation measures have been identified that would mitigate this impact to a less-than-significant level.

Adverse cumulative impacts would not occur due to the loss of parking. In addition, parking losses would be partially offset by the increase in access provided by rail transit and replacement parking. Therefore, potential impacts would be less than significant.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would extend from the 7th Street/Metro Center Station north along Flower Street, east under 2nd Street, and emerge at an at-grade connection north of Temple Street parallel to Alameda Street and along 1st Street, east of Alameda Street.

To construct Fully Underground LRT Alternative – Little Tokyo Variation 2, it is expected that 11 to 12 parcels would be acquired as partial takes and 13 to 16 parcels as full takes. In addition, temporary easements during construction affecting five parcels and permanent easements affecting six parcels would be required for this alternative. These parcels would be utilized for TPSS site locations, construction staging, below grade tunneling, and station locations. Additionally, if further engineering analysis indicates, three additional parcels may be taken in full on the block bounded by Central Avenue, 1st Street, 2nd Street, and Alameda Street.

Construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in similar potential adverse impacts as both the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternative – Little Tokyo Variation 1. Consequently, the same mitigation measures identified for these impacts would be required to reduce potential impacts to a less than significant level. In addition, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would have an additional impact of potentially displacing parking and a setback for businesses on the south side of 1st Street between Hewitt Street and Garey Street. Mitigation measures have been identified that would result in less than significant impacts. Cumulative adverse impacts would not occur with respect to parking displacement. In addition, lost parking would be offset by increased transit access and replacement parking. Therefore, potential impacts would be less than significant.

7.6.2 CEQA Determinations

Based on the CEQA thresholds of significance (see Section 3.2), the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not have a significant impact associated with displacement or relocation because it would not displace or relocate persons or housing, including affordable housing.

Although no thresholds of significance exist under CEQA for employment displacement, the net loss of employment is considered an adverse impact. However, mitigation measures have been identified that would mitigate this impact to a less-than-significant level.

Adverse cumulative impacts would not occur due to the loss of parking. In addition, parking losses would be partially offset by increased access provided by rail transit and replacement parking. Therefore, potential impacts would be less than significant.

1.0 SUMMARY

This technical memorandum analyzes potential impacts of the Regional Connector Transit Corridor project on communities and neighborhoods in the central downtown area of Los Angeles. For purposes of this analysis, the central downtown area is defined as the area bounded on the north by Sunset Boulevard/Cesar Chavez Avenue, on the south by the Santa Monica Freeway (I-10), on the west by the Harbor Freeway (SR 110), and on the east by Alameda Street.

The project area encompasses seven communities (or neighborhoods) including the Financial District, Bunker Hill, Civic Center, Historic Core, Little Tokyo, and the Arts District. The alternatives analyzed include the No Build Alternative, the Transportation System Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2.

The No Build Alternative would not involve any construction and is presented to show potential impacts of not building the proposed project. The TSM Alternative involves creating two new shuttle bus routes to connect the Metro Gold and Blue Lines. This alternative would involve minimal construction and would create a new bus public transportation route through the central downtown area; however, the TSM Alternative would not substantially decrease commute times or reduce the number of transfers required. Therefore, it is not expected to encourage new growth in population, housing, or employment.

The At-Grade Emphasis LRT Alternative would potentially have construction and operational impacts in the project area. The major potential community and neighborhood impacts associated with this alternative would be reduced mobility and access to businesses during construction and elimination of mid-block left turn lanes along 2nd Street in the Civic Center and Bunker Hill neighborhoods during operation. Some partial property acquisitions, including both temporary and permanent easements, would also be necessary. (Temporary easements are used during construction, and permanent easements are obtained to provide for operations.)

Overall, the improved transit infrastructure, coupled with the city's transit-oriented growth policies, could encourage new residential and commercial development, thus improving the supply of housing and job opportunities in the downtown area.

The Underground Emphasis LRT Alternative would have similar potential construction impacts as the At-Grade Emphasis LRT Alternative. It would require displacing several existing businesses in Little Tokyo and the Historic Core area.

Operation of the Underground Emphasis LRT Alternative would not adversely affect existing businesses because the alignment would not run along existing streets. The project would bring additional pedestrians to the downtown area, providing opportunities for businesses to attract new customers.

The new transit infrastructure of the Underground Emphasis LRT Alternative could attract development to the immediate area of the stations and alignment. The number of housing units and jobs could increase if coupled with the City's transit-oriented land use policies. Access to and from the project area communities and within the entire Los Angeles region would be greatly enhanced.

Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2 would also have potential construction and operational impacts. West of Central Avenue, the impact would be identical to that of the Underground Emphasis LRT Alternative when built with the 2nd Street station - Broadway option. East of Central Avenue, additional property would need to be acquired, and additional buildings would need to be displaced. These displacements would include removing existing businesses.

Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2 include a new underground station in Little Tokyo. This station would connect train service from more branches of the rail system than other alternatives. Therefore, these alternatives provide the most access to the community from other parts of the county.

Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2 would bring more pedestrians to the downtown area, benefitting businesses and housing developments, and providing opportunities for businesses to attract new customers. Communities near stations along the project corridor will have direct light rail access to four different corridors throughout the County.

2.0 INTRODUCTION

As the second largest metropolitan region in the United States, Los Angeles is home to approximately 15 million people and contains diverse cultures, world-renowned entertainment venues, and unique industries. At the heart of Los Angeles is the central downtown, considered the industrial, governmental, and financial core of the City.

Los Angeles was originally established in 1781 beginning in the area now known as central downtown (City of Los Angeles 2003a). The area saw a large increase in growth in the 1800s as the transcontinental railway was constructed. By the 1900s, the population continued to grow with development of manufacturing, industrial, and commercial industries.

While the Great Depression and World War II resulted in slower population growth, the economic and suburban expansion after the war helped the City to rebound. Recently, the central downtown area has been the center of the City's revitalization plans and continues to undergo redevelopment to improve the economic vitality and quality of life for those living and working in the area (City of Los Angeles Planning Department 2003a).

The central downtown community area, defined in the Central City Community Plan (City of Los Angeles 2003a), encompasses approximately three square miles south of Sunset Boulevard/Cesar Chavez Avenue, north of the Santa Monica Freeway (I-10), east of Harbor Freeway (SR 110), and west of Alameda Street. It is bounded by the Central Downtown North, Silver Lake-Echo Park, Westlake, Southeast, and South Central Los Angeles communities (City of Los Angeles Planning Department 2003a). In addition to housing many of the City's government and financial institutions, central downtown has important architecture, unique ethnic communities, historic landmarks, and growing residential areas.

The Regional Connector Transit Corridor project would provide a public transit option through central downtown, linking the Metro Gold Line to the City of Azusa via Pasadena and I-605 via the Eastside Extension with the Metro Blue Line to Long Beach, and the proposed Metro Expo Line to Santa Monica. Currently, public transit users must transfer to the Metro Red Line to connect from the Metro Gold Line to or from the Metro Blue Line. Thus, this project would help commuters by providing them a means to travel directly through the central downtown, reducing the number of necessary transfers.

The project would provide residents and businesses in the communities of downtown with greatly expanded access to and from the entire Los Angeles region. Up to four new landmark rail stations would enhance the visibility and identity of downtown communities. While the overall project is expected to provide many beneficial impacts, it also has the potential to adversely affect the quality of life for the diverse neighborhoods and communities that make up central downtown.

This document discusses the potential adverse and beneficial, direct and indirect construction and operation impacts of the Regional Connector Transit Corridor project on the various affected communities and neighborhoods. The document also discusses possible mitigation measures that could be implemented to offset potential impacts.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section discusses the community and neighborhood-related regulatory requirements potentially relevant to the project.

3.1 Federal Regulatory Requirements

3.1.1 Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970

The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 and implementing regulations (49CFR24) outline minimum standards for federally funded projects that acquire real property or displace persons from their homes or businesses. The purpose of the Act is to provide fair and equitable treatment and relocation assistance to those whose property is acquired or who have been displaced. The Regional Connector Transit Corridor project will comply with this Act in the event that properties must be acquired or any persons are displaced.

3.1.2 Americans with Disabilities Act of 1990

The Americans with Disabilities Act of 1990 ensures equal rights to all those with disabilities. The regulations implementing this Act (49CFR38) outline specific requirements for buses and light rail vehicles, including access ramps, handrails, priority seats for persons with disabilities, auditory and visual warnings for door closings, and minimum door widths to ensure persons with disabilities can safely use public transit facilities. The Regional Connector Transit Corridor project will comply with the Americans with Disabilities Act and will ensure adequate access to persons with disabilities.

3.2 State Regulatory Framework

The California State Environmental Quality Act (CEQA) requires an analysis of potential project impacts on communities and neighborhoods. CEQA guidelines include standards of significance that provide a framework for evaluating potential impacts. These standards are discussed in further detail in Section 3.4.

3.3 Local Regulatory Framework

3.3.1 Central City Community Plan

The Central City Community Plan is part of the City of Los Angeles General Plan Land Use Element and guides future development within the central downtown area. All proposed build alternatives would be consistent with the transportation objectives and policies stated in the Central City Community Plan, specifically:

Objective: 11-2.10 Extend light rail transit northerly from the existing 7th Street/Metro Center terminal to serve Bunker Hill and Little Tokyo connecting to Union Station.

Policies:

- Provide additional bus routes to link businesses and housing districts with existing and planned cultural/entertainment districts. Coordinate additional routes with extended hours of operation.
- Provide for the efficient circulation into and within downtown.

Small portions of the build alternatives' alignments near the Little Tokyo/Arts District Station are located east of Alameda Street, in the Central City North Community Plan area. Both the Central City Community Plan and the Central City North Community Plan are consistent in their treatment of this location.

3.3.2 Zoning Code Provisions Encouraging Density Around Transit Stations

The City of Los Angeles Planning and Zoning Code includes incentives for development within 1,500 feet of transit station entrances. For example, the City may permit developments in these areas to include more square footage and fewer off-street parking spaces than zoning would otherwise allow (Los Angeles, California, Planning and Zoning Code art. II, § 12-24 [2000]).

By adding new rail stations to downtown Los Angeles, the Regional Connector would expand the number of parcels eligible for density and parking incentives. This could enhance economic activity in the downtown area, encourage growth in locations served by the rail system, and provide new opportunities for increased transit use.

3.4 Significance Criteria

Under CEQA, a project would create a significant adverse impact to communities and neighborhoods if it would physically divide an established community or neighborhood.

According to the U.S. Department of Transportation NEPA guidance for assessing transportation project impacts on communities, a significant adverse impact to communities and neighborhoods could result if it would:

- Adversely alter the social and physical character of the community or neighborhood; or
- Degrade the quality of life by:
    - Adversely affecting public health or safety
    - Increasing the potential for crime

- Adversely affecting important community resources and events (such as festivals, parades, landmarks, parks, or community centers)
- Adversely affecting senior citizens or disabled persons
- Adversely affecting viability of local businesses (through loss of parking, re-routing of vehicles, decreasing pedestrian access, relocation)
- Reducing mobility (pedestrian, bicycle, or vehicle) in and between communities or neighborhoods
- Adversely affecting existing community public services (emergency services)
- Substantially changing the population or employment of the area

3.5 Methodology

The analysis of impacts on existing communities and neighborhoods was conducted according to the "*Community Impact Assessment: A Quick Reference For Transportation"* (U.S. Department of Transportation, Federal Highway Administration 1996).

The analysis includes a description of community profiles to identify population, housing, and employment characteristics; unique community features and events; community linkages and mobility; crime; and important public services. These community profiles have been established using the Central City Community Plan of the Los Angeles General Plan, the Central City Association of Los Angeles resources, site visits, U.S. Census Bureau statistics, Southern California Association of Governments (SCAG) data, information from local neighborhood councils, and public comments and input received on the project from ongoing meetings and outreach activities.

Communities have a set of identifiable elements (both perceptual and physical) within a specific geographic area. Once a profile has been described for each of the potentially affected communities, the analysis describes short-term (temporary) and long-term (permanent) effects from both construction and operation of the project alternatives on each community. The analysis includes several aspects: creation of physical, social, or psychological barriers within an established community or neighborhood; disruption of access to community assets; and displacement effects on the community assets. The analysis describes qualitative, and where possible, quantitative impacts associated with potential changes to the local communities.

Each impact is examined based on the profile of the community or neighborhood in which it would occur. The significance of each impact is determined based on the significance criteria listed above, the nature of the impact (temporary or permanent), both direct and indirect

impacts on each local community or neighborhood, and the potential mitigation measures that could be implemented to reduce or avoid the impact.

3.6 Project Area

The project area for the community and neighborhood analysis includes all communities and neighborhoods that would be potentially directly and/or indirectly impacted by the construction and operation of the proposed project. The communities that could be potentially beneficially or adversely impacted by the proposed project include:

- Financial District
- Bunker Hill
- Toy District
- Arts District
- Civic Center
- Historic Core
- Little Tokyo

A map of these communities is provided in Figure 3-1. Other areas that would be indirectly affected by the project include communities along the Metro Gold Line and the Metro Blue Line because they would be linked by the Regional Connector Project. Indirect effects to these communities are discussed at a qualitative level.

The area analyzed is slightly larger than the actual footprint of the proposed alternatives because communities near the area also have the potential to be affected by project construction and operation . This analysis includes all of the central downtown area, defined as south of Sunset Boulevard/Cesar Chavez Avenue, north of the Santa Monica Freeway (I-10), east of Harbor Freeway (I-110), and west of Alameda Street. For purposes of this community and neighborhood impact analysis, the area examined includes the following census tracts within central downtown: 2074, 2062, 2063, 2073, 2075, 2077.10, 2060.30, and 2060.40. Figure 3-2 presents a map of the census tracts included in this analysis.

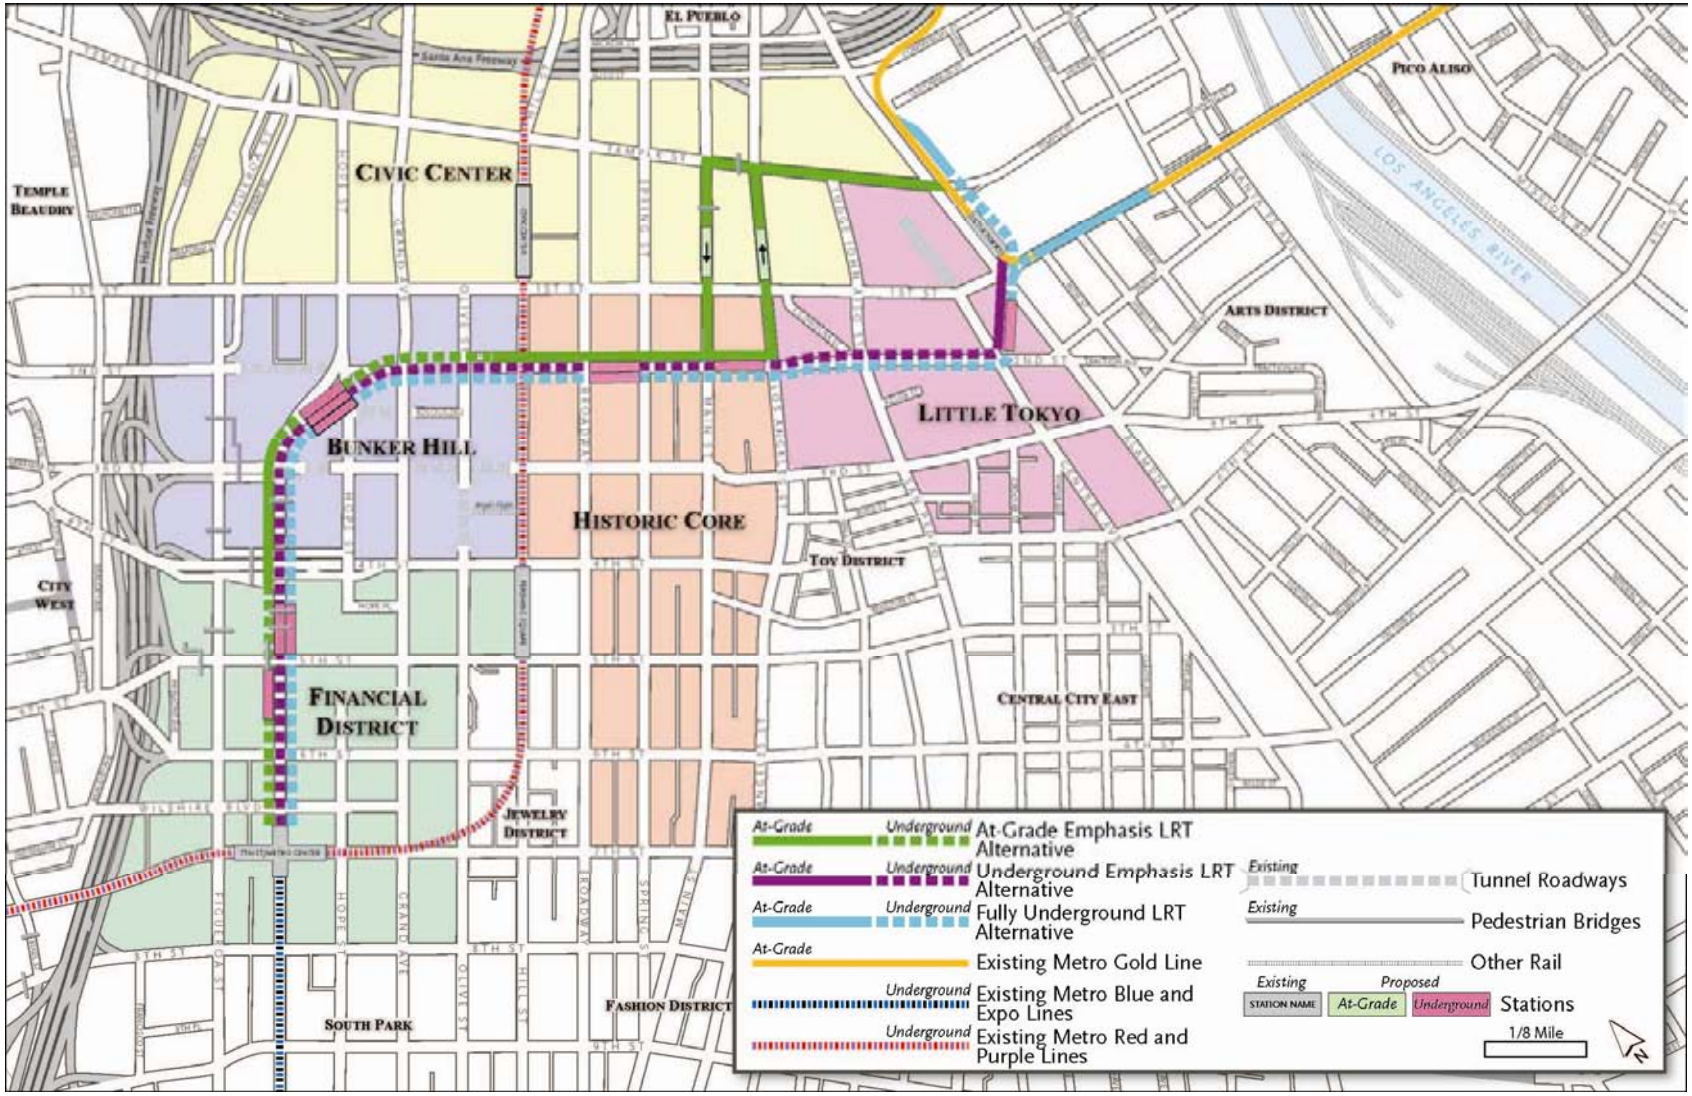

Figure 3-1. Central Downtown Communities

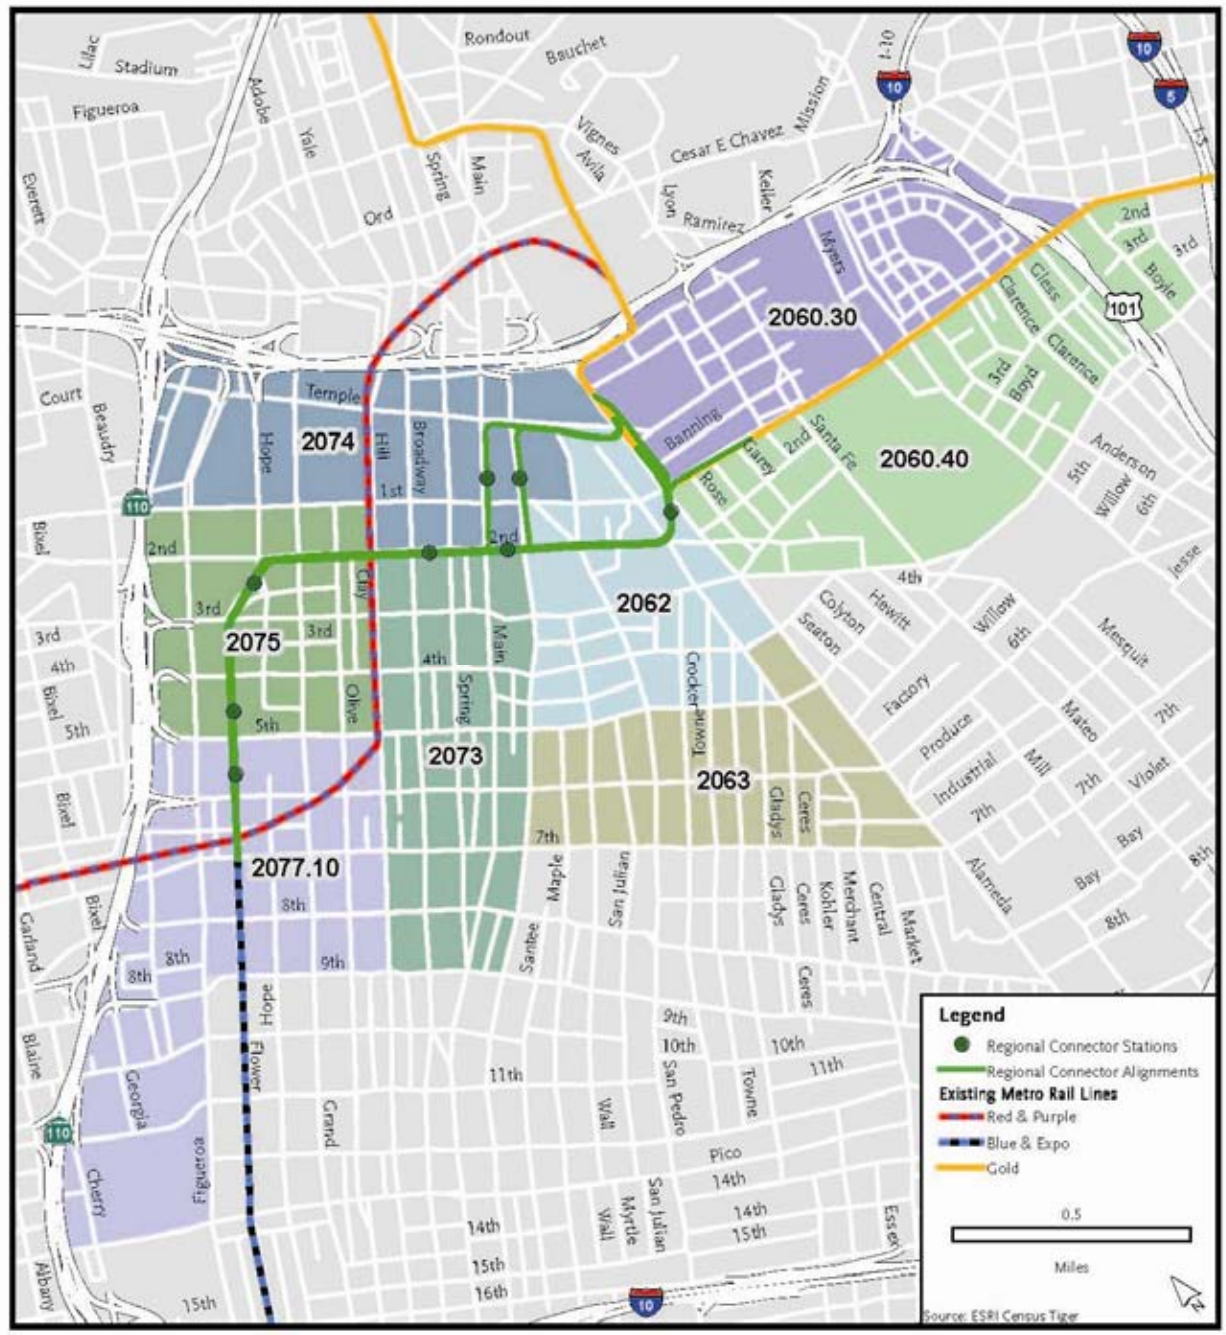

Figure 3-2. Census Tracts Analyzed

4.0 AFFECTED ENVIRONMENT

This section describes the current conditions of the central downtown area, including general demographics and community profiles.

4.1 Population and Ethnicity

In 2000, the central downtown area's[1] population was approximately 23,175, representing less than 0.6 percent of the entire City of Los Angeles' population (Census Bureau 2000). In 2005 SCAG estimated that the central downtown area's population was approximately 24,794, about 0.6 percent of the City's population (City of Los Angeles Planning Department /Demographic Research Unit 2009). Table 4-1 shows the 2000 and 2005 population by census tract for central downtown.

Table 4-1. Population for the Central Downtown Area

Census Tract	Approximate Neighborhoods	2000[1] Population	2005[2] Estimated Population
2060.30	Little Tokyo, Arts District, Boyle Heights*	955	1,029
2060.40	Little Toyko, Arts District, Boyle Heights*	3,445	3,753
2062	Little Tokyo, Central City East*	3,477	3,638
2063	Central City East*, Central Industrial District*	4,995	5,320
2073	Historic Core	3,739	4,068
2074	Civic Center	1,237	1,344

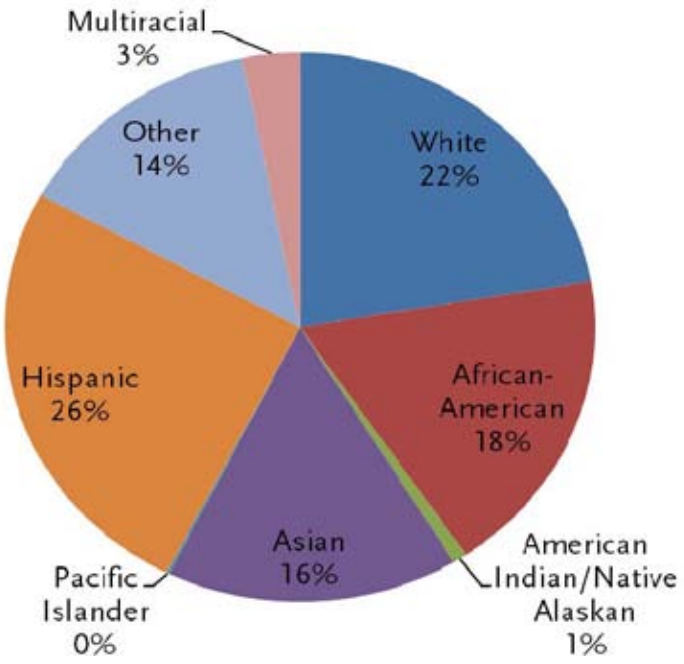
[1] Note: The total population of the analysis area for community and neighborhood impacts is shown. The area and population defined in the Central City Community Plan and the Central City North Community Plan will vary. Also, some of the census tracts included in the demographic data extend beyond the boundaries of the communities to be analyzed.

Table 4-1. Population for the Central Downtown Area			
Census Tract	**Approximate Neighborhoods**	**2000[1] Population**	**2005[2] Estimated Population**
2075	Bunker Hill	4,098	4,326
2077.10	Financial District, South Park	1,229	1,316
Total		**23,175**	**24,794**

Source: [1]Census Bureau, Summary File 1, 2000; [2]SCAG 2009.

** Neighborhood included in census tract data, but is too far from proposed alternatives to be impacted. More specific data is not available.*

Central downtown has a diverse ethnic population. As shown in Figure 4-1, 26 percent of the population in 2000 was Hispanic, 18 percent was African-American, 16 percent was Asian, 22 percent was White, 1 percent was American Indian/Native American, 3 percent was designated as multiple race, and less than 1 percent was designated as Pacific Islander and Other Race (Census Bureau 2000).



Source: Census Bureau 2000.

Figure 4-1. Ethnicity for Central Downtown

The age of the population in the central downtown area varies considerably throughout the different communities. In 2000 there were three main areas with relatively higher populations of seniors (over the age of 65): the Bunker Hill area, the Little Tokyo area, and the northern portion of central downtown.

Table 4-2 shows the median age of the downtown population by census tract for the year 2000. An area around the Historic Core and Jewelry District had a median age of 49, while the northern portion of the Arts District had a median age of just 28. The Little Tokyo area had a median age of 45 (Census Bureau 2000).

4.2 Languages Spoken At Home

The most common language spoken at home throughout the central downtown area in 2000 was English, followed by Asian/Pacific Isle languages, Spanish, Indo-European languages, and other languages (Census Bureau 2000). Each community within the downtown area varies considerably regarding the language spoken at home.

Table 4-2. Median Age of Central Downtown Population

Census Tract	Both Sexes	Male	Female
2060.30	28.2	28.7	27.1
2060.40	32.3	31.5	33.1
2062	45.1	43.6	50.4
2063	42.1	43.3	38.4
2073	49.2	49.2	49.4
2074	35	34.5	38
2075	48.5	43.1	53.4
2077.10	45.4	43.6	48

Source: Census Bureau, Summary File 1, 2000.

Figure 4-2 shows the percentage breakdown of the languages spoken at home by census tract for the year 2000. Census tracts in the northwest and in the Little Tokyo area spoke predominantly Asian languages, and census tracts in the southern portion spoke mainly Spanish.

4.3 Housing

There were an estimated 10,500 housing units in the central downtown area in 2008. Of the 10,500 housing units, 10,200 were multi-family units and only 200 were single-family units. The vacancy rate for all housing units was about 11 percent (City of Los Angeles Planning Department /Demographic Research Unit 2009).

Land designated for residential use is found in the east and south portions of central downtown and makes up only about five percent of the total land use (City of Los Angeles Planning Department 2003a). The residentially-zoned properties in the central downtown area are found in Bunker Hill and Little Tokyo. Some residential uses are permitted within commercial buildings in the central downtown area as they are redeveloped into residential units to meet an increased demand for housing (City of Los Angeles Planning Department 2003a).

4.4 Employment

The central downtown area employs a substantial number of people; over 170,000 in 2005. As shown in Table 4-3, most of the people working in the downtown area do not live there and must commute to it each day. The areas within the central downtown that provide the largest number of jobs include the Financial District, the Civic Center, the Historic Core/Jewelry District, and the Fashion District.

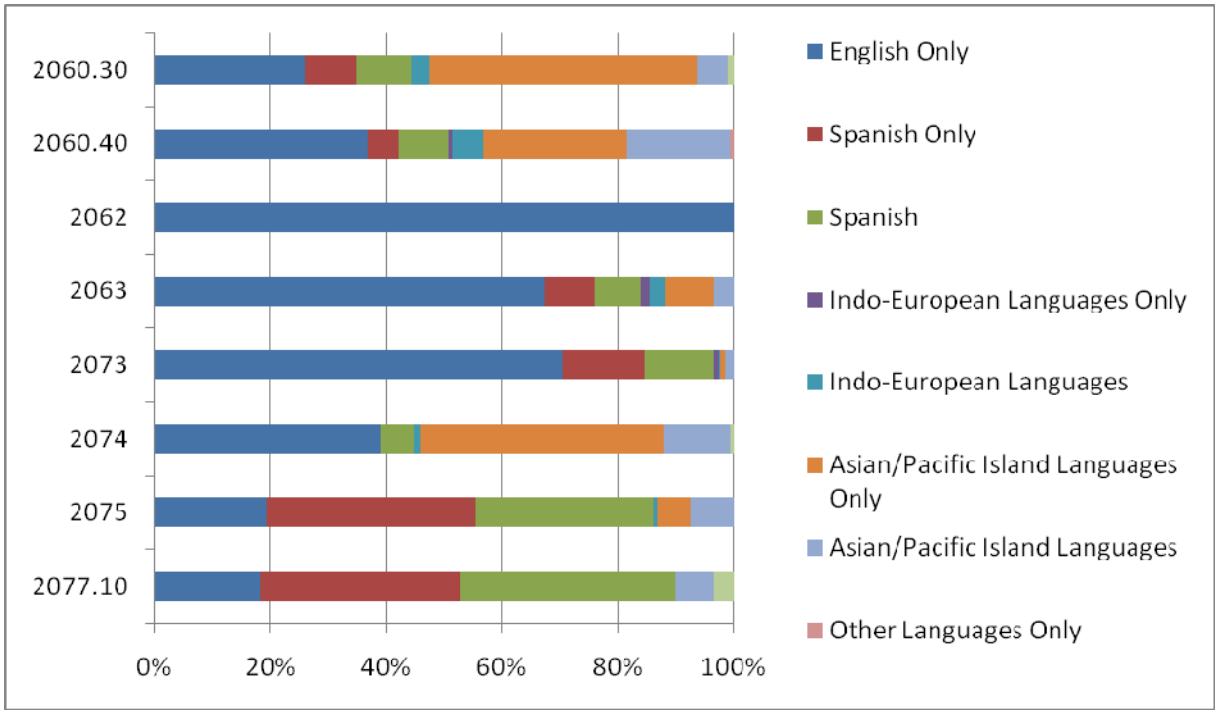


Figure 4-2. Languages Spoken at Home by Census Tract in Central Downtown

Source: Census Bureau, Summary File 3, 2000.

4.5 Community Mobility

The central downtown area experiences heavy pedestrian traffic on weekdays and during the lunch hours (City of Los Angeles Planning Department 2003a). Much of the pedestrian traffic occurs in areas with daytime employment such as Bunker Hill, the Financial District, and the Historic Core. Some pedestrian movement occurs between the Civic Center and Little Tokyo along Temple, 1st, and 2nd Streets (City of Los Angeles Planning Department 2003a).

The Fashion District attracts many pedestrians during both weekdays and weekends, as does Broadway between 2nd and 7th Streets. 7th Street often experiences large volumes of pedestrians due to the Wilshire Grand and Sheraton Hotels. There is much less pedestrian activity in the central downtown area at night because much of the daytime population leaves after business hours. The exceptions are Little Tokyo and the Arts District that have experienced a resurgence of evening activity due to increases in new housing in the area and a solid commercial base of restaurants.

The main pedestrian infrastructure in central downtown consists of sidewalks and crosswalks. There is an elevated pedestrian walkway on Bunker Hill that connects many of the large hotels and office buildings.

Table 4-3. Population, Households, and Employment for the Central Downtown Area

Census Tract	2005 Population	2005 Households	2005 Employment
2060.30	1,029	267	2,444
2060.40	3,753	1,125	2,855
2062	3,638	1,179	6,631
2063	5,320	1,591	4,670
2073	4,068	3,101	35,488
2074	1,344	8	38,760
2075	4,326	3,024	27,319
2077.10	1,316	635	53,760
Total	**24,794**	**10,930**	**171,927**

Source: SCAG, 2009.

The downtown area offers several Angels Walk tours, which were developed to promote pedestrian and public transit use in the City. Each Angels Walk encourages pedestrians to explore important cultural and historic areas of the City. Brochures and maps are provided for self-guided tours. Stanchions located throughout the Angels Walk routes mark important features and provide information in text and photographs.

The central downtown area is served by over 100 bus lines, operated by ten different transit agencies, and a network of commuter rail, light rail, and heavy rail lines. Metrolink operates commuter rail trains from Union Station to multiple points in Los Angeles, Ventura, Orange, San Bernardino, San Diego, and Riverside Counties. Metro operates the Metro Red Line heavy rail subway to North Hollywood, the Metro Purple Line heavy rail subway to Wilshire/Western Station, the Metro Blue Line light rail service to Long Beach, and the Metro Gold Line light rail service to Pasadena and East Los Angeles. The Metro Expo Line light rail service to Culver City is expected to open in 2011.

Transit mobility within downtown, to and from the communities of downtown, and within the region as a whole is impaired by the lack of a train connection between the Metro Gold and Blue Lines. Passengers travelling between these two LRT lines must currently transfer via the Metro Red and Metro Purple Lines. This lack of direct connection adversely affects travel times and the ability of transit to attract automobile commuters.

The Regional Connector project would eliminate transfers by enabling through service between the Metro Gold, Blue, and Expo Lines. The Regional Connector would add additional reliable transit service that, unlike buses, will not be subject to future deteriorating traffic conditions if surface street congestion increases.

For information on existing traffic patterns within the study area, see the Transportation Technical Memorandum.

4.6 Emergency Services

The Central Area Community Police Station is located on East 6th Street and serves an area in central downtown of 4.5 square miles, including the communities of Little Tokyo, South Park, Historic Core, Financial District, Jewelry District, Arts District, and Fashion District. There are approximately 400 sworn and civilian members of the Los Angeles Police Department stationed at this location (Los Angeles Police Department 2008).

Parker Center, the current Los Angeles Police Department headquarters, is located on Los Angeles Street between 1st and Temple Streets. A new headquarters building, scheduled to open in 2010, will replace Parker Center. The new building is currently under construction on the block bounded by 1st, Spring, 2nd, and Main Streets.

Los Angeles Fire Department Station 9 provides fire protection services for the central downtown area. Station 9 is located at 430 East 7th Street at the corner of 7th Street and San Julian. The station employs approximately 50 staff members (Fire Station 9 Skid Row 2006; City of Los Angeles Undated).

An additional fire station (Station 4) and emergency center are located on Temple Street east of Alameda Street. Fire Station 4 serves the Little Tokyo, El Pueblo, and Chinatown areas (Los Angeles Fire Department 2009). Fire Station 3 at 1st Street and Fremont Avenue serves the western portion of the downtown area.

4.7 Crime

Although many community groups have been working together to improve public safety, crime is an issue in the Central Downtown area. The downtown area is served by the Central Area Community Police.

There were 6,138 arrests made in 2007 and 5,497 in 2008. By the end of May 2009, 5,190 arrests had been made. The majority of the arrests from January 2007 through May 2009 were made for larceny and aggravated assault. The number of violent crimes was 397 in 2007 and 385 in 2008. By the end of May 2009, there were 437 violent crimes reported, a 14 percent increase since 2008 (Los Angeles Police Department 2009).

4.8 Community Events

There are many important community events that occur in the central downtown area each year, including music and cultural festivals, parades, arts/theatre performances, and exhibitions. These events often attract hundreds of people to downtown. Table 4-4 lists community events in the project area that were scheduled for 2009.

Table 4-4. Community Events in Central Downtown

Event	Description
World City	Free performances and art workshops for children at the Disney Concert Hall
1st Thursday San Pedro Art Walk	San Pedro Street between 4th and 8th Streets celebrates the arts by opening up galleries and studios, offering live entertainment with cafes and live street vendors in the evening of the first Thursday of each month.
Downtown Art Walk	A monthly self-guided tour of art exhibition venues in the Downtown.

Table 4-4. Community Events in Central Downtown	
Event	**Description**
St. Patrick's Day and Parade	Annual celebration of St. Patrick's Day with a parade that starts on 5th and Olive Streets.
Cherry Blossom Festival of Southern California	This event celebrates spring, cherry blossoms, and the Japanese American culture in Little Tokyo.
Azusa Street Festival	A music festival in Little Tokyo.
AT&T Fiesta Broadway	Cinco De Mayo Celebration on Broadway Street between 1st and 11th Streets
Annual Children's Day	Arts and crafts and activities for children of all ages at the Japanese American Cultural and Community Center in Little Tokyo.
Mixed Roots Film and Literary Festival	Celebration of the mixed racial and cultural through readings, live performances, and films at the Japanese American National Museum in Little Tokyo.
Shakespeare Festival/L.A. Romeo and Juliet	Live theatre and free outdoor shows influenced by Shakespeare at Cathedral of Our Lady of the Angels on Temple Street.
Grand Performances	Free afternoon and evening performing arts events at the California Plaza.
Nisei Week Japanese Festival	Cultural festival that celebrates community cultural diversity in Little Tokyo.
L.A. County Holiday Celebration	Choirs, instrumental groups, and dance are used to celebrate the season at the Music Center on Grand Avenue.

Source: City of Los Angeles Department of Cultural Affairs 2009

4.9 Community Profiles

This section presents brief profiles for each of the communities and districts within the central downtown area that have the potential to be directly affected by construction or operation of the Regional Connector Transit Corridor project. A map of the approximate locations of these communities is provided in Figure 3-1. While distinctions have been made

between the different districts, many districts continue to develop and expand their area of influence, often resulting in overlap with other districts or communities. The boundaries of the districts discussed below are for descriptive purposes and are not meant to delineate distinct borders.

4.9.1 Financial District

The Financial District generally extends between 3rd Street to the north, 6th Street to the south, Hill Street to the east, and SR 110 to the west. The Financial District contains most of the city's banks, large hotels, and skyscraper office buildings. It is also home to the Central Library, Maguire Gardens, retail stores, and clubs. This area experiences a high volume of traffic during daytime hours because of its location next to the SR 110 freeway.

While not as pedestrian friendly as some of the other districts, the Financial District lies within walking distance to the 7th Street retail area, Grand Avenue corridor, and Pershing Square. This neighborhood is within walking distance to the Metro Red Line, Metro Purple Line and the Metro Blue Line (CCA & DCBID 2003).

The Central Library, located at Hope Street, is one of the key features of the Financial District. North of the library is downtown's tallest building, Library Tower (City of Los Angeles Planning Department 2003a). At 73 stories high, the tower is visible for miles. The Bunker Hill Steps surround the building and connect the Financial District to Bunker Hill (City of Los Angeles Planning Department 2003a).

The proposed 2.7 million square foot Metropolis mixed-use development is located in the southwestern end of the Financial District. Phase I of this project will provide 360 residential units. Park Fifth is a major, planned, 76-story high-rise development across from Pershing Square and will provide over 700 condominiums and a 200 room hotel.

4.9.2 Bunker Hill

Located generally between 1st Street on the north, Hill Street on the east, 3rd Street on the south, and Figueroa Street on the west, Bunker Hill is a developed hill centered roughly around 3rd Street and Grand Avenue. Bunker Hill has a large portion of central downtown's population because of numerous apartments and condominiums. This district is within close walking and public transit distance to the Financial District, the Historic District, and the Civic Center.

Major downtown destinations located within Bunker Hill include the Walt Disney Concert Hall, Museum of Contemporary Art (MOCA), high-rise office towers, senior and market rate housing, hotels, and commercial/retail centers. Bunker Hill has over 3,200 residential units, mainly in mid- and high-rise buildings. Large development projects planned for this area include Civic Park and the Grand Avenue Development Project that will develop this area into

a regional arts, entertainment, and residential destination. The proposed Grand Avenue Development includes 3.6 million square feet, including 449,000 square feet of retail space. Plans call for 2,600 new housing units, almost doubling the existing number of units in the area.

4.9.3 Toy District

The Toy District is south of Little Tokyo and includes 12 blocks between 3rd, San Pedro, and 5th Streets, and Werdin Place. The Toy District is a wholesale and retail area with over 500 businesses offering silk flowers, incense/oils, craft supplies, luggage, electronics, and traditional toys like dolls, die-cast cars, action figures, and video games (Central City East Association 2009). This area experiences high volumes of pedestrians. The Medallion project proposed for this district is expected to provide 192 residential lofts and over 200,000 square feet of retail space.

4.9.4 Civic Center

The Civic Center contains federal, state, and local government offices and has the second largest concentration of civic buildings in the country (City of Los Angeles Planning Department 2003a). The Civic Center extends from US 101 in the north to 4th Street in the south, and from SR 110 in the west to Alameda Street in the east. Important community resources in this area include the Cathedral of Our Lady of the Angels on Temple Street, Los Angeles City Hall, the County Hall of Administration, the California State Department of Transportation (CalTrans) Headquarters, and a U.S. Federal District Courthouse planned for the block bounded by 2nd, Hill, and 1st Streets, and Broadway. The area includes the Civic Center Historic District centered around the City Hall building.

Most of the government facilities in this area are within a 10-minute walk of each other designated as the "10 minute diamond". There are also several cultural, arts, and music facilities found in the Civic Center such as the Ahmanson Theater, Mark Taper Forum, and the Dorothy Chandler Pavilion (City of Los Angeles Planning Department 2003a).

4.9.5 Historic Core/Center City

The Historic Core/Center City links many of the districts and communities of central downtown. It encompasses an area from 1st to 11th Streets between Los Angeles and Hill Streets. The Historic Core approximates the area where Los Angeles originated in the early 1800s, and a variety of historic and architecturally significant buildings are found here. There are two historic districts in this area registered in the National Register of Historic Places: the Spring Street Financial District between 4th and 7th Streets, and the Broadway Theater District between 3rd and 9th Streets (City of Los Angeles Planning Department 2003a).

The major corridor in the Historic Core/Center City is Broadway, with clothes outlets, restaurants, Grand Central Market, and other shops frequented by the Hispanic population

(City of Los Angeles Planning Department 2003a). To the east, a variety of offices, hotels, shops and government buildings exist along Los Angeles, Spring, and Main Streets. Many buildings here have been renovated and converted to residential uses with ground floor retail, restaurants, and art galleries. Most of the historic financial buildings of the 1920s are found on Spring Street. Several historic theatres are located in this area; however, some are being used for retail purposes or are currently vacant.

The southern end of the Historic Core/City Center is adjacent to the Fashion District and contains historic buildings now used to manufacture clothing. The Metro Red Line travels beneath this district with a station on Hill Street between 4th and 5th Streets (City of Los Angeles Planning Department 2003a). The Skid Row community is located adjacent to the Historic Core/Center City area and contains a large homeless population and many single occupancy hotel residential properties.

4.9.6 Little Tokyo

Little Tokyo is a unique cultural community in downtown Los Angeles with the largest Japanese-American community in the continental United States (City of Los Angeles Planning Department 2003). Los Angeles' Little Tokyo is one of only three remaining Japantowns in the US (in addition to San Francisco and San Jose). Located between 1st, 3rd, San Pedro, and Alameda Streets, Little Tokyo has a range of mixed uses including retail, hotel, office, and commercial spaces.

The area also contains a substantial portion of the central downtown's residential units and has several new residential developments. The rehabilitation of existing spaces into residential uses is also occurring in Little Tokyo. Important developments in the early planning stages include a 4.5-acre site adjacent to the Little Tokyo/Arts District Station on the Metro Gold Line. This development could potentially contain a high-density combination of offices and housing, utilizing its proximity to transit.

Little Tokyo contains a variety of important cultural venues and resources including the Japanese American National Museum (JANM), the Jodo Shu Betsuin Temple, the former Nishi Hongwanji Temple, and the Japanese American Cultural and Community Center. The Geffen Contemporary at the Museum of Contemporary Art (MOCA) is located behind JANM. North of The Geffen Contemporary at MOCA, at Temple and Alameda Streets, is the Go For Broke Monument, a monument dedicated to the Japanese American veterans of World War II who fought for the United States even as their families were classified as "enemy aliens" and were forced into internment camps (Experience L.A. 2009). Little Tokyo also houses the Little Tokyo Service Center that provides affordable housing and community services to the area.

The Little Tokyo Historic District was listed on the National Register of Historic Places in 1986. The district spans the north side of 1st Street from Judge John Aiso Street to Central Avenue, and the east side of Judge John Aiso Street from 1st Street to midblock between 1st

and Temple Streets. Buildings in the Historic District include commercial buildings on the north side of 1st Street, the Union Church on San Pedro Street, and the former Nishi Hongwanji Temple at 1st and Central streets, the first Buddhist Temple built in Los Angeles.

4.9.7 Arts District

The Arts District is technically outside central downtown and considered a part of the Central City North Community Plan area; however it is discussed in this section because it is adjacent to Little Tokyo and could be affected by the project. The Arts District is generally considered to be between 1st, 6th and Alameda Streets, and the Los Angeles River. The Arts District consists mostly of old warehouses that have been converted to artists' lofts and studios (City of Los Angeles Planning Department 2003b). The largest concentration of artists is within the area between 1st, Palmetto, and Alameda Streets, and the Los Angeles River. This area is referred to as the Artist-in-Residence District (City of Los Angeles Planning Department 2003b).

5.0 IMPACTS

5.1 No Build Alternative

The No Build Alternative would not involve any new construction. This alternative would not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP). The transit network within the project area would be largely the same as it is now.

5.1.1 Community Mobility

Community mobility in the study area would be expected to worsen along with region-wide traffic congestion. Future increases in the area's population and employment would attract more people to the area each day, causing more vehicle and pedestrian traffic. This may reduce mobility in certain communities, especially during the commute hours.

Pedestrian mobility would not be expected to substantially change by 2035. As suggested in the Central City Community Plan, some improvements may occur to encourage pedestrian movement through the various communities and districts, but overall no substantial changes in pedestrian movement are expected. Transit mobility would deteriorate as the No Build Alternative would not provide enhanced access from downtown communities to other parts of the Los Angeles region or from the region to downtown communities.

5.1.2 Viability of Existing Businesses

The viability of existing businesses would be expected to remain similar to current conditions. No substantial transportation improvements are planned that would result in long-term construction that could affect the viability of businesses in the project area. Businesses would not benefit from enhanced access potentially afforded by build alternatives.

5.1.3 Emergency Services

As the population of the central downtown area grows, it is expected that emergency service providers would increase staff to meet the needs of the changing population. Access and response times could potentially be hampered by future traffic congestion.

5.1.4 Public Health and Safety and Crime

Crime may slightly increase in the central downtown area as a result of population growth, but public safety services would be expected to increase staff in response to new demands. Access and response times could potentially be hampered by future traffic congestion

5.1.5 Community Resources and Events

Community resources and events are not expected to change in the future. Enhanced access to events from around the region, potentially provided by build alternatives, would not occur.

5.1.6 Population, Housing, and Employment

Table 5-1 shows population estimates through 2035 for the central downtown area. The population is expected to reach about 30,000 by 2035, an increase of about 20 percent over the 2005 population. Areas projected to experience the largest percent increase in population growth (over 26 percent) from 2005 to 2035 include the Financial District, the Toy District, and Little Tokyo.

Table 5-1. Central Downtown Population Projections through 2035

Census Tract	Population 2010	Population 2015	Population 2020	Population 2025	Population 2030	Population 2035
2060.30	1,059	1,081	1,105	1,128	1,150	1,171
2060.40	3,866	3,947	4,033	4,116	4,195	4,272
2062	3,835	4,009	4,174	4,330	4,476	4,611
2063	5,598	5,846	6,084	6,308	6,516	6,709
2073	4,221	4,331	4,464	4,593	4,716	4,833
2074	1,370	1,387	1,407	1,427	1,449	1,470
2075	4,484	4,596	4,728	4,855	4,977	5,094
2077.10	1,394	1,454	1,513	1,568	1,621	1,672
Total	**25,827**	**26,651**	**27,508**	**28,325**	**29,100**	**29,832**

Source: SCAG 2009.

Table 5-2 presents the household projections through 2035. The number of households in central downtown is expected to increase to 14,200 by 2035, an increase of about 4,000 households from 2005. The Historic Core/Jewelry District area is expected to experience the largest increase in households; approximately 900 households would be added to the area by 2035. The Bunker Hill area is expected to add over 800 new households by 2035. The majority of these new households are expected to be multi-family housing.

Employment is expected to rise steadily through 2035 in the central downtown area, as shown in Table 5-3. By 2035, the largest increase in employment is expected to occur in the Financial District with the addition of over 4,600 new jobs. Over 3,600 new jobs are expected in the Civic Center area.

The No Build Alternative would not be expected to substantially change existing communities and neighborhoods in the project area. Future growth projections for population, housing, and employment would remain unchanged.

Table 5-2. Households in Central Downtown through 2035

Census Tract	Households 2010	Households 2015	Households 2020	Households 2025	Households 2030	Households 2035
2060.30	282	297	313	325	337	347
2060.40	1,186	1,243	1,304	1,352	1,398	1,435
2062	1,250	1,317	1,390	1,447	1,502	1,548
2063	1,671	1,748	1,833	1,899	1,963	2,016
2073	3,275	3,441	3,622	3,763	3,900	4,012

Source: SCAG 2009.

5.2 Transportation System Management (TSM) Alternative

The TSM Alternative would create two new express shuttle bus lines linking 7th Street/Metro Center Station with Union Station in addition to the infrastructure improvements described for the No Build Alternative. These buses would run frequently, especially during peak hours. The buses may have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes.

Table 5-3. Central Downtown Employment through 2035						
Census Tract	Employment 2010	Employment 2015	Employment 2020	Employment 2025	Employment 2030	Employment 2035
2060.30	2,480	2,508	2,527	2,548	2,570	2,592
2060.40	2,955	3,034	3,086	3,146	3,211	3,273
2062	6,730	6,809	6,861	6,921	6,985	7,047
2063	4,718	4,756	4,781	4,810	4,841	4,871

Source: SCAG 2009.

5.2.1 Construction

There would be no significant impact on communities and neighborhoods from construction of this alternative. The only construction that would occur would be for the enhanced bus stops located every about two blocks along the shuttle routes. Construction of such bus stops would require a minimal amount of construction equipment. This would not be expected to reduce mobility or affect emergency services, viability of existing businesses, public health and safety and crime, population, housing, or employment. There would be no significant impact from construction of the TSM alternative.

5.2.2 Operation

Operation of the TSM Alternative would have a minimal impact on existing communities and neighborhoods. This alternative would introduce two new shuttle bus routes that would run every five minutes during commute hours. This would increase bus traffic through the following districts/communities:

- Upper Grand Route Shuttle Bus: Little Tokyo, Civic Center, Bunker Hill, Financial District.

- Lower Grand Route Shuttle Bus: Little Tokyo, Historic Core, Bunker Hill, Financial District.

5.2.2.1 Community Mobility

Since the shuttle buses would use existing streets, they would not be expected to impair pedestrian mobility between neighborhoods. New infrastructure would not have the potential to physically divide existing communities.

The shuttle buses under the TSM Alternative would help to link the Metro Gold Line to the Metro Blue Line and would provide additional public transportation within the central downtown area. However, the requirement to transfer from a train to a bus operating in street traffic would limit the potential of this alternative. Transfers increase overall trip times and make the transit system less attractive to prospective riders.

New bus stops along the shuttle bus lines would increase transit mobility within the central downtown area. However, the shuttle buses would be subject to deteriorating traffic conditions as traffic congestion worsens in the future. Thus, the mobility benefits may not be permanent. The buses themselves may also add to traffic congestion, which would decrease mobility in the area, particularly during peak hours.

The overall impact of adding new transit service would be beneficial. Still, any benefits would be contingent on the ability of buses operating in street traffic to attract patrons. Noise and air quality impacts of buses proposed under the TSM Alternative are detailed in the Noise and Vibration Technical Memorandum and the Air Quality Technical Memorandum. Additional details about the potential congestion effects of adding new shuttle bus service to the project area, including level of service (LOS) data, are provided in the Transportation Technical Memorandum.

All shuttle buses and bus stops would be designed to comply with existing disability laws and would be wheel-chair and stroller accessible. There would be no adverse impacts to senior citizens or disabled persons.

5.2.2.2 Viability of Existing Businesses

Operation of the shuttle buses may slightly improve business viability in and around the new bus stops because it could increase the number of visitors to the area. This would be a beneficial impact. Bus stops could also be slightly detrimental to businesses if they impede visibility or access to the business.

5.2.2.3 Emergency Services

The shuttle buses under this alternative would use existing roads, and the addition of frequent new bus service could potentially add to traffic congestion and lengthen emergency vehicle response times.

5.2.2.4 Public Health and Safety and Crime

It is unlikely that there will be any impacts to public health and safety, as the shuttle buses would use existing roads, although emergency vehicle response times could lengthen.

The creation of new bus stops may slightly increase the potential for crimes such as vandalism, depending on the structures placed at each new bus stop. There would not likely be any increase in any other types of crimes. While there is a perception that transit stops may increase crime levels in general, mitigation measures, such as additional security services, would help prevent an increase in crime. Overall, impacts related to crime are expected to be less than significant.

5.2.2.5 Community Resources and Events

No community resources or events would be adversely affected by operation of this alternative. This alternative may be beneficial for some community events and resources because it would provide a new public transit method from the central downtown area to the Metro Gold and Blue Lines. However, because the shuttle buses would run on public streets, the beneficial impact of the buses might be reduced if service needs to be rerouted or suspended during street closures for major events. Rerouting of buses would not affect the community events.

5.2.2.6 Population, Housing, and Employment

While this alternative would provide two new bus routes and several new bus stops, it is not expected to attract a large number of new residents to the area because it would not substantially reduce commute times. The shuttle buses would provide a link between the Metro Gold and Blue Lines that would help people commuting to and from the area. However, the connection would still require commuters to make a bus transfer between the rail lines, reducing travel time savings. Since the two new bus routes would not substantially reduce commute times, they would not be expected to attract many new commuters. There would be no impact to population, housing, or employment.

5.2.3 Cumulative Impacts

This section presents the cumulative effects of the TSM Alternative.

5.2.3.1 Community Mobility

The TSM Alternative would potentially increase mobility because it would provide two new shuttle routes. Other future planned transportation projects would also contribute to beneficial impacts associated with community mobility because they would create more linkages and additional transportation routes. Overall, cumulative effects on community mobility could be beneficial. The benefit is contingent upon whether shuttle buses operating in mixed traffic would attract commuters who would otherwise drive.

However, benefits to mobility under this alternative may not be permanent if developments already planned for the downtown area (listed in the Cumulative Impacts Methodology Memorandum) increase local traffic congestion to the point where the speed of the shuttle buses is reduced. Any reduction in congestion created by the new shuttle bus service could be offset, at least partially, by the addition of these frequent buses to existing streets. There is no way to be certain if the benefits of the TSM Alternative will be permanent until the outcomes of other planned projects are known.

5.2.3.2 Viability of Existing Businesses

The TSM Alternative would result in beneficial impacts to the viability of existing businesses by providing new bus stops in central downtown. No other transportation projects are expected along the proposed shuttle routes, and there would be no cumulative impacts associated with the viability of existing businesses. A future increase in traffic and congestion may lessen the benefits to downtown businesses under the TSM Alternative. Additional buses running on downtown streets may also increase congestion to the point where it lengthens travel times under this proposal, offsetting some of the potential benefits.

5.2.3.3 Emergency Services

There would be no cumulative impacts on emergency services.

5.2.3.4 Public Health and Safety and Crime

Future population growth has the potential to increase crime. The TSM Alternative would have very little impact associated with crime but may increase the potential for vandalism by adding new facilities that are susceptible to graffiti. Overall, the TSM Alternative's contribution to cumulative crime impacts would be less than significant.

5.2.3.5 Community Resources and Events

The TSM Alternative, in tandem with future transportation projects outside the central downtown area, could result in beneficial impacts because all projects would create new linkages and provide more options for commuters in the region. This would be a beneficial cumulative impact.

5.2.3.6 Population, Housing, and Employment

There would be no cumulative impact to population, housing or employment.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would extend from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces north of 4th Street, crosses 3rd Street at-grade, enters Bunker Hill, and turns northeast through a new entrance to the existing

2nd Street tunnel. The new underground portions of the alignment would be constructed using the cut and cover method that is described in detail in the Description of Construction.

After entering the 2nd Street tunnel, the alignment continues along 2nd Street and splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). It then heads east on Temple Street, realigns into a dual track configuration just east of Los Angeles Street, and connects to the Metro Gold Line in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street.

An automobile underpass and a potential pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets because of the high volume of auto and truck traffic on Alameda Street. These grade separations would reduce potential pedestrian-train and automobile-train conflicts.

The communities directly affected by construction and operation of the At-Grade Emphasis LRT Alternative would include:

- Civic Center
- Little Tokyo
- Historic Core
- Bunker Hill
- Financial District

Other surrounding communities and neighborhoods may be indirectly affected by this alternative. Potential direct and indirect effects are described in more detail in the following sections.

5.3.1 Construction

Construction of the At-Grade Emphasis LRT Alternative would have the potential to temporarily affect community mobility, viability of local businesses, emergency services, public health and safety, crime, community resources and events, population, housing, and employment. Construction staging areas have been identified along the proposed alignment and are included in this analysis.

Additional information about the construction staging areas is provided in the Description of Construction. Most impacts would be temporary and intermittent and would be reduced or eliminated after construction is complete (four to five years).

5.3.1.1 Community Mobility

This At-Grade Emphasis LRT Alternative would require the construction of three new stations; one in the Civic Center area composed of two one-way stations located on adjacent streets, one at Bunker Hill, and one in the Financial District along Flower Street. Construction of these stations would require temporary sidewalk and street closures. Street closure locations have not yet been defined and some may last only overnight or for a few days. Mobility would be temporarily reduced in these areas during construction.

Installation of the at-grade tracks and other necessary light rail infrastructure would occur on Temple, Main, Los Angeles, and 2nd Streets in the Civic Center and Historic Core areas and would require street closures during construction. This would temporarily reduce pedestrian and vehicle mobility between the Civic Center, the Historic Core, and Little Tokyo for the duration of construction.

Under this alternative, the alignment would run underground from Flower Street and the Financial District through the Bunker Hill area onto 2nd Street. Cut and cover excavation activities for the underground portion of the alignment would result in road closures in these areas and would likely shift traffic to the surrounding streets. This could temporarily add congestion and reduce mobility to surrounding communities.

The addition of an automobile underpass at the intersection of Temple and Alameda Streets would facilitate movement of traffic on Alameda Street by allowing it to travel below the intersection without stopping. Frontage roads would allow some turning movements between Alameda and Temple Streets to be maintained, though some turns would no longer be permitted. The underpass would enhance community mobility by removing most of the automobile traffic from the intersection of Temple and Alameda Streets, thus improving traffic flow along a major regional arterial. Additional details regarding congestion improvements are provided in the Transportation Technical Memorandum.

Overall, pedestrian and vehicle mobility between communities and neighborhoods in the central downtown area would be reduced during construction because of road and sidewalk closures and traffic detours. However, these impacts would only last for the duration of construction. This impact could be potentially significant but would be reduced to a less than significant level with mitigation measure 1 in Section 6.0. Ultimately, after construction, mobility would be improved (see Section 5.3.2).

5.3.1.2 Viability of Existing Businesses

No businesses would be directly affected by construction of this alternative because no properties on which businesses are located would need to be acquired. Still, indirect effects to businesses may occur. Businesses around each of the new stations, and along the proposed alignment, could be affected by construction activities, construction-related traffic,

and road and sidewalk closures. Construction activities would likely result in a decrease in accessibility to many businesses and could reduce on-street and off-street parking.

Construction could negatively affect business activity levels because the number of customers may temporarily decline. The decline in customers could have a potentially significant impact to businesses. Even with implementation of mitigation measures in Section 6.0, this impact may remain significant. While all attempts would be made to provide adequate detours and minimize road closures, some indirect effects to businesses would still likely occur because consumers might avoid the area altogether.

Thus, the potential impact to businesses could be significant during the construction phase but would be reduced by mitigation measures. Short term adverse construction impacts would be offset by long term benefits of new transit access to businesses and the enhancement of downtown as a business destination.

5.3.1.3 Emergency Services

Construction of the At-Grade Emphasis LRT Alternative would likely require road closures, and this could result in increased response times for emergency services such as police and fire. Any increase in response times for emergency services would be considered a significant impact. Mitigation measures in Section 6.0 would reduce this impact to a less than significant level.

No increases in staff would be required for emergency service providers because construction security would be the responsibility of the construction contractor.

5.3.1.4 Public Health and Safety and Crime

Construction of the At-Grade Emphasis LRT Alternative is not expected to increase crime or pose a threat to public health and safety. Any construction and staging areas that would be dangerous to the public would be adequately fenced to prevent entry. Signs would be posted to alert the public to any areas where large construction vehicles or equipment are operating or where roads or sidewalks have been closed. The construction contractor would be responsible for providing security for the construction site throughout the duration of construction. The potential impact to crime and public health and safety would be less than significant, and mitigation measures are identified in Section 6.0.

5.3.1.5 Community Resources and Events

Construction of the At-Grade Emphasis LRT Alternative may require road and sidewalk closures and would add construction vehicles and equipment to central downtown streets. Construction of this alternative has the potential to adversely (if periodically) affect annual festivals and events in the downtown area. Construction could also disrupt traffic patterns and make public access to certain community resources (such as the MOCA Geffen

Contemporary building and the Go For Broke Monument) more difficult. This potential impact could be significant. Mitigation measures described in Section 6.0 would reduce this potential impact to a less than significant level.

5.3.1.6 Population, Housing, and Employment

Construction of the At-Grade Emphasis LRT Alternative would affect properties along the alignment and in areas around the proposed new stations Metro would have to acquire parts of three properties just north of Little Tokyo on Temple Street between Main Street and Central Avenue for the track alignments. Two of the properties are currently government buildings and one is a parking lot.

In the Bunker Hill area, easements for construction and staging would need to be obtained for two properties that contain multi-family housing, a pool, and tennis courts. A partial take would be required for construction and staging along 3rd Street on property that currently contains the Central Plant. Only one property would need to be acquired it its entirety: a vacant lot between Hope Street and Flower Street. Easements would be required for construction and staging on five additional properties along Flower Street in the Financial District area.

In the Historic Core area, residents of the Higgins Building are concerned about construction and operation noise near their building under this alternative. These concerns are addressed, along with mitigation measures, in the Noise and Vibration Technical Memorandum.

Residents of the Savoy condominium development have expressed concerns over construction and operation noise. Since the building is located across the street from the proposed underpass site, there would be additional noise and construction detours around the building. These concerns, along with mitigation measures, are addressed in the Noise and Vibration Technical Memorandum and the Transportation Technical Memorandum.

All properties requiring full or partial takes would be compensated according to the requirements of the Uniform Relocation Act. Easements and properties acquired under this alternative would not result in the displacement of houses or businesses; therefore, no changes to population, housing, or employment would occur during construction of the At-Grade Emphasis LRT Alternative.

This alternative would provide new construction jobs during the four to five years of construction. Creation of these new jobs in central downtown would be beneficial but temporary because the jobs would no longer be needed after construction is complete. Most construction workers would be expected to commute from surrounding areas and not permanently relocate to the work site. Thus, the workers would not substantially change the population in central downtown. Impacts on housing would be less than significant.

5.3.2 Operation

Operation of the At-Grade Emphasis LRT Alternative could result in direct and indirect impacts associated with mobility, viability of existing businesses, population and housing, emergency services, public health and safety, community events, and senior and disabled persons.

5.3.2.1 Community Mobility

The At-Grade Emphasis LRT Alternative would create a new LRT alignment through central downtown that would provide a new connection between the Civic Center, Historic Core, Bunker Hill, and Financial District. This new connection would also provide a link to the central downtown area from outside communities via the Metro Gold and Blue Lines. This increase in mobility, both within downtown communities and to the central downtown from outside communities, would be a beneficial impact.

For the at-grade segments of the At-Grade Emphasis LRT Alternative, the two LRT tracks would typically occupy a 26-foot wide surface right-of-way bordered by mountable curbs. This width would increase to approximately 39 feet at station locations. Similar to current conditions, pedestrian crossings would be limited to traffic signal-controlled intersections, though signal phasing may be modified to provide adequate green time for the LRT vehicles to safely cross.

The At-Grade Emphasis LRT Alternative would have the potential to reduce pedestrian mobility between the Civic Center, Little Tokyo, and the Historic Core because at-grade trains would be running frequently along 2nd, Main, and Los Angeles Streets. Since adequate pedestrian street crossings would be provided at all traffic signal-controlled intersections, pedestrians would still be able to cross the streets. This potential impact would be less than significant.

Vehicular crossings would also be limited to traffic signal-controlled intersections, with the signal phasing modified to provide adequate green time for the LRT vehicles to safely cross. No uncontrolled mid-block vehicular crossing of the tracks would be permitted. Access to existing parking structures, parking lots, loading docks and commercial frontage would be affected by some at-grade LRT facilities.

Impacts could be offset by providing alternate street access. Access and egress to parking lots, by making a left turn from the street, presently exists at many locations downtown. However, at-grade LRT facilities would eliminate uncontrolled mid-block left turns, modifying existing approach and departure traffic patterns around parking sites. The Transportation Technical Memorandum contains additional details regarding modification of automobile access to lots adjacent to the proposed alignment.

These potential changes in traffic flow could decrease mobility between communities and neighborhoods and could affect access to local businesses in the area. This potential reduction in vehicle mobility on existing streets is unavoidable. This potential adverse impact to adjacent properties from decreased vehicular mobility could be partially offset by increases in access via the new trains that would be available to businesses and their patrons.

The at-grade alignment along Temple Street in the Civic Center area, just north of Little Tokyo, could result in increased conflicting traffic movements. This area would have a high volume of trains using the Regional Connector corridor and a large volume of traffic using Alameda Street and pedestrians crossing Alameda Street to access the existing Little Tokyo/Arts District Station. In order to improve operation of the Temple and Alameda Streets intersection, a vehicle underpass and a potential pedestrian overpass would be constructed. With the construction of the proposed underpass/overpass, the potential for increased conflicting traffic movements would be a less than significant impact.

The new LRT stations and trains would comply with the Americans with Disabilities Act and would be designed to ensure accessibility to all persons. The stations would be wheelchair and stroller accessible with ramps and/or elevators. The LRT train platforms would be constructed with ramps to allow passengers with strollers or disabilities to easily move in and out of the trains. As required by law, several seats on each of the trains would be designated for persons with disabilities and senior citizens. There would be no adverse impacts on disabled persons or senior citizens.

5.3.2.2 Viability of Existing Businesses

Most businesses in the central downtown area along the proposed alignment would likely benefit from the At-Grade Emphasis LRT Alternative. This alternative would provide a new means of public transportation through the Civic Center, Historic Core, Bunker Hill, and Financial District and would likely increase the number of pedestrians around each of the new stations. This new access could potentially increase customers for local businesses. This would be a beneficial effect.

Some adverse indirect effects may occur to existing businesses along the at-grade portions of the alignment through the Civic Center and Historic Core. As noted in the mobility section, at-grade LRT facilities would eliminate uncontrolled mid-block left turns, modifying existing approach and departure traffic patterns. Some businesses may be adversely affected since access may become more difficult. This could reduce customers to and decrease the viability of some existing businesses.

On 2nd Street, the at-grade LRT tracks would run along the southern side of the street, so impacts would likely be greater for businesses on the south side of the street than those on the north side. These impacts could potentially be significant. The elimination of mid-bock left turns cannot be avoided or reduced. The significance of the resulting impact could be

partially offset by increases in access via the new trains that would be available to businesses and their patrons.

5.3.2.3 Emergency Services

Operation of the At-Grade Emphasis LRT Alternative would not be expected to increase emergency response times. Emergency services would be notified of any changes to existing roads needed for the operation of Regional Connector trains.

In fact, the proposed vehicular underpass at Temple and Alameda Streets may improve emergency response times by increasing roadway capacity. Still, some rerouting of emergency vehicles may be needed due to new restrictions on turning movements. No new emergency services staff would be required. The potential impact to emergency services would be less than significant.

5.3.2.4 Public Health and Safety and Crime

Operation of the At-Grade Emphasis LRT Alternative is not expected to substantially increase crime in the central downtown area. Mitigation measures, such as adding security services, would prevent an increase in crime. Stations and trains would be designed to maximize public safety and minimize the potential for crime.

Stations would be constructed from materials such as brick, concrete, steel, aluminum, and heavy plastic that are generally resistant to vandalism. Adequate lighting and security cameras would be provided to deter criminal activity. Metro would continue to contract with the Sheriff's Department to provide specialized security at all rail stations.

Maintenance access to underground facilities would be designed to prevent unauthorized entry. Overall, the facilities are not expected to substantially change crime levels in the central downtown area. The potential impact to crime would be less than significant, and potential mitigation measures are identified in Section 6.0.

Additionally, this project would contribute to a pedestrian friendly community and encourage compact development. This would lead to increased walking, which would be a beneficial health impact of all the project build alternatives.

Operation of the LRT in Bunker Hill and the Financial District would not be expected to cause any public health and safety issues since trains would be travelling underground. Operation of the trains through the Civic Center and Historic Core would be at-grade and introduces an opportunity for collisions between trains and pedestrians. Thus, like other Metro trains currently in use, the new trains would be equipped with auditory signals that would alert pedestrians when trains are approaching.

As required by law, all track crossings at intersections would have appropriate signal lights, auditory signals, and traffic barriers. Speed limits would be established for areas with heavy pedestrian use. Overall, the potential impact to public safety would be less than significant.

5.3.2.5 Community Resources and Events

Operation of the At-Grade Emphasis LRT Alternative could benefit community resources and events because it would provide an efficient public transportation method for people travelling to the area. This effect would be beneficial. The only permanent impacts to communities would be easements, and partial and full takes of properties necessary for the track alignment.

Major events, particularly in the City Hall area, would require coordination between Metro and city law enforcement officials. Since the At-Grade Emphasis LRT Alternative would run at grade in the Civic Center area, temporary service interruptions may be necessary to accommodate crowds and ensure safety. These interruptions would not impact events but could cause light rail system delays throughout the County.

5.3.2.6 Population, Housing, and Employment

Over the long-term, the presence of the Regional Connector may attract new residents to the central downtown area because it would provide three new stations that would link to the regional LRT system. As the City of Los Angeles continues to encourage public transportation and transit-oriented growth, new developments, including additional housing units, may occur around transit stations. This would be consistent with the Central City Community Plan and would be a beneficial impact.

The At-Grade Emphasis LRT Alternative may indirectly increase employment. Operation of the Regional Connector would decrease commute times and would result in three new transit stations in the central downtown area. A more efficient public transportation option could encourage people in the surrounding communities to seek employment downtown. This potential impact would be beneficial.

5.3.3 Cumulative Impacts

This section describes cumulative effects of the At-Grade Emphasis LRT Alternative.

5.3.3.1 Community Mobility

The At-Grade Emphasis LRT Alternative, when considered cumulatively with other future projects, may result in benefits to the central downtown area. The Regional Connector Transit Corridor project and other Metro projects would increase community mobility, provide additional regional transit linkages, and increase ridership systemwide. Taken cumulatively, the projects would result in a beneficial impact.

5.3.3.2 Viability of Existing Businesses

There are no other planned transportation projects that would affect the viability of businesses along the alignment for the At-Grade Emphasis LRT Alternative. However, many new construction and renovation projects are planned in the area. If these construction projects also affect accessibility to local businesses, then there may be a cumulative impact during construction of the Regional Connector.

However, these impacts are all expected to be temporary and would be eliminated after construction is complete. No future projects are expected to alter existing streets or on-street parking in the construction area. Overall, the potential cumulative impacts associated with the viability of existing businesses would be less than significant. Viability of existing businesses would improve after the At-Grade Emphasis LRT Alternative is completed because it would bring more potential customers to the area.

5.3.3.3 Emergency Services

Many new construction and renovation projects are planned in central downtown for the same time as construction of the At-Grade Emphasis LRT Alternative. If these projects require road closures or detours in the same time frame as the construction of this alternative, a cumulative effect could result in increased response times for emergency services. However, each construction project, including the At-Grade Emphasis LRT Alternative, would be responsible for alerting emergency services to any road closures or detours to help avoid increased response times. The potential cumulative impact would be less than significant.

5.3.3.4 Public Health and Safety and Crime

The At-Grade Emphasis LRT Alternative, and other projects planned for the central downtown area, would potentially result in safety risks or increased crime during both construction and operation. However, each project would be responsible for reducing or avoiding potential adverse impacts. The At-Grade Emphasis LRT Alternative includes measures to protect public health and safety and reduce or avoid crime. All Metro Rail facilities are continuously monitored by security personnel to minimize risks to the public. With implementation of the mitigation measures in Section 6.0, the At-Grade Emphasis LRT Alternative would not contribute adversely to cumulative public health and safety or crime impacts.

5.3.3.5 Community Resources and Events

Many new construction and renovation projects are planned in and around the central downtown area during construction of the At-Grade Emphasis LRT Alternative. If these projects require road closures or detours in the same timeframe as this alternative, cumulative effects to community resources or events may occur through traffic congestion, decreased mobility, and closures of sidewalks and roads. However, each project, including the At-Grade Emphasis LRT Alternative, would be responsible for coordinating with local

community groups prior to construction to minimize impacts. With implementation of the mitigation measures listed in Section 6.0, the potential cumulative impact would be less than significant.

5.3.3.6 Population, Housing, and Employment

The At-Grade Emphasis LRT Alternative has the potential to indirectly increase population, housing, and employment over the long-term because it would better link the project area to the LRT system. This could encourage more people to live and work in central downtown. Future development in the project area would also increase population, housing, and employment.

The cumulative population, housing, and employment growth under this alternative and other planned future projects would be expected to be consistent with the Central City Community Plan objectives and would result in a beneficial cumulative impact. Los Angeles' transit-oriented growth policies could encourage new, dense, development around the proposed stations under this alternative. This development would add to the housing supply and create new jobs in the downtown area, which is a beneficial impact.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would connect directly to the Metro Blue/Expo Line tracks at 7th Street/Metro Center Station, continue north underneath Flower Street to 3rd Street, then travel further northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north into a new portal on the private property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. The tracks would then enter the intersection of 1st and Alameda Streets in the same type of three-way junction planned for the At-Grade Emphasis LRT Alternative. The option exists under this alterative for a potential pedestrian overpass and vehicular underpass for through traffic on Alameda Street.

The communities potentially directly affected by construction and operation of the Underground Emphasis LRT Alternative would include:

- Little Tokyo
- Historic Core
- Bunker Hill
- Financial District

5.4.1 Construction

Construction impacts from the Underground Emphasis LRT Alternative would have the potential to affect community mobility, viability of local businesses, emergency services, public health and safety, crime, community resources and events, population, housing, and employment. Construction staging areas have been identified along the proposed alignment and are included in the analysis for this report. Additional information about the construction staging areas is provided in the Description of Construction.

Most impacts would be temporary and intermittent, and they would be reduced or eliminated after construction is complete in four to five years. Cut and cover tunnel construction would be required on Flower Street and all of the station sites, except possibly at the 2nd/Hope Street station, which may be constructed using the sequential excavation method. The remainder of the alignment on 2nd Street would be constructed using a tunnel boring machine. Further information about these construction methods is available in the Description of Construction.

5.4.1.1 Community Mobility

This alternative would require the construction of three new underground stations: one near the Financial District, one at Bunker Hill, and one in the Historic Core/Little Tokyo. Construction of these stations would require temporary sidewalk and street closures. Mobility would be reduced in these areas during construction. Installation of underground tracks would require tunneling along 2nd and Flower Streets. The segment on Flower Street would require temporary cut and cover excavations and concrete decking along the entire length of the roadway from 7th Street/Metro Center Station to the new portal just south of 3rd Street. Along 2nd Street, a tunnel boring machine (TBM) would be used for the majority of the alignment. As such, construction impacts to surface traffic and mobility would be less pronounced on 2nd Street than on Flower Street.

The TBM would be placed in the ground near 2nd and Hope Streets in the Bunker Hill area and would tunnel east toward Little Tokyo. In order to bore a second tunnel, the TBM could be removed at 2nd and Alameda Streets and placed back in the ground at 2nd and Hope Streets, or two TBMs could be used simultaneously. It would also be possible for the TBMs to be inserted at 2nd and Alameda Streets and tunnel east toward Little Tokyo. The tunneling activities would affect the Little Tokyo area, Bunker Hill, and Flower Street at 7th Street. Temporary excavations could periodically reduce mobility in these areas.

However, most of the construction would occur beneath temporary concrete decking while traffic operates normally on the surface. The extent of the temporary excavations would be greater on Flower Street than on 2nd Street. Streets and sidewalks in the vicinity of the temporary excavation areas would likely be closed periodically during construction.

Temporary street closures and construction activities, similar to cut and cover construction, would be needed in the vicinity of the proposed underpass at 1st and Alameda Streets. This could result in temporary mobility impacts during construction. Further information about construction activities and mobility impacts is available in the Description of Construction and the Transportation Technical Memorandum.

In summation, road and sidewalk closures and traffic detours could reduce mobility for pedestrian and vehicle traffic in the central downtown area. This potential impact could be significant. Mitigation measures in Section 6.0 would reduce this potential impact to a less than significant level.

5.4.1.2 Viability of Existing Businesses

Businesses around each of the new stations and along the proposed alignment could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Construction activities would likely result in a temporary decrease in accessibility to many businesses and could reduce on-street and off-street parking. Construction operations could negatively affect business activity levels as the number of customers may temporarily decline. This potential impact could be significant.

While Metro would provide adequate detours and minimize road closures, some indirect effects to businesses may occur as people may avoid the project area altogether. This potential impact could be significant and unavoidable during the construction phase. Mitigation measures could help reduce the significance of these impacts. The Underground Emphasis LRT Alternative could offset business losses because it would require construction employees to be in the area on a regular basis. These employees could potentially provide business for neighborhood restaurants and retail establishments. The project could also create local construction-related and other permanent jobs.

Some existing commercial properties would need to be acquired under this alternative in Little Tokyo and the Historic Core. Properties would be acquired according to the Uniform Relocation Act, and owners would be compensated. However, loss of these businesses could indirectly affect the viability of surrounding businesses because less people could be drawn to the general area. This potential impact could be significant and unavoidable if not necessarily permanent. Mitigation measures would help reduce the significance of these impacts.

After construction, access to local businesses would be enhanced by the improved transit service provided by the Underground Emphasis LRT Alternative. Viability of businesses along the alignment would be increased by added pedestrian activity (more potential customers) on streets near the alignment, especially near stations.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and businesses in the area, particularly during the construction phase of the

project. Measures to ensure these concerns are addressed will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

It is anticipated that the Underground Emphasis LRT Alternative would require acquisition of a portion of the block bounded by 1st, 2nd, and Alameda Streets and Central Avenue in order to safely construct and operate a new portal, ancillary facilities, and a potential TBM launch site. TBMs could also be launched from the vicinity of 2nd/Hope Street station, though acquisitions in Little Tokyo would still be necessary.

Displaced businesses could include Office Depot, Señor Fish, and Starbucks Coffee. All other businesses on Central Avenue would remain. Additionally, some off-street parking on this block would be removed during construction. Retail, restaurant, and parking areas could potentially be restored on the site after construction is complete, so job losses would only be temporary. Any further displacement of businesses could cause additional temporary job losses. Because the project would bring new jobs to the project area, the net result would be a local increase in jobs. Further engineering may be able to minimize the acquisition area.

The businesses that would be removed do not contribute to the community identity as a Japanese American cultural center. Aside from Starbucks Coffee, they do not provide sidewalk seating or otherwise contribute to street activity. Temporary parking for remaining businesses on Central Avenue, some of which do provide sidewalk seating and are Japanese American-oriented, could potentially be provided by restriping Central Avenue for diagonal parking or by placing a temporary lot on the Nikkei parcel. This, and other mitigation measures outlined in Section 6.0, would reduce potential adverse impacts to a less than significant level.

5.4.1.3 Emergency Services

The Underground Emphasis LRT Alternative would likely require temporary road closures during construction. This could result in increased response times for emergency services such as police and fire. Any increase in response times for emergency services could be considered a significant impact. Mitigation measures in Section 6.0 would reduce this impact to a less than significant level.

5.4.1.4 Public Health and Safety and Crime

Construction of the Underground Emphasis LRT Alternative is not expected to increase crime or pose a threat to public health and safety. Any construction and staging areas that would be dangerous to the public would be adequately fenced or blocked off to prevent entry. The construction contractor would be responsible for providing security for the construction site at all times. The potential impact from this alternative on crime and public health and safety would be less than significant, and potential mitigation measures are identified in Section 6.0.

5.4.1.5 Community Resources and Events

Construction of the Underground Emphasis LRT Alternative would require road and sidewalk closures and would introduce construction vehicles and equipment into central downtown. Construction under this alternative has the potential to create temporary adverse affects on festivals and events in the downtown area. It could also disrupt traffic patterns and make it more difficult for the public to access certain community resources like the Japanese American National Museum and the MOCA Geffen Building. The potential resulting impact could be significant; however, mitigation measures described in Section 6.0 would reduce this potential impact to a less than significant level.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and cultural events in the area. Measures to address these concerns will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

5.4.1.6 Population, Housing, and Employment

Construction of the Underground Emphasis LRT Alternative would affect properties along the alignment, near proposed underground stations, and where the alignment connects to the Metro Gold Line.

In order to construct a portal and launch site for the TBM, some properties on the block bounded by 1st, Alameda, and 2nd Streets, and Central Avenue in Little Tokyo would be acquired. These properties include commercial buildings and parking lots. Acquisition of properties housing businesses could temporarily reduce employment in the Little Tokyo area. Further engineering may be able to minimize the acquisition area. The 2nd/Hope Street station area is also under consideration as an alternative TBM launch site, but the acquisitions in Little Tokyo would still be necessary.

This direct decrease in employment at this location in Little Tokyo would be unavoidable. However, construction activities would introduce new employees into the area on a regular basis, which could offset the decrease in economic activity. After the project is complete, the added mobility and access it would provide to the area would likely increase business viability and overall employment. In addition, new employment at new businesses developed in the station vicinities would likely occur.

Residents of the Savoy condominium development have expressed concerns over construction and operation noise. The Savoy is located across the street from a construction staging area (and a potential tunnel boring machine launch area) and adjacent to the proposed underpass site. There would be noise and construction detours around the building under this project alternative. These concerns, along with potential mitigation

measures, are addressed in the Noise and Vibration Technical Memorandum and the Transportation Technical Memorandum.

Along 2nd Street in the Historic Core, up to 19 easements, six partial takes, and four full takes could be required, depending on the location for the proposed new station. These totals encompass all of the acquisitions needed for all of the potential station entrances being considered. However, not all proposed station entrances would be built, so the actual number of easements needed would likely be smaller. The four properties that would be acquired in full include three parking lots and commercial buildings. A direct decrease in employment at this location in the Historic Core and would be an unavoidable. After the project is complete, the added mobility and access it would provide to the area would likely increase business viability and overall employment. In addition, new employment at new businesses developed in the station vicinities would likely occur.

Residents of the Higgins Building are concerned about construction noise that would result from implementation of the Underground Emphasis LRT Alternative. The building is located less than one block from the proposed 2nd Street station (under either the Broadway option or the Los Angeles Street option). These concerns are addressed, along with mitigation measures, in the Noise and Vibration Technical Memorandum.

In the Bunker Hill area, seven easements, one partial take, and one full take would be necessary. The Central Plant property would be partially acquired, and a vacant lot would be fully acquired. No commercial or residential properties would be displaced, so there would be no impact to population, housing, or employment.

The Underground Emphasis LRT Alternative would provide a number of new construction jobs in the four to five years construction would last. Creation of new employment in central downtown would be beneficial but temporary since the jobs would end with completion of the project.

Most construction workers are expected to come from surrounding areas and not permanently relocate around the work site. They would not substantially change the population or create a new demand for housing in central downtown. This potential impact would be less than significant.

5.4.2 Operation

Operation of the Underground Emphasis LRT Alternative could result in direct and indirect impacts on mobility, viability of existing businesses, population and housing, emergency services, public health and safety, community events, and senior and disabled persons.

5.4.2.1 Community Mobility

The Underground Emphasis LRT Alternative would create a new LRT alignment through central downtown and provide a new connection between Little Tokyo, the Historic Core, Bunker Hill, and the Financial District. This new connection would provide a link to the central downtown area from outside communities via the Metro Gold and Blue Lines. This increase in mobility, both within downtown and to the central downtown from outside communities, would be a beneficial impact.

Unlike the At-Grade Emphasis LRT Alternative, operation of the Underground Emphasis LRT Alternative would run almost entirely underground. Operation would not affect existing pedestrian or vehicle traffic except around the at-grade portion of the alignment near Alameda Street. Alameda Street experiences heavy vehicle traffic and large volumes of pedestrians cross Alameda Street to get to and from the Little Tokyo/Arts District Station.

Many of the traffic movements that could conflict with LRT trains would be eliminated by construction of a new underpass that would carry car and truck traffic along Alameda Street beneath 1st Street and the rail junction. Additionally, a potential new overhead pedestrian bridge structure would allow pedestrians to safely cross the street. Potential mobility impacts from this alternative would be less than significant and smaller than those for the At-Grade Emphasis LRT Alternative.

New LRT stations and trains would comply with the Americans with Disabilities Act and would be designed to ensure accessibility to all persons. The stations would be wheelchair and stroller accessible with ramps and/or elevators. The LRT train platforms would be constructed with ramps to allow passengers with strollers or disabilities to easily move in and out of the trains. As required by law, several seats on each train would be designated for persons with disabilities and senior citizens. There would be no adverse impacts on senior citizens or disabled persons.

5.4.2.2 Viability of Existing Businesses

Most businesses in the central downtown area along the proposed alignment would likely benefit from operation of this alternative. This alternative would provide a new means of public transportation through Little Tokyo, the Historic Core, Bunker Hill, and the Financial District and would likely increase the number of pedestrians around each of the new stations. An increase in pedestrian traffic would have a beneficial impact to businesses by increasing the number of potential customers.

5.4.2.3 Emergency Services

Operation of the Underground Emphasis LRT Alternative would not be expected to increase emergency response times because it would be underground. Modifications to the intersection at 1st and Alameda Streets would likely improve emergency vehicle response

times by increasing roadway capacity. Some alteration of emergency routes may be needed due to potential new turning restrictions. No new emergency service staff would be required as a result of operation of this alternative. There would be no adverse impact to emergency services.

5.4.2.4 Public Health and Safety and Crime

Operation of the Underground Emphasis LRT Alternative is not expected to substantially increase crime in the central downtown area. While there is a perception that transit stops increase crime levels in general, mitigation measures, such as additional security services, would help prevent an increase in crime. Stations and trains would be designed to maximize public safety and minimize the potential for crime. Stations would be constructed from materials that are resistant to vandalism, such as brick, concrete, steel, aluminum, and heavy plastic. Adequate lighting and security cameras would be provided to deter criminal activity.

Metro contracts with the Sheriff's Department to provide specialized security at all stations. Maintenance access to underground facilities would be designed to prevent unauthorized entry. Overall, the facilities are not expected to substantially change crime levels in the central downtown area. The potential impact of this alternative related to crime would be less than significant, and potential mitigation measures are identified in Section 6.0.

Additionally, this project would contribute to a pedestrian friendly community and encourage compact development. This would lead to increased walking, which would be a beneficial health impact of all the project build alternatives.

5.4.2.5 Community Resources and Events

Operation of the Underground Emphasis LRT Alternative would benefit community resources and events since it would provide a new transit option for travelers to the area. Since the alignment would run almost entirely underground, train service would continue uninterrupted during large events. Potential event attendees would gain new access to the area. This impact would be beneficial.

5.4.2.6 Population, Housing, and Employment

Over the long-term, the presence of the Regional Connector may attract new residents to the central downtown area since it increases access to the area. The City of Los Angeles continues to encourage public transportation and transit-oriented growth. Development, including additional housing units, may occur around proposed stations. This potential increase in population and housing would be consistent with the Central City Community Plan and would be a beneficial impact.

The Underground Emphasis LRT Alternative may indirectly increase employment. Operation of the Regional Connector would decrease commute times and increase access to and within

the central downtown area. Increased access could make employment in the central downtown area more attractive to residents of surrounding communities. This potential impact would be beneficial.

5.4.3 Cumulative Impacts

This section describes cumulative effects of the Underground Emphasis LRT Alternative.

5.4.3.1 Community Mobility

The Underground Emphasis LRT Alternative, when considered cumulatively with future projects, may result in benefits to the central downtown area. The Regional Connector Transit Corridor project and other Metro projects would increase community mobility, provide additional regional transit linkages, and increase ridership systemwide. This would be a cumulatively beneficial impact.

5.4.3.2 Viability of Existing Businesses

There are no other planned transportation projects that would affect the viability of businesses along the alignment for the Underground Emphasis LRT Alternative. However, many new construction and renovation projects are planned in the area. If these construction projects affect accessibility to local businesses, there may be a cumulative adverse impact. Still, these impacts are expected to be temporary and would be eliminated after construction is complete. The potential cumulative impacts associated with the viability of existing businesses would be less than significant.

5.4.3.3 Emergency Services

Many new construction and renovation projects are planned in the central downtown area for the same time as construction of the Underground Emphasis LRT Alternative. If these related projects require road closures or detours in the same timeframe as construction of the Underground Emphasis LRT Alternative, a cumulative effect could occur resulting in increased response times for emergency vehicles.

However, each project, including the Regional Connector, would be responsible for alerting emergency services to any road closures or detours. This would lessen increased emergency response times due to construction. The potential cumulative impact to emergency services would be less than significant.

5.4.3.4 Public Health and Safety and Crime

The Underground Emphasis LRT Alternative, and the future projects planned for the central downtown area, could have the potential to increase safety risks and crime during both construction and operation. However, each project would be responsible for reducing or avoiding potential adverse impacts.

The Underground Emphasis LRT Alternative has included measures to protect public health and safety and reduce or avoid crime. All Metro Rail facilities are continuously monitored by security personnel to minimize risks to the public. With implementation of such measures, the Underground Emphasis LRT Alternative would not contribute to significant cumulative public health and safety or crime impacts.

5.4.3.5 Community Resources and Events

Many new construction and renovation projects are planned in the central downtown area for the same time as the potential construction of the Underground Emphasis LRT Alternative. If these related projects require road closures or detours in the same timeframe as construction of the Underground Emphasis LRT Alternative, a cumulative effect could occur resulting in adverse impacts to community resources and events.

Potential adverse impacts could include temporary traffic congestion, decreased mobility, and closures of sidewalks and roads.

However, each specific project, including the Underground Emphasis LRT Alternative, would be responsible for coordinating with local community groups prior to construction to minimize impacts. With implementation of the mitigation measures listed in Section 6.0, this potential cumulative impact would be less than significant.

5.4.3.6 Population, Housing, and Employment

The Underground Emphasis LRT Alternative has the potential to indirectly increase population, housing, and employment in central downtown over the long-term. This alternative would better link the project area to the LRT system, encouraging people to live and work in central downtown. Combined with the city's transit-oriented growth policies, the new transit stations could encourage denser development and make alternatives to the single occupancy vehicle more viable.

Future development projects in the project area could also increase population, housing, and employment. The cumulative population, housing, and employment growth from the Underground Emphasis LRT Alternative, and other planned future projects, would be expected to be consistent with the Central City Community Plan objectives and would result in a beneficial cumulative impact.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would connect directly to the Metro Blue/Expo Line tracks at 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north beneath the private property bounded by 1st, Alameda, and 2nd Streets, and Central

Avenue. Next, the tracks would enter a junction beneath the intersection of 1st and Alameda Streets.

From the junction, the track would diverge into two directions. One set of tracks bound for the City of Azusa would proceed north and rise through a portal just northeast of the intersection of Temple and Alameda Streets. Here, the track would connect to the Metro Gold Line LRT bridge over US 101. Another set of tracks, bound for I-605 via the Eastside Extension, would proceed east from the junction and rise through a new portal in the middle of 1st Street between Alameda and Hewitt Streets. These tracks would connect to the existing Metro Gold Line to East Los Angeles tracks.

The communities directly affected by construction and operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would include:

- Arts District
- Little Tokyo
- Historic Core
- Bunker Hill
- Financial District

5.5.1 Construction

Construction impacts from the Fully Underground LRT Alternative - Little Tokyo Variation 1 would potentially affect community mobility, viability of local businesses, emergency services, public health and safety, crime, community resources and events, and population, housing, and employment. Construction staging areas have been identified along the proposed alignment and are included in the analysis for this report. Additional information about the construction staging areas is provided in the Description of Construction.

Most impacts under this alternative would be temporary and intermittent and would be reduced or eliminated after construction is completed in four to five years. Cut and cover tunnel construction would be required on Flower Street between 7th Street/Metro Center Station and 3rd Street. The potential 2nd /Hope Street station could be constructed using either the cut and cover method or the sequential excavation method. The proposed 2nd Street/Central Avenue station, the portal on the Department of Water and Power site, and tunnels beneath the Nikkei parcel would be constructed using the open cut method.

Other stations would be constructed using the cut and cover method. Cut and cover construction would also be needed for the junction beneath the intersection of 1st and

Alameda Streets and tunnel approaches to nearby portals. The remainder of the alignment on 2nd Street would be constructed using a tunnel boring machine. Further information about these construction methods is available in the Description of Construction.

5.5.1.1 Community Mobility

This alternative would require the construction of four new underground stations: one near the Financial District, one at Bunker Hill, one in the Historic Core, and one in Little Tokyo. Construction of these stations would require temporary sidewalk and street closures. Mobility would be reduced in these areas during construction.

Installation of underground tracks would require tunneling along 2nd and Flower Streets. A segment on Flower Street would require temporary cut and cover excavations. Concrete decking would be installed along the entire length of Flower Street from 7th Street/Metro Center Station to the new portal just south of 3rd Street. Along 2nd Street, a TBM would be used for the majority of the alignment. Since the TBM operates underground, construction impacts to surface traffic and mobility would be less pronounced on 2nd Street than on Flower Street.

The TBM would be placed in the ground near 2nd and Hope Streets in the Bunker Hill area and would tunnel east toward Little Tokyo. In order to bore a second tunnel, the TBM could be removed at 2nd and Alameda Streets and placed back in the ground at 2nd and Hope Streets, or two TBMs could be used simultaneously. It would also be possible for the TBMs to be inserted at 2nd and Alameda Streets and tunnel east toward Little Tokyo. The tunneling activities would affect the Little Tokyo area, Bunker Hill, and Flower Street at 7th Street. Temporary excavations could periodically reduce mobility in these areas.

Tunneling activities would affect Flower Street at 7th Street , Bunker Hill, Little Tokyo, and the Arts District. Temporary excavations in these areas could periodically reduce mobility during construction. Most of the construction, however, would occur beneath temporary concrete decking while traffic operates normally on the surface. The extent of the temporary excavations would be greater on Flower Street than on 2nd Street. Construction could necessitate the periodic closing of streets and sidewalks near excavations.

Temporary street closures, and construction activities similar to cut and cover construction, would be needed in the vicinity of the two portals near the intersection of 1st and Alameda Streets. This could result in temporary mobility impacts while construction is underway. Further information about construction activities and mobility impacts are available in the Description of Construction and the Transportation Technical Memorandum.

Overall, pedestrian and vehicle mobility between communities and neighborhoods in the central downtown area could be reduced during construction because of road and sidewalk

closures and traffic detours. This potential impact could be significant. Mitigation measures in Section 6.0 would reduce this potential impact to mobility to a less than significant level.

5.5.1.2 Viability of Existing Businesses

Businesses around each of the new stations and along the proposed alignment could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Construction activities would result in a temporary decrease in accessibility to some businesses and could reduce on-street and off-street parking. Less accessibility could negatively affect business activity levels if the number of customers temporarily declines. This potential impact could be significant.

While Metro would provide adequate detours and minimize road closures, some indirect effects to businesses may occur if consumers avoid the project area altogether. This potential impact could be significant and would be unavoidable during the construction phase. Mitigation measures would help reduce the significance of these impacts. The Fully Underground LRT Alternative - Little Tokyo Variation 1 could offset business losses because it would require construction employees to be in the area on a regular basis. These employees could potentially provide business for neighborhood restaurants and retail establishments. The project could create local construction-related and permanent jobs.

Partial takes would be needed along only the north side of 1st Street between Alameda and Garey Streets. A partial take on the north side of 1st Street would come from the proposed Nikkei parcel. Though less space would remain, the development potential of the Nikkei parcel would be enhanced by the proposed 2nd Street/Central Avenue station that would improve access to the site.

Under this alternative, some existing commercial properties would need to be acquired in Little Tokyo and the Historic Core. These properties would be acquired according to the Uniform Relocation Act and owners would be compensated. However, losing these businesses could indirectly affect the viability of other local businesses because fewer people might be drawn to the area. This impact would be unavoidable during construction and could be considered significant. Mitigation measures would help reduce the significance of these impacts.

After construction, access to the area would be enhanced by the improved transit service provided by the Fully Underground LRT Alternative – Little Tokyo Variation 1. After construction, this alternative would increase viability of area businesses by increasing pedestrian activity (adding more potential customers) on streets near the alignment and especially near stations.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and businesses in the area, particularly during the construction phase of the

project. Measures to address these concerns will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

It is anticipated that the Fully Underground LRT Alternative – Little Tokyo Variation 1 could require acquisition of the entire block bounded by 1st, 2nd, and Alameda Streets and Central Avenue in order to safely construct and operate a new station, entrances, ancillary facilities, and a potential TBM launch site. TBMs could also be launched from the vicinity of 2nd/Hope Street station, though acquisitions in Little Tokyo would still be necessary.

Displaced businesses would include Office Depot, Señor Fish, Starbucks Coffee, Weiland's Brewery, and Café Cuba. All other businesses on Central Avenue would remain. Additionally, all off-street parking on this block would be removed during construction. Retail, restaurant, and parking areas could potentially be restored on the site after construction is complete, so job losses would only be temporary. Because the project would bring new jobs to the project area, the net result would be a local increase in jobs. Further engineering may be able to minimize the acquisition area.

The businesses that would be removed do not contribute to the community identity as a Japanese American cultural center. Aside from Starbucks Coffee, they do not provide sidewalk seating or otherwise contribute to street activity. Temporary parking for remaining businesses on Central Avenue, some of which do provide sidewalk seating and are Japanese American-oriented, could potentially be provided by restriping Central Avenue for diagonal parking or by placing a temporary lot on the Nikkei parcel. This, and other mitigation measures outlined in Section 6.0, would reduce potential adverse impacts to a less than significant level.

5.5.1.3 Emergency Services

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would require temporary road closures during construction. Road closures could result in increased response times for emergency services such as police and fire. Any increase in response times for emergency services could be considered a significant impact. Mitigation measures in Section 6.0 would reduce this impact to a less than significant level.

5.5.1.4 Public Health and Safety and Crime

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 is not expected to increase crime or pose a threat to public health and safety. Any construction and staging areas that would be dangerous to the public would be adequately blocked off to prevent entry. The construction contractor would be responsible for providing security for the construction site at all times. This potential impact would be less than significant, and mitigation measures are identified in Section 6.0.

5.5.1.5 Community Resources and Events

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 may require road and sidewalk closures and would introduce construction vehicles and equipment into central downtown. This has the potential for temporary adverse affects on annual festivals and events held in the downtown area. Construction could disrupt traffic patterns and make it more difficult for the public to access community resources such as the Nishi Hongwanji Temple, the Japanese American National Museum, and the MOCA Geffen building. This potential impact could be significant; however, mitigation measures, described in Section 6.0, would reduce this potential impact to a less than significant level.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and cultural events in the area. Measures to address these concerns will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

5.5.1.6 Population, Housing, and Employment

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would affect properties along the alignment, near the proposed underground stations, and near the portals where the alignment would connect to the Metro Gold Line.

All of the properties on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue in Little Tokyo would be acquired under this alternative to allow for construction of a portal and launch site for the TBM. Though they would be acquired under this project alternative, the strip of businesses facing Central Avenue would remain in place, except possibly Starbucks Coffee. These properties consist of commercial buildings and parking lots. Acquisition of these properties could temporarily reduce employment in the Little Tokyo area since these properties contain existing businesses. Further engineering may be able to minimize the acquisition area. The 2nd/Hope Street station area is also under consideration as an alternative TBM launch site, but the acquisitions in Little Tokyo would still be necessary.

This alternative would result in a decrease in employment at this location in Little Tokyo and would be unavoidable. However, construction activities would introduce new people into the area on a regular basis. This influx could offset the decrease in employment and economic activity. After construction there would likely be additional new employment since the increased access to the area afforded by the project would enhance local business viability.

Should it be necessary to acquire all properties on the aforementioned block, a temporary reduction in employment would be more pronounced but would not extend to other areas of the community. New space for businesses could potentially be constructed on the same site once the Regional Connector is finished, possibly as part of a transit-oriented development that would boost business activity throughout the community.

Residents of the Savoy condominium development have expressed concerns over construction and operation noise. The Savoy is located across the street from a construction staging area (and a potential TBM launch area) and is adjacent to the proposed portal site. There would be additional noise and construction detours would be implemented around the building during construction. Potential noise and access effects, along with mitigation measures, are addressed in the Noise and Vibration Technical Memorandum and the Transportation Technical Memorandum.

Along 2nd Street in the Historic Core, up to eighteen easements, six partial takes, and four full takes could be required depending on the location for the proposed new station. These totals encompass all of the acquisitions needed for all of the potential station entrances being considered. Not all proposed station entrances would be built however, so the number of easements needed would likely be smaller. Three commercial properties and a parking lot would be acquired in full.

This acquisition is unavoidable and would result in a direct decrease in employment at this location. After construction this impact could be offset by new employment at new businesses developed in the vicinity of new stations. When the area becomes more accessible by rail, employment could increase since local businesses would become more viable.

Residents of the Higgins Building are concerned about construction noise that would result from the Fully Underground LRT Alternative - Little Tokyo Variation 1. The Higgins Building is located less than one block from the proposed 2nd Street/Broadway station. Construction noise concerns are addressed, along with mitigation measures, in the Noise and Vibration Technical Memorandum.

In the Bunker Hill area, seven easements, one partial take, and one full take would be necessary. Property housing the Central Plant would be partially acquired, and a vacant lot would be fully acquired. No commercial or residential properties would be displaced, and no population, housing, or employment impacts would occur.

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would provide a number of new construction jobs over the four to five year construction period. Creation of new employment in central downtown would be beneficial but temporary since the jobs would no longer be needed after construction is complete. Most construction workers are expected to commute from surrounding areas and are not expected to permanently relocate to the work site. Construction workers would not substantially change the population or create a new demand for housing in central downtown. This potential impact would be less than significant.

5.5.2 Operation

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 could result in direct and indirect impacts associated with mobility, viability of existing businesses, population and housing, emergency services, public health and safety, community events, and senior and disabled persons.

5.5.2.1 Community Mobility

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would create a new LRT alignment through central downtown and provide a new connection between the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. This new connection would provide a link to the central downtown area from outside communities via the Metro Gold and Blue Lines. This increase in mobility, both between downtown communities and to central downtown from outside communities, would be a beneficial impact. Mobility for Little Tokyo and the Arts District would be enhanced under this alternative because the proposed 2nd Street/Central Avenue station would be served by both North-South and East-West Regional Connector routes.

Unlike the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative, operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would run entirely underground and would not affect existing pedestrian or vehicle traffic. One exception exists where the alignment would surface on 1st Street. Pedestrians and vehicles would no longer be able to cross 1st Street at Hewitt Street, but they would still be able to cross at Alameda Street and Vignes Street. Alameda Street currently experiences heavy vehicle and pedestrian traffic. Additionally, large volumes of pedestrians cross Alameda Street to get to and from the existing Little Tokyo/Arts District Station.

However, by placing the 2nd Street/Central Avenue Station close to major activity centers in Little Tokyo, this alternative would eliminate the need for many pedestrians to cross Alameda Street. Operation of this alternative would not conflict with existing traffic movements, but some intersections would be modified by new turning restrictions. Potential mobility impacts from this alternative would be less than significant. Additionally, mobility impacts would be less than those of the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative.

New LRT stations and trains would comply with the Americans with Disabilities Act and be designed to ensure accessibility to all persons. Stations would be wheelchair and stroller accessible with ramps and/or elevators. LRT train platforms would be constructed with ramps to allow passengers with strollers or disabilities to easily move in and out of the trains. As required by law, several seats on each train would be designated for persons with disabilities and senior citizens. There would be no adverse impacts to senior citizens or disabled persons.

5.5.2.2 Viability of Existing Businesses

Most businesses along the proposed alignment would likely benefit from operation of this alternative. This alternative would provide a new means of public transportation through the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. The number of pedestrians in the areas around new stations would likely increase.

An increase in pedestrians would benefit local businesses by increasing the volume of potential customers. An entrance to the 2nd Street/Central Avenue station could be incorporated into the planned Nikkei Center on the northeast corner of 1st and Alameda Streets. Such transit-oriented development could increase transit ridership and local business activity. This potential effect would be beneficial.

5.5.2.3 Emergency Services

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not be expected to increase emergency response times because it would run underground. Modifications to the intersection at 1st and Alameda Streets would likely improve emergency vehicle response times by increasing roadway capacity. Some alteration of emergency routes may be needed due to added turning restrictions. New emergency service staff would not be required as a result of operation of this alternative. There would be no adverse impact to emergency services.

5.5.2.4 Public Health and Safety and Crime

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not result in an increase in crime in the central downtown area. Mitigation measures, such as additional security services, would prevent an increase in crime. Stations and trains would be designed to maximize public safety and minimize the potential for crime. Stations would be constructed from materials such as brick, concrete, steel, aluminum, and heavy plastic which are generally resistant to vandalism. Adequate lighting and security cameras would be provided to deter criminal activity.

Metro contracts with the Sheriff's Department to provide specialized security at all stations. Maintenance access to underground facilities would be designed to prevent unauthorized entry. Overall, the operation of this alternative is not expected to change crime levels in the central downtown area. The potential impact of the project on crime would be less than significant. Mitigation measures are identified in Section 6.0.

Additionally, this project would contribute to a pedestrian friendly community and encourage compact development. This would lead to increased walking, which would be a beneficial health impact of all the proposed build alternatives.

5.5.2.5 Community Resources and Events

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would benefit community resources and events because it would provide a new transit option for travelers to the area. Since the alignment would operate entirely underground, train service would continue uninterrupted during large events, facilitating access for event attendees. This increased access would be beneficial.

5.5.2.6 Population, Housing, and Employment

Over the long-term, this alternative could attract new residents to the central downtown area. This alternative would link the project area to the regional LRT system through four new stations. As Los Angeles continues to encourage public transportation and transit-oriented growth, new development, including additional housing units, could occur around new stations. This increase in population and housing would be consistent with the Central City Community Plan and the Central City North Community Plan and would be a beneficial impact.

The Fully Underground LRT Alternative - Little Tokyo Variation 1 could indirectly increase employment. This alternative creates four new stations and would decrease commute times for workers. In general, increased public transportation would make central downtown a more desirable location to work and live in, increasing jobs and population. This potential impact would be beneficial.

5.5.3 Cumulative Impacts

This section describes cumulative effects of the Fully Underground LRT Alternative - Little Tokyo Variation 1.

5.5.3.1 Community Mobility

Upon completion, the Fully Underground LRT Alternative - Little Tokyo Variation 1, when considered cumulatively with future projects, may result in benefits to the central downtown area. The Regional Connector Transit Corridor project and other Metro projects would increase community mobility, provide additional regional transit linkages, and increase ridership systemwide. This would be a cumulatively beneficial impact.

5.5.3.2 Viability of Existing Businesses

There are no other planned transportation projects that would affect the viability of businesses along the alignment for the Fully Underground LRT Alternative - Little Tokyo Variation 1. Many new construction and renovation projects are planned in the area. If these construction projects affect accessibility to local businesses, there may be a cumulative adverse impact.

However, impacts are expected to be temporary and would be eliminated after construction is complete. Overall, the potential cumulative impacts associated with the viability of existing businesses would be less than significant.

5.5.3.3 Emergency Services

Many new construction and renovation projects are planned in the central downtown area during the time the Regional Connector would be constructed. If these projects require road closures or detours in the same timeframe as the Fully Underground LRT Alternative - Little Tokyo Variation 1's construction, a cumulative effect could occur resulting in increased response times for emergency vehicles.

However, each specific project, including the Regional Connector, would be responsible for alerting emergency services to any road closures or detours. This measure would help avoid increased response times due to construction. The potential cumulative impact to emergency response time would be less than significant.

5.5.3.4 Public Health and Safety and Crime

The Fully Underground LRT Alternative - Little Tokyo Variation 1, and future projects planned for the central downtown area could potentially result in safety risks or increased crime during both construction and operations. However, each project would be responsible for reducing or avoiding potential impacts.

The Fully Underground LRT Alternative - Little Tokyo Variation 1 includes measures to protect public health and safety and reduce or avoid crime. All Metro Rail facilities are continuously monitored by security personnel to minimize risks to the public. With implementation of such measures, the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not contribute to significant cumulative public health and safety or crime impacts.

5.5.3.5 Community Resources and Events

Many new construction and renovation projects are planned in the central downtown area during the time the Fully Underground LRT Alternative - Little Tokyo Variation 1 would be constructed. If these projects require temporary road closures or detours in the same timeframe as the Fully Underground LRT Alternative - Little Tokyo Variation 1's construction, cumulative effects to community resources or events may occur.

Adverse effects could include temporary traffic congestion, decreased mobility, and closures of sidewalks and roads. However, each specific project, including the Fully Underground LRT Alternative - Little Tokyo Variation 1, would be responsible for coordinating with local community groups prior to construction to minimize impacts. With implementation of the mitigation measures listed in Section 6.0, potential cumulative impacts to community resources and events would be less than significant.

5.5.3.6 Population, Housing, and Employment

Over the long-term, the Fully Underground LRT Alternative - Little Tokyo Variation 1 has the potential to indirectly increase population, housing, and employment in the downtown area. This alternative would link the project area to the LRT system, encouraging people to live and work in central downtown. Combined with the city's transit-oriented growth policies, the new transit stations could encourage denser development and make alternatives to the single occupancy vehicle more viable.

Future development in the project area would also increase population, housing, and employment. The cumulative population, housing, and employment growth from the Fully Underground LRT Alternative - Little Tokyo Variation 1, and other planned future projects, would be consistent with the Central City Community Plan objectives. Such growth would be a beneficial cumulative impact.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would connect directly to the Metro Blue and Expo Line tracks at 7th Street/Metro Center Station and continue north underneath Flower Street to 3rd Street and then northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tracks would then veer north beneath the private property bounded by 1st, Alameda, and 2nd Streets and Central Avenue. The tracks would then enter a junction beneath the intersection of 1st and Alameda Streets.

From the junction, the track would diverge into two sets. One set of tracks bound for the City of Azusa would proceed north and rise through a portal just northeast of the intersection of Temple and Alameda Streets. Here, the track would connect to the Metro Gold Line LRT bridge over US 101. Another set of tracks, bound for I-605 via the Eastside Extension, would proceed east from the junction and rise through a new portal in the middle of 1st Street between Alameda and Hewitt Streets. These tracks would connect to the existing Metro Gold Line.

Communities potentially directly affected by construction and operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would include:

- Arts District
- Little Tokyo
- Historic Core
- Bunker Hill

- Financial District

5.6.1 Construction

Construction impacts from the Fully Underground LRT Alternative - Little Tokyo Variation 2 could affect community mobility, viability of local businesses, emergency services, public health and safety, crime, community resources and events, and population, housing, and employment. Construction staging areas have been identified along the proposed alignment and are included in the analysis for this report. Additional information about construction staging areas is provided in the Description of Construction.

Most potential impacts would be temporary and intermittent and would be reduced or eliminated after construction is complete in four to five years. Cut and cover tunnel construction would be required on Flower Street between 7th Street/Metro Center Station and 3rd Street. The 2nd/Hope Street station could be constructed using either the cut and cover method or the sequential excavation method. The 2nd Street/Central Avenue station would be constructed using the open cut method.

Other stations would be constructed using the cut and cover method. Cut and cover construction would be needed for the junction beneath the intersection of 1st and Alameda Streets and tunnel approaches to nearby portals. A TBM would create the remainder of the alignment on 2nd Street. Further information about construction methods is available in the Description of Construction.

5.6.1.1 Community Mobility

This alternative would construct four new underground stations: one near the Financial District, one at Bunker Hill, one in the Historic Core, and one in Little Tokyo. Construction of these stations would require temporary sidewalk and street closures. Mobility would be reduced in these areas during construction.

Installation of underground tracks would require tunneling along 2nd and Flower Streets. Temporary cut and cover excavation would be required on a segment of Flower Street. Concrete decking would be installed along the entire length of Flower Street from 7th Street/Metro Center Station to the new portal just south of 3rd Street. A TBM would be used to build the majority of the alignment along 2nd Street. As such, construction impacts to mobility of surface traffic would be less pronounced on 2nd Street than on Flower Street.

The TBM would be placed in the ground near 2nd and Hope Streets in the Bunker Hill area and would tunnel east toward Little Tokyo. In order to bore a second tunnel, the TBM could be removed at 2nd and Alameda Streets and placed back in the ground at 2nd and Hope Streets, or two TBMs could be used simultaneously. It would also be possible for the TBMs to be inserted at 2nd and Alameda Streets and tunnel east toward Little Tokyo. The tunneling

activities would affect the Little Tokyo area, Bunker Hill, and Flower Street at 7th Street. Temporary excavations could periodically reduce mobility in these areas.

Tunneling activities would affect Flower Street at 7th Street, Bunker Hill, Little Tokyo, and the Arts District. Temporary excavations could periodically reduce mobility in these areas during construction. However, most construction would occur beneath temporary concrete decking while traffic operates normally on the surface. The extent of temporary excavations would be greater on Flower Street than on 2nd Street. Some streets and sidewalks in the vicinity of temporary excavation areas would periodically be closed during construction.

Temporary street closures, and construction activities similar to cut and cover construction, would be needed in the vicinity of the two portals near the intersection of 1st and Alameda Streets. This could result in temporary mobility impacts while construction is underway. Further information about construction activities and mobility impacts are available in the Description of Construction and the Transportation Technical Memorandum.

Overall, construction could lead to road and sidewalk closures and traffic detours and reduce pedestrian and vehicle mobility between communities and neighborhoods in the central downtown area. This potential impact to mobility could be significant. Mitigation measures in Section 6.0 would reduce this potential impact to a less than significant level.

5.6.1.2 Viability of Existing Businesses

Businesses around the proposed stations and along the proposed alignment could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Construction activities would likely result in a temporary decrease in accessibility to many businesses and could reduce on-street and off-street parking.

Construction could negatively impact business activity levels because the number of customers may temporarily decline. This potential impact could be significant. While Metro would provide adequate detours and minimize road closures, some adverse effects to businesses may occur as people may avoid the project area altogether.

This potential adverse impact would be unavoidable during construction and could be significant. Mitigation measures would help reduce the significance of these impacts. The Fully Underground LRT Alternative - Little Tokyo Variation 2 could offset business losses because it would require construction employees to be in the area on a regular basis. These employees could potentially provide business for neighborhood restaurants and retail establishments. The project could also create local construction-related and permanent jobs.

Some commercial properties in Little Tokyo and the Historic core would be acquired under this alternative. These properties would be acquired according to the Uniform Relocation Act and owners would be compensated. However, loss of these businesses could adversely affect

the surrounding communities and indirectly affect the viability of other businesses because fewer people could be drawn to the area. This impact would be unavoidable and could be considered significant if not permanent. Mitigation measures would help reduce this potential impact to a less than significant level.

Under this alternative, partial property acquisitions would occur along both sides of 1st Street east of Alameda Street. Easements on the south side of the street would be located on a private parking lot and vacant space, causing little disruption to the community. The partial take on the north side of 1st Street would be from the proposed Nikkei parcel. Though less space would remain, the development potential of the Nikkei parcel would be enhanced by the proposed 2nd Street/Central Avenue station that would improve access to the site.

After construction, access to the area would be enhanced by the improved transit service provided by the Fully Underground LRT Alternative – Little Tokyo Variation 2. After construction, this alternative could increase viability of area businesses by increasing pedestrian activity (adding more potential customers) on streets near the alignment and especially near stations.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and businesses in the area, particularly during the construction phase of the project. Measures to address these concerns will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

It is anticipated that the Fully Underground LRT Alternative – Little Tokyo Variation 2 could require acquisitions of the entire block bounded by 1st, 2nd, and Alameda Streets and Central Avenue in order to safely construct and operate a new station, entrances, ancillary facilities, and a potential TBM launch site. TBMs could also be launched from the vicinity of 2nd/Hope Street station, though acquisitions in Little Tokyo would still be necessary.

Displaced businesses would include Office Depot, Señor Fish, Starbucks Coffee, Weiland's Brewery, and Café Cuba. All other businesses on Central Avenue would remain. Additionally, all off-street parking on this block would be removed during construction. Retail, restaurant, and parking areas could potentially be restored on the site after construction is complete, so job losses would only be temporary. Because the project would bring new jobs to the project area, the net result would be a local increase in jobs. Further engineering may be able to minimize the acquisition area.

The businesses that would be removed do not contribute to the community identity as a Japanese American cultural center. Aside from Starbucks Coffee, they do not provide sidewalk seating or otherwise contribute to street activity. Temporary parking for remaining businesses on Central Avenue, some of which do provide sidewalk seating and are Japanese American-oriented, could potentially be provided by restriping Central Avenue for diagonal

parking or by placing a temporary lot on the Nikkei parcel. This, and other mitigation measures outlined in Section 6.0, would reduce potential adverse impacts to a less than significant level.

5.6.1.3 Emergency Services

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would require temporary road closures during the construction period; this could result in increased response times for emergency services such as police and fire. Any increase in response times for emergency services could be considered a significant impact. Mitigation measures in Section 6.0 would reduce this impact to a less than significant level.

5.6.1.4 Public Health and Safety and Crime

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 is not expected to increase crime or pose a threat to public health and safety. Any construction and staging areas that would be dangerous to the public would be adequately blocked off to prevent entry. The construction contractor would be responsible for providing security for the construction site at all times. This potential impact would be less than significant, and potential mitigation measures are identified in Section 6.0.

5.6.1.5 Community Resources and Events

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 may require road and sidewalk closures and would introduce construction vehicles and equipment into central downtown. This has the potential for temporary adverse affects on annual festivals and events held in the downtown area. Construction could disrupt traffic patterns and make it more difficult for the public to access community resources such as the Nishi Hongwanji Temple, the Japanese American National Museum, and the MOCA Geffen building. This potential impact could be significant; however, mitigation measures, described in Section 6.0, would reduce this potential impact to a less than significant level.

Little Tokyo stakeholders have expressed concern about retaining the character of the existing community and cultural events in the area. Measures to address these concerns will be considered for implementation once the ongoing coordination process with the Little Tokyo community is completed.

5.6.1.6 Population, Housing, and Employment

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would affect properties along the alignment, near the proposed underground stations, and near the portals where the alignment would connect to the Metro Gold Line.

All of the properties on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue in Little Tokyo would be acquired under this alternative to allow for construction of a

portal and launch site for the TBM. Though they would be acquired under this project alternative, the strip of businesses facing Central Avenue would remain in place, except possibly Starbucks Coffee. These properties consist of commercial buildings and parking lots. Acquisition of these properties could temporarily reduce employment in the Little Tokyo area since these properties contain existing businesses. Further engineering may be able to minimize the acquisition area. The 2nd/Hope Street station area is also under consideration as an alternative TBM launch site, but the acquisitions in Little Tokyo would still be necessary.

This alternative would result in a decrease in employment at this location in Little Tokyo and would be unavoidable. However, construction activities would introduce new people into the area on a regular basis. This influx could offset the decrease in employment and economic activity. After construction there would likely be additional new employment since the increased access to the area afforded by the project would enhance local business viability.

Should it be necessary to acquire all properties on the aforementioned block, a temporary reduction in employment would be more pronounced but would not extend to other areas of the community. New space for businesses could be constructed on the same site once the Regional Connector is finished, possibly as part of a transit-oriented development that would boost business activity throughout the community.

Residents of the Savoy condominium development have expressed concerns over potential construction and operation noise. The Savoy is located across the street from a construction staging area (and a potential TBM launch area) and adjacent to the proposed portal site. Potential noise impacts and construction detours could occur around the building. Noise and traffic concerns, along with potential mitigation measures, are addressed in the Noise and Vibration Technical Memorandum and the Transportation Technical Memorandum.

Along 2nd Street in the Historic Core, up to eighteen easements, six partial takes, and four full takes could be required depending on the location for the proposed new station. These totals encompass all of the acquisitions needed for all of the potential station entrances being considered. Not all potential station entrances would be built however, so the number of easements needed would likely be smaller. Three commercial properties and a parking lot would be acquired in full.

This acquisition would be unavoidable and could result in a direct decrease in employment at this location. After construction this impact could be offset by new employment at new businesses developed in the vicinity of the proposed stations. When the area becomes more accessible by rail, employment could increase since local businesses would become more viable.

Residents of the Higgins Building are concerned about potential construction noise that would result from Fully Underground LRT Alternative - Little Tokyo Variation 2. The Higgins

Building is located less than one block from the proposed 2nd Street/Broadway station. Construction noise concerns are addressed, along with mitigation measures, in the Noise and Vibration Technical Memorandum.

In the Bunker Hill area, seven easements, one partial take, and one full take would be necessary. Property housing the Central Plant would be partially acquired, and a vacant lot would be fully acquired. No commercial or residential properties would be displaced, and no population, housing, or employment impacts would occur.

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would provide a number of new construction jobs over the four to five year construction period. Creation of new employment in central downtown would be beneficial but temporary since the jobs would no longer be needed after construction is complete. Most construction workers are expected to commute from surrounding areas and are not expected to permanently relocate to the work site. Construction workers would not substantially change the population or create a new demand for housing in central downtown. This potential impact would be less than significant.

5.6.2 Operation

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 could result in direct and indirect impacts associated with mobility, viability of existing businesses, population and housing, emergency services, public health and safety, community events, and senior and disabled persons.

5.6.2.1 Community Mobility

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would create a new LRT alignment through central downtown and provide a new connection between the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. This new connection would provide a link to the central downtown area from outside communities via the Metro Gold and Blue Lines. This increase in mobility, both between downtown communities and to central downtown from outside communities, would be a beneficial impact. Mobility for Little Tokyo and the Arts District is particularly enhanced under this alternative because the proposed 2nd Street/Central Avenue station would be served by both North-South and East-West Regional Connector routes.

Unlike the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative, operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would run entirely underground and would not affect existing pedestrian or vehicle traffic. One exception exists where the alignment would surface on 1st Street. Pedestrians and vehicles would no longer be able to cross 1st Street at Hewitt Street, but they would still be able to cross at Alameda Street and Vignes Street. Alameda Street currently experiences

heavy vehicle traffic. Additionally, large volumes of pedestrians cross Alameda Street to get to and from the existing Little Tokyo/Arts District Station.

However, by placing the 2nd Street/Central Avenue Station close to major activity centers in Little Tokyo, this alternative could eliminate the need for many pedestrians to cross Alameda Street. Operation of this alternative would not conflict with existing traffic movements, but some intersections would be modified by new turning restrictions. Potential mobility impacts from this alternative would not be significant. Additionally, mobility impacts would be less than those of the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative.

New LRT stations and trains would comply with the Americans with Disabilities Act and be designed to ensure accessibility to all persons. Stations would be wheelchair and stroller accessible with ramps and/or elevators. LRT train platforms would be constructed with ramps to allow passengers with strollers or disabilities to easily move in and out of trains. As required by law, several seats on each train would be designated for persons with disabilities and senior citizens. There would be no adverse impacts to senior citizens or disabled persons.

5.6.2.2 Viability of Existing Businesses

Most businesses along the proposed alignment would likely benefit from operation of this alternative. This alternative would provide a new means of public transportation through the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. The number of pedestrians in the areas around proposed new stations would likely increase.

An increase in pedestrians would benefit local businesses by increasing the volume of potential customers. An entrance to the 2nd Street/Central Avenue station could be incorporated into the planned Nikkei Center on the northeast corner of 1st and Alameda Streets. Such transit-oriented development could increase transit ridership and local business activity. This potential effect would be beneficial.

5.6.2.3 Emergency Services

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would not be expected to increase emergency response times because it would run underground. Modifications to the intersection at 1st and Alameda Streets would likely improve emergency vehicle response times by increasing roadway capacity. Some alteration of emergency routes may be needed due to added turning restrictions. New emergency service staff would not be required as a result of operation of this alternative. There would be no adverse impact to emergency services

5.6.2.4 Public Health and Safety and Crime

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 is not expected to increase crime in the central downtown area. Mitigation measures, such as additional security services, would prevent an increase in crime. Stations and trains would be designed to maximize public safety and minimize the potential for crime. Stations would be constructed from materials such as brick, concrete, steel, aluminum, and heavy plastic which are generally resistant to vandalism. Adequate lighting and security cameras would be provided to deter criminal activity.

Metro contracts with the Sheriff's Department to provide specialized security at all stations. Maintenance access to underground facilities would be designed to prevent unauthorized entry. Overall, the operation of this alternative is not expected to substantially change crime levels in the central downtown area. The potential effects related to crime would be less than significant. Potential mitigation measures are identified in Section 6.0.

Additionally, this project would contribute to a pedestrian friendly community and encourage compact development. This would lead to increased walking, which would be a beneficial health impact of all the build alternatives.

5.6.2.5 Community Resources and Events

Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would benefit community resources and events because it would provide a new transit option for travelers to the area. Since the alignment would operate entirely underground, train service would continue uninterrupted during large events, facilitating access for event attendees. This increased access would be beneficial.

5.6.2.6 Population, Housing, and Employment

Over the long-term, this project alternative could attract new residents to the central downtown area. This alternative would link the project area to the regional LRT system through four new stations. As Los Angeles continues to encourage public transportation and transit-oriented growth, new development, including additional housing units, could occur around new stations. This increase in population and housing would be consistent with the Central City Community Plan and the Central City North Community Plan and would be a beneficial impact.

The Fully Underground LRT Alternative - Little Tokyo Variation 2 could indirectly increase employment. This alternative creates four new stations and would decrease commute times for workers. In general, increased public transportation would make central downtown a more desirable location to work and live in, potentially increasing jobs and population. This potential impact would be beneficial.

5.6.3 Cumulative Impacts

This section describes cumulative effects of the Fully Underground LRT Alternative - Little Tokyo Variation 2.

5.6.3.1 Community Mobility

Upon completion, the Fully Underground LRT Alternative - Little Tokyo Variation 2, when considered cumulatively with other future projects, may result in benefits to the central downtown area. The Regional Connector Transit Corridor project and other Metro projects would increase community mobility, provide additional regional transit linkages, and increase ridership systemwide. This would be a cumulatively beneficial impact.

5.6.3.2 Viability of Existing Businesses

There are no other planned transportation projects that would affect the viability of businesses along the alignment for the Fully Underground LRT Alternative - Little Tokyo Variation 2. Many new construction and renovation projects are planned in the area. If these construction projects affect accessibility to local businesses, there may be a cumulative adverse impact.

However, impacts are expected to be temporary and would be eliminated after construction is complete. Overall, the potential cumulative impacts associated with the viability of existing businesses would be less than significant.

5.6.3.3 Emergency Services

Many new construction and renovation projects are planned in the central downtown area during the time the Regional Connector would be constructed. If these projects require road closures or detours in the same timeframe as the Fully Underground LRT Alternative - Little Tokyo Variation 2's construction, a cumulative effect could occur resulting in increased response times for emergency vehicles.

However, each specific project, including the Regional Connector, would be responsible for alerting emergency services to any road closures or detours. This measure would help avoid increased response times due to construction. The potential cumulative impact to emergency response time would be less than significant.

5.6.3.4 Public Health and Safety and Crime

The Fully Underground LRT Alternative - Little Tokyo Variation 2, and future projects planned for the central downtown area, could potentially result in safety risks or increased crime during both construction and operations. However, each project would be responsible for reducing or avoiding potential impacts.

The Fully Underground LRT Alternative - Little Tokyo Variation 2 includes measures to protect public health and safety and reduce or avoid crime. All Metro Rail facilities are continuously monitored by security personnel to minimize risks to the public. With implementation of such measures, the Fully Underground LRT Alternative - Little Tokyo Variation 2 would not contribute to significant cumulative public health and safety or crime impacts.

5.6.3.5 Community Resources and Events

Many new construction and renovation projects are planned in the central downtown area during the time the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be constructed. If these projects require temporary road closures or detours in the same timeframe as the Fully Underground LRT Alternative - Little Tokyo Variation 2's construction, cumulative effects to community resources or events may occur.

Adverse effects could include temporary traffic congestion, decreased mobility, and closures of sidewalks and roads. However, each specific project, including the Fully Underground LRT Alternative - Little Tokyo Variation 2, would be responsible for coordinating with local community groups prior to construction to minimize impacts. With implementation of the potential mitigation measures listed in Section 6.0, potential cumulative impacts to community resources and events would be less than significant.

5.6.3.6 Population, Housing, and Employment

Over the long-term, the Fully Underground LRT Alternative - Little Tokyo Variation 2 has the potential to increase population, housing, and employment in the downtown area. This alternative would link the project area to the LRT system, encouraging people to live and work in central downtown. Combined with the City's transit-oriented growth policies, the new transit stations could encourage denser development and make alternatives to the single occupancy vehicle more viable.

Future development in the project area would also increase population, housing, and employment. The cumulative population, housing, and employment growth from the Fully Underground LRT Alternative - Little Tokyo Variation 2, and other planned future projects, would be consistent with the Central City Community Plan objectives. Such growth would be a beneficial cumulative impact.

6.0 POTENTIAL MITIGATION MEASURES

Mitigation measures could be implemented to avoid, minimize, or mitigate potentially significant impacts identified in Section 5.0. Additional measures may be considered once the ongoing coordination process with the communities in the project area is completed. The following is a list of potential mitigation measures:

- Whenever possible, develop detours for any road or sidewalks to be closed during construction. Post signs (in appropriate languages) alerting pedestrians and vehicles of road and sidewalk closures and detours. Ensure pedestrian detours are accessible to seniors and disabled persons. Develop Worksite Traffic Control Plans in conjunction with the City of Los Angeles Department of Transportation (LADOT) to accommodate automobile and pedestrian traffic.

- Maintain access to community facilities affected by construction activities.

- Provide early notification to emergency service providers of any road closures or detours.

- Develop a community outreach plan to notify local communities of construction schedules, road and sidewalk closures, and detours. Coordinate with local communities during preparation of traffic management plans to minimize potential construction impacts to community resources and special events. Consider limiting construction activities during special events.

- Develop a construction mitigation plan with community input to address construction impacts unique to the Little Tokyo community. Determine truck hauling routes and schedules that would minimize impacts on sensitive uses in all parts of the project area.

- During construction, provide temporary replacement parking to offset the loss of parking due to acquisitions on the block bounded by 1st, 2nd Street, and Alameda Streets, and Central Avenue. Temporary parking could be added by constructing surface lots on nearby vacant parcel or restriping nearby streets to allow diagonal curb parking.

- Provide crossing guards in the vicinity of construction sites, haul routes and other relevant sites as proposed in the *California DOT Traffic Manual, Chapter 10-07.3, Warrants for Adult Crossing Guards*,

- Erect barriers and provide security personnel during construction to minimize trespassing and vandalism. Barriers could be enhanced with artwork and attractive design features where possible.

- Forewarn the public of any anticipated road closures or detours due to construction activity.
- Work with businesses along the alignment to increase their visibility during construction.

7.0 CONCLUSIONS

7.1 No Build Alternative

The No Build Alternative would result in some population, housing, and employment growth. However, this alternative would not be expected to create any substantial changes in the quality of life for communities and neighborhoods in the project area. While this alternative would not have significant adverse impacts it also would not have beneficial mobility, business or community effects.

7.2 TSM Alternative

The TSM Alternative would require minimal construction and would not affect existing communities or neighborhoods. Operation of the TSM Alternative could be beneficial. This alternative could increase mobility through the central downtown area and increase viability for local businesses along new bus routes. However, adding additional buses to the street network in downtown Los Angeles could contribute to additional congestion.

Potential benefits from the TSM alternative depend upon whether it would attract current automobile commuters. The TSM Alternative would not substantially decrease commute times for commuters to central downtown. This alternative would not affect population, housing or employment growth in the central downtown area.

7.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would have potentially significant adverse impacts to community mobility, emergency service response times, and community resources and events. These impacts would be reduced to a less-than-significant level with mitigation measures described in Section 6.0.

Furthermore, this alternative could have a significant adverse impact on the viability of some local businesses. Road and sidewalk closures could decrease accessibility to businesses near the proposed alignment and staging areas. Some customers might avoid the area altogether during construction activities. This impact would be unavoidable during construction. Mitigation measures would be developed with affected parties to reduce this impact to a less than significant level. The efficacy of the measures would be evaluated after implementation.

Operation of the At-Grade Emphasis LRT Alternative would have beneficial effects on population, housing, and employment. This alternative would decrease commute times to central downtown and could encourage more people to live and work in the area. Operation of this alternative would be beneficial for community resources and events because it would provide a new public transportation option through central downtown. This alternative would

increase mobility between the Financial District, Bunker Hill, the Civic Center, and the Historic Core.

The At-Grade Emphasis LRT Alternative would, however, limit mid-block left turns through the Civic Center and Historic Core areas where the track runs along the surface. This change in traffic flow could adversely affect accessibility to existing businesses and would be unavoidable. This impact would be partially offset by increased access from the new trains that would be available to patrons of local businesses.

7.4 Underground Emphasis LRT Alternative

Construction of the Underground Emphasis LRT Alternative would have largely the same impacts as the At-Grade Emphasis LRT Alternative. Construction could have potentially significant, if temporary, impacts to community mobility, emergency service response times, and community resources and events. These impacts could be reduced to a less-than-significant level with mitigation measures described in Section 6.0.

Compared with the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative would have potentially greater impacts on local business viability during construction. This alternative could reduce accessibility to existing businesses during construction but would also require the displacement of existing businesses in Little Tokyo and near Bunker Hill.

Property acquisition would be carried out according to the Uniform Relocation Act requirements. Still, displaced businesses would be unavoidably affected and surrounding businesses would be potentially indirectly affected by a smaller overall customer base. Mitigation measures identified in the Displacement and Relocation Technical Memorandum would reduce the impacts of these business losses below the level of significance. Additionally, new development of businesses around new stations would help offset adverse impacts to business.

Operation of the Underground Emphasis LRT Alternative would result in benefits similar to the At-Grade Emphasis LRT Alternative. The Underground Emphasis LRT Alternative would benefit population growth, housing, and employment during operation because it would decrease commute times to central downtown and would encourage more people to live and work in the area. This alternative would also be beneficial for community resources and events since it would increase mobility in and accessibility of the central downtown area.

This alternative would increase mobility between the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. It would transform a portion of the site bounded by 1st, 2nd, and Alameda Streets, and Central Avenue to a potential location for a mixed-use joint development. The main difference between this alternative and the At-Grade Emphasis LRT Alternative would be that this alternative would operate mainly below ground and not on

surface streets. Thus, this alternative would not adversely affect existing businesses through the elimination of mid-block left turns in the Civic Center and Bunker Hill areas.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Construction impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would generally mirror those from construction of the Underground Emphasis LRT Alternative. However, construction activities would extend further east along 1st Street to Garey Street. Construction could have potentially significant, if temporary, impacts to community mobility, emergency service response times, and community resources and events. These impacts could be reduced to a less-than-significant level with mitigation measures described in Section 6.0.

Compared with the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1 could potentially have greater unavoidable impacts associated with the viability of existing businesses. Under this alternative, additional businesses might need to be acquired on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue. Property acquisition would be carried out according to the Uniform Relocation Act. Still, acquisitions would unavoidably impact project area communities through direct loss of businesses and related, indirect effects on surrounding business.

Mitigation measures identified in Section 6.0 and the Displacement and Relocation Technical Memorandum would reduce the potential impacts of these business losses below the level of significance. Additionally, new development of businesses around stations would help offset adverse impacts to business viability.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in more benefits to the Little Tokyo community than the At-Grade Emphasis LRT Alternative or the Underground Emphasis LRT Alternative because it includes a new station with greater connectivity than the existing Little Tokyo/Arts District Station. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would be beneficial to population, housing, and employment during operation because it would decrease commute times to central downtown and encourage more people to live and work in the area.

This alternative would also be beneficial to community resources and events since it would provide a new public transportation option through central downtown. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would increase mobility between the Financial District, Bunker Hill, the Historic Core, Little Tokyo, and the Arts District. This alternative would transform a portion of the site bounded by 1st, 2nd, and Alameda Streets, and Central Avenue into a potential location for a mixed-use joint development. This potential new development would combine the site with the proposed 2nd Street/Central Avenue station and the proposed Nikkei Center across the street.

Unlike the At-Grade Emphasis LRT Alternative, this alternative would not operate on the surface of existing streets and would not adversely affect existing businesses by eliminating mid-block left turns in the Civic Center and Bunker Hill areas.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would generally have the same impacts as construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, construction activities would extend further east along 1st Street to Vignes Street because two single track portals would be constructed instead of one double track portal.

Construction could have potentially significant, if temporary, impacts to community mobility, emergency service response times, and community resources and events. These impacts could be reduced to a less-than-significant level with mitigation measures described in Section 6.0.

Compared with the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 2 could potentially have greater unavoidable impacts associated with the viability of existing businesses. Under this alternative, additional businesses might need to be acquired on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue. Property acquisition would be carried out according to the Uniform Relocation Act. Still, acquisitions would unavoidably impact project area communities through direct loss of businesses and related, indirect effects on surrounding business.

Mitigation measures identified in Section 6.0 and the Displacement and Relocation Technical Memorandum would reduce the impacts of these business losses to a less than significant level. Additionally, new development of businesses around stations would help offset adverse impacts to business viability.

Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in more benefits to the Little Tokyo community than the At-Grade Emphasis LRT Alternative or the Underground Emphasis LRT Alternative because it includes a new station with greater connectivity than the existing Little Tokyo/Arts District Station. Fully Underground LRT Alternative – Little Tokyo Variation 2 would be beneficial to population, housing, and employment during operation because it would decrease commute times to central downtown and encourage more people to live and work in the area.

This alternative would also be beneficial to community resources and events since it would provide a new public transportation option through central downtown. Fully Underground LRT Alternative – Little Tokyo Variation 2 would increase mobility between the Financial District, Bunker Hill, the Historic Core, Little Tokyo, and the Arts District. This alternative would transform a portion of the site bounded by 1st, 2nd, and Alameda Streets, and Central

Avenue into a potential location for a mixed-use joint development. This potential new development would combine the site with the proposed 2nd Street/Central Avenue station and the proposed Nikkei Center across the street.

Unlike the At-Grade Emphasis LRT Alternative, this alternative would not operate on the surface of existing streets and would not adversely affect existing businesses by eliminating mid-block left turns in the Civic Center and Bunker Hill areas.

MOCA	Museum of Contemporary Art
NEPA	National Environmental Policy Act
NHPA	National Historic Preservation Act of 1966
TBM	Tunnel boring machine
TSM	Transportation System Management
VMC	Visual Modification Class

1.0 SUMMARY

The findings of this visual and aesthetic impact assessment are based upon the California Environmental Quality Act (CEQA) Thresholds of Significance Criteria included in Appendix G. These thresholds are used to identify significant visual and aesthetic impacts associated with "substantial degradation of existing visual character or quality of a site and its surroundings." Significance is also determined by "the degree of contrast between proposed features and existing features that represent the valued aesthetic image of an area."

This technical memorandum evaluates proposed alternatives of the Regional Connector Transit Corridor Project. These alternatives include the No Build Alternative, Transportation System Management (TSM) Alternative, At-Grade Emphasis Light Rail Transit (LRT) Alternative, Underground Emphasis LRT Alternative, and Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2.

Primary visual resources in the project area include historic buildings located along or near the proposed alignments. The alignments are located in or near (depending on the alternative) the Civic Center and the Little Tokyo Historic Districts. Table 7-1 summarizes visual and aesthetic impacts associated with each of the six alternatives.

The No Build Alternative would result in no visual impacts to these resources. The TSM Alternative would result in minor visual modifications to the existing environment due to construction of enhanced bus stops; potential impacts would be less than significant.

There would be permanent potential visual impact associated with the At-Grade Emphasis LRT Alternative because new tracks, an overhead contact system, catenary poles, train portals, and two at-grade platforms would be added to streets adjacent to historic buildings. However, this potential impact would be less than significant. Visual impacts associated with construction of the At-Grade Emphasis LRT Alternative would be temporary and less than significant.

Potential permanent visual impacts of the Underground Emphasis LRT Alternative would be less than significant because the only visible street-level features would be a single tunnel portal and pedestrian entrances to underground stations. Visual impact associated with construction of the Underground Emphasis LRT Alternative would be temporary and less than significant.

Potential permanent visual impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same as for the Underground Emphasis LRT Alternative. Both alternatives follow the same alignment and configuration for most of the corridor. Portions of the corridor in the vicinity of Little Tokyo, along Alameda and east of Alameda, would have prominent, visible street-level features, including pedestrian entrances to an underground

station and a single tunnel portal in 1st Street. Visual impacts in this vicinity, including the area along the proposed train portal, would be less than significant. Visual impact associated with construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be temporary and less than significant.

Potential permanent and temporary visual impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1. For most of the alignment, the two alternatives follow the same route and configuration. An exception is the portal location and arrangement in 1st Street.

Visual impacts in the vicinity of 1st Street would potentially occur because the portals are staggered and potential visual effects would extend farther along 1st Street than Fully Underground Alternative – Little Tokyo Variation 1. Impacts in this vicinity would be low to moderate and less than significant for about three blocks. In consultation with the Los Angeles Hompa Hongwanji Temple, the Reverend, indicated to the Los Angeles County Metropolitan Transportation Authority (Metro) that the portal's proximity to the temple would be visually intrusive.

Under all build alternatives, the visual character of the corridor would be altered; however, views would not be degraded to the extent that significant impacts would result from project implementation. There are no scenic highways or protected views near the proposed alignments, so these types of resources would be unaffected.

All build alternatives would provide new pedestrian-friendly street improvements, including landscaping as appropriate, in the vicinity of the alignments and stations, thereby enhancing the aesthetics of the project area. Addition of an enhanced pedestrian environment would offset the potential low to moderate levels of visual impacts described above. The build alternatives would create improved and safer settings from which pedestrians could view visual and aesthetic resources and create a streetscape that complements those visual and aesthetic resources.

2.0 INTRODUCTION

Downtown Los Angeles is known for its designated historic districts, buildings, and sites. The region's colorful history is captured in the downtown area's many historic buildings, several of which are located adjacent to the Regional Connector build alternative alignments.

Construction activities and potential changes to the streetscape could affect views of these historic resources. This technical memorandum evaluates the potential for visual and aesthetic impacts resulting from construction and operation of the proposed Regional Connector alternatives.

The portions of downtown Los Angeles near the proposed alignments lack broad views of mountains, water bodies, and other natural features. Therefore, there would be no impacts to such views. The significant visual resources currently along the proposed Regional Connector transit corridor are historic buildings, many of which are eligible for listing in the National Register of Historic Places and/or the California Register of Historic Resources.

Potential impacts to historic resources are evaluated in the Cultural Resources - Built Environment Technical Memorandum. The project would not impede views from any nationally recognized scenic highways, designated scenic routes, corridors, or parkways, nor would it affect any public viewing locations that are otherwise recognized or valued.

3.0 METHODOLOGY FOR IMPACT EVALUATION

Criteria used to evaluate the proposed alternatives are described below. Potential impacts have been evaluated according to CEQA guidelines. While there are other evaluation criteria for visual assessments, CEQA guidelines are most relevant to the Regional Connector Transit Corridor Project. Guidance and methodologies have been adapted to address the project's urban setting as appropriate.

Multiple federal agencies have developed analytical frameworks for visual resource management, including the U.S. Department of Agriculture, Forest Service (USFS 1974, 1995); U.S. Department of Interior, Bureau of Land Management (BLM 1978); and U.S. Department of Transportation, Federal Highway Administration (FHWA 1981). The methodology and assumptions presented here build on the guidance developed by these federal agencies and the extensive work of Lawrence Headley of LH&A for the Port of Los Angeles and other Los Angeles projects (Headley 2008, 2006, and 2005).

3.1 Regulatory Framework

3.1.1 Federal

The National Environmental Policy Act (NEPA) is an umbrella law that requires an evaluation and disclosure of potential impacts that might result from construction and operation of a project. As such, NEPA often does not have-topic specific requirements or guidance. There are no specific thresholds or evaluation criteria for potential visual and aesthetic impacts.

Compliance with other federal, state and local regulations is often used as a means of demonstrating that a proposed project would not have significant impacts under NEPA. Guidance for the Regional Connector Transit Project was found in the National Historic Preservation Act (NHPA) and CEQA, and is used to evaluate potential impacts under NEPA.

Section 106 of the National Historic Preservation Act (NHPA) as amended in 1966 [36 CFR § 800.5(a)(2)] regulates activities that could impact historic properties by "diminishing the visual integrity of the property's significant historic features." There are approximately 50 properties, including three historic districts, within the project area in downtown Los Angeles that are listed in, determined, or found eligible for the National Register of Historic Properties. Potential visual impacts on historic resources are evaluated in the Cultural Resources Built Environment Technical Memorandum.

3.1.2 State

The principal evaluation criteria used in this visual resource analysis come from Appendix G of the CEQA Guidelines; the methodology to evaluate visual resources also follows guidance from the *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006), referred to in this document as the *Thresholds Guide*. This guide recommends that impacts and their

significance be evaluated on a case-by-case basis. Except for shadow impacts, the *Thresholds Guide* includes no absolute principles, rules, standards, criteria, or thresholds for assessing the degree or significance of visual and aesthetic impacts.

Aesthetic impact assessment generally deals with the issue of contrast, or the degree to which elements of the environment differ visually. Aesthetic features occur in a diverse array of environments, ranging in character from urban centers to rural regions and wildlands. Adverse visual effects can include a loss of natural features or areas, removal of urban features with aesthetic value, or introduction of contrasting urban features into natural areas or urban settings. The key applicable visual consideration for downtown Los Angeles would be "introduction of contrasting urban features into ... urban settings." Significant alteration of the visual character through the introduction of a proposed project can result in a visual impact.

This aesthetic impact assessment concentrates on urban features because the proposed project is located within an urban setting. Urban features that may contribute to a valued aesthetic character or image include structures of architectural or historic significance or visual prominence; public plazas, art, or gardens; heritage oaks or other trees or plants protected by the City; consistent design elements (such as setbacks, massing, height, and signage) along a street or district; pedestrian amenities; and landscaped medians or park areas (*L.A. CEQA Thresholds Guide* 2006). Additionally, CEQA guidelines require impacts to historic buildings within a state scenic highway be evaluated.

Visual and aesthetic findings can be highly subjective, making them difficult to analyze using rigid technical standards. The Regional Connector project is set in an urban context, where visual change is expected. Whether visual change in the downtown environment is adverse or beneficial remains a subjective matter. Different viewers may consider the same change in the visual environment as either beneficial or adverse. This analysis discusses potential impacts for public and agency consideration with as much objectivity as practical given the subjective nature of aesthetic perceptions.

3.2 Standards of Significance

This analysis examines whether the proposed Regional Connector alternatives have potential to cause significant visual impacts. Though NEPA offers no definition for "significance," CEQA Guidelines § 15382 define a significant impact as "... a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including ... objects of ... aesthetic significance." The methodology applied to this assessment expands upon the CEQA definition and draws from methodology recommendations included in the *L.A. CEQA Thresholds Guide*.

As outlined in Appendix G of the CEQA guidelines, determination of a significant impact to visual and aesthetic resources is based on the following thresholds:

- Would the project have a substantial, adverse effect on a scenic vista?
- Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within [view from] a state scenic highway?
- Would the project substantially degrade the existing visual character or quality of a site and its surroundings?
- Would the project create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?

In addition to the thresholds identified in Appendix G of the CEQA guidelines, the *City of Los Angeles CEQA Thresholds Guide* includes the following criteria for identifying and evaluating potentially significant visual resources impacts from proposed actions occurring within the City:

- Would project-related structures result in the shading of shadow-sensitive uses for more than three hours between the hours of 9:00 a.m. and 3:00 p.m. Pacific Standard Time (between late October and early April), or for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. Pacific Standard Time (between early April and late October)?

3.2.1 Definitions

According to the *L.A. CEQA Thresholds Guide*, urban features that may contribute to a valued aesthetic character may include, but are not limited to, structures of architectural or historic significance or visual prominence; public plazas, art, or gardens; heritage oaks or other protected trees; consistent design elements along a street or district; pedestrian amenities; and landscaped medians or park areas. Significant alteration of the visual character resulting from a proposed project can result in a visual impact.

According to Headley (2007), a visual impact on a visual or aesthetic resource occurs when:

- Features are altered, introduced, made less visible, or removed, and the resultant effect on the views is perceptibly inconsistent with the inherent, established character of the landscape; and/or
- Access to public views is diminished such that the affected view is limited to some degree and/or physical access to public viewing positions is impeded.

Headley (2007) further defines a significant visual impact as one that:

- Causes a substantial adverse change in the visual resources of the affected environment, and/or
- Would cause views from scenic highways, designated scenic routes, corridors, and parkways, or public views that are otherwise recognized or valued, to become substantially blocked or screened from view, and/or
- Would cause historically available public access to such views to become substantially diminished.

A substantial adverse change in visual resources occurs when visual quality has been noticeably reduced. The perception that visual quality has been noticeably reduced is influenced by public sensitivity to adverse visual impacts, including intensity and duration of the impacts, as qualified by the temporal viewing context. A highly sensitive public is more apt to notice adverse changes in visual resources of lesser intensity than a less sensitive public. A highly sensitive public is therefore more likely to regard the effects of adverse changes as "substantial" and significant.

For example, a highly sensitive public would likely react adversely to a large, contemporary sculpture placed on the sidewalk directly in front of a national historic landmark building. The two could be at cross purposes visually. On the other hand, the public may be less sensitive to changes in the urban landscape of downtown Los Angeles along the proposed Regional Connector build alignments due to the large number of urban structures, circulation systems, and activities already present.

3.2.2 Impact Intensity

Both NEPA and CEQA use the concept of "intensity" to help determine the significance of an impact. For potential visual impacts, the intensity is the degree to which visual conditions change adversely relative to existing (baseline) conditions.

Changes in visual conditions can be classified by Visual Modification Classes (VMC) as defined by Headley (2008). VMCs provide a useful framework for describing and evaluating visual conditions. Table 3-1 provides definitions for each VMC.

A change from one VMC to another provides a method to evaluate the intensity or magnitude (and thus potential significance) of a change in visual condition. For example, a reduction from existing (baseline) conditions of VMC 1 to VMC 2 is a level 1 impact intensity; a reduction from VMC 1 to VMC 3, or VMC 2 to VMC 4, is a level 2 impact intensity; and a reduction from VMC 1 to VMC 4 is a level 3 impact intensity. The intensity of a visual impact

is a function of how apparent the proposed project's features, or those of its alternatives, may be within their context (e.g., barely noticeable versus visually dominant) (Table 3-1).

Table 3-1. Visual Modification Class Definitions

VM Class 1	Not noticeable: changes in the landscape are within the field of view but generally would be overlooked by all but the most concerned and interested viewers; they generally would not be noticed unless pointed out (inconspicuous because of such factors as distance, screening, low contrast with context, or other features in view, including the adverse impacts of past activities).
VM Class 2	Noticeable, visually subordinate: changes in the landscape would not be overlooked (noticeable to most without being pointed out), they may attract some attention but do not compete for it with other features in the field of view, including adverse impacts of past activities. Such changes often are perceived as being in the background.
VM Class 3	Distracting, visually co-dominant: changes in the landscape compete for attention with other features in view, including adverse impacts of past activities (attention is drawn to the change about as frequently as to other features in the landscape).
VM Class 4	Visually dominant, demands attention: changes in the landscape are the focus of attention and tend to become the subject of the view; such changes often cause a lasting impression of the affected landscape.

Source: Headley 2008

3.3 Evaluation Methodology

This visual and aesthetic impact analysis used a multi-step process to evaluate potential aesthetic impacts associated with the proposed alternatives. The progressive steps of this analysis are described in the following paragraphs.

- An inventory that included field observations and photography was undertaken of the visual and aesthetic resources along each alternative alignment. The inventory focused primarily on relevant historic buildings. Photos of the project area are included in this technical memorandum.
- The City of Los Angeles Circulation Element was reviewed to determine the presence of any scenic highways or recognized and valued views.

- Significant views along the corridor that warranted further aesthetic impact evaluation were identified. Close attention was paid to views that were potentially significant based on the key evaluation criteria, which include: substantial damage to scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within [a view from] a state scenic highway (*Appendix G of the CEQA Guidelines*); and potential for substantial degradation of existing visual character or quality of a site and its surroundings.
- A site visit was conducted of the views identified in step 3 (selected photographs are included in Section 4 of this technical memorandum).
- Views of historic buildings were then highlighted and evaluated from the public right-of-way to assess potential impact of the proposed Regional Connector alternatives.
- Potential visual impacts of the build alternatives on historic features of the downtown streetscape were analyzed. Mitigation recommendations were made as appropriate.

4.0 AFFECTED ENVIRONMENT

4.1 Area of Potential Visual and Aesthetic Effects

The four build alternatives (At-Grade Emphasis LRT Alternative, Underground Emphasis LRT Alternative, and Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2) were subjected to a cultural resource identification process to define the area of potential impact for the visual and aesthetic analysis. The process resulted in development of a Area of Potential Effect (APE) The APE used to evaluate indirect impacts to cultural resources includes the entire Los Angeles Civic Center Historic District (determined eligible for listing in the California Register) and the Little Tokyo Historic District, a National Historic Landmark. The visual impact analysis used a modified APE including only the portions of the historic districts within one city block of the build alternatives. The areas within one city block of the proposed alignments are the only portions visible from the proposed alternatives.

4.2 Existing Visual and Aesthetic Environment

The existing visual and aesthetic APE was surveyed on May 7 and 8, 2009. Multiple photographs were taken and reviewed. Research was completed to locate previously identified visual and aesthetic resources. These resources include, but are not limited to, structures of architectural or historic significance or visual prominence; public plazas, art, and gardens; heritage oaks or other trees or plants protected by the City of Los Angeles; consistent design elements (such as setbacks, massing, height, and signage) along a street or district; pedestrian amenities; and landscaped medians or park areas. The objective was to capture relationships between existing buildings and the streetscape/corridor alignment environment.

The build alternatives' existing visual and aesthetic environment is characterized by an established urban landscape. Based on site reviews, the predominant visual resources within the modified APE are recognized historic buildings. Figures 4-1 through 4-4 show the visual resources identified within the modified APE.

This analysis includes historic structures and visual resources in the following communities within the modified APE:

- Financial District
- Bunker Hill
- Historic Core
- Civic Center
- Little Tokyo

Each of these areas has unique visual and aesthetic qualities, as shown in Figures 4-5 through 4-27. The potential for visual intrusion, blockage of views, and visual incompatibility by the project alternatives is assessed in Section 5.

4.2.1 Scenic Vistas

The City of Los Angeles General Plan and the Scenic Highways Plan within the General Plan's Circulation Element were reviewed to determine whether the project would affect scenic vistas.

Based on this review, it was determined that no scenic highways are located in downtown Los Angeles. Though Objective 11 of the Circulation Element is to "preserve and enhance access to scenic resources and regional open space," there are no such features adjacent to the TSM or build alternatives.

4.2.2 Scenic Resources

The following buildings and open spaces have been identified as scenic resources along the proposed alignment corridors for the TSM and build alternatives.

4.2.2.1 Financial District:

- Fine Arts Building
- 818 Building
- Roosevelt Lofts
- Pegasus
- 811 Wilshire Boulevard
- Engine Company No. 28
- The Standard Hotel
- California Club
- Los Angeles Central Library and Maguire Gardens
- Arco Plaza
- Citigroup Center Plaza

4.2.2.2 Bunker Hill:

- Walt Disney Concert Hall
- 2nd Street Tunnel
- Grassy Open Space at General Thaddeus Kosciuszko Way

4.2.2.3 Historic Core:

- Los Angeles Law Center
- Times Annex
- Times Building
- Higgins Building
- St. Vibiana's Cathedral
- Redwing Shoes

4.2.2.4 Civic Center:

- City Hall South
- Los Angeles City Hall
- U.S. Courthouse
- Fletcher Bowron Square
- Parker Center
- Tinker Toy Parking Structure

4.2.2.5 Little Tokyo:

- Little Tokyo Historic District
- Los Angeles Hompa Hongwanji Temple

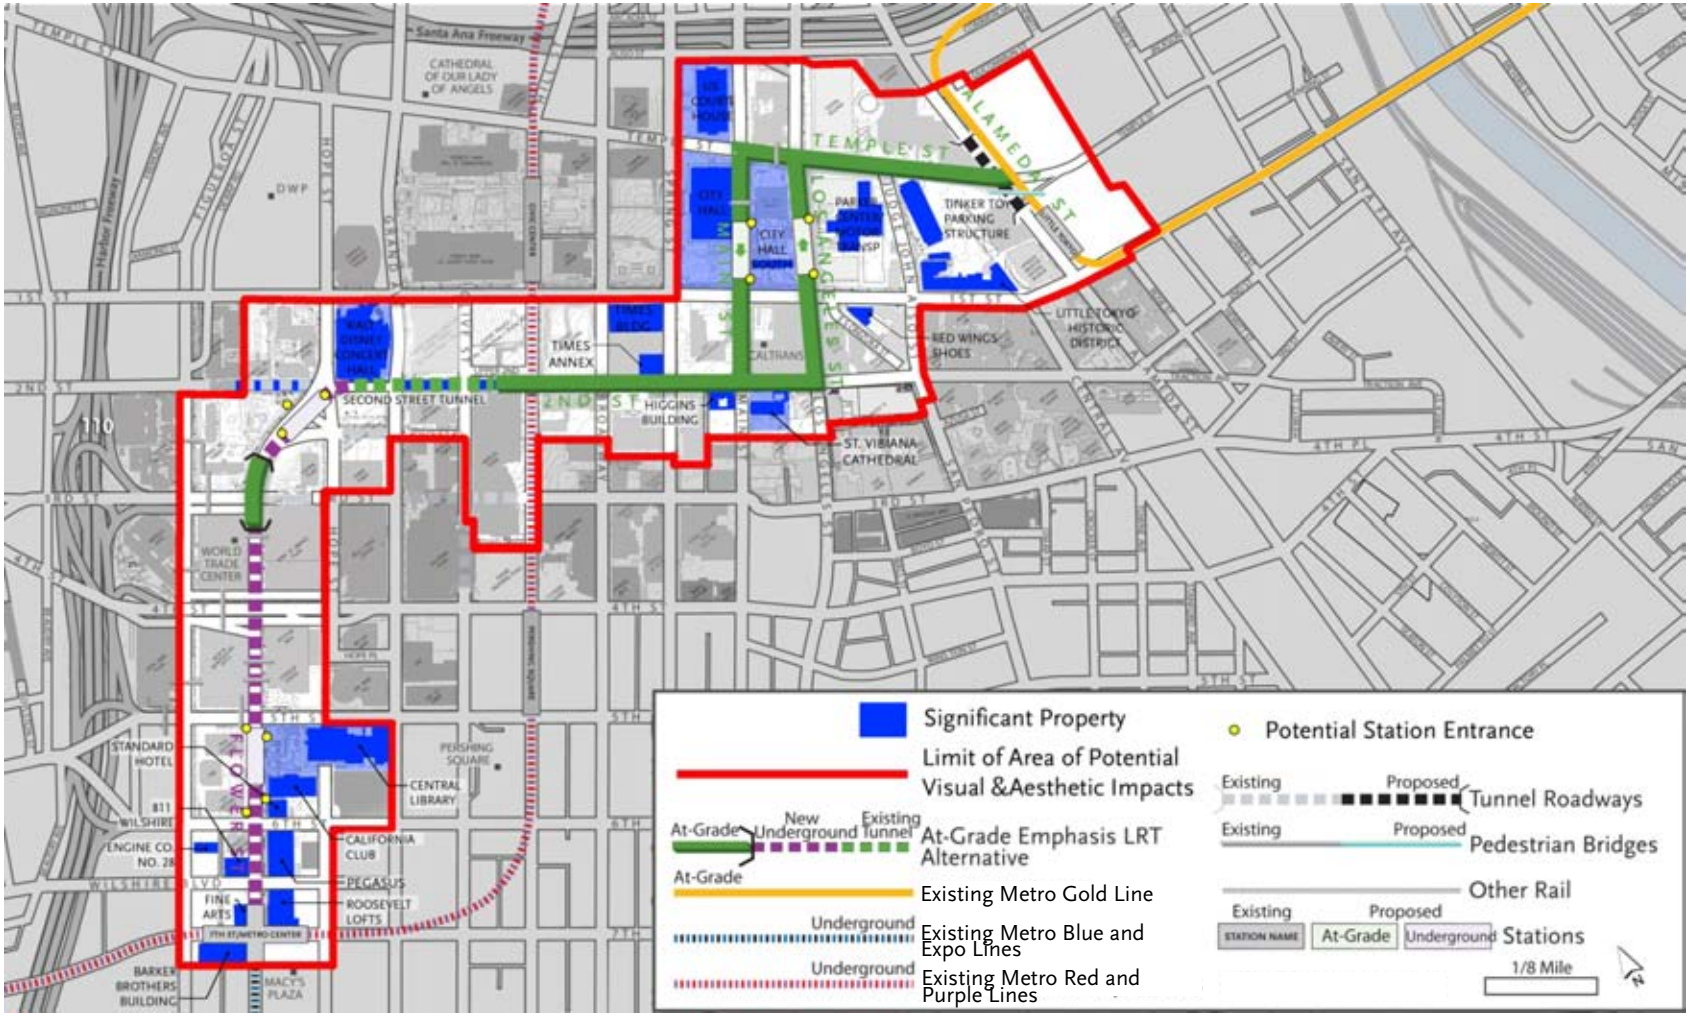

Figure 4-1. Visual Resources Associated with the At-Grade Emphasis LRT Alternative

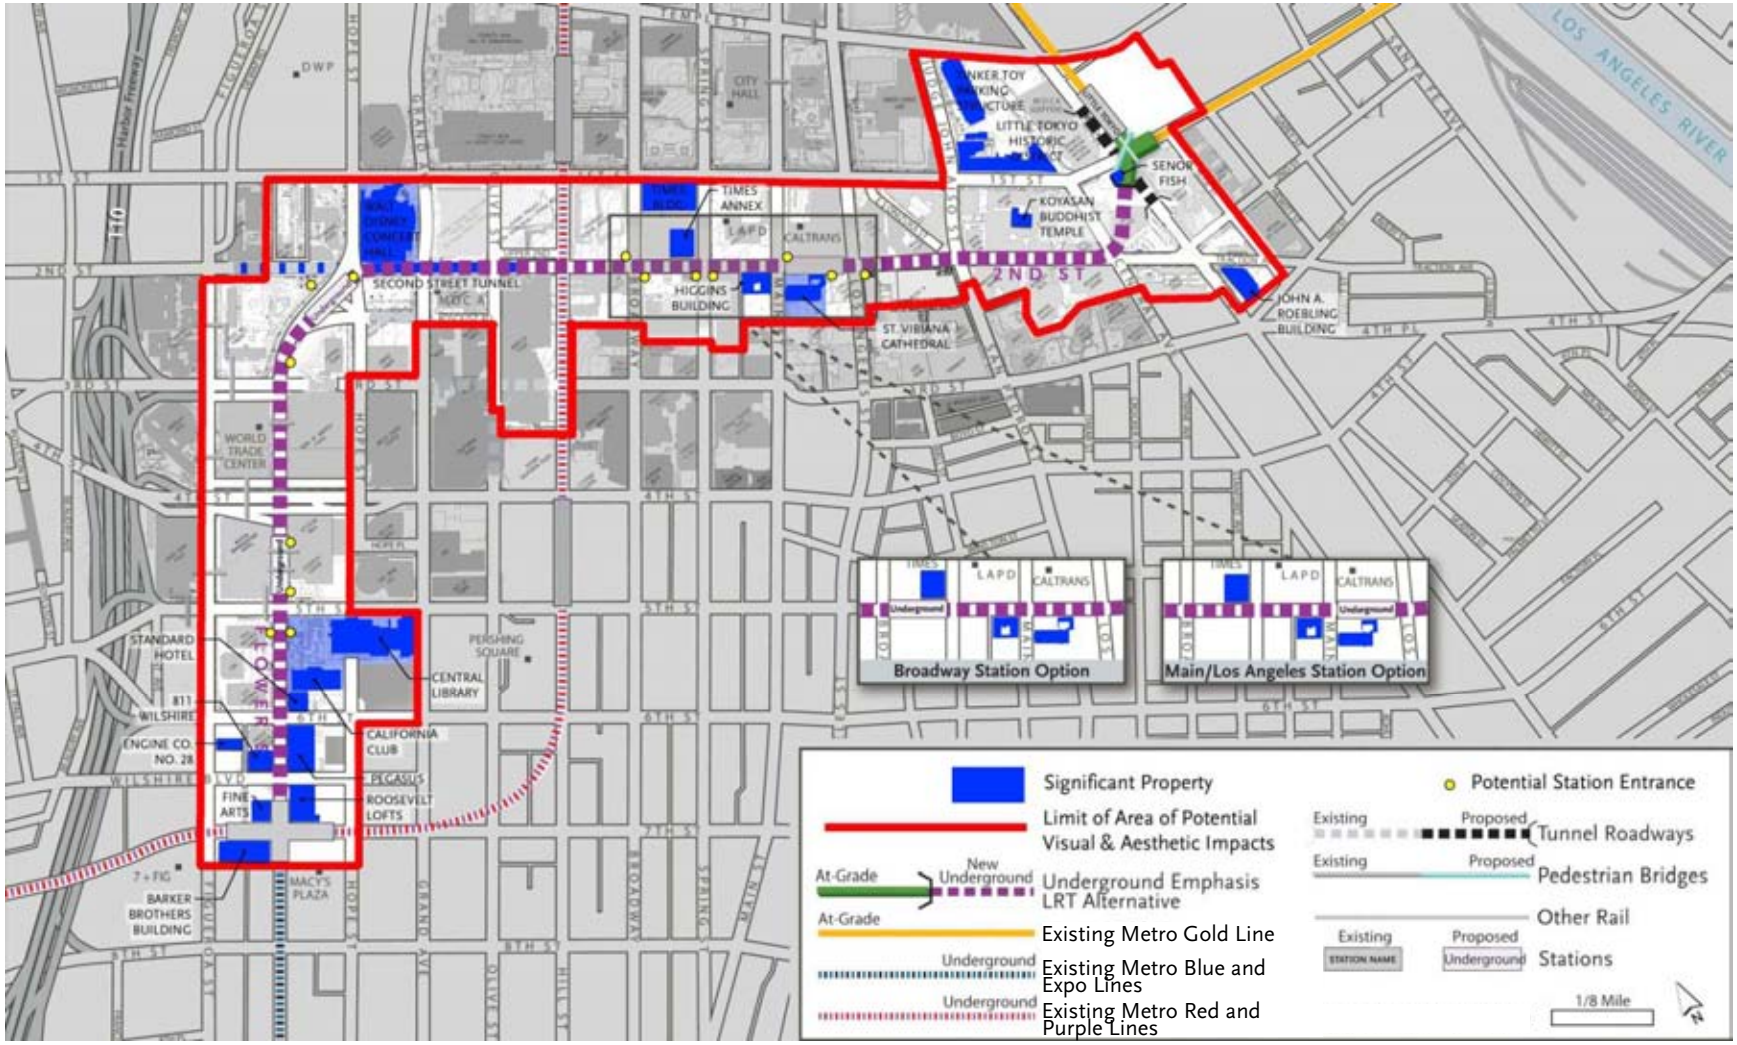

Figure 4-2. Visual Resources Associated with the Underground Emphasis LRT Alternative

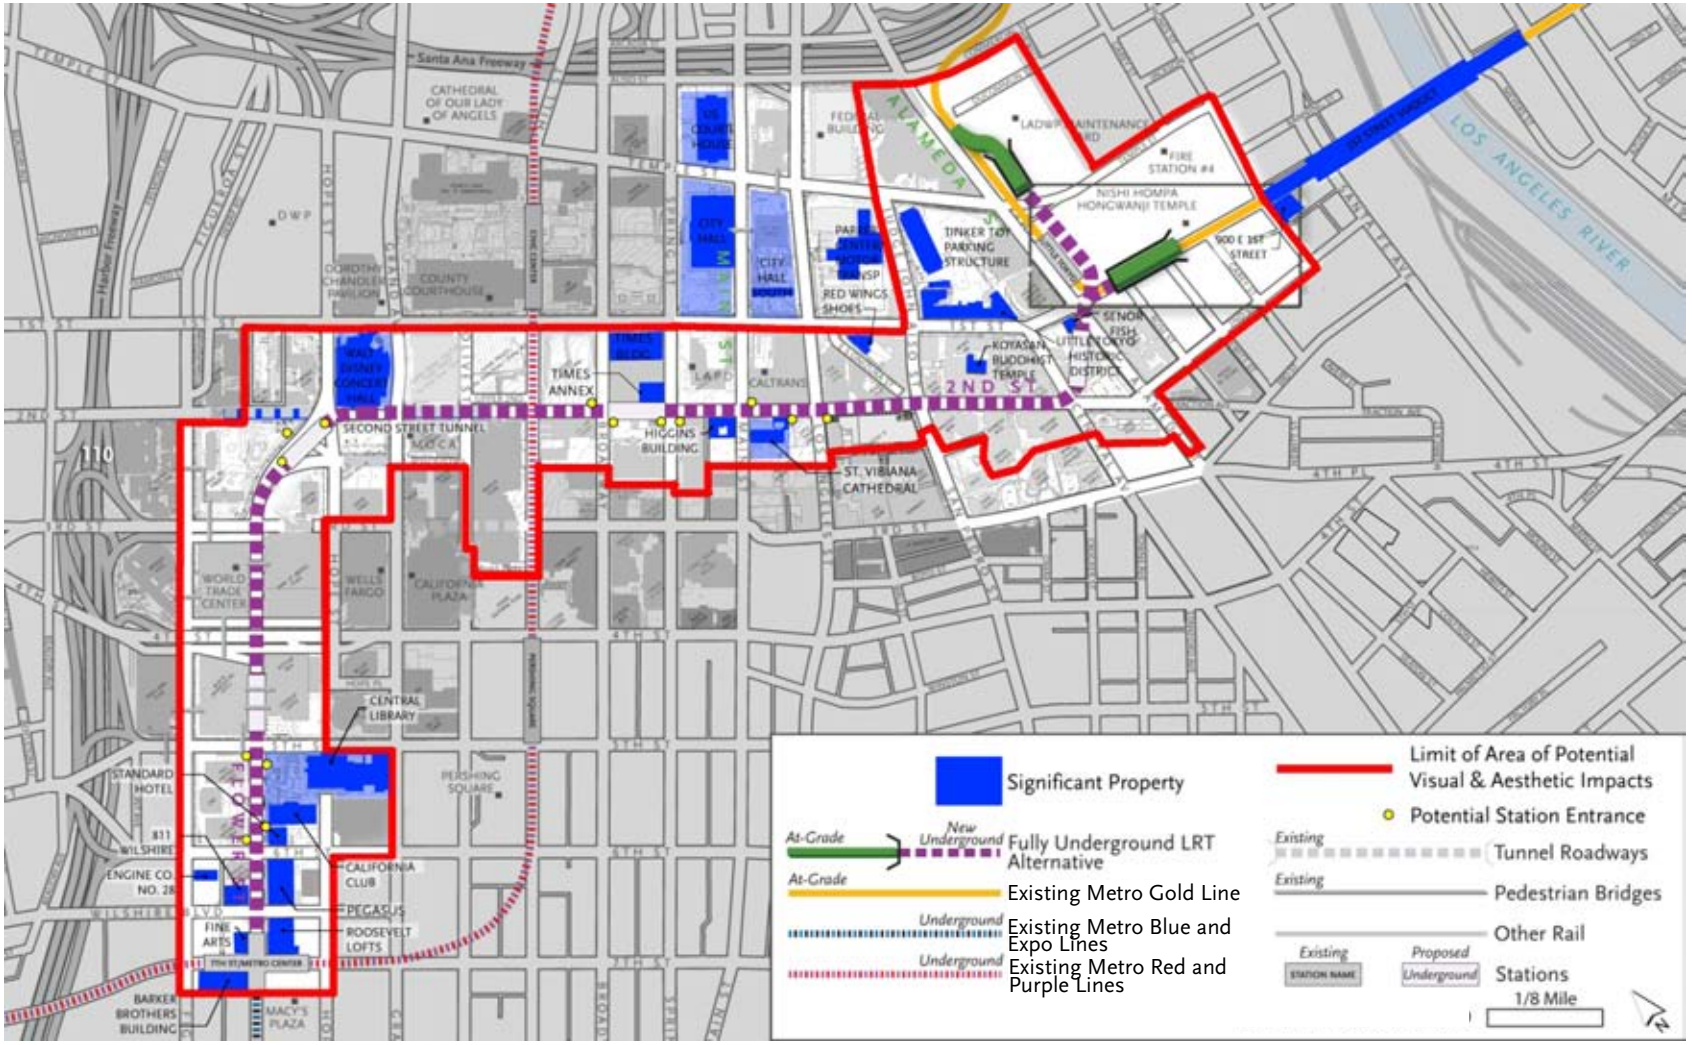

Figure 4-3. Visual Resources Associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1

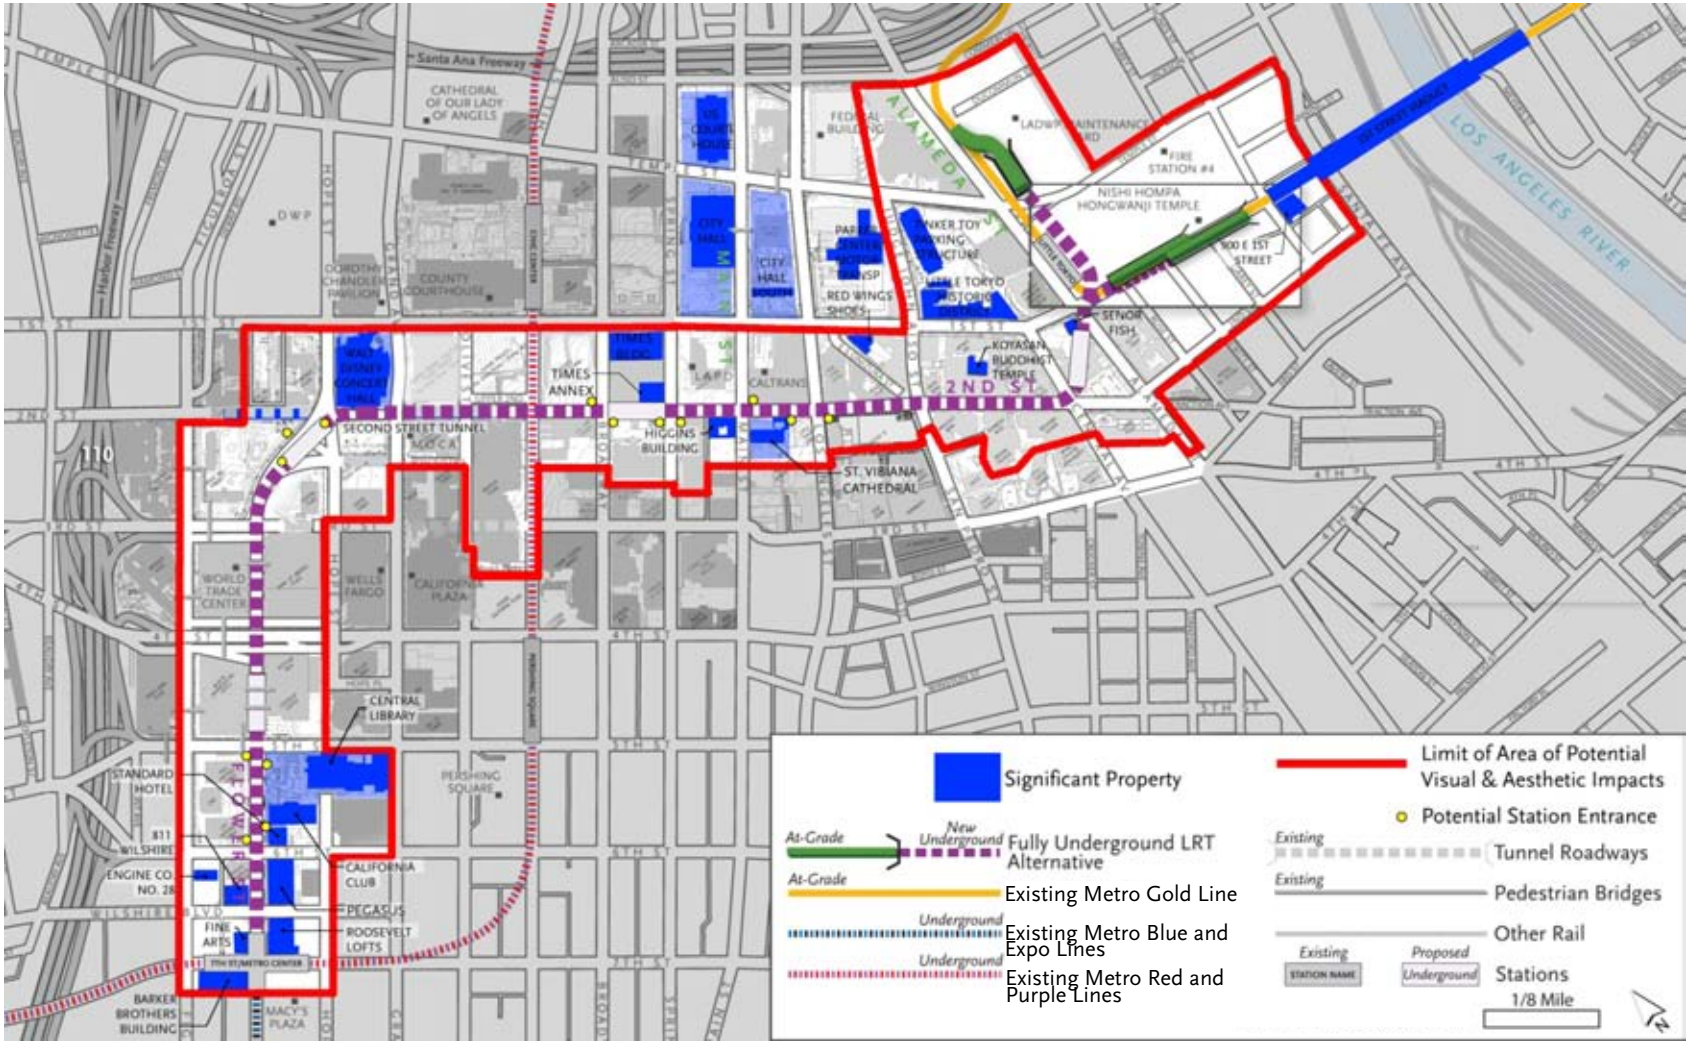

Figure 4-4. Visual Resources Associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2

4.2.3 Visual Character

The visual context for the build alternatives consists of five distinct communities. Each is rich with a variety of buildings and public and private spaces that create an individual character. These communities include the Financial District, Bunker Hill, Historic Core, Civic Center, and Little Tokyo and are described in the following paragraphs.

4.2.3.1 Financial District

Located around Flower Street, the Financial District is characterized by predominantly high-rise institutional, hotel, and financial buildings, as shown in Figure 4-5. The area contains several open space areas of varying character. The Central Library's Maguire Gardens is located immediately west of the Central Library and south of 5th Street between the library building and Flower Street, as shown in Figures 4-6, 4-7, and 4-8.

Across the street and to the west of the Central Library is the City National Plaza, a paved private open space that serves as a forecourt to the Paul Hastings Tower, CNB, and City National Tower complex (shown in Figure 4-9). A paved plaza is located at the Citigroup Center on the northeast corner of the intersection of Flower and 5th Streets, as shown in Figure 4-10.

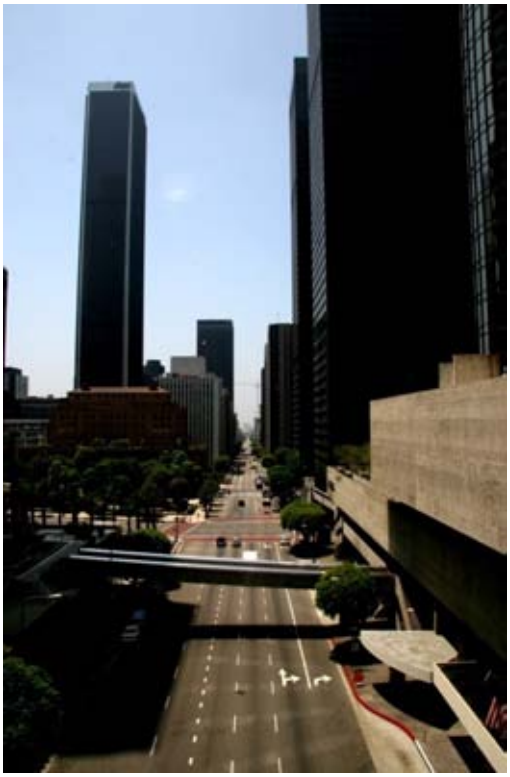

Figure 4-5. Financial District/Flower Street Corridor

Figure 4-6. Los Angeles Central Library

Figure 4-7. Central Library's Maguire Gardens - 1

Figure 4-8. Central Library's Maguire Gardens - 2

Figure 4-9. City National Plaza

Figure 4-10. Citigroup Center Plaza

4.2.3.2 Bunker Hill

Located approximately near the intersection of Flower and 2nd Streets, Bunker Hill includes several high-rise institutional and cultural buildings that interface with the Civic Center to the east and a residential complex to the west. The iconic Walt Disney Concert Hall (Figure 4-16), flanked by the Dorothy Chandler Pavilion to the north, is located in this neighborhood, as are the Colburn School for the Performing Arts and the Museum of Contemporary Art (MOCA).

Topographically, Bunker Hill is the highest point in downtown Los Angeles, with several viewpoints toward the northeast, southwest, and east. A grassy open space area on Bunker Hill (Figure 4-11) is located on the north end of Flower Street. Office towers located on the southern part of Bunker Hill are visible from various points in the downtown area. Crossing beneath Bunker Hill are the 2nd and 3rd Street tunnels, linking areas east and west of Bunker Hill. These tunnels are shown in Figures 4-12, 4-13, 4-14, and 4-15.

Figure 4-14. West End of 3rd Street Tunnel

Figure 4-15. 3rd Street Corridor and East End of 3rd Street Tunnel

Figure 4-16. Walt Disney Concert Hall

4.2.3.3 Historic Core

The 2nd Street portion of the Historic Core is centered around Broadway and characterized by large civic buildings to the north and a mixture of retail, religious, and office buildings to the south (Figures 4-17, 4-18, and 4-19). Broadway runs roughly north-south through this area, and numerous vestiges of downtown Los Angeles' historic past are found here. Broadway is lined with many mid-rise commercial and residential buildings, typically with no space between them.

Many buildings were constructed between 1880 and the late 1920s and range in height from four to 12 stories; heights were restricted by the City's 150-foot height limit at that time. Most of the ground floor retail shops along Broadway have been modernized, but the exterior facades of the upper floors are largely intact and unchanged since the buildings' original construction. Most of Broadway's historic buildings are located south of 3rd Street, at least one block from the proposed LRT alignments.

Figure 4-17. 2nd Street Corridor and the Los Angeles Times Building

Figure 4-18. 2nd Street and the Higgins Building

Figure 4-19. 2nd Street and St. Vibiana's Cathedral

4.2.3.4 Civic Center

The Civic Center District includes both city and federal buildings, including the Los Angeles City Hall, the Los Angeles Law Center, the United States Federal Courthouse, Parker Center, and other civic buildings (Figures 4-20 through 4-23). Many of these buildings, including the

Los Angeles City Hall Building, collectively contribute to the determined-eligible-for-listing Los Angeles Civic Center Historic District, shown in Figure 4-23. Buildings within the Civic Center district of Central Los Angeles are primarily mid-rise structures with large open space and/or plaza setbacks separating the buildings from the streets.

Figure 4-20. Los Angeles Law Center

Figure 4-21. Los Angeles City Hall

Figure 4-22. Fletcher Bowron Square/Los Angeles Mall

Figure 4-23. Temple Street Corridor through the Civic Center

4.2.3.5 Little Tokyo

This community includes the Little Tokyo Historic District, which is a National Historic District as defined by the National Park Service. It is also listed in the National Register of Historic Places. The Little Tokyo Historic District is described in more detail in the Cultural Resources – Built Environment Technical Memorandum.

The neighborhood surrounding the National Historic District has become known as "Little Tokyo" and is approximately four city blocks in size. First called Little Tokyo in 1903, this neighborhood contains an assemblage of buildings and spaces that are inviting to pedestrians and tourists. There is a diversity of buildings in Little Tokyo, including cultural, religious, retail, office, hotel, institutional, and residential uses (Figures 4-24 through 4-27). The area is pedestrian and transit friendly, with numerous bus stops, pedestrian alleyways, plazas, and storefront retail.

Figure 4-26. Onizuka Street with "Friendship Knot" at San Pedro & 2nd Street

Figure 4-27. 1st Street Corridor in the Heart of Little Tokyo

4.2.4 Nighttime Illumination

The build alternative alignments are within the greater downtown Los Angeles area, which is a heavily urbanized environment. Extensive nighttime lighting is provided throughout the region via street lighting, building entrance lighting, and general illumination from lights shining through the windows of high- and mid-rise buildings lining the corridor.

4.2.5 Shade and Shadows

Within this heavily urbanized environment, extensive shadows are cast by the existing mid- and high-rise buildings lining the corridor. Therefore, the project area experiences extensive shade during certain parts of the day as the sun moves from east to west in the sky.

4.3 Conclusions

There are no scenic byways, scenic vistas, or protected public view corridors. All of the proposed alignments are located in downtown Los Angeles, which is heavily urbanized. All of the proposed alignments include several downtown communities, each with its own unique character and visual context. Most of these downtown communities include historic buildings. Two communities in particular, Civic Center and Little Tokyo, include designated historic districts. The visual and aesthetic context of the project area is primarily shaped by these historic resources.

The key difference between the visual contexts for the alternatives is that the alignments follow slightly different routes through downtown Los Angeles. The TSM Alternative's proposed bus routes extend farther north and east to Union Station than the other alternatives.

The At-Grade Emphasis LRT Alternative incorporates both Los Angeles and Main Streets and the buildings fronting them, including City Hall. It also includes the Temple Street environment, which consists primarily of large-scale office buildings, institutional buildings, and parking lots. The At-Grade Emphasis LRT Alternative would traverse through the eligible-for-listing Civic Center Historic District.

The Underground Emphasis LRT Alternative remains predominantly underground and would pass through only four of the five districts comprising the project area: the Financial District, Bunker Hill, the Historic Core, and Little Tokyo. The Underground Emphasis LRT Alternative would be located within one block of the Little Tokyo Historic District and pass through Little Tokyo at grade east of Central Avenue between 1st and 2nd Streets.

Both Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 are identical to the Underground Emphasis LRT Alternative except for segments that continue east for several blocks in 1st Street, and north for two blocks just east of Alameda Street.

5.0 IMPACTS

5.1 Build Alternative Features

Visual and aesthetic impacts associated with the No Build, TSM, and build alternatives are described in the following subsections. Impacts discussed within this section are summarized in Tables 5-1 through 5-5. These tables list the identified visual resources in the project area potentially affected by each of the build alternatives, and show how aspects of construction and operation for each alternative have the potential to affect the identified visual resources.

5.2 No Build Alternative

The No Build Alternative would not involve construction of a new light rail transit project in downtown. It would also not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan. The transit network within the project area would be largely the same as it is now (Figure 5-1).

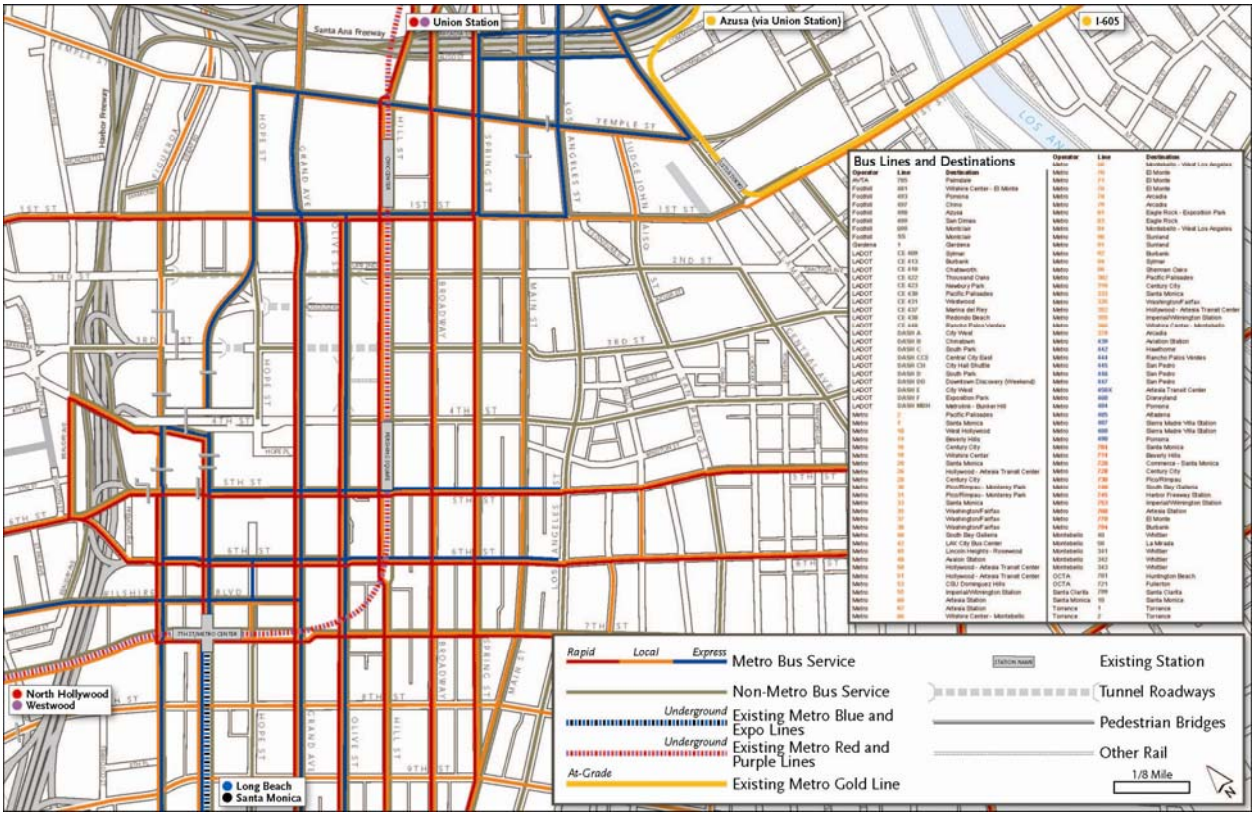

Figure 5-1. No Build Alternative

5.1.1 Direct Impacts

There will be no new transit projects constructed or operated in the project area under this alternative. No new streetscape improvements will be made. Therefore, there will be no direct visual impacts to scenic vistas, scenic resources, nighttime lighting, and shade and shadow impacts. Additionally, because the streetscape will remain unchanged, the existing visual character of the project area will not be degraded.

5.1.2 Indirect Impacts

No indirect construction or operation impacts to scenic vistas, scenic resources, nighttime lighting, and shading and shadowing would occur with the No Build Alternative because there would be no construction or new rail operations. Additionally, because the streetscape will remain unchanged, the existing visual character of the project area will not be indirectly degraded or enhanced.

5.1.3 Cumulative Impacts

No cumulative impacts would result from the No Build Alternative because there would be no direct or indirect impacts under this alternative.

5.2 Transportation System Management (TSM) Alternative

The TSM Alternative would include new express shuttle bus lines linking 7th Street/Metro Center Station and Union Station. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. The TSM Alternative shuttle bus routes are shown in Figure 5-2.

5.2.1 Direct Impacts

The enhanced bus stops constructed under the TSM Alternative would consist of select streetscape improvements, including bus stops, seating opportunities for those waiting for buses, and shelters. These improvements are shown in Figures 5-3a and 5-3b. Streetscape improvements would be consistent with existing enhanced bus stops and shelters already located throughout the project area and Greater Los Angeles. Views to scenic resources along the TSM Alternative alignment would not be obstructed due to the small scale and size of these bus stops and shelters and their location within an existing heavily urbanized environment.

Adding bus stops and shelters within the Civic Center Historic District and near the Little Tokyo Historic District would not alter the visual character of these districts. Context sensitive design of bus shelters would be applied to avoid any potential visual effects. Therefore, no significant visual impacts to scenic vistas, scenic resources, nighttime lighting, and shade and shadow impacts would occur.

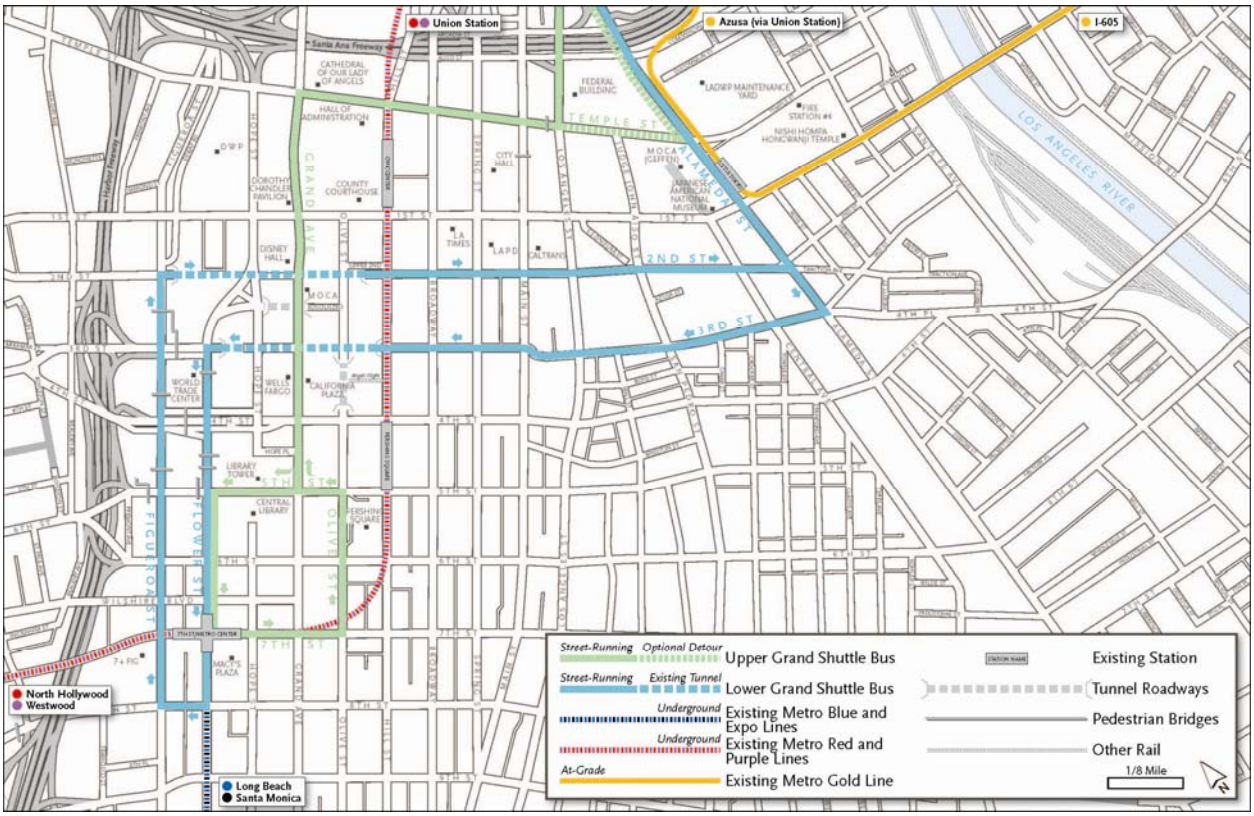

Figure 5-2. Transportation System Management (TSM) Alternative

5.2.2 Indirect Impacts

No indirect construction or operation impacts to scenic vistas, scenic resources, nighttime lighting, and shading and shadowing would occur under the TSM Alternative because there would be no major construction or new light rail operation. Additionally, because the streetscape would remain unchanged except for new and expanded bus stops, the existing visual character of the project area would not be indirectly degraded.

5.2.3 Cumulative Impacts

No cumulative impacts would result from the TSM Alternative because there would be no direct or indirect impacts.

Figure 5-3a and Figure 5-3b. Enhanced Bus Stops

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces to at grade north of 4th Street, crosses 3rd Street at grade, enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The new underground portions of the alignment would be constructed using the cut-and-cover method.

After entering the 2nd Street tunnel, the alignment continues along 2nd Street and splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). The alignment then heads east on Temple Street, realigns into a dual-track configuration just east of Los Angeles Street, and connects to the Metro Gold Line in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street. An automobile underpass and a potential pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to reduce pedestrian-train and automobile-train conflicts associated with the high volume of auto and truck traffic that would traverse the Regional Connector alignment.

A pedestrian bridge may also be constructed from the 2nd/Hope Street Station to Upper Grand Avenue in the Bunker Hill area. The At-Grade Emphasis LRT Alternative is shown in Figure 5-4. As discussed in Section 4, there are no scenic vistas identified in the project area and therefore no scenic vista impacts would occur. Other potential visual and aesthetic impacts associated with implementation of the At-Grade Emphasis LRT Alternative are discussed in the following subsections.

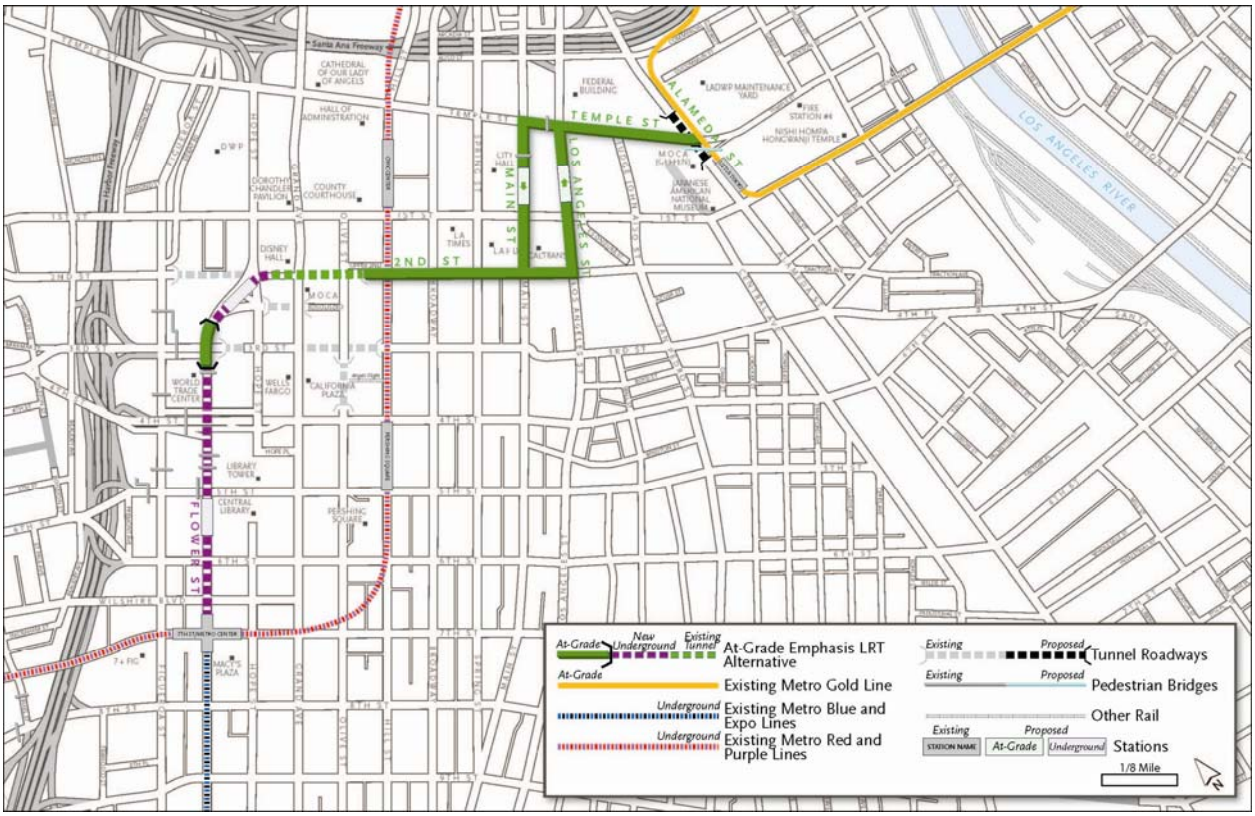

Figure 5-4. At-Grade Emphasis LRT Alternative

5.3.1 Direct Construction Impacts

Construction of the At-Grade Emphasis LRT Alternative would involve both at-grade and underground construction activities. At-grade construction would include installing tracks and guideway structures and constructing station platforms and ancillary facilities along roadways in the Historic Core, Civic Center, and Little Tokyo areas of downtown Los Angeles. At-grade construction activities would also include streetscape improvements along the entire alignment.

For above-ground construction, activities, equipment, and staging locations would be visible to nearby land uses and passersby. Proposed construction staging locations for the at-grade portion of this alternative include the Main/1st Street station, the Los Angeles/1st Street station, and the Temple and Alameda junction. At each of these three staging locations, construction equipment, worker vehicles, and construction trailers would be visible to nearby land uses and passersby for a period of two to three years.

For underground construction activities, tracks, guideways, and ancillary facilities would be installed by cut-and-cover construction techniques. Cut-and-cover construction would be conducted primarily below ground along approximately 1,600 feet of Flower Street north of

the existing 7th Street/Metro Center Station and extend to the proposed 2nd/Hope Street station. At any given time, two to three blocks would be closed during cut-and-cover construction activities. Above-ground activities associated with cut-and-cover construction would be visible to nearby land uses and passersby; however, the bulk of construction would occur below ground and, therefore, would not obstruct views or substantially alter the visual character of the Flower Street corridor in the Financial District.

Also associated with underground construction are construction staging areas. Staging locations are proposed at the Flower/6th/5th Street station site and the 2nd/Hope Street station site. Construction staging locations would be visible to nearby land uses and passersby; however, the construction sites themselves would be sheltered from direct public view by temporary construction walls.

After underground construction activities are complete, pedestrian station entrances would be constructed using methods involving placement of concrete inverts, walls, and walkways. Station entrance locations are generally used as access points to the underground station, including during the construction process. Exterior entrances would be constructed after the station structure has been completed.

Table 5-1 summarizes construction impacts on scenic resources associated with construction of the At-Grade Emphasis LRT Alternative.

LTS = Less than significant impact

5.3.1.1 Scenic Resource Impacts

There would be temporary impacts to views of historic buildings during construction. Construction staging areas and temporary construction walls surrounding these staging areas, movement of construction equipment, and stockpiling could temporarily hinder views of historic buildings from selected locations in downtown Los Angeles.

To summarize findings shown in Table 5-1, buildings and/or recognized visual resources could potentially be affected by construction activities associated with installation of tracks and poles, station construction, cut-and-cover activities, and pedestrian and train portal construction. These construction activities are discussed in more detail in the following subsections.

Installation of Tracks and Poles

Above-ground portions of the trackwork construction would involve demolition of the roadway section being displaced by the LRT trackway, preparation of the track bed, construction of the supporting track slab, and laying of rail. Foundations for overhead wire poles may be installed with the track. Given the urban context, approximately two-block segments of roadway are likely to be reserved at a time for construction activities. Construction durations for a two-block segment are estimated to be two to four months to complete trackwork in each roadway segment.

These activities would occur in the vicinity of the Los Angeles Law Center, the Times Annex, the Higgins Building, Saint Vibiana's Cathedral, City Hall and the open space area located immediately south of the building, the United States Courthouse, Fletcher Bowron Square/Los Angeles Mall, Parker Center, and the Tinker Toy Parking Structure. Given the temporary and short-term (two to four months) nature of construction activities immediately adjacent to these visual resources, no permanent or adverse impacts would occur to these scenic resources. All construction activities would remain off-site from the resources, and views of these resources within the surrounding area would remain intact. Therefore, impacts associated with installation of tracks and poles along the above-ground portions of this alternative would be less than significant.

Installation activities for tracks and poles along the underground portions of this alternative would not be visible to nearby land uses or passersby. Therefore, no visual impacts would result to scenic resources along Flower Street in the Bunker Hill and Financial District areas of downtown Los Angeles.

Above-ground Station Construction

The at-grade stations on Main Street and Los Angeles Street would be constructed simultaneously with other segments of the alternative. These would be single, high floor station platforms constructed from standard building materials such as concrete, steel, aluminum, and heavy plastic. The stations would be similar in size and scale to the existing Metro Blue Line and Gold Line stations.

Buildings located in the vicinity of station locations include City Hall South, the Los Angeles City Hall building and open space plaza south of the building, and Parker Center. Impacts to views of scenic buildings and resources along Main Street and Los Angeles Street just north of 1st Street, and to the resources themselves, would be less than significant due to the location of the platforms within existing street rights-of-way and the limited height, size, and scale of these platforms.

Underground Stations and Pedestrian Portals

Two underground stations would be constructed along the At-Grade Emphasis LRT Alternative alignment: the Flower/6th/5th Street station and the 2nd/Hope Street station. Similar to construction of the tunnel and trackwork for the underground portion of this alternative, stations would be constructed using cut-and-cover techniques. Buildings and scenic resources located within the immediate proximity of the proposed Flower/6th/5th Street underground station and pedestrian portal include the Central Library and Maguire Gardens, the City National Plaza, and the Citigroup Center Plaza. No identified scenic resources or buildings are located immediately adjacent to the proposed 2nd/Hope Street station.

Most station construction activities would occur below ground, and therefore would not be visible to nearby buildings, land uses, and passersby. Following underground construction, the ground surface would be completed and pedestrian portals would be finished. Therefore, construction activities for the underground stations, ancillary facilities, and pedestrian portals for this alternative would be primarily invisible to nearby land uses; impacts to surrounding visual resources would be less than significant.

Train Portal

Under the At-Grade Emphasis LRT Alternative, one train portal would be constructed along the southern wall in the central portion of the 2nd Street Tunnel. Creating the portal in the 2nd Street Tunnel would require major construction work and closure of the tunnel during portal construction. Views of the central portion of this tunnel, where the bulk of construction activities would occur, are limited and available only to drivers using the tunnel. Therefore, by closing the tunnel during construction activities, visual impacts associated with portal construction in the 2nd Street Tunnel would be limited and no impacts would occur.

5.3.1.2 Visual Character Impacts

Both above and below ground construction activities—including installation of the tracks and poles, station construction, and pedestrian and train portal construction—would temporarily alter the existing visual character of downtown Los Angeles. Areas of downtown Los Angeles through which the underground portions of the alternative would pass consist of high-rise and high-density development.

Wide sidewalks and avenues provide pedestrians and vehicles with views along corridors in the project area. Construction activities would result in two- to four-month street and sidewalk closures on a two-block basis. Construction staging areas with tall walls surrounding construction sites would be placed in specific locations for periods ranging from 12 to 48 months. Construction activities would result in overall congestion and temporary obstructions to views currently experienced along corridors. There would not be a significant effect on visual character of the historic districts because potential impacts to historic buildings that contribute to these districts would be less than significant.

Construction activities occurring in roadways and sidewalks would have the potential to temporarily disrupt views along the corridors as well as impede views of historic resources, visual resources, and viewshed corridors. However, no recognized or valued views are located in the project area. Viewers would see construction-related activities and equipment, and the urban streetscape would be temporarily altered. However, the project would be constructed in a heavily urbanized environment where construction activities are not uncommon. Construction of the project would not noticeably reduce visual quality or alter viewing context. Therefore, temporary construction impacts would be less than significant.

5.3.1.3 Nighttime Illumination Impacts

During construction, nighttime lighting would be introduced into the project area at construction staging locations. Lighting would predominantly consist of security lighting, and light would be directed on-site. As such, nighttime lighting impacts would be less than significant during construction of the At-Grade Emphasis LRT Alternative.

5.3.1.4 Shade and Shadow Impacts

The At-Grade Emphasis LRT Alternative would involve both at-grade and underground construction. Heights of structures and construction-related facilities and equipment located above ground would be limited; as such, the potential for construction activities to result in shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment's corridors would be minimal. No shade or shadow impacts would result from construction of the At-Grade Emphasis LRT Alternative.

5.3.2 Indirect Construction Impacts

Construction of the At-Grade Emphasis LRT Alternative would result in limited localized visual impacts on the Financial District, Bunker Hill, Historic Core, Civic Center, and Little Tokyo areas of downtown.

5.3.2.1 Scenic Resource Impacts

Construction activities for the proposed project would be localized and not result in any indirect impacts to scenic resources beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. No indirect visual impacts to scenic resources would occur as a result of construction.

5.3.2.2 Visual Character Impacts

Construction activities for the proposed project would be localized and not result in any indirect impacts to visual character beyond those discussed in the Built Environment Technical Memorandum. No indirect impacts to visual character would occur as a result of construction activities.

5.3.2.3 Nighttime Illumination Impacts

During construction, nighttime lighting would be introduced into the immediate project area at construction staging locations, along Flower Street at cut-and-cover construction sites, and along the two-block at-grade segments on 2nd, Los Angeles, Main, and Temple Streets. The project is located in an urban environment with substantial existing nighttime lighting. All lighting associated with project construction activities would be localized. Therefore, no indirect nighttime lighting impacts would occur from construction of the At-Grade Emphasis LRT Alternative.

5.3.2.4 Shade and Shadow Impacts

The At-Grade Emphasis LRT Alternative would involve both at-grade and underground construction. Heights of structures and construction-related facilities and equipment located above ground would be limited and localized to the areas immediately surrounding the facilities themselves; therefore, no indirect shade and shadow impacts would result from construction activities.

5.3.3 Direct Operational Impacts

Operation of the At-Grade Emphasis LRT Alternative would include both underground and at-grade segments of the project. Underground operations would occur beneath Flower Street, extending north from the existing 7th Street/Metro Center Station through the Financial District and Bunker Hill to the 2nd Street Tunnel. At the 2nd Street Tunnel the line would continue at-grade in an easterly direction through the Historic Core and Civic Center and ultimately connect with the existing Little Tokyo/Arts District Station.

Three new stations are proposed: one at-grade couplet and two underground stations. The at-grade couplet station would be located in the existing street rights-of-way on Los Angeles Street and Main Street and include single, high floor station platforms. The underground stations, at Flower/6th/5th Streets and 2nd/Hope Streets, would be accessed by pedestrian portals with above-ground entrances. Table 5-2 summarizes impacts on scenic resources associated with operation of the At-Grade Emphasis LRT Alternative.

Table 5-2. Scenic Resources Potentially Affected by Operation of the At-Grade Emphasis LRT Alternative

NO = No impact
LTS = Less than significant impact

5.3.3.1 Scenic Resource Impacts

Views of several historic buildings in the Historic Core and Civic Center could be minimally disrupted during project operations due to the presence of overhead contact wire and catenary poles. Table 5-2 summarizes potential impacts to scenic resources along the route of the proposed At-Grade Emphasis LRT Alternative.

Historic buildings within the Historic Core include the Los Angeles Law Center, Times Annex, Higgins Building, and Redwing Shoes. Historic buildings within the Civic Center include City Hall South, Los Angeles City Hall, the U.S. Courthouse, Fletcher Bowron Square/Los Angeles Mall, Parker Center, and the Tinker Toy parking structure. Of these buildings, the first three are large in scale and would experience only minimally visual impacts by the overhead contact systems and catenary poles. Even the three-story Redwing Shoes building is tall enough to experience only minor impacts from the overhead wires and catenary poles, which would be approximately two stories in height. This minimal impact would be visible only from the far side of the street beyond the overhead contact system. Viewers on the same side of the street as the building would experience no visual impact.

The overhead catenary system features would not degrade views of historic buildings in the Historic Core, nor would they contrast with the buildings' form, size, color, or texture. Therefore, operation impacts to these buildings in the Historic Core would be less than significant under the At-Grade Emphasis LRT Alternative.

Views of several historic buildings located in the Civic Center would potentially be minimally disrupted during project operations due to the presence of overhead contact wire and catenary poles. These include City Hall South, Los Angeles City Hall, the U.S. Courthouse, Fletcher Bowron Square/Los Angeles Mall, Parker Center, and the Tinker Toy parking structure. All of these buildings are tall and would be only minimally impacted by the proposed overhead contact system and catenary poles, which would be approximately two stories high.

The potential effect of the LRT facilities on these historic buildings is described in the Cultural Resources – Built Environment Technical Memorandum. The LRT facilities would be consistent with the historical context of many of the structures and reminiscent of the historic system of trolleys and street cars. These buildings are all institutional in scale, and their large sizes would visually outweigh the minor intrusion of the LRT facilities. The LRT facilities would not degrade views of historic buildings in the Civic Center, nor would they contrast with the buildings' form, size, color, or texture. Therefore, visual impacts to these resources would be less than significant.

Three Civic Center buildings along the At-Grade Emphasis LRT Alternative alignment would experience minimal to no potential visual impacts from station platforms and associated appurtenances. These include City Hall South, Los Angeles City Hall, and Parker Center. These buildings are much greater in scale than the light rail platforms and, therefore, would experience only minimal visual disturbance at the first floor level.

The stations would not degrade views of historic buildings in the Civic Center, nor would they contrast with the buildings' form, size, color or texture. Therefore, visual resource impacts would be less than significant.

One building in the project area, the Los Angeles Central Library (and the adjacent Maguire Gardens), may experience potential visual impacts from entrances to underground stations. The entrance to the proposed Flower/6th/5th Street station would be located in a widened sidewalk area and have low visual impact on the Central Library. Pedestrians walking along the west side of Flower Street would experience low visual impacts looking across the street toward Maguire Gardens. People walking along the east side of Flower Street would not experience any visual impacts. The entrance would not degrade views of the Central Library, nor would it contrast greatly with its appearance. Therefore, visual impacts to the Los Angeles Central Library and Maguire Gardens would be less than significant.

Train portals would be located:

- Within Flower Street between 3rd Street and 4th Street
- On Bunker Hill
- On 2nd Street between Olive Street and Hill Street (existing 2nd Street Tunnel portal)
- Inside the 2nd Street Tunnel (where the new tunnel from the south punches into the existing 2nd Street Tunnel)

The proposed train portals would not be tall enough to degrade views of any historic buildings, nor would they contrast visually with the buildings. As such, no impacts from train portals would occur.

In the Bunker Hill area, there may be a pedestrian bridge constructed from the 2nd/Hope Street Station to Upper Grand Avenue above the existing General Thaddeus Koscuiszko Way right-of-way. The bridge would not be visible from any historic buildings, and thus no adverse visual impacts to historic buildings would occur.

Several scenic resources are near the underground portion of the At-Grade Emphasis LRT Alternative alignment, but there would be no visible project facilities nearby. These include the Fine Arts Building, the 818 Building, Roosevelt Lofts, Pegasus, 811 Wilshire Boulevard, Engine Company Number 28, the Standard Hotel, and the California Club. No features of the proposed project would be visible to these buildings and therefore no visual impacts would occur.

Other buildings within the Area of Potential Visual Impact are located too far from the at-grade portions of the At-Grade Emphasis LRT Alternative alignment to be visually affected. These include the Times Building, St. Vibiana's Cathedral, Union Arts Center, and San Pedro Farm Building. Therefore, no visual impacts to these buildings would occur.

5.3.3.2 Visual Character Impacts

The At-Grade Emphasis LRT Alternative would be located in a heavily urbanized environment and adding a fixed guideway, whether at grade or underground, would not noticeably reduce visual quality or alter the viewing context in the Financial District, Bunker Hill, Historic Core, Civic Center, or Little Tokyo areas of downtown Los Angeles. The introduction and operation of these improvements would contribute to the existing urban character and high-density, pedestrian friendly environment that already exists in downtown Los Angeles. There would not be a significant effect on the visual character of the historic districts because potential impacts to historic buildings that contribute to the historic districts would be less than significant. Therefore, visual character impacts associated with the At-Grade Emphasis LRT Alternative would be less than significant.

5.3.3.3 Nighttime Illumination Impacts

The At-Grade Emphasis LRT Alternative would introduce new nighttime lighting to the immediate project area and at station locations. Nighttime lighting would primarily consist of security lighting and would be similar to the existing lighting located throughout downtown Los Angeles. Therefore, no new nighttime lighting impacts would result from implementation or operation of the At-Grade Emphasis LRT Alternative.

5.3.3.4 Shade and Shadow Impacts

Operation of the At-Grade Emphasis LRT Alternative would involve light rail trains running both at-grade and underground. Above-ground structures, including station platforms and catenary structures (which include poles and wires), would be limited to approximately two stories in height; therefore, the potential for the project to result in increased shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment corridors would be minimal. No shade or shadow impacts would result from implementation or operation of the At-Grade Emphasis LRT Alternative.

5.3.4 Indirect Operational Impacts

5.3.4.1 Scenic Resource Impacts

The At-Grade Emphasis LRT Alternative would not result in indirect operational impacts to the visual environment of downtown historic buildings.

5.3.4.2 Visual Character Impacts

Implementation and operation of the At-Grade Emphasis LRT Alternative would be localized and would not result in indirect impacts to visual character beyond those discussed in the Built Environment Technical Memorandum. No indirect impacts to visual character would occur.

5.3.4.3 Nighttime Illumination Impacts

New nighttime lighting would be introduced into the immediate project area and at station locations as a result of implementation of this alternative. All project-related lighting would be localized. Therefore, no indirect nighttime lighting impacts would result from operation of the At-Grade Emphasis LRT Alternative.

5.3.4.4 Shade and Shadow Impacts

Implementation and operation of the At-Grade Emphasis LRT Alternative would include both at-grade and underground operations. Structures located above ground, including station platforms and catenary structures, would be limited in height. Therefore, the potential for this alternative to result in shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment's corridors is limited. No indirect shade or shadow impacts would result from implementation or operation of the At-Grade Emphasis LRT Alternative.

5.3.5 Cumulative Construction Impacts

5.3.5.1 Scenic Resource Impacts

Construction projects besides the proposed LRT project are planned throughout the downtown Los Angeles area. Construction of the At-Grade Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of the proposed project would not contribute to a cumulatively considerable visual resource impact. Nor would the project, in combination with other future construction projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.3.5.2 Visual Character Impacts

The proposed project is located in greater downtown Los Angeles, which is a dynamic environment where new projects are being constructed on an on-going basis. Construction projects are seen throughout the project vicinity and, in addition to construction of the proposed LRT project, additional development projects are planned throughout the downtown Los Angeles area.

Construction of the At-Grade Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of this alternative would not contribute to a cumulatively considerable visual character impact. Nor would the project, in combination with other future projects in the downtown Los Angeles area. result in significant cumulative visual impacts to the visual character of downtown.

5.3.5.3 Nighttime Illumination Impacts

The At-Grade Emphasis LRT Alternative would not result in direct or indirect nighttime illumination impacts during construction. Therefore, the alternative would not result in, or contribute to, cumulatively considerable nighttime illumination impacts.

5.3.5.4 Shade and Shadow Impacts

The At-Grade Emphasis LRT Alternative would not result in direct or indirect shade and shadow impacts during construction. Therefore, the alternative would not result in, or contribute to cumulatively considerable shade and shadow impacts.

5.3.6 Cumulative Operational Impacts

5.3.6.1 Scenic Resource Impacts

Other development projects are planned throughout the downtown Los Angeles area in addition to the operation of the LRT project. Operation of this LRT alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, implementation of the alternative would not contribute to a cumulatively considerable visual resource impact. Nor would the project, in combination with other future construction projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.3.6.2 Visual Character Impacts

The proposed project is located in greater downtown Los Angeles, which is a dynamic environment where new projects are being implemented on an on-going basis. Additional development projects are planned throughout the downtown Los Angeles area. Operation of the At-Grade Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, operation of this alternative would not contribute to a cumulatively considerable visual resource impact. Nor would the alternative, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative visual impacts to the visual character of downtown.

5.3.6.3 Nighttime Illumination Impacts

The At-Grade Emphasis LRT Alternative would not result in direct or indirect nighttime illumination impacts from operations. Therefore, the alternative would not result in or contribute to significant cumulative nighttime illumination impacts.

5.3.6.4 Shade and Shadow Impacts

The At-Grade Emphasis LRT Alternative would not result in direct or indirect shade and shadow impacts from operations. Therefore, the alternative would not result in or contribute to significant cumulative shade and shadow impacts.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would connect directly to the tracks at 7th Street/Metro Center Station, continue north underneath Flower Street to 3rd Street, and then northeast to 2nd and Hope Streets. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue, where they would then veer north into a new portal on the private property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue.

The tracks would then enter the intersection of 1st and Alameda Streets in the same type of three-way junction planned for the At-Grade Emphasis LRT Alternative, with a potential pedestrian overpass and a vehicular underpass for through traffic on Alameda Street. A pedestrian bridge may also be constructed from the 2nd/Hope Street station to Upper Grand Avenue in the Bunker Hill area.

The proposed Underground Emphasis LRT Alternative alignment is shown in Figure 5-5. No identified scenic vistas are within the project area and therefore no scenic vista impacts would occur. Potential visual and aesthetic impacts associated with implementation of the Underground Emphasis LRT Alternative are discussed in the following subsections of this technical memorandum.

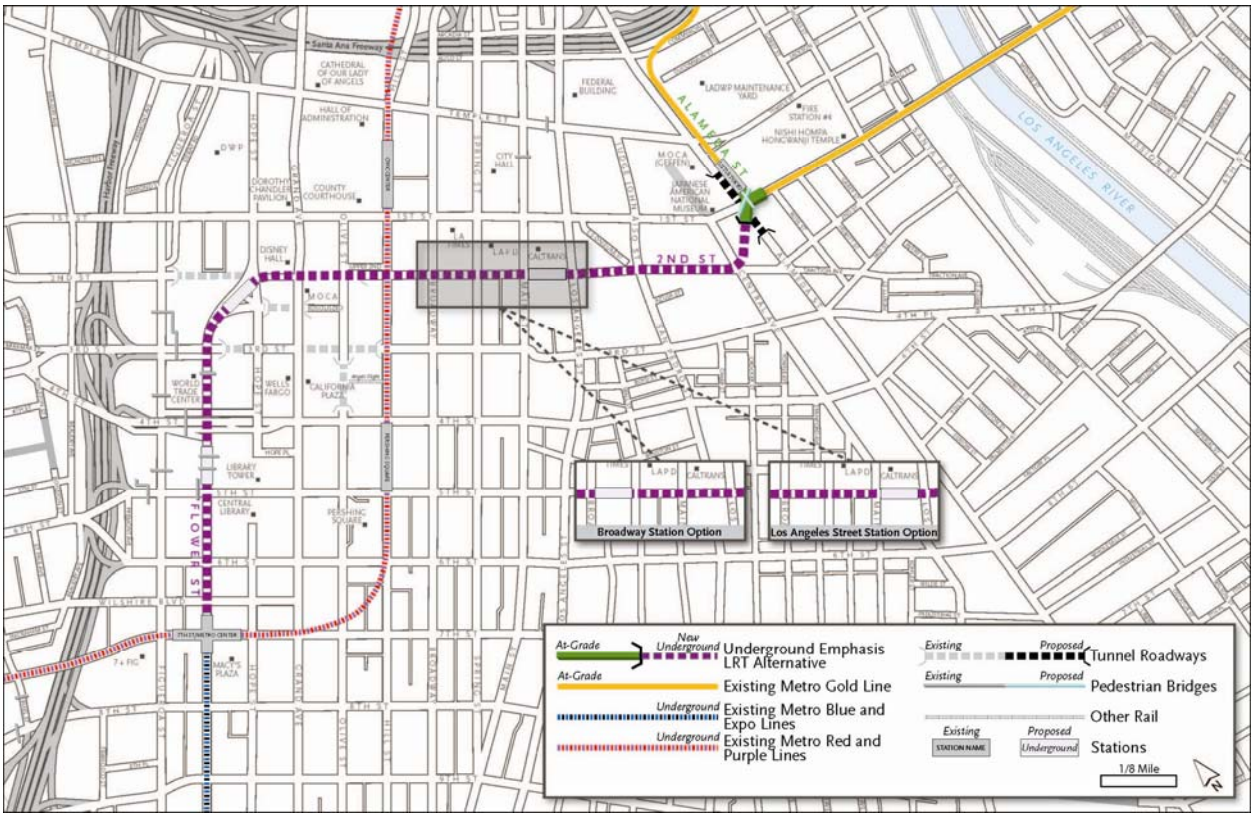

Figure 5-5. Underground Emphasis LRT Alternative

5.4.1 Direct Construction Impacts

The Underground Emphasis LRT Alternative would involve primarily underground construction due to the proposed configuration of the alignment. The portion of the alignment located beneath Flower Street, through the Financial District and Bunker Hill, would involve 2,200 feet of cut-and-cover tunneling and the portion of the alignment along 2nd Street, through the Historic Core and Little Tokyo, would be constructed using a Tunnel Boring Machine (TBM). Where cut-and-cover construction occurs, portions of two- to three-block segments of Flower Street through the Financial District and Bunker Hill would be closed at any given time.

The TBM could be launched from two potential sites: the proposed 2nd/Hope Street station site on the western end of alignment, or the block at the 1st Street and Alameda Street junction on the eastern end of the alignment. The selected launch site would be one of the three proposed construction staging locations. The other two construction staging sites would be at the proposed Flower/5th/4th Street station site and either the 2nd Street station – Los Angeles Street option or the 2nd Street station – Broadway option, depending on which is selected.

Nearby land users and passersby would have visual access to cut-and-cover construction, construction staging locations, and potential TBM launch sites. However, most construction would occur below ground, and temporary construction walls would prevent direct public view of construction staging and TBM launch sites. TBM operation would be entirely below ground and not visible to nearby land uses or passersby in the Historic Core and Little Tokyo areas of downtown Los Angeles.

After construction of the three stations is completed, pedestrian access portals would be constructed using methods involving placement of concrete inverts, walls, and walkways. Station entrances to access underground stations and ancillary facilities would be constructed above ground and over the pedestrian portals. Table 5-3 summarizes potential impacts on scenic resources associated with construction of the Underground Emphasis LRT Alternative.

LTS = Less than significant impact

5.4.1.1 Scenic Resource Impacts

There would be temporary impacts to views of historic buildings during construction. Construction staging areas and temporary construction walls surrounding these staging and stockpiling areas, as well as movement of construction equipment, could temporarily hinder views of historic buildings from selected locations in downtown Los Angeles.

Table 5-3 summarizes findings regarding buildings and/or recognized visual resources that could potentially be affected by installation of tracks and poles, cut-and-cover activities, and construction of station and pedestrian portals.

Installation of Tracks and Poles

Above-ground portions of the trackwork under the Underground Emphasis LRT Alternative would be much less than the At-Grade Emphasis Alternative and limited to the vicinity of 1st Street and Alameda Street in Little Tokyo. Trackwork construction would involve demolition of the roadway section being displaced by the LRT trackway, preparation of the track bed, construction of the supporting track slab, and laying of rail. These activities would occur near the Little Tokyo Historic District.

Given the temporary and short-term nature of construction activities related to installation of tracks and poles (between two and four months) and the distance to the nearest scenic resource (approximately one block), no permanent or adverse impacts would occur to these scenic resources. Construction activities would occur only on affected streets, and resources and views of these resources within the surrounding area would remain intact. Therefore, potential impacts associated with installation of tracks and poles along the above-ground portion of this alternative would be less than significant.

Installation of tracks and poles along the underground portions of this alternative would not be visible to nearby land uses or passersby. Therefore, no visual impacts would result to scenic resources along Flower Street in the Bunker Hill and Financial District areas of downtown Los Angeles or along 2nd Street through Bunker Hill and the Historic Core.

Underground Station Sites and Pedestrian Portals

The Underground Emphasis LRT Alternative would include construction of three underground stations at three of the four identified construction staging sites along the alignment: the Flower/5th/4th Street station, the 2nd/Hope Street station, and either the 2nd Street station – Los Angeles Street or 2nd Street station – Broadway Options. Stations would be constructed using cut-and-cover techniques similar to construction of the tunnel and trackwork for the underground portion of this alternative.

Buildings and scenic resources located within the immediate proximity of the proposed Flower/5th/4th Street station and pedestrian portal include the Central Library and Maguire Gardens, City National Plaza, and Citigroup Center Plaza. No identified scenic resources or buildings are located immediately adjacent to the 2nd/Hope Street station. In the immediate vicinity of both 2nd Street station options are the Times Annex building, Higgins Building, and St. Vibiana's Cathedral.

Most station construction would occur below ground, and therefore would not be visible to nearby buildings, land uses, and passersby. After underground construction is complete, the

ground surface would be restored and the pedestrian portals finished. Therefore, construction activities for the underground stations, ancillary facilities, and pedestrian portals for this alternative would be primarily invisible to nearby land uses; impacts to surrounding visual resources would be less than significant.

Train Portal

Construction of the train portal just west of Alameda Street would result in removal of the Señor Fish building. Removal of this structure would result in a less than significant visual impact to the Little Tokyo area because of the building's modest size and reduced level of historical significance. Through appropriate urban design, the portal area structures and surrounding streetscape and landscaping would comply with the Secretary of the Interior's *Standards for Rehabilitation*. Furthermore, design of the Underground Emphasis LRT Alternative would incorporate historical and visual references to the surrounding Little Tokyo and Arts District neighborhoods that complement these important communities.

5.4.1.2 Visual Character Impacts

Construction activities—including cut-and-cover construction, installation of the tracks and poles in the at-grade segment of the Underground Emphasis LRT Alternative, and station and pedestrian portal construction—would temporarily alter the existing visual character of downtown Los Angeles. The areas of downtown Los Angeles through which the underground portions of this alignment would pass currently consist of high- and mid-rise buildings and high-density construction.

The at-grade portion of this alternative would be limited to the area of the 1st Street and Alameda Street junction in the immediate vicinity of the existing Little Tokyo/Arts District Station. The Little Tokyo Historic District is about one block away. Wide sidewalks and avenues in the project area provide pedestrians and vehicles with views along the alignment. Construction activities would result in partial two- to three-block closures of the street and sidewalks along Flower Street through the Financial District and Bunker Hill. Construction staging areas and their associated construction walls would be visible for a period ranging from 12 to 48 months. During construction of the Underground Emphasis LRT Alternative, activities occurring above ground in the roadways and along sidewalks would have the potential to temporarily disrupt views along the corridors and impede views of historic resources, visual resources, and viewshed corridors. No recognized or valued views have been identified in the project area. Viewers would see construction equipment and construction-related activities, and the urban streetscape would be temporarily altered. However, the Underground Emphasis LRT Alternative would be constructed in a heavily urbanized environment where construction activities are not uncommon, and would not noticeably reduce visual quality or alter viewing context. Therefore, temporary construction impacts would be less than significant.

5.4.1.3 Nighttime Lighting Impacts

During construction, nighttime lighting would be introduced into the project area at construction staging locations. Lighting would predominantly consist of security lighting, and would be directed on-site. Therefore, nighttime lighting impacts would be less than significant during construction of the Underground Emphasis LRT Alternative.

5.4.1.4 Shade and Shadow Impacts

Construction of the Underground Emphasis LRT Alternative would occur primarily underground. Heights of structures and construction-related facilities located above ground would be limited to no more than two stories. Therefore, the potential for construction activities to result in shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment corridors is limited. No shade or shadow impacts would result from construction of the Underground Emphasis LRT Alternative.

5.4.2 Indirect Construction Impacts

Construction of the Underground Emphasis LRT Alternative would result in limited localized visual impacts on the Financial District, Bunker Hill, Historic Core, and Little Tokyo areas of downtown.

5.4.2.1 Scenic Resource Impacts

Construction activities for the Underground Emphasis LRT Alternative would be localized and not result in any indirect impacts to scenic resources beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. Construction of this alternative would not create indirect visual impacts to scenic resources.

5.4.2.2 Visual Character Impacts

Construction activities for the Underground Emphasis LRT Alternative would be localized and not result in any indirect impacts to visual character beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. Construction of this alternative would not create indirect impacts to visual character.

5.4.2.3 Nighttime Illumination Impacts

During construction, nighttime lighting would be introduced into the immediate project area at construction staging locations. All lighting impacts would be localized and, therefore, would not result in indirect nighttime lighting impacts.

5.4.2.4 Shade and Shadow Impacts

Construction of the Underground Emphasis LRT Alternative would occur primarily underground. Above-ground construction and related facilities and equipment would be limited in height and extent, and any related shadows would be localized to the areas

immediately surrounding these facilities. Therefore, no indirect shade and shadow impacts would result from construction activities.

5.4.3 Direct Operational Impacts

The Underground Emphasis LRT Alternative would operate primarily underground, with a short at-grade segment in Little Tokyo near the existing Little Tokyo/Arts District Station. Underground operations would occur beneath Flower Street, extending north from the existing 7th Street/Metro Center Station through the Financial District and Bunker Hill to 2nd Street. At 2nd Street the line would continue underground in an easterly direction through the Historic Core and Little Tokyo before traveling up to an at-grade elevation and joining with the existing Little Tokyo/Arts District Station at the 1st and Alameda Street junction.

The Underground Emphasis LRT Alternative would require construction of three new underground stations: the Flower/5th/4th Street station, the 2nd/Hope Street station, and either the 2nd Street station – Los Angeles Street or the 2nd Street station – Broadway Option. Above-ground entrances would provide access to pedestrian portals. With the exception of these above-ground entrances and the at-grade portion of the alignment at the 1st and Alameda Street junction, all operations of this alternative would be located underground. Table 5-4 summarizes potential impacts to scenic resources associated with operation of the Underground Emphasis LRT Alternative.

Table 5-4. Scenic Resources Potentially Affected by Operation of the Underground Emphasis LRT Alternative

NO = No impact.
LTS = Less than significant impact

5.4.3.1 Scenic Resource Impacts

Operation of the Underground Emphasis LRT Alternative would result in only minimal potential visual impacts to scenic resources. Potential impacts to identified scenic resources along the route of the Underground Emphasis LRT Alternative are summarized in Table 5-4.

Other than pedestrian access and egress through pedestrian portals at the Flower/5th/4th Street station, 2nd/Hope Street station, and either the 2nd Street station – Los Angeles Street Option or 2nd Street station – Broadway Option, most operational activities associated with this alternative would occur underground. Therefore, there would be no degradation of views of historic buildings and little or no contrasting visual conditions. There would be no visual impacts as a result of the new trackway and systems appurtenances, which would be located underground except where the trackway returns to street level at the intersection of 1st and Alameda Streets. These impacts would be the same regardless of which 2nd Street station option is selected.

The only above-ground features of this alternative would be station entrances within the Financial District, Bunker Hill, and Historic Core areas of downtown Los Angeles. Identified scenic buildings and scenic resources are located within close proximity of only two of the proposed station locations. These include the Los Angeles Central Library and Maguire Gardens, City National Plaza, and Citigroup Center Plaza near the proposed Flower/5th/4th Street station, and the Times Annex building and St. Vibiana's Cathedral near the proposed 2nd Street station options.

The Los Angeles Central Library and Maguire Gardens would experience low visual impacts by locating the underground station entrance in a widened sidewalk area adjacent to the northern half of the garden. Pedestrians walking along the west side of Flower Street would

experience low visual impacts looking across the street toward Maguire Gardens. People walking along the east side of Flower Street would not experience any visual impacts.

The pedestrian portal and station entrance would not degrade views of the Central Library, nor would it contrast heavily with the building. Therefore, potential visual impacts to the Central Library and Maguire Gardens would be less than significant.

In the Bunker Hill area, there may be a pedestrian bridge constructed from the 2nd/Hope Street station to Upper Grand Avenue above the existing General Thaddeus Koscuiszko Way right-of-way. The bridge would not be visible from any historic buildings, and thus no adverse visual impacts to historic buildings would occur.

There would be station entrances at up to four potential locations within one block of the Times Annex for the 2nd Street station - Broadway Option, though not all of the potential locations would be developed. None of these entrances would be immediately adjacent to the Times Annex site. Three would be located on the south side of 2nd Street. Of these, only one would be directly across 2nd Street from the Times Annex property. This station entrance would be located in the northeastern corner of the parking lot at the southwest corner of Spring and 2nd Streets.

None of these station entrances would adversely affect views of the Times Annex Building from the pedestrian right-of-way. Therefore, potential visual impacts to this building would be less than significant.

There would be three pedestrian portal locations within one-half block of St. Vibiana Cathedral, assuming the 2nd Street station – Los Angeles Street option is selected. However, only one of these portals would be proximate to St. Vibiana Cathedral. This pedestrian portal would be located in the triangular space between the St. Vibiana property and the Little Tokyo Library, adjacent to the sidewalk. The view of St. Vibiana from the public right-of-way is of the institutional/office side of the building, and visual impacts would be less than significant.

At the easternmost terminus of the Underground Emphasis LRT Alternative alignment, the underground alignment would ascend up through a portal to meet the existing at-grade Metro Gold Line alignment at the 1st Street and Alameda Street junction. This portal would be located on the block bounded by Alameda Street on the east, Central Avenue on the west, 2nd Street on the south, and 1st Street on the north. Within this block, the light rail tracks would rise to the surface, then cross the intersection of 1st and Alameda Street at grade. Alameda Street would pass below 1st Street in a new underpass that would begin more than one-half block south of 1st Street and continue one-half block north of 1st Street.

At-grade overhead contact systems, catenary poles, and trackway (standard features required for a light rail system to operate) would be located only at the easternmost end of the

Underground Emphasis LRT Alternative alignment. The block bordered by Alameda Street, 2nd Street, 1st Street, and Central Avenue is the only block that would have exposed overhead contact wires, catenary poles, and track.

Older buildings on this block include the Señor Fish and John A. Roebling structures. The Cultural Resources – Built Environment Technical Memorandum describes these buildings and potential project impacts. The portal area structures and surrounding streetscape and landscaping would incorporate historical and visual references to the surrounding Little Tokyo and Arts District neighborhoods, complementing these important communities.

Given that most features associated with the Underground Emphasis LRT Alternative would be located below ground, and that only one city block would experience potential visual changes associated with the above-ground operations of this alternative, no significant visual impacts to scenic resources would occur. Therefore, any potential impacts to visual resources would be less than significant.

5.4.3.2 Visual Character Impacts

The Underground Emphasis LRT Alternative is located in a heavily urbanized environment, and adding primarily underground structures and a limited fixed guideway would not noticeably reduce visual quality or alter the viewing context in the Financial District, Bunker Hill, Historic Core, and Little Tokyo areas of downtown Los Angeles. Construction and operation of these features would contribute to the existing urban character and high-density, pedestrian friendly environment that already exists in downtown Los Angeles.

The alternative's alignment and proposed pedestrian portals are located outside the Civic Center and Little Tokyo Historic Districts. Additionally, the Underground Emphasis LRT Alternative would be primarily underground and not visually accessible to the public. Therefore, potential visual character impacts associated with the Underground Emphasis LRT Alternative would be less than significant.

5.4.3.3 Nighttime Lighting Impacts

With operation of a new underground LRT project, limited new nighttime lighting would be introduced into the project area. Lighting would predominantly consist of security lighting at pedestrian portal locations, and would be directed on-site. Therefore, no nighttime lighting impacts would occur during operation of the Underground Emphasis LRT Alternative.

5.4.3.4 Shade and Shadow Impacts

Operation of the Underground Emphasis LRT Alternative would introduce limited, new above-ground structures in the already heavily urbanized Financial District, Bunker Hill, Historic Core, and Little Tokyo areas of downtown Los Angeles. The only above-ground structures would be pedestrian portals to underground stations and one block with at-grade light rail

operations and associated structures and facilities. Heights of structures located above ground would be limited to approximately two stories. Therefore, the potential for shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment's corridors would be limited. No shade or shadow impacts would result from construction of the Underground Emphasis LRT Alternative.

5.4.4 Indirect Operational Impacts

5.4.4.1 Scenic Resource Impacts

All potential impacts to scenic resources would be localized. Therefore, no indirect impacts to the downtown historic buildings' visual environment would occur from operation of the Underground Emphasis LRT Alternative.

5.4.4.2 Visual Character Impacts

Changes in visual character from operation of this alternative would be localized and not result in any indirect impacts to visual character beyond those discussed above and within the Cultural Resources – Built Environment Technical Memorandum. No indirect impacts to visual character would occur.

5.4.4.3 Nighttime Illumination Impacts

New nighttime lighting would be introduced into the immediate project area and at pedestrian portal locations. Nighttime lighting, however, would primarily consist of security lighting and would be localized. Therefore, no indirect nighttime lighting impacts would result from implementation and operation of the Underground Emphasis LRT Alternative.

5.4.4.4 Shade and Shadow Impacts

Operation of the Underground Emphasis LRT Alternative would primarily occur underground. Placement of structures above ground would be limited to facilities associated with pedestrian portals to stations and one block with at-grade light rail operations and associated structures and facilities. The shading and shadows associated with these structures would be localized to the immediate vicinity of the facilities themselves. Therefore, no indirect shade or shadow impacts would result from operation of the Underground Emphasis LRT Alternative.

5.4.5 Cumulative Construction Impacts

5.4.5.1 Scenic Resource Impacts

Other construction projects are planned throughout the downtown Los Angeles area. Construction of the Underground Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of the proposed project would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future construction projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.4.5.2 Visual Character Impacts

The proposed project is located in greater downtown Los Angeles, which is a dynamic environment where new projects are constructed on an ongoing basis. Additional development projects are planned throughout the downtown Los Angeles area. Construction of the Underground Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of the proposed alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative impacts to the visual character of downtown.

5.4.5.3 Nighttime Illumination Impacts

Construction of the Underground Emphasis LRT Alternative would not result in nighttime illumination impacts; therefore, it would not result in or contribute to significant cumulative nighttime illumination impacts.

5.4.5.4 Shade and Shadow Impacts

Construction of the Underground Emphasis LRT Alternative would not result in shade and shadow impacts; therefore, this alternative would not result in or contribute to significant cumulative shade and shadow impacts.

5.4.6 Cumulative Operational Impacts

5.4.6.1 Scenic Resource Impacts

Other development projects are planned throughout the downtown Los Angeles area. Operation of the Underground Emphasis LRT Alternative would not result in either direct or indirect significant impacts to scenic resources. Therefore, operation of this alternative would not contribute to cumulatively considerable visual resource impacts. Nor would the alternative, in combination with other future development projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.4.6.2 Visual Character Impacts

The Underground Emphasis LRT Alternative alignment is located in greater downtown Los Angeles, which is a dynamic environment where new projects are being implemented on an ongoing basis. Development of additional projects is planned throughout downtown. Operation of the Underground Emphasis LRT Alternative would not result in direct or indirect significant impacts to scenic resources. Therefore, operation of the proposed project would not contribute to a cumulatively considerable visual resource impact. Nor would it result in significant cumulative impacts to the visual character of downtown in combination with other future projects in the downtown Los Angeles area.

5.4.6.3 Nighttime Illumination Impacts

The Underground Emphasis LRT Alternative would not result in direct or indirect nighttime illumination impacts from operations. Therefore, it would not result in or contribute to significant cumulative nighttime illumination impacts.

5.4.6.4 Shade and Shadow Impacts

The Underground Emphasis LRT Alternative would not result in direct or indirect shade and shadow impacts. Therefore, it would not result in or contribute to significant cumulative shade and shadow impacts.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 1 is very similar to the Underground Emphasis LRT Alternative. Therefore, only specific differences between the two alternatives are addressed in this section.

The proposed alignment for the Fully Underground LRT Alternative – Little Tokyo Variation 1 is the same as the Underground Emphasis LRT Alternative from the 7th Street/Metro Center Station to 2nd Street and Central Avenue. East of 2nd Street and Central Avenue, the tracks would veer northeast under the property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue, where the alignment would connect with a new underground station within this block. The tracks would continue from the station under the 1st and Alameda Streets intersection into a new underground three-way junction.

Leaving the junction, one set of tracks would continue north underground along the eastern side of Alameda Street, beneath Temple Street, and surface in the Los Angeles Department of Water and Power yard. The other set of tracks leaving the three-way junction would rise to the east within 1st Street to accommodate a new portal as well as the Metro Gold Line tracks.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment is shown in Figure 5-6. No identified scenic vistas are within the project area; therefore, no scenic vista impacts would occur. Potential visual and aesthetic impacts associated with implementation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 are discussed in the following paragraphs.

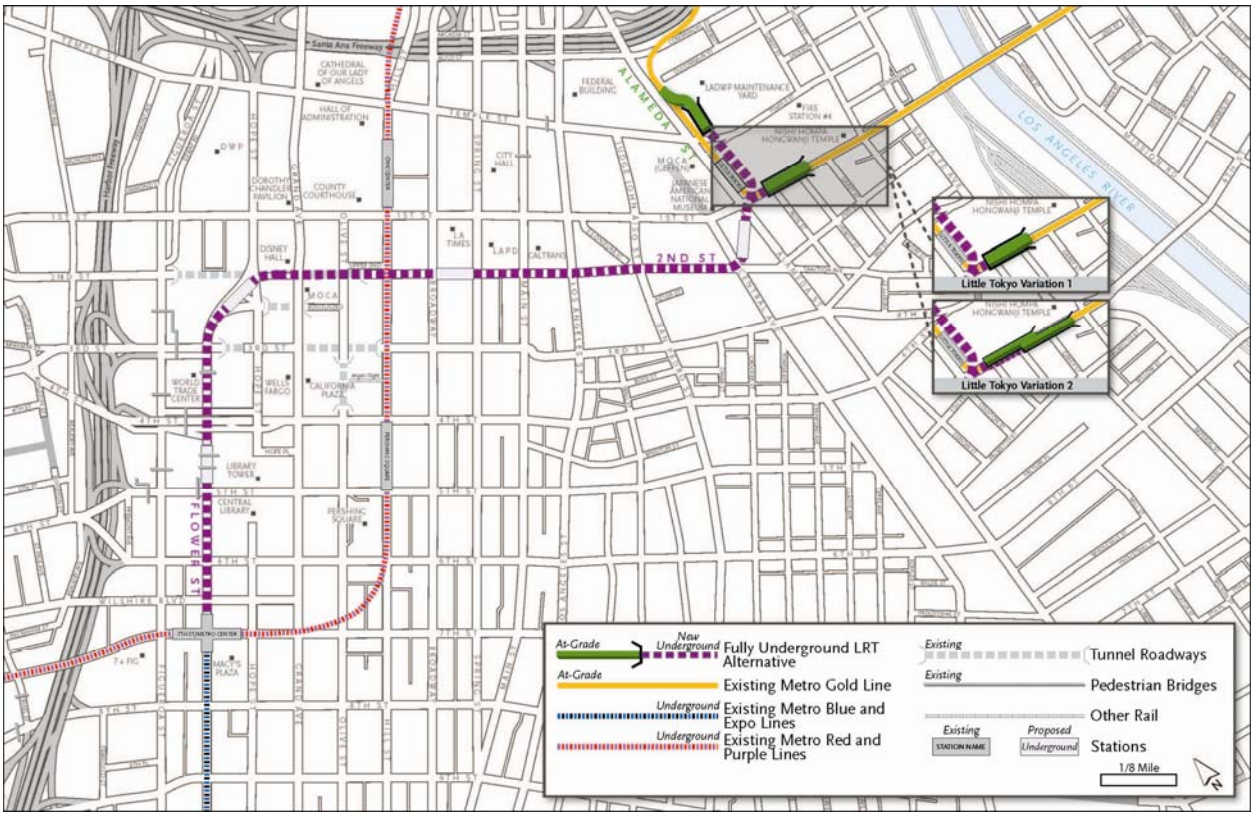

Figure 5-6. Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2

5.5.1 Direct Construction Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require mostly underground construction due to the proposed configuration of the alignment. A cut-and-cover section would begin west of Central Avenue through the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue.

A center platform station would be constructed under this block, with tracks to the north and east proceeding at the same grade. The tracks leaving this block would split into two different directions. One set of tracks would head east within 1st Street, where it would rise up to an at-grade elevation and join the Metro Gold Line to I-605 about one and a half blocks east of Alameda. The other set of tracks would head northerly east of and parallel to Alameda Street, joining the Metro Gold Line to Azusa and heading north to Union Station. Both north and east portals would be wide enough to accommodate out-bound and in-bound trains in a single structure.

Nearby land users and passersby would have visual access to cut-and-cover construction, construction staging locations, and TBM launch sites. However, most of the construction

associated with this alternative would be below ground and the construction staging sites themselves would be sheltered from direct view by temporary construction walls. TBM construction activities would be entirely below ground and would not be visible to nearby land users or passersby in the Little Tokyo area of downtown Los Angeles.

Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities. Metro may also use the site to launch TBMs and transport material from the tunnels.

Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not directly be impacted by construction. This would represent a worst-case scenario. Reductions in acquisition may occur based on further engineering analysis during the preliminary engineering and final design stages. Compared to the Underground Emphasis LRT Alternative, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would require removal of two additional businesses and their associated parking. This construction scenario would not have a different visual effect than already described.

NO = No impact
LTS = Less than significant impact

5.5.1.1 Scenic Resource Impacts

Construction staging areas and associated temporary construction walls would be located on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue. These areas would not be visible to anyone but those in the vicinity of this block. There would be no impact to scenic resources in this vicinity because there are no nearby resources. There would be no potential impacts to views of historic buildings during construction because the existing historic resources along 1st Street are too far to the east.

Nearby historic resources include a brick building located at 900 East 1st Street and the 1st Street Viaduct. These two structures are each located more than one and a half blocks east of the portal entrance of the Fully Underground LRT Alternative – Little Tokyo Variation 1, and therefore would not experience potential visual impacts.

The Los Angeles Hompa Hongwanji Temple, an important community/cultural resource, is located at approximately 800 East 1st Street. Construction of the portal within 1st Street would

involve cut-and-cover methods and occur in the vicinity of the temple. There would be moderate potential visual impacts during construction near this Buddhist temple.

Table 5-5 includes the only buildings and/or recognized visual resources that could potentially be affected by construction activities associated with installation of tracks and poles, cut-and-cover activities, station construction, and pedestrian and LRT portals. These findings would be the same regardless of whether the entire block or only a portion of the block at 1st, 2nd, and Alameda Streets, and Central Avenue is acquired during construction.

Installation of Tracks and Poles

Installation of tracks and poles along the underground portions of this alternative would not be visible to nearby land users or passersby. Above-ground trackwork already exists at the eastern end of the Fully Underground LRT Alternative – Little Tokyo Variation 1 as part of the Metro Gold Line. This alternative would include construction of tracks and poles to link the Regional Connector to existing structures. The only locations where construction of tracks and poles would be visible would be associated with the train portals in 1st Street and between Temple and Commercial Streets just east of Alameda Street. At these locations, the tracks and poles would transition from fully underground, sloping uphill out of the tunnel portals, to at-grade level with the existing tracks. Therefore, no or very low visual impacts would result to scenic resources along 1st or Alameda Streets during construction.

Underground Station Sites and Pedestrian Portals

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require one more underground station than the Underground Emphasis LRT Alternative. This additional station would be located under the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue. The station would be constructed using cut-and-cover techniques.

Construction of this underground station would result in removal of the Señor Fish building. Removal of this structure would result in a less than significant visual impact to the Little Tokyo area because of the building's modest size and its reduced level of historical significance. Through Appropriate urban design of pedestrian portals and surrounding streetscape and landscaping would incorporate historical and visual references of the surrounding Little Tokyo and Arts District neighborhoods that complement these important communities.

No other scenic resources or buildings are located immediately adjacent to the proposed 2nd Street/Central Avenue station. Most of the station construction would occur below ground, and therefore would not be visible to nearby buildings, land users, or passersby. After underground construction is complete, the pedestrian portals would be finished and the ground surface restored. Therefore, construction of the underground station, ancillary facilities, and pedestrian portals—as with all other proposed underground stations—would

be primarily invisible to nearby land uses. Potential impacts to visual resources would be less than significant.

5.5.1.2 Visual Character Impacts

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 1 would include cut-and-cover methods, installation of tracks and poles in the at-grade locations within this alternative, and station and pedestrian portal construction. These activities would temporarily alter the existing visual character of downtown Los Angeles. Areas of downtown Los Angeles through which the underground portions of this alignment would pass currently consist of high- and mid-rise buildings and high-density construction. The at-grade portion of this alternative would be limited to the transition areas at the 1st Street and Alameda Street portals, interfacing with the existing at-grade LRT trackway of the Metro Gold Line. The Little Tokyo Historic District would be more than a block away from the proposed train portals and almost a block from the pedestrian portals to the proposed underground station. Construction staging areas and the surrounding walls would be visible for a period ranging from 12 to 48 months.

No recognized or valued views are located in the project area. During construction, activities occurring above ground in roadways and along sidewalks could potentially temporarily disrupt views along the corridors and impede views of historic resources and visual resources. Viewers would see construction-related equipment and activities, and the urban streetscape would be temporarily altered. However, the project would be constructed in a heavily urbanized environment where construction activities are not uncommon. Therefore, project construction would not noticeably reduce visual quality or alter viewing context. Furthermore, temporary construction impacts on visual character would be less than significant.

5.5.1.3 Nighttime Lighting Impacts

During construction, nighttime lighting would be introduced into the project area at the construction staging locations. Lighting would predominantly consist of security lighting and be directed on-site. Therefore, nighttime lighting impacts would be less than significant during construction of Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.1.4 Shade and Shadow Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would primarily involve underground construction. In addition, the heights of structures and construction-related facilities located above ground would be limited to no more than two stories. Therefore, the potential for construction activities to result in shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment corridor is limited. Along 1st Street, east of Alameda Street, several of the existing buildings on the south side of the street that cast shade are two stories high. No shade or shadow impacts would result from construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.2 Indirect Construction Impacts

5.5.2.1 Scenic Resource Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in limited localized visual impacts on the Little Tokyo and Arts District areas of downtown. Construction activities would be localized and would not result in any indirect impacts to scenic resources beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. No indirect visual impacts to scenic resources would occur as a result of construction activities.

5.5.2.2 Visual Character Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be localized and not result in any indirect impacts to visual character beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. No indirect impacts to visual character would occur as a result of construction activities.

5.5.2.3 Nighttime Illumination Impacts

During construction, nighttime security lighting would be introduced into the immediate project area at construction staging locations. All potential lighting impacts would be localized and therefore would not result in indirect nighttime lighting impacts.

5.5.2.4 Shade and Shadow Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would mostly occur underground. Above ground construction and related facilities and equipment, including portals, would be limited, and resulting shadows would be localized to the immediate area. Therefore, no indirect shade and shadow impacts would result from construction activities.

5.5.3 Direct Operations Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would operate primarily underground with short at-grade segments in the Little Tokyo and Arts District vicinity where the alignment transitions to connect to the existing Metro Gold Line tracks. These transition areas would be adjacent to proposed portals in 1st Street and parallel to Alameda Street. Construction of above-ground entrances to provide access to pedestrian portals at underground stations, including at the proposed 2nd Street/Central Avenue station, would be the same as the Underground Emphasis LRT Alternative. With the exception of these above-ground entrances and the at-grade portion of the alignment at the 1st Street and Alameda Street train portals, all operations of this alternative would be located underground. Table 5-6 summarizes potential impacts to scenic resources associated with operation of Fully Underground LRT Alternative – Little Tokyo Variation 1.

Table 5-6. Scenic Resources Potentially Affected by Operation of Fully Underground LRT Alternative – Little Tokyo Variation 1

1ST Street Viaduct	NO	NO	NO	NO

NO = No impact
LTS = Less than significant impact

5.5.3.1 Scenic Resource Impacts

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in only minimal potential visual impacts to scenic resources. Other than pedestrian access and egress through pedestrian portals at the proposed underground stations, most operational

activities would occur underground, with no degradation of views of historic buildings and little or no contrasting visual conditions. There would be no visual impacts as a result of the new trackway and systems appurtenances, which would be located underground, except where the trackway returns to grade in 1st Street and at the Alameda Street train portal.

In the Bunker Hill area, there may be a pedestrian bridge constructed from the 2nd/Hope Street station to Upper Grand Avenue above the existing General Thaddeus Koscuiszko Way right-of-way. The bridge would not be visible from any historic buildings, and thus no adverse visual impacts to historic buildings would occur.

Within the Little Tokyo and Arts District areas, the only above-ground features associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be station pedestrian entrances, and the train portals in 1st Street and next to Alameda Street. Two identified visual resources near the eastern end of the alignment are the 900 East 1st Street building and the 1st Street viaduct, both of which are located too far east along 1st Street to experience any impacts.

The Los Angeles Hompa Hongwanji Buddhist Temple at 800 East 1st Street, an important community and cultural resource, would experience low visual impacts from the train portal just west of this location. Pedestrians walking along the north or south sides of 1st Street would experience low to moderate visual impacts looking into the street corridor toward the train portal. People walking along the east side of Alameda on the block between Temple and Commercial Streets would experience low visual impacts when looking east into the block at the train portal.

There would be station entrances at up to four potential locations within one block of the proposed 2nd Street/Central Avenue station, though not all of the potential locations would necessarily be used. None of these would adversely affect views due to their relatively small size.

At-grade overhead contact systems, catenary poles, and trackway for the Fully Underground LRT Alternative – Little Tokyo Variation 1 (standard features required for a light rail system to operate) would be located only at the easternmost train portal (1st Street) and northernmost train portal (located on the block east of and adjacent to Alameda Street, north of Temple Street). The rest of the alignment and potential visual effects would be the same as described for the Underground Emphasis LRT Alternative. Given that the majority of the features associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be located below ground, potential impacts to scenic resources would be less than significant.

5.5.3.2 Visual Character Impacts

Fully Underground LRT Alternative – Little Tokyo Variation 1 is located in a heavily urbanized environment, and adding primarily underground structures and a limited fixed guideway

would not noticeably reduce visual quality or alter the viewing context in the Little Tokyo or Arts District areas of downtown Los Angeles. Implementation and operation of the alternative would contribute to the existing urban character and high-density, pedestrian friendly environment that already exists in downtown Los Angeles.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would be primarily underground and thereby not visually accessible to the public. Therefore, potential visual character impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less than significant.

5.5.3.3 Nighttime Lighting Impacts

With operation of a new underground LRT project, limited new nighttime lighting would be introduced into the project area. Lighting would predominantly consist of security lighting at pedestrian portal locations, and nighttime lighting would be directed on site. Therefore, no nighttime lighting impacts would occur during operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.3.4 Shade and Shadow Impacts

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would introduce limited new above-ground structures in the already heavily urbanized Little Tokyo and Arts District areas of downtown Los Angeles. The only new above-ground structures would be pedestrian portals to underground stations and two train portals located in 1st Street and east of and adjacent to Alameda Street north of Temple Street. Heights of structures located above ground would be limited to approximately two stories; therefore, the potential for shading and shadows beyond those currently created by the buildings along the alignment's corridors would be limited. No shade or shadow impacts would result from operation of Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.4 Indirect Operational Impacts

5.5.4.1 Scenic Resource Impacts

All potential impacts to scenic resources would be localized. Therefore, no indirect impacts would occur to scenic resources from operation of Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.4.2 Visual Character Impacts

Potential changes in visual character from operation of this alternative would be localized and therefore not result in any indirect impacts to visual character beyond those discussed above and within the Cultural Resources - Built Environment Technical Memorandum. No indirect impacts to visual character would occur.

5.5.4.3 Nighttime Illumination Impacts

New nighttime lighting would be introduced into the immediate project area and at pedestrian portal locations. Nighttime lighting, however, would primarily consist of security lighting and improved pedestrian streetscape lighting where necessary, and effects would be localized. Therefore, no indirect nighttime lighting impacts would result from implementation or operation of Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.4.4 Shade and Shadow Impacts

Operation of Fully Underground LRT Alternative – Little Tokyo Variation 1 would be primarily limited to underground LRT operations. Placement of structures above ground would be limited to facilities associated with pedestrian portals to stations and the two train portals discussed previously. Shade and shadows associated with these structures would be localized to the immediate vicinity of the facilities themselves. Therefore, no indirect shade or shadow impacts would result from operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.5 Cumulative Construction Impacts

5.5.5.1 Scenic Resource Impacts

Other construction projects are planned throughout the downtown Los Angeles area. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of this alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future construction projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.5.5.2 Visual Character Impacts

Fully Underground LRT Alternative – Little Tokyo Variation 1 is located in greater downtown Los Angeles, which is a dynamic environment where new projects are constructed on an ongoing basis. Additional development projects are planned throughout the downtown Los Angeles area. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in either direct or indirect significant impacts to visual character. Therefore, construction of this alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative impacts to the visual character of downtown.

5.5.5.3 Nighttime Illumination Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in nighttime illumination impacts. Therefore, this alternative would not result in or contribute to significant cumulative nighttime illumination impacts.

5.5.5.4 Shade and Shadow Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in shade and shadow impacts. Therefore, this alternative would not result in or contribute to significant cumulative shade and shadow impacts.

5.5.6 Cumulative Operational Impacts

5.5.6.1 Scenic Resource Impacts

Other development projects besides the Regional Connector Transit Corridor project are planned throughout the downtown Los Angeles area. Operation of Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in either direct or indirect significant impacts to scenic resources. Therefore, operation of this alternative would not contribute to cumulatively considerable scenic resource impacts, nor would it, in combination with other future development projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.5.6.2 Visual Character Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 is located in greater downtown Los Angeles, which is a dynamic environment where new projects are being implemented on an ongoing basis. Additional development projects are planned throughout downtown. Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in either direct or indirect significant impacts to visual character. Therefore, operation of this alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative impacts to the visual character of downtown.

5.5.6.3 Nighttime Illumination Impacts

Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in direct or indirect nighttime illumination impacts from operation. Therefore, this alternative would not result in or contribute to significant cumulative nighttime illumination impacts.

5.5.6.4 Shade and Shadow Impacts

Fully Underground LRT Alternative – Little Tokyo Variation 1 would not result in direct or indirect shade and shadow impacts. Therefore, this alternative would not result in or contribute to significant cumulative shade and shadow impacts.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1 for most of its alignment. Therefore, only differences in potential impacts between these two alternatives are addressed in this section.

The proposed alignment for the Fully Underground LRT Alternative – Little Tokyo Variation 2 is the same as Variation 1 from the 7th Street/Metro Center Station to the proposed 2nd Street/Central Avenue station. One exception is that, as the tunnels turn northeast from 2nd Street, the northbound tunnel would descend and the southbound tunnel would rise so that the southbound tunnel would be stacked on top of the northbound tunnel. The 2nd Street/Central Avenue station would have two underground levels, each with a single-track platform. The tracks would then leave the 2nd Street/Central Avenue station and proceed northeast under the intersection of 1st and Alameda Streets, where a two-level underground junction would be constructed.

Another difference between Little Tokyo Variations 1 and 2 is that there are two train portals that would extend farther east on 1st Street under Little Tokyo Variation 2. The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment is shown in Figure 5-6.

No scenic vistas were identified within the project area; therefore, no impacts to scenic vistas would occur. Potential visual and aesthetic impacts associated with implementation of Fully Underground LRT Alternative – Little Tokyo Variation 2 are discussed in the following subsections.

5.6.1 Direct Construction Impacts

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 2 would mostly occur underground due to the proposed configuration of the alignment. The cut-and-cover section would begin west of Central Avenue through the block bounded by 1st, 2nd, and Alameda Streets and Central Avenue. A single-track, stacked platform station would be constructed underground at this site.

One set of tracks would travel east within 1st Street, rise up to street level over a three-block stretch, and join the Metro Gold Line to East Los Angeles. The other set of tracks would travel north, just east of and parallel to Alameda Street, to join the tracks heading north to Union Station between Temple and Commercial Streets. The north portal would be wide enough to accommodate out-bound and in-bound trains in a single structure. The east portals would separate eastbound and westbound tracks into two distinct structures.

Nearby land uses and passersby would have visual access to cut-and-cover construction, construction staging locations, and TBM launch locations; however most construction would

be below ground and temporary construction walls would shelter construction staging sites from direct view by the public. TBM construction activities would be entirely below ground and would not be visible to nearby land users or passersby in the Little Tokyo area.

Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities. Metro may use the site to launch tunnel boring machines and transport material from the tunnels.

Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that are not directly impacted by construction activities. This would represent a worst-case scenario. Fewer acquisitions may occur based on further engineering analysis during the preliminary engineering and final design stages. This would result in removal of two more businesses and associated parking than the Underground Emphasis LRT Alternative. This construction scenario would not have a different visual effect than described in this technical memorandum.

NO = No impact.
LTS = Less than significant impact.

5.6.1.1 Scenic Resource Impacts

Construction staging areas and associated temporary construction walls would be located on the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue, and would, therefore, not be visible to anyone but those in the vicinity of this block. There would be no impact to scenic resources in this vicinity because there are no nearby resources.

There would be no potential impacts to views of historic buildings during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 because existing historic resources along 1st Street are too far to the east. Two local historic resources include a brick building located at 900 East 1st Street and the 1st Street Viaduct. These structures are each located more than one-half block east of the easternmost portal of the Fully Underground LRT Alternative – Little Tokyo Variation 2. Therefore, there would be no visual impacts to or from these two resources. The Los Angeles Hompa Hongwanji Buddhist Temple another important community/cultural resource, is located at approximately 800 East 1st Street. Construction of the portal within 1st Street would involve cut-and-cover methods and occur in the vicinity of the temple, creating moderate potential visual impacts to this resource during construction. In consultation with the Los Angeles Hompa Hongwanji Temple, the Reverend indicated to Metro that the portal's proximity to the temple would be visually intrusive.

Table 5-7 shows buildings and/or recognized visual resources that could potentially be affected by construction activities associated with installation of tracks and poles, cut-and-cover methods, station construction, and pedestrian and LRT portals. Impacts to these resources would be the same regardless of whether the entire block or only a portion of the block at 1st, 2nd, and Alameda Streets, and Central Avenue is acquired.

Installation of Tracks and Poles

Installation of tracks and poles along the underground portions of this alternative would not be visible to nearby land uses or passersby. Above-ground trackwork already exists at the eastern end of Fully Underground LRT Alternative – Little Tokyo Variation 2 as part of the Metro Gold Line.

The proposed alternative would include construction of tracks and poles to link the Regional Connector to the existing structures. The only locations where construction of tracks and poles would be visible would be associated with the train portals in 1st Street and between Temple and Commercial Streets just east of Alameda Street. At these locations, the tracks and poles transition from fully underground, sloping uphill out of the tunnel portals, to at grade with the existing tracks. Therefore, no or very low visual impacts would potentially result to scenic resources along 1st Street or Alameda Street during construction.

Underground Station Sites and Pedestrian Portals

Fully Underground LRT Alternative – Little Tokyo Variation 2 would require that another underground station be constructed under the block bounded by 1st, 2nd, and Alameda Streets, and Central Avenue. This additional proposed station would be constructed using cut-and-cover methods.

Construction of this underground station would result in removal of the Señor Fish building. Removal of this structure would result in a less than significant visual impact to the Little Tokyo area because of its modest size and reduced level of historical significance. Appropriate urban design of pedestrian portals and surrounding streetscape and landscaping would incorporate historical and visual references of the surrounding Little Tokyo and Arts District neighborhoods that complement these important communities.

No other scenic resources or buildings are located immediately adjacent to the proposed 2nd Street/Central Avenue station. Construction of this station would occur below ground and therefore would not be visible to nearby buildings, land uses, or passersby. After underground construction is complete, the pedestrian portals would be finished and the ground surface restored. Therefore, construction activities for this underground station, ancillary facilities, and pedestrian portals—as with the other proposed underground stations—would be primarily invisible to nearby land users. Potential impacts to visual resources would be less than significant.

5.6.1.2 Visual Character Impacts

Cut-and-cover construction, installation of tracks and poles in the at-grade locations within this alternative, and station and pedestrian portal construction would temporarily alter the existing visual character of downtown Los Angeles. Areas of downtown Los Angeles through which the underground portions of this alignment would pass currently consist of high- and mid-rise buildings and high-density construction. The at-grade portion of this alternative would be limited to the transition areas at the 1st Street and Alameda Street portals, interfacing with the existing at-grade LRT trackway of the Metro Gold Line.

The Little Tokyo Historic District would be more than a block away from the proposed train portals and almost a block from the pedestrian portals to the proposed underground station. Construction staging areas and surrounding construction walls would be visible for a period ranging from 12 to 48 months.

During construction, activities occurring above ground in the roadways and along sidewalks could potentially temporarily disrupt views along corridors and impede views of historic resources, visual resources, and viewshed corridors. However, no recognized or valued views are located in the project area.

Viewers would see construction-related equipment and activities, and the urban streetscape would be temporarily altered. However, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would occur in a heavily urbanized environment where construction activities are not uncommon, and would not noticeably reduce visual quality or alter viewing context. Therefore, temporary construction impacts would be less than significant.

5.6.1.3 Nighttime Lighting Impacts

During construction, nighttime lighting would be introduced into the project area at construction staging locations. Lighting would predominantly consist of security lighting, and light would be directed on-site. Therefore, potential nighttime lighting impacts would be less than significant during construction of Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.1.4 Shade and Shadow Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would mostly occur underground. Heights of structures and construction-related facilities located above ground would be limited to no more than two stories. Therefore, the potential for construction to result in shading and shadows beyond those currently created by the high- and mid-rise buildings along the alignment corridors is limited. Even along 1st Street, east of Alameda Street, several of the existing buildings on the south side of the street cast shade

that is two stories high. No shade or shadow impacts would result from construction of Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.2 Indirect Construction Impacts

5.6.2.1 Scenic Resource Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in limited localized visual impacts on the Little Tokyo and Arts District areas of downtown. Construction of this alternative would be localized and not result in any indirect impacts to scenic resources beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. No indirect visual impacts to scenic resources would occur as a result of construction of this alternative.

5.6.2.2 Visual Character Impacts

Construction activities for the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be localized and not result in any indirect impacts to visual character beyond those discussed in the Cultural Resources – Built Environment Technical Memorandum. No indirect impacts to visual character would occur as a result of construction of this alternative.

5.6.2.3 Nighttime Illumination Impacts

During construction, nighttime security lighting would be introduced into the immediate project area at construction staging locations. All potential lighting impacts would be localized and therefore would not result in indirect nighttime lighting impacts.

5.6.2.4 Shade and Shadow Impacts

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 2 would mostly occur underground. Above ground construction-related facilities and equipment would be limited, and shadows cast by these facilities and equipment would be localized to the immediate area and at the portal locations. Therefore, no indirect shade and shadow impacts would result from construction of this alternative.

5.6.3 Direct Operational Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would occur primarily underground with short at-grade segments in the Little Tokyo and Arts District vicinity where the alignment transitions connect to the existing Metro Gold Line tracks. These transition areas would be adjacent to the portals in 1st Street and parallel to Alameda Street.

As with the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1 includes above-ground entrances to access to pedestrian portals to underground stations, including the proposed 2nd Street/Central Avenue station. With the exception of these above-ground entrances and the at-grade portion of the alignment at the 1st

Street and Alameda Street train portals, all operations of this alternative would be located underground. Table 5-8 summarizes potential impacts to scenic resources associated with operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Table 5-8. Scenic Resources Potentially Affected by Operation of Fully Underground LRT Alternative – Little Tokyo Variation 2

900 East 1st Street	NO	NO	NO	NO
1ST Street Viaduct	NO	NO	NO	NO

NO = No impact.
LTS = Less than significant impact.

5.6.3.1 Scenic Resource Impacts

Operation of Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in only minimal visual impacts to scenic resources. Other than pedestrian access and egress through pedestrian portals at the proposed underground stations, most operational activities would occur underground, with no degradation of views of historic buildings and little or no contrasting visual conditions. There would be no visual impacts as a result of the new trackway and system appurtenances, which would be located underground except where the trackway returns to grade in 1st Street, and at the Alameda Street train portal.

In the Bunker Hill area, there may be a pedestrian bridge constructed from the 2nd/Hope Street station to Upper Grand Avenue above the existing General Thaddeus Koscuiszko Way right-of-way. The bridge would not be visible from any historic buildings, and thus no adverse visual impacts to historic buildings would occur.

Within the Little Tokyo and Arts District areas, the only above-ground features associated with the project would be station pedestrian entrances and the train portals in 1st Street and next to Alameda Street. Two identified visual resources near the eastern end of the alignment are the 900 East 1st Street building and the 1st Street Viaduct. Both of these resources are located too far east along 1st Street to experience any visual impacts.

The Los Angeles Hompa Hongwanji Buddhist Temple at 800 East 1st Street, an important community and cultural resource, would experience low to moderate visual impacts from the train portal in front of and west of this location. Pedestrians walking along the north or south sides of 1st Street would experience low to moderate visual impacts looking into the street corridor toward the train portal. People walking along the east side of Alameda on the block between Temple and Commercial Streets would experience low visual impacts when looking east into the block at the train portal. In consultation with the Los Angeles Hompa Hongwanji Temple, the Reverend indicated to Metro that the portal's proximity to the temple would be visually intrusive.

There would be station entrances at up to four potential locations within one block of the proposed 2nd Street/Central Avenue station, though not all of the potential locations would necessarily be used. None of these entrances would adversely affect views due to their relatively small size.

At-grade overhead contact systems, catenary poles, and trackway for the Fully Underground LRT Alternative – Little Tokyo Variation 2 (standard features required for a light rail system to operate) would be located only at the easternmost train portals on 1st Street and the northernmost train portal adjacent to Alameda Street between Temple and Commercial Streets. The rest of the alignment and potential visual effects would be the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1. Given that the majority of features

associated with Fully Underground LRT Alternative – Little Tokyo Variation 2 would be below ground, potential impacts to scenic resources would be less than significant.

5.6.3.2 Visual Character Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 is located in a heavily urbanized environment, and adding primarily underground structures and a limited fixed guideway would not noticeably reduce visual quality or alter the viewing context in the Little Tokyo or Arts District areas of downtown Los Angeles.

Construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would contribute to the existing urban character and high-density, pedestrian friendly environment that already exists in downtown Los Angeles. Additionally, this alternative would be primarily underground and thereby not visually accessible to the public. Therefore, potential visual character impacts associated with Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less than significant.

5.6.3.3 Nighttime Lighting Impacts

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would introduce limited new nighttime lighting into the project area. Lighting would predominantly consist of security lighting at pedestrian portal locations, and nighttime lighting would be directed on site. Therefore, no nighttime lighting impacts would occur during operation of this alternative.

5.6.3.4 Shade and Shadow Impacts

Operation of Fully Underground LRT Alternative – Little Tokyo Variation 2 would introduce limited new above-ground structures in the already heavily urbanized Little Tokyo and Arts District areas of downtown Los Angeles. The only new above-ground structures would be pedestrian portals to underground stations and two train portals in 1st Street and east of and adjacent to Alameda Street north of Temple Street. Heights of structures located above ground would be limited to approximately two stories. Therefore, the potential for shading and shadows beyond those currently created by the buildings along the alignment's corridors is limited. No shade or shadow impacts would result from operation of Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4 Indirect Operational Impacts

5.6.4.1 Scenic Resource Impacts

All potential impacts to scenic resources would be localized. Therefore, no indirect impacts to scenic resources would occur from operation of Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4.2 Visual Character Impacts

Potential changes in visual character from operation of Fully Underground LRT Alternative – Little Tokyo Variation 2 would be localized and not result in any indirect impacts to visual character beyond those discussed above and within the Cultural Resources - Built Environment Technical Memorandum. No indirect impacts to visual character would occur with this alternative.

5.6.4.3 Nighttime Illumination Impacts

Fully Underground LRT Alternative – Little Tokyo Variation 2 would introduce new nighttime lighting into the immediate project area and at pedestrian portal locations. Nighttime lighting, however, would primarily consist of security lighting and improved pedestrian streetscape lighting where necessary, and effects would be localized. Therefore, no indirect nighttime lighting impacts would result from implementation or operation of Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4.4 Shade and Shadow Impacts

Operation of Fully Underground LRT Alternative – Little Tokyo Variation 2 would be primarily limited to underground LRT operations. Placement of structures above ground would be limited to facilities associated with pedestrian portals to stations and the three train portals discussed previously. Shade and shadows associated with these structures would be localized to the immediate vicinity of the facilities themselves. Therefore, no indirect shade or shadow impacts would result from operation of this alternative.

5.6.5 Cumulative Construction Impacts

5.6.5.1 Scenic Resource Impacts

Other construction projects besides the proposed Regional Connector Transit Corridor project are planned throughout the downtown Los Angeles. Construction of Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in either direct or indirect significant impacts to scenic resources. Therefore, construction of this alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future construction projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.6.5.2 Visual Character Impacts

The alignment of Fully Underground LRT Alternative – Little Tokyo Variation 2 is located in greater downtown Los Angeles, which is a dynamic environment where new projects are constructed on an ongoing basis. Additional development projects are planned throughout the downtown Los Angeles area.

Construction of Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in either direct or indirect significant impacts to visual character. Therefore, construction of this alternative would not contribute to a cumulatively considerable visual resource impact, nor would it, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative impacts to the visual character of downtown.

5.6.5.3 Nighttime Illumination Impacts

During construction, Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in nighttime illumination impacts; therefore, this alternative would not result in or contribute to significant cumulative nighttime illumination impacts.

5.6.5.4 Shade and Shadow Impacts

During construction Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in shade and shadow impacts; therefore, this alternative would not result in or contribute to significant cumulative shade and shadow impacts.

5.6.6 Cumulative Operational Impacts

5.6.6.1 Scenic Resource Impacts

Other development projects are planned throughout the downtown Los Angeles area. Operation of Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in either direct or indirect significant impacts to scenic resources. Therefore, operation of this alternative would not contribute to cumulatively considerable scenic resource impacts, nor would it in combination with other future development projects in the downtown Los Angeles area, result in significant cumulative visual impacts to scenic resources.

5.6.6.2 Visual Character Impacts

The alignment of Fully Underground LRT Alternative – Little Tokyo Variation 2 is located in greater downtown Los Angeles, which is a dynamic environment where new projects are being implemented on an ongoing basis. Additional development projects are planned throughout downtown.

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in either direct or indirect significant impacts to visual character. Therefore, operation of this alternative would not contribute to a cumulatively considerable visual resource impact. Nor would the alternative, in combination with other future projects in the downtown Los Angeles area, result in significant cumulative impacts to the visual character of downtown.

5.6.6.3 Nighttime Illumination Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in direct or indirect nighttime illumination impacts from operations. Therefore, this alternative would not result in or contribute to significant cumulative nighttime illumination impacts.

5.6.6.4 Shade and Shadow Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not result in direct or indirect shade and shadow impacts. Therefore, this alternative would not result in or contribute to significant cumulative shade and shadow impacts.

6.0 POTENTIAL MITIGATION MEASURES

6.1 Potential Construction-Related Mitigation Measures

6.1.1 No Build Alternative

No significant construction-related visual impacts were identified for the No Build Alternative. Therefore, no mitigation measures would be required.

6.1.2 Transportation System Management (TSM) Alternative

No significant construction-related visual impacts were identified for the TSM Alternative. Therefore, no mitigation measures would be required.

6.1.3 At-Grade Emphasis LRT Alternative

While no significant construction-related visual impacts were identified. The following mitigation measure would further reduce potential impacts.

- Construction staging areas would be screened to the extent necessary to minimize potential effects on scenic resources.

6.1.4 Underground Emphasis LRT Alternative

While no significant construction-related visual impacts were identified for the Underground Emphasis LRT Alternative, the mitigation measure described previously for the At-Grade Emphasis LRT Alternative would further reduce less than significant potential impacts.

6.1.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

While no significant construction-related visual impacts were identified for the Fully Underground LRT Alternative – Little Tokyo Variation 1, the mitigation measure identified previously under the At-Grade Emphasis LRT Alternative would further reduce less than significant potential impacts.

6.1.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

While no significant construction-related visual impacts were identified for the Fully Underground LRT Alternative – Little Tokyo Variation 2, the mitigation measure described previously for the At-Grade Emphasis LRT Alternative would further reduce less than significant potential impacts.

6.2 Potential Operation-related Mitigation Measures

6.2.1 No Build Alternative

No significant operation-related visual impacts were identified for the No Build Alternative. Therefore, no mitigation measures would be required.

6.2.2 Transportation System Management (TSM) Alternative

No significant operation-related visual impacts were identified for the TSM Alternative. Therefore, no mitigation measures would be required.

6.2.3 At-Grade Emphasis LRT Alternative

While no significant impacts to the Historic Core, Civic Center, or Little Tokyo communities would result from operation of the At-Grade Emphasis LRT Alternative, the following mitigation measures would further reduce less than significant impacts.

- Metro would work cooperatively with the City of Los Angeles to develop detailed urban design guidelines that could guide future development in and around the Little Tokyo community and in the vicinity of the Regional Connector Transit Corridor project.
- Metro would coordinate with the Little Tokyo community to obtain input on the urban design of the project within the community. Urban design measures would be developed to integrate the LRT facilities into each community as appropriate. Designs might address elements such as catenary poles, materials, station colors, etc.

6.2.4 Underground Emphasis LRT Alternative

While no significant visual impacts to the Little Tokyo community would result from operation of the Underground Emphasis LRT Alternative, the mitigation measures described previously for the At-Grade Emphasis LRT Alternative would further reduce less than significant impacts.

6.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

While no significant visual impacts to the Little Tokyo or Arts District community would result from operation of Fully Underground LRT Alternative – Little Tokyo Variation 1, the mitigation measures described previously for the At-Grade Emphasis LRT Alternative and the additional measure provided below would further reduce less than significant impacts.

- The train portal in 1st Street would be screened with appropriate, context sensitive urban design features.

6.2.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

While no significant visual impacts to the Little Tokyo or Arts District community would result from operation of Fully Underground LRT Alternative – Little Tokyo Variation 2, the mitigation measures described for Variation 1 would further reduce less than significant impacts.

7.0 CONCLUSIONS

Table 7-1 summarizes the overall visual and aesthetic impacts associated with each Regional Corridor Transit Connection Project alternative. As the table shows, there would either be no visual or aesthetic impacts or the impacts would be less than significant.

7.1 No Build Alternative

7.1.1 NEPA Findings

No visual impacts would result under this alternative.

7.1.2 CEQA Determination

No visual impacts would result under this alternative.

7.2 TSM Alternative

7.2.1 NEPA Findings

No adverse visual impacts would result under this alternative.

7.2.2 CEQA Determination

The visual character of the corridor would not change with construction and operation of the TSM Alternative. No visual impacts would result under this alternative.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would result in minor changes in visual character. However, all potential impacts would be less than significant.

7.3.2 CEQA Determination

The visual character of the corridor would change slightly with the At-Grade Emphasis LRT Alternative. The LRT trackway embedded in the street pavement, catenary poles, and overhead wires would result in less than significant visual impacts to the corridor environment. Views would not be degraded under this alternative, and no impacts to existing views from scenic highways would occur. Any potential impacts would be less than significant.

Table 7-1. Summary of Visual and Aesthetic Impacts

Impacts	No Build	TSM		At-Grade Emphasis LRT		Underground Emphasis LRT		Fully Underground LRT			
								Little Tokyo Variation 1		Little Tokyo Variation 2	
		Construction	Operation	Construction	Operation	Construction	Operation	Construction	Operation	Construction	Operation

Shade and Shadows	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO
Indirect Impacts	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO
Direct Impacts	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO
Cumulative Impacts	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO

[1] *No scenic vistas are located in the project area; therefore, no analysis of impacts is included.*
NO = No impact.
LTS = Less than significant impact.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

The Underground Emphasis LRT Alternative would result in minor changes to visual character in localized places along the proposed alignment. However, all potential impacts would be less than significant.

7.4.2 CEQA Determination

The visual character of the corridor would slightly change with the Underground Emphasis LRT Alternative. The principal features visible above ground would be station entrances and visual alterations in the vicinity of 1st, 2nd, and Alameda Streets. These visual alternations would not result in significant visual impacts. Views would not be degraded under this alternative, and no impacts to existing views from scenic highways would occur. Any impacts would be less than significant.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in minor changes to visual character in localized places along the proposed alignment. However, all impacts would be less than significant.

7.5.2 CEQA Determination

The visual character of the corridor would slightly change with the Fully Underground LRT Alternative – Little Tokyo Variation 1. The principal features visible above ground would be station entrances, visual alterations in the vicinity of the proposed 2nd/ Central Avenue station, and the train portals in 1st Street and just east of Alameda Street between Temple and Commercial Streets. These visual alterations would not result in significant visual impacts. Views would not be degraded under this alternative, and no impacts to existing views from scenic highways would occur. All impacts would be less than significant.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in minor changes to visual character in localized places along the proposed alignment. However, potential impacts would be less than significant.

7.6.2 CEQA Determination

The visual character of the corridor would slightly change with the Fully Underground LRT Alternative – Little Tokyo Variation 2. The principal features visible above ground would be

station entrances, visual alterations in the vicinity of the 2nd/ Central Avenue station, and the train portals in 1st Street and just east of Alameda Street between Temple and Commercial Streets. These visual alterations would not result in significant visual impacts. Views would not be degraded under this alternative, and no impacts to existing views from scenic highways would occur. All impacts would be less than significant.

1.0 SUMMARY

This technical memorandum (memo) discusses the results of the proposed Regional Connector Transit Corridor project air quality impact analysis and health risk assessment. The analysis and assessment fulfill project impact disclosure requirements under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). This section summarizes potential impacts to air quality and inhalation health risks associated with the proposed construction and operation of the Regional Connector Transit Corridor project. The analysis includes the preparation of emissions inventories for construction and operations, health risk assessments for construction activities, and a carbon monoxide (CO) hot spots analysis.

This analysis discusses both criteria pollutants and toxic air contaminants (TACs). Criteria pollutants, which are regulated by human health-based permissible levels (hence, "criteria"), include six common pollutants: particulate matter (PM_{10} and $PM_{2.5}$), ozone (O_3)[1] (commonly known as "smog"), carbon monoxide (CO), sulfur dioxide (SO_2), nitrogen dioxide (NO_2), and lead (Pb). A TAC is an air pollutant that can cause or contribute to an increase in mortality or serious illness or that may pose another potential hazard to human health. Common TACs associated with mobile sources, such as passenger vehicles and construction equipment, include: toluene, xylenes, acrolein, and diesel particulate matter (DPM).

This memo discusses potential impacts from both construction activities and operations. For operations-related impacts, the analysis provides a comparison between the air quality conditions that currently exist without the proposed project (i.e., existing conditions in 2009)and air quality conditions projected to occur in the future with implementation of each alternative being considered for the proposed project (i.e., full implementation of each alternative in the future horizon year of 2035). The focus of the operations impact analysis is on the change in vehicle traffic, and associated air pollutant emissions, that would result from implementation of each alternative. While this type of direct comparison can help characterize how existing air quality conditions may be different in the future with implementation of the proposed project, it is not a true representation of the impacts directly attributable to the project. This is because background traffic conditions will change substantially between 2009 and 2035 due to regional population growth and development that is anticipated to occur irrespective of the Regional Connector Transit Corridor project. A more accurate and meaningful delineation of air quality impacts directly attributable to

[1] Ozone is a secondary pollutant, formed from "precursor compounds" - volatile organic compounds (VOCs) and oxides of nitrogen (NOx) - in the presence of sunlight. Because the formation of ozone is complex and difficult to assess on a project level, air quality impact analyses address ozone by analyzing emissions of NOx and VOC precursors instead.

project-related changes in traffic is achieved through a comparison of a proposed future alternative (2035) and the No Build Alternative (2035). In assessing the difference in vehicle-related air pollutant emissions for future conditions with and without the project, the amount of change was compared to thresholds of significance developed by the South Coast Air Quality Management District (SCAQMD) to evaluate project significance under CEQA. The increment between a proposed future alternative (2035) and the No Build Alternative (2035) was also compared against general conformity thresholds established in 40 CFR 51. A transportation conformity analysis was also completed.

1.1 Operational Emissions Results

Incremental daily operational emissions associated with each of the proposed alternatives above existing conditions are summarized in Table 1-1. For the reasons discussed in Section 1.0, this increment is provided for informational purposes only and is not intended to be the basis for any determination of significance. Rather, incremental daily operational emissions associated with each of the proposed alternatives above the No Build Alternative (2035) are summarized in Table 1-2 for CEQA. Incremental annual operational emissions associated with each of the proposed alternatives above the No Build Alternative are summarized in Table 1-3 for NEPA.

1.1.1 CEQA Analysis

A CEQA analysis typically evaluates project-related impacts measured against a "baseline" that is defined by the physical environmental conditions occurring at the time the EIR Notice of Preparation was published. In the case of the Regional Connector Transit Corridor project, the CEQA baseline year would be 2009. Based on the long-term regional nature of the proposed project, a horizon year of 2035 is used for characterizing the project's operational characteristics at full implementation. As such, the CEQA analysis completed for the Regional Connector Transit Corridor project includes a delineation of the emissions for the future project year (2035) as compared to those for existing conditions (2009); however, this increment is provided for informational purposes only.

Table 1-1 delineates the incremental increase in emissions associated with each alternative, as measured against the 2009 baseline year. Future emission levels will be affected primarily by regional growth and associated increases in vehicle travel that are projected to occur between 2009 and 2035, as evidenced by comparing each of the build alternatives to the No Build Alternative (i.e., the increased emissions associated with the No Build Alternative, as measured from the 2009 baseline year, reflect the emissions from regional growth and associated increases in background traffic). Despite the increase in vehicle miles traveled (VMT), improvements in engine technology are expected to reduce emission rates of several

pollutants in future years, including VOCs, CO, and NOx. These reductions are shown in parentheses in Table 1-1.

PM_{10} and $PM_{2.5}$ emissions associated with re-entrained road dust, which consists of a mixture of brake wear and tire wear emissions, and the re-suspension of loose material on the road surface, are unaffected by engine technology. In addition, SO_2 emission rates are dependent on sulfur content of fuel. California already capped sulfur content of fuel at 15 parts per million (ppm) and is not expected to substantially reduce the cap in the future. Therefore, PM_{10}, $PM_{2.5}$, and SO_2 emission factors (in grams/mile) are expected to remain relatively flat from 2009 through 2035. The large increase in PM_{10}, $PM_{2.5}$, and SO_2 emissions reflects the magnitude of the study area that includes emissions from a four-county region (Los Angeles, Orange, Riverside, and San Bernardino Counties). In fact, regional population growth, which is predicted to cause an increase in vehicle miles traveled, and hence, an increase in engine exhaust emissions, between 2009 and 2035 would be the source of increased emissions of PM_{10}, $PM_{2.5}$, and SO_2.

Table 1-1. Incremental Daily Operational Emissions Compared to Baseline Year

Alternative	Incremental Emissions[1,2] (lbs/day)					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
No Build	(35,100)	(884,700)	(114,700)	2,900	200,300	53,900
TSM	(35,100)	(885,100)	(114,700)	2,800	200,100	53,900
At-Grade Emphasis	(35,100)	(885,200)	(114,800)	2,800	200,000	53,900
Underground Emphasis	(35,100)	(885,300)	(114,800)	2,800	200,000	53,900
Fully Underground[3]	(35,100)	(885,300)	(114,800)	2,800	200,000	53,900

Notes:
[1] Incremental emissions are determined by subtracting the given alternative emissions from the Baseline emissions.
[2] Emission reductions (beneficial impacts) are shown in parentheses.
[3] Emissions for Fully Underground LRT Alternative are the same for Variation 1 and Variation 2.

As noted above, the determination of significant impacts within the CEQA analysis of daily, traffic-related operational emissions is based on a comparison to the No Build Alternative,

which accounts for regional growth and increases in background traffic that would occur independent of the project. Compared to the No Build Alternative, the daily incremental emissions associated with each action alternative would either decrease or remain unchanged for all pollutants under all alternatives; thus all operational emission impacts are less than significant under CEQA. Overall, vehicular travel would decrease as a result of the project. This result would be consistent with air quality goals in the region.

Table 1-2. Incremental Daily Operational Emissions Compared to the No Build Alternative (2035)

Alternative	Incremental Emissions[1,2] (lbs/day)					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
TSM	0	(400)	0	(100)	(200)	0
At-Grade Emphasis	0	(500)	(100)	(100)	(300)	0
Underground Emphasis	0	(600)	(100)	(100)	(300)	0
Fully Underground[3]	0	(600)	(100)	(100)	(300)	0
CEQA Threshold	55	550	55	150	150	55

Notes:
[1] *Incremental emissions are determined by subtracting the given alternative emissions from the No Build Alternative emissions.*
[2] *Emission reductions (beneficial impacts) are shown in parentheses.*
[3] *Emissions for Fully Underground LRT Alternative are the same for Variation 1 and Variation 2.*

1.1.2 NEPA Analysis

NEPA analysis requires comparing emissions for the future project year (2035) to those for the No Build Alternative (2035). Operational emissions of all project alternatives would be less than significant under the NEPA analysis. Each of the alternatives reduced highway VMT when compared to the No Build Alternative. The TSM Alternative, however, would result in additional compressed natural gas (CNG) bus emissions. NOx emissions would increase beyond the NEPA significance threshold under the TSM Alternative.

Table 1-3. Incremental Annual Operational Emissions Compared to No Build Alternative

Alternative	Incremental Emissions (tons per year)[1,2]					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
TSM	(2)	(85)	**16**	(1)	(43)	(7)
At-Grade Emphasis	(2)	(105)	(7)	(1)	(51)	(11)
Underground Emphasis	(2)	(109)	(7)	(1)	(53)	(12)
Fully Underground[3]	(2)	(112)	(7)	(1)	(55)	(12)
NEPA Threshold	10	100	10	100	70	100

*Note: Emissions greater than threshold of significance are shown in **bold**.*
Notes:
[1] Incremental emissions are determined by subtracting the given alternative emissions from the No Build Alternative emissions.
[2] Emission reductions (beneficial impacts) are shown in parentheses.
[3] Emissions for the Fully Underground LRT Alternatives are the same for Variation 1 and Variation 2.

1.1.3 CO Hot Spots

This memo evaluates the significance of localized concentrations of CO under the proposed project. The analysis used the methodology in the *Transportation Project-Level Carbon Monoxide Protocol* (CO Protocol) that was developed by the University of California Davis for the California Department of Transportation (Caltrans). A screening analysis was completed using Appendix A of the CO Protocol. It evaluated which street intersections under the project alternatives would contribute the most to adverse impacts to localized air quality.

This memo analyzes the five intersections with the most potential for adverse impacts using the CAL3QHC model. This is the Environmental Protection Agency's (EPA) preferred model for CO hot spots modeling. Concentrations of CO at the intersections would not exceed the California Ambient Air Quality Standards (CAAQS) or National Ambient Air Quality Standards (NAAQS). Thus, the CO hot spots would not be significant. The results of the analysis are provided in Table 1-4.

Table 1-4. Summary of CO Hot Spots Analysis (Localized Concentrations of CO)

ID	Intersection	Max. CO Conc. (ppm)[1]		Significance	
		1-Hour	8-Hour	1-Hour[2]	8-Hour[3]
Existing Conditions (2009)					
5	1st Street and Main Street	4.20	3.17	no	no

Underground Emphasis LRT Alternative (2035)					
5	1st Street and Main Street	1.40	1.04	no	no
12	2nd Street and Hill Street	1.30	0.97	no	no
57	Temple Street and Main Street	1.40	1.04	no	no
58	Temple Street and Los Angeles Street	1.40	1.04	no	no
60	Temple Street and Alameda Street	1.40	1.04	no	no
Fully Underground LRT Alternative (2035)					
5	1st Street and Main Street	1.40	1.04	no	no
12	2nd Street and Hill Street	1.30	0.97	no	no
57	Temple Street and Main Street	1.40	1.04	no	no
58	Temple Street and Los Angeles Street	1.40	1.04	no	no
60	Temple Street and Alameda Street	1.40	1.04	no	no

Notes:
[1] Maximum concentrations for a given year include the ambient background CO concentrations (1-hour and 8-hour) for that year.
[2] 1-Hour CAAQS = 9.0 ppm; 1-Hour NAAQS = 9 ppm
[3] 8-Hour CAAQS = 20 ppm; 8-Hour NAAQS = 35 ppm
[4] Intersection data do not change between the Fully Underground LRT Alternative Alternatives.

1.2 Construction Emission Results

This memo estimates potential construction emissions and compares them to thresholds of significance published by the SCAQMD. The SCAQMD also recommends that localized impacts be evaluated for significance. Thus, this section summarizes construction air quality impacts locally and regionally.

1.2.1 Regional Construction Emissions

Emissions from construction of the project are analyzed under CEQA. Thresholds of significance developed for CEQA were also used for the NEPA analysis, since CEQA requirements are at least as stringent as NEPA requirements. Construction emissions would not occur if not for the project, so baseline emissions are assumed to be zero. Short-term, peak, daily emissions of VOC, NOx, CO, and $PM_{2.5}$ would exceed thresholds of significance for CEQA under all build alternatives. In addition, emissions of PM_{10} would exceed thresholds of significance for CEQA for the At-Grade Emphasis LRT Alternative. Emissions are summarized in Table 1-5.

Table 1-5. Summary of Unmitigated Peak Daily Construction Emissions

Alternative	Unmitigated Peak Daily Construction Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
At-Grade Emphasis LRT Alternative	**289**	**2,175**	**1,150**	4	**151**	**126**

2nd/Hope Streets Station (SEM) + Broadway Station	**308**	**2,336**	**1,249**	4	111	**89**
2nd/Hope Streets Station (Cut & Cover) + Broadway Station	**313**	**2,375**	**1,272**	4	113	**90**

Table 1-5. Summary of Unmitigated Peak Daily Construction Emissions						
Alternative	**Unmitigated Peak Daily Construction Emissions (lbs/day)**					
	VOC	**NOx**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
2nd/Hope Streets Station (SEM) + Los Angeles Street Station	**308**	**2,332**	**1,247**	4	110	**89**
2nd/Hope Streets Station (Cut & Cover) + Los Angeles Street Station	**313**	**2,371**	**1,270**	4	113	**90**
Fully Underground LRT Alternative – Little Tokyo Variation 1						
2nd/Hope Streets Station (SEM)	**376**	**2,699**	**1,542**	5	129	**102**
2nd/Hope Streets Station (Cut & Cover)	**386**	**2,777**	**1,593**	5	133	**105**
Fully Underground LRT Alternative – Little Tokyo Variation 2						
2nd/Hope Streets Station (SEM)	**376**	**2,698**	**1,545**	5	131	**102**
2nd/Hope Streets Station (Cut & Cover)	**386**	**2,777**	**1,597**	5	135	**105**
Threshold of Significance	75	100	550	150	150	55

*Note: Emissions greater than threshold of significance are shown in **bold**.*

Since emissions from construction would exceed thresholds of significance for CEQA, it would be necessary to mitigate emissions from off-road construction equipment. Significant emission levels would be exceeded even if construction contractors used the cleanest equipment technology available at the time of construction. However, such adverse impacts would end after project construction was completed.

1.2.2 SCAQMD Localized Significance Thresholds (LST)

In June 2003 (revised July 2008), the SCAQMD developed a methodology to evaluate localized construction impacts on air quality that would account for air dispersion. The SCAQMD developed localized significance thresholds (LSTs) for projects based on the project location,

size (acreage), and distance to the nearest receptor. Look-up tables were published for NOx, CO, PM_{10}, and $PM_{2.5}$ for both construction and operational impacts.

Maximum daily emissions for each project construction activity, considering their locations, were compared to relevant LSTs. The comparison assumes a one acre site for each construction activity and a distance of 25 meters to the nearest sensitive receptor. This approach provides conservative results for the LST analysis. After mitigation measures, emissions of all pollutants would be less than LST thresholds. Thus, construction-related pollutant concentrations would not be significant.

1.3 Mitigation Measures

Emissions of VOC, NOx, CO, and $PM_{2.5}$ would exceed thresholds of significance for construction emissions under CEQA (see Table 1-5). It would be necessary to apply mitigation measures to reduce emissions of these pollutants. This study uses the same criteria for determining significance under CEQA and NEPA. Construction that used new equipment (model year 2014 or newer) would reduce emissions, but emissions of VOC, NOx, and CO would still remain significant (see Table 1-6).

After applying mitigation measures, emissions of PM_{10} (for the At-Grade Emphasis LRT Alternative) and $PM_{2.5}$ would be less than regional thresholds of significance, but emissions of NOx, VOC, and CO would still exceed relevant thresholds. All mitigation measures would be implemented to the maximum extent possible. Measures like installing catalytic convertors or diesel particulate filters would reduce NOx emissions but would not reduce emissions of VOC and CO. Thus, significant regional emission levels of VOC and CO would be unavoidable under all project alternatives.

Long-term benefits of the project would outweigh adverse impacts from emission levels that temporarily exceeded acceptable levels during construction. The proposed Regional Connector Transit Corridor project would improve transportation in the region, helping to remove vehicles from the region's roadways. Operational emissions for build alternatives would be less than baseline emissions for key criteria pollutants (VOC, CO, and NOx). The project build alternatives would improve air quality in the region.

Table 1-6. Summary of Maximum Daily Mitigated Construction Emissions (lbs/day)						
Alternative	**Maximum Daily Construction Mitigated Emissions (lbs/day)**					
	VOC	**NOx**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
At-Grade Emphasis LRT Alternative	**119**	**432**	**908**	4	27	12
Underground Emphasis LRT Alternative						
2nd/Hope Streets Station (SEM) + Broadway Station	**144**	**473**	**978**	4	27	12
2nd/Hope Streets Station (Cut & Cover) + Broadway Station	**147**	**488**	**998**	4	28	12
2nd/Hope Streets Station (SEM) + Los Angeles Street Station	**144**	**469**	**977**	4	27	12
2nd/Hope Station (Cut & Cover) + Los Angeles Street Station	**146**	**485**	**997**	4	28	12
Fully Underground LRT Alternative – Little Tokyo Variation 1						
2nd/Hope Station (SEM)	**189**	**602**	**1,266**	5	35	16
2nd/Hope Station (Cut & Cover)	**193**	**626**	**1,304**	5	36	16
Fully Underground LRT Alternative – Little Tokyo Variation 2						
2nd/Hope Station (SEM)	**188**	**601**	**1,268**	5	37	16
2nd/Hope Station (Cut & Cover)	**193**	**626**	**1,307**	5	38	16
Threshold of Significance	75	100	550	150	150	55

*Note: Emissions greater than threshold of significance are shown in **bold**.*
Mitigated emissions are based on the assumption that new model year engines (2014 or newer) will be used in project construction equipment.

2.0 INTRODUCTION

Air basins are defined as areas that share similar geographical and meteorological conditions. The South Coast Air Basin (SoCAB) consists of Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The SoCAB is confined by the Pacific Ocean and the San Gabriel, San Bernardino, San Jacinto, and Santa Ana Mountains. Normally, temperature decreases with altitude. However, the SoCAB is marked by frequent temperature inversions, where the temperature at higher elevations is higher than at lower elevations.

Furthermore, the region has very low average traffic speeds. The combination of low traffic speeds, temperature inversions, and surrounding mountains, creates a situation where pollutants are readily trapped in the basin. Pollutants cannot easily disperse horizontally or vertically. These factors, along with high population and high reliance on the automobile, make air quality in the SoCAB among the worst in the nation.

The Regional Connector Transit Corridor project would ultimately decrease air pollution in the region by removing vehicles from the roads and increasing regional transportation from clean emission sources. Although the addition of electric vehicles would be expected to cause an increase in emissions at the source of fossil fuel-fired electricity generation (power plant), the emission reduction from the motor vehicles being taken off the road due to persons mode switching to transit outweighs the effect of increased emissions from fossil fuel-fired electricity generation; therefore, a net benefit remains for air quality. However, construction of the project could cause a temporary increase in air pollution and negatively impact air quality temporarily. Therefore, this memo evaluates the potential for adverse impacts from construction and operation of the proposed Regional Connector Transit Corridor project.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section describes the methodology for analyzing potential impacts to air quality and assessing potential health risks. Emissions from construction equipment and the generation of dust could negatively impact air quality. Conversely, the operation of mass transit systems would benefit air quality through reducing vehicle traffic.

3.1 Standards of Significance

3.1.1 NEPA Guidelines

Pursuant to the Clean Air Act, EPA has established NAAQS for six criteria pollutants that are considered harmful to public health and welfare; the primary NAAQS set limits with an adequate margin of safety to protect public health, whereas the secondary NAAQS set limits to protect public welfare from any known or anticipated adverse effects. A project is considered significant under NEPA if it causes or contributes to ambient air concentrations that exceed NAAQS. The EPA developed emission levels that identify major stationary sources in nonattainment areas (40 CFR 51.165). These levels are also used to define de minimis thresholds for general conformity evaluations (40 CFR 51.853). Potentially adverse impacts may occur if project emissions exceed these thresholds (see Table 3-1). If project emissions do not exceed these thresholds, it would indicate that the project would not cause or contribute to emission levels that exceed NAAQS; thus, emissions would not be significant under NEPA.

Table 3-1. Federal Thresholds

Pollutants	Emissions Increase
Volatile organic compounds (VOC)	10 tons per year
Oxides of nitrogen (NOx)	10 tons per year
Carbon monoxide (CO)	100 tons per year
Inhalable Particulate Matter (PM_{10})	70 tons per year
Fine Particulate Matter ($PM_{2.5}$)	100 tons per year

Source: EPA, 40 CFR 51, 2009.
Note: On August 27, 2009, the EPA proposed to approve a "bump-up" request to reclassify the South Coast Air Basin from severe-17 nonattainment to extreme nonattainment for ozone (74 FR 43654). When finalized, this action would reduce the threshold of significance from 25 tons per year to 10 tons per year for VOC and NOx.

This memo analyzes both short-term impacts of emissions during construction and long-term impacts associated with operations. The analysis considers the long-term effect of the project on local and regional traffic emissions.

For construction emissions, this memo uses CEQA thresholds of significance to analyze NEPA compliance because NEPA does not contain thresholds specific to construction. Since CEQA has stricter requirements than NEPA, this is a conservative assumption. Construction emission sources considered include trucks used to haul material and debris to and from the project sites, fugitive dust from tunneling, earthwork and storage piles, and construction worker vehicles traveling to and from the sites. This analysis used the construction activity summaries provided in the proposed project's Description of Construction to estimate construction activities, equipment, and associated emissions.

From an operational standpoint, incremental project emissions were determined for motor vehicles based on the change in VMT between each alternative and the No Build Alternative. Changes in VMT were determined by project traffic consultants for each alternative. VMT estimates include project impacts on individual automobile VMT as well as transit bus VMT. The analysis assumes that electric light rail transit (LRT) motors would not generate any local exhaust emissions.

Finally, the analysis looks at surface traffic intersections that would be altered by the project, either during construction or after project completion. The memo analyzes CO concentration impacts at five intersections. The analysis focuses on these intersections because they were estimated to have the highest potential CO concentrations. Transportation Conformity (40 CFR 93, Subpart A) requires localized concentrations ("hot spots") of pollutants be analyzed for CO, PM_{10}, and $PM_{2.5}$. Other pollutants are either reactive in the atmosphere (such as NOx) or dissipate rapidly (such as SO_2) and do not contribute to local concentrations. A quantitative analysis of PM_{10}/$PM_{2.5}$ is not required unless the project results in an increase in diesel vehicles, which is not the case for this project.

This analysis uses the same emissions models for both NEPA and CEQA analyses. The EPA approved the current California Air Resources Board (CARB) motor vehicle emissions model, EMFAC2007, for use in developing on-road motor vehicle emission inventories in California after April 18, 2008 (73 FR 3464). Recently, the EPA approved baseline and projected emissions inventories contained in the 2003 Air Quality Management Plan (AQMP) for the SoCAB (74 FR 10176) as part of the California State Implementation Plan (SIP). The 2003 AQMP used the CARB OFFROAD model to estimate emissions from construction equipment and other off-road mobile sources. Therefore, the current versions of EMFAC (EMFAC2007) and OFFROAD (OFFROAD2007) were used to estimate on-road and off-road mobile source

emissions, respectively. The NEPA analysis was completed with limited air dispersion modeling (CO hot spot modeling only).

3.1.2 CEQA

3.1.2.1 Regional Criteria Pollutant Emissions

The SCAQMD is the agency most responsible for improving air quality in the SoCAB. The SCAQMD published CEQA significance thresholds for analyzing the significance of project air quality impacts in the *CEQA Air Quality Handbook* (SCAQMD 1993). Regular updates are published on the SCAQMD website (SCAQMD 2009). The City of Los Angeles has also published significance thresholds for CEQA in the *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006). Since the most recent thresholds of significance published by the SCAQMD on its website were released in 2009, these thresholds supersede the City of Los Angeles thresholds; therefore, this analysis uses the most recent significance thresholds from the SCAQMD.

The SCAQMD developed significance thresholds for mass daily emission rates of criteria pollutants for both construction and operational sources. These thresholds are summarized in Table 3-2.

Project emissions for typical developments are usually defined as the difference between future project alternatives and existing conditions at the time the project NOP was published. However, that approach ignores the regional background growth in population, traffic, and transportation infrastructure that would occur between the NOP date and project build-out. Considering such growth is critical when determining future mitigation for transit projects designed to reduce traffic congestion and associated air quality impacts. Therefore, project emissions for this CEQA analysis are defined as the difference between a project alternative (2035) and the 2009 Baseline adjusted for regional growth that would occur by 2035. The emissions associated with this adjusted baseline are equivalent to those for the No Build Alternative (2035). Project emissions greater than thresholds for a given air pollutant would be considered significant under CEQA. Thresholds in Table 3-2 indicate the maximum emissions that would not be expected to cause a violation of an air quality standard and consequently are used as surrogates for the CAAQS.

Table 3-2. SCAQMD Mass Daily Thresholds		
Pollutant	**Construction**	**Operation**
Oxides of nitrogen (NOx)	100 lbs/day	55 lbs/day
Volatile organic compounds (VOC)	75 lbs/day	55 lbs/day
Inhalable particulate matter (PM_{10})	150 lbs/day	150 lbs/day
Fine particulate matter ($PM_{2.5}$)	55 lbs/day	55 lbs/day
Oxides of sulfur (SOx)	150 lbs/day	150 lbs/day
Carbon monoxide (CO)	550 lbs/day	550 lbs/day
Lead (Pb)	3 lbs/day	3 lbs/day

Source: SCAQMD, 2009.

3.1.2.2 Localized Significance Thresholds (LSTs)

The SCAQMD has developed thresholds for local air quality impacts from construction activity (SCAQMD 2003 and SCAQMD 2006). Localized significance thresholds (LSTs) are applicable to the following criteria pollutants: NOx, CO, inhalable particulate matter (PM_{10}), and fine particulate matter ($PM_{2.5}$). LSTs are analogous to NAAQS and CAAQS (pollutant levels below LSTs necessarily do not violate NAAQS and CAAQs). LSTs consider ambient concentrations of pollutants for each source receptor area and distances to the nearest sensitive receptor. For PM_{10}, LSTs were based on SCAQMD Rule 403 – Fugitive Dust.

LST emission tables have been developed for project sizes up to 5 acres. Most construction sites could be partitioned into active areas less than or equal to 5 acres in size. If two active areas of 5 acres each were adjacent to each other (meaning there is a common boundary between them) then the LST value was reduced to one-half of the single 5-acre value.

Applying LST methodology reduces the need to conduct dispersion modeling of construction emissions. If construction emission rates were less than the LST thresholds, the analysis assumed that concentration impacts would not cause NAAQS or CAAQS to be exceeded. Even if a pollutant exceeds a LST, a significant impact could be avoided through mitigation measures. Furthermore, a detailed dispersion analysis could be conducted to quantify the predicted ambient air quality concentration.

3.1.2.3 Toxic Air Contaminants

The SCAQMD established thresholds of significance for both carcinogenic and non-carcinogenic TACs. A significant adverse health risk impact would occur if a project alternative would result in a:

- Maximum Incremental Cancer Risk ≥ 10 in 1 million, or
- Hazard Index ≥ 1.0 (project increment for either chronic or acute exposure)

3.1.3 FTA Guidance for Air Quality Conformity

Approval, funding, and implementation of Federal Highway Administration (FHWA) and Federal Transit Authority (FTA) projects are subject to transportation conformity regulations under the Clean Air Act. (40 CFR 93, Subpart A). The SoCAB is defined as a non-attainment area for O_3, PM_{10}, and $PM_{2.5}$. The SoCAB is defined as a maintenance area for CO and nitrogen dioxide (NO_2). If a potential project is included in a conforming Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP), the project is already included in emission budgets developed for the region. Thus, a unique, regional analysis of project emissions would not be required. However, analysis regarding possible localized impacts is still required.

The Southern California Association of Governments (SCAG) adopted a 2008 RTP and 2008 RTIP. The FHWA/FTA approved and made a positive conformity determination in June 2008 for the RTP and January 2009 for the RTIP. The Regional Connector Transit Corridor project was included in the list of modeled projects for the Final 2008 RTP and RTIP. Therefore, it is assumed that the project was considered in the transportation conformity determination for the 2008 RTP and RTIP.

Since the Regional Connector Transit Corridor project is included in the Final 2008 RTP and RTIP, the following parameters were evaluated as part of the conformity determination as required by 40 CFR 93:

- §93.110 – The conformity determination must be based upon the most recent planning assumptions in force at the time the conformity analysis begins.
- §93.111 – The conformity determination must be based on the latest emission estimation model available, including EMFAC for California-based projects.
- §93.112 – Conformity must be determined according to the consultation procedures in 40 CFR 93; the Southern California Association of Governments (SCAG) will be consulted regarding this project.

- §93.114 – There must be a currently conforming transportation plan and currently conforming Transportation Improvement Program at the time of project approval.
- §93.115 – The project must come from a conforming plan and program.
- §93.116 – The project must not cause or contribute to any new localized CO, PM_{10}, and/or $PM_{2.5}$ violations or increase the frequency or severity of any existing CO, PM_{10}, and $PM_{2.5}$ violations.
- §93.117 – The project must comply with any PM_{10} and $PM_{2.5}$ control measures in the applicable SIP.

3.2 Area of Potential Impact

The area of potential impact must be sufficiently large to identify the location of the maximum exposed individual for health risk purposes. The zone of impact normally encompasses the area where a person would be subject to an added lifetime cancer risk of one in one million or greater ($\geq 1.0 \times 10^{-6}$). However, the project is expected to have a long-term beneficial impact on air quality and inhalation risk. The area of potential impact was limited to a one kilometer radius around each exposed excavation site, which, based on related experience, is a sufficient distance to encompass the zone of impact related to cancer risk. In addition, emissions were quantified for haul trucks, delivery trucks, and construction worker vehicle trips from the site to trip ends (landfills, material source locations, or construction worker homes).

3.3 Analysis Methodology

3.3.1 Construction Emissions

This memo analyzes construction emissions with the methodology developed by the SCAQMD in its *CEQA Air Quality Handbook* (1993). Fugitive dust and engine exhaust emissions were characterized into the following main categories:

- Grading and excavation
- Heavy-duty equipment on unpaved areas
- Paved road dust (haul/delivery trucks)
- Loading/unloading of trucks
- Vehicle trips (including construction worker commuting and haul/delivery trucks)

Although the analysis used the *CEQA Air Quality Handbook* to estimate emissions, several emission factors and calculation methods in the Handbook are outdated. Thus, the analysis used current versions of the EMFAC and OFFROAD models, to generate on- and off-road emission factors, respectively, instead of the mobile source emission factors established in the *CEQA Air Quality Handbook*. The analysis used the Midwest Research Institute (MRI) *Improvement of Specific Emission Factors* report as necessary to update the fugitive dust emission factors identified in the *CEQA Air Quality Handbook*. (MRI 1996)

The analysis used EPA's *Compilation of Air Pollutant Emission Factors* (AP-42) to estimate emissions from fugitive dust (EPA 1995).

Dust emissions and dirt track-out will be minimized through compliance with SCAQMD Rule 403. Although projects are required to follow all of the Best Available Control Measures described in the rule, several of the key measures applicable to this project are as follows:

- For cut and fill at large sites, pre-water with sprinklers or water trucks and allow time for penetration.
- Apply water or stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
- Track-out shall not extend 25 feet or more in cumulative length from the point of origin from an active operation. All track-out from an active operation shall be removed at the conclusion of each workday or evening shift.

If the disturbed surface area is five acres or more, or if the daily import or export of bulk material is 100 cubic yards or more, then at least one of the following precautions must also be taken:

- Install a pad consisting of washed gravel (minimum-size: one inch) maintained in a clean condition to a depth of at least size inches and extending at least 30 feet wide and at least 50 feet long.
- Pave the surface extending at least 100 feet and at least 20 feet wide.
- Use a wheel shaker/wheel spreading device consisting of raise divides at least 24 feet long and 10 feet wide to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.
- Install and use a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.

3.3.2 Operational Emissions

3.3.2.1 CO Hot Spots

The first step in an air dispersion analysis is the selection of an applicable model. Two models commonly used to assess CO concentrations at roadway intersections (CO hot spots) are CAL3QHC and CALINE4. The EPA's *Guideline on Air Quality Models* (40 CFR 51, Appendix W) recommends the use of CAL3QHC. CAL3QHC combines CALINE3 with a traffic model to calculate delays and queues that occur at signalized intersections. Recent Metro projects requiring NEPA and CEQA findings have relied on the CAL3QHC model for CO hot spots analysis, and this memo follows suit.

3.3.2.2 Regional Emissions

Regional emissions were calculated from projected VMT for each of the project alternatives. Regional VMT data for each alternative was developed by project traffic consultants. This report used the current EPA-approved version of EMFAC to develop emission factors for different vehicle classes. EMFAC was used to describe the on-road fleet mix (relative ratio of light duty automobiles and trucks) for Los Angeles County in each year of the analysis. Passenger vehicles are the basic unit of traffic for modeling purposes. Other types of regional vehicles use regional highways, and the model accounts for large trucks by lowering roadway capacity. Changes in usage of other types of vehicles are not expected to occur as a result of this project.

3.3.3 Health Risk Assessment

CEQA analysis typically includes a health risk assessment for sensitive receptors (e.g., residents, workers, school children) near the project site that are likely to be exposed to TACs emitted from project activities. Most TACs are categorized as organic emissions or inorganic (primarily particulate) emissions. Therefore, emissions of TACs are typically calculated by applying chemical-specific mass fractions (also called speciation profiles) to VOC or PM_{10} emission rates calculated for criteria pollutant emission inventories.

CARB has developed speciation profiles for a variety of sources including diesel and gasoline motor vehicles, off-road diesel and gasoline mobile equipment, and fugitive dust. This analysis uses speciation profiles with projected VOC and PM_{10} emission levels to determine TAC emissions for each alternative.

This analysis uses SCAQMD Rule 1401 to determine the TACs to be evaluated for risk. Rule 1401 contains requirements related to New Source Review of TACs. In addition to specifying the risk limits for carcinogens and non-carcinogens (i.e., pollutants with chronic or acute hazards), the rule defines the pollutants that the SCAQMD considers to be toxic. This study identified 25 TACs from the speciation profiles for mobile emission sources. Several common

TACs from mobile sources (engine exhaust) include benzene, 1,3- butadiene, formaldehyde, acrolein, and diesel particulate matter (DPM). The analysis calculates speciated emissions for exhaust, tire wear, brake wear, paved road dust, and construction dust.

3.3.3.1 Construction Health Risk Assessment

This memo analyzes short-term, construction-related TAC emissions to determine acute risk impacts to those nearby. The SCAQMD developed a tiered approach to assessing risk from exposure to TACs (SCAQMD 2005a and SCAQMD 2008b). The memo applies tier 1 analysis (a series of lookup tables) to the construction phase to determine if acute impacts may be significant. Tier 1 analysis predicted no acute health risks from project construction, so further analysis did not need to be completed.

3.3.3.2 Operational Health Risk Assessment

Although emissions of particulate matter are expected to increase in the future alternatives (2035) when compared to existing conditions (2009) (see Table 1-1), this increment should not be used as the basis for determinations of significance, as noted in Section 3.1.2.1. Rather, an adjusted CEQA increment that compares the difference between a future alternative with the No Build Alternative would be used to evaluate significance. As shown in Table 1-2, emissions of all pollutants will either be less than or equal to the adjusted CEQA baseline. Since there will be a net benefit to air quality for operational emissions, an operational health risk assessment was not completed.

4.0 AFFECTED ENVIRONMENT

This section describes the area of analysis and the regulatory and environmental setting for air quality.

4.1 Area of Analysis

The air quality area of analysis includes the four-county region covered by the SoCAB (all of Orange County and the urban, non-desert portions of Los Angeles, Riverside, and San Bernardino Counties).

4.1.1 Regulatory Setting

Federal, state and local government all share responsibility for air quality management. The Federal Clean Air Act (CAA) and the California Clean Air Act (CCAA) are the primary statutes that establish ambient air quality standards. They establish regulatory authorities to design and enforce air quality regulations.

4.1.1.1 Federal

The EPA is responsible for implementation of the CAA. The CAA was enacted in 1955 and has amended in 1963, 1965, 1967, 1970, 1977, 1990, and 1997. Under authority of the CAA, EPA established NAAQS for the following criteria pollutants: CO, Pb, NO_2, O_3, particulate matter (PM_{10} and $PM_{2.5}$), and SO_2.

Table 4-1 presents current NAAQS for criteria air pollutants. Ozone is a secondary pollutant, meaning that it is formed in the atmosphere from reactions of precursor compounds under certain conditions. Primary precursor compounds that lead to formation of O_3 include VOC and NOx. Fine particulate matter ($PM_{2.5}$) can be emitted directly from sources (engines) or can form in the atmosphere from precursor compounds. $PM_{2.5}$ precursor compounds in SCoAB include SOx, NOx, VOC, and ammonia.

The CAA specifies dates for achieving compliance with NAAQS and mandates that states submit and implement a SIP for local areas not meeting these standards. SIPs must include pollution control measures and demonstrate how standards will be met. The CAA identifies specific emission reduction goals for areas not meeting NAAQS. The act requires a demonstration of reasonable further progress toward attainment and provides additional sanctions for failure to attain or meet interim milestones.

The SoCAB is designated as a federal non-attainment area for O_3, PM_{10}, and $PM_{2.5}$. Non-attainment designations are classified into levels of severity based on the pollutant concentration levels. Pollution concentration levels determine the mandated attainment date.

In 1998, the EPA designated the SoCAB as an attainment/maintenance area for NO_2. NO_2 levels in SoCAB dropped below NAAQS in the early 1990s. The EPA designated SoCAB as a maintenance area for CO in 2007.

An attainment/maintenance designation means a pollutant is currently in attainment. It indicates measures included in the SIP will ensure that the NAAQS for a pollutant are not exceeded. Table 4-2 presents the attainment designation for each of the federal criteria air pollutants.

Table 4-1. National and California Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS	NAAQS Primary	NAAQS Secondary
Ozone (O_3)	1-Hour	0.09 ppm (180 µg/m^3)	NS	NS
	8-Hour	0.070 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3) [1]	Same as primary [2]
Inhalable particulate matter (PM_{10})	24-Hour	50 µg/m^3	150 µg/m^3	Same as primary
	Annual	20 µg/m^3	NS	NS
Fine particulate matter ($PM_{2.5}$)	24-Hour	No separate State standard	35 µg/m^3	Same as primary
	Annual	12 µg/m^3	15.0 µg/m^3	Same as primary
Carbon monoxide (CO)	8-Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	NS
	1-Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	NS
Nitrogen dioxide (NO_2)	Annual	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as primary
	1-Hour	0.18 ppm (339 µg/m^3)	0.100 ppm (189 µg/m^3) [3]	NS

Table 4-1. National and California Ambient Air Quality Standards				
Pollutant	**Averaging Time**	**CAAQS**	**NAAQS Primary**	**NAAQS Secondary**
Sulfur dioxide (SO_2)[4]	Annual	NS	0.030 ppm (80 µg/m^3)	NS
	24-Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)	NS
	3-Hour	NS	NS	0.5 ppm (1,300 µg/m^3)
	1-Hour	0.25 ppm (655 µg/m^3)	NS	NS
Lead (Pb) [5]	30-Day Average	1.5 µg/m^3	NS	NS
	Calendar Quarter	NS	1.5 µg/m^3	Same as primary
	Rolling 3-Month Average	NS	0.15 µg/m^3	Same as primary

Source: CARB 2008

Notes:

[1] On January 19, 2010, the EPA released a proposed rule to strengthen the 8-hour primary O_3 NAAQS to a level within the range of 0.060 to 0.070 parts per million by volume (ppmv).

[2] On January 19, 2010, the EPA proposed to establish a cumulative, seasonal secondary O_3 NAAQS within the range of 7 to 15 ppm-hours.

[3] On February 9, 2010, the EPA finalized a rule to supplement the current annual NO_2 standard by establishing a new 1-hour NO_2 standard at a level of 100 parts per billion (ppb), based on the 3-year average of the 98th percentile of the yearly distribution of the 1-hour daily maximum concentrations (75 FR 6474). For comparison, this would be more stringent than the current California 1-hour CAAQS of 180 ppbv. The final rule is effective on April 12, 2010.

[4] On December 8, 2009, the EPA proposed to establish a new one-hour primary SO_2 NAAQS within the range of 50 – 100 parts per billion by volume (ppbv), based on the 3-year average of the annual 99th percentile of one-hour daily maximum concentrations (74 FR 64810). The EPA also proposed to revoke the existing 24-hour and annual primary SO_2 NAAQS.

[5] On November 12, 2008, the EPA revised the primary lead standard to 0.15 µg/m^3 and revised the averaging period to a rolling 3-month period with a not-to-be-exceeded form, evaluated over a 3-year period (73 FR 66964).

Key:
NAAQS = National Ambient Air Quality Standard
CAAQS = California Ambient Air Quality Standard
ppm = parts per million
µg/m^3 = micrograms per cubic meter
mg/m^3 = milligrams per cubic meter
NS = no standard

Table 4-2. Federal and State Attainment Status

Pollutant	State Status	Federal Status
O_3	Non-attainment, Extreme	Non-attainment, Extreme [1]
PM_{10}	Non-attainment	Non-attainment, Serious
$PM_{2.5}$	Non-attainment	Non-attainment [2]
CO	Attainment	Maintenance
NO_2	Attainment	Maintenance
SO_2	Attainment	Attainment
Pb	Attainment	Attainment [3]

Source: CARB 2009
Notes:
[1] On August 27, 2009, the EPA proposed to reclassify the SoCAB non-attainment area from severe-17 to extreme (74 FR 43654).
[2] On October 8, 2009, the EPA issued a final Federal Register notice designating the attainment status for the 24-hour NAAQS for $PM_{2.5}$ (EPA 2009). The notice was effective on December 14, 2009.
[3] Los Angeles County was designated as in attainment for the previous Pb NAAQS; however, the EPA has not proposed area designations under the current NAAQS. CARB recommended that Los Angeles County be designated as in non-attainment in August 2009 (CARB 2009).
Key:
O_3 = ozone
PM_{10} = inhalable particulate matter
$PM_{2.5}$ = fine particulate matter
CO = carbon monoxide
NO_2 = nitrogen dioxide
SO_2 = sulfur dioxide
Pb = lead

4.1.1.2 State

The CCAA, signed into law in 1988, requires all areas of the state to achieve and maintain CAAQS by the earliest practicable date. CAAQS are at least as stringent as, and often more stringent than, NAAQS. Table 4-1 lists currently applicable CAAQS and NAAQS. Attainment status for each pollutant with regard to CAAQS is presented in Table 4-2.

The California Air Resources Board (CARB) has jurisdiction over a number of air pollutant emission sources in the state. Specifically, CARB can develop emission standards for on-road motor vehicles, stationary sources and some off-road mobile sources. CARB has delegated authority to regional air pollution control and air quality management districts to develop stationary source emission standards, issue air quality permits, and enforce permit conditions.

4.1.1.3 Regional

Under conformity regulations of the CAA, SCAG is the metropolitan planning organization (MPO) responsible for coordinating the development of transportation infrastructure in the Southern California region. This ensures that air quality objectives are included with transportation goals in regional transportation plans. (40 CFR 93) SCAG predicts population and business growth in the region.

SCAG estimates future demand for traffic (VMT) seaports, airports, and heavy and light rail infrastructure. From the demand estimates, SCAG develops a Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP) to guide transportation growth and infrastructure development. The RTIP and RTP consider air quality requirements in the region. SCAG updates its forecasts approximately every three years. SCAQMD uses VMT, as well as activities predicted for seaports, airports, and rail, to develop updates to Air Quality Management Plans (AQMPs) discussed below.

4.1.1.3 Local

The SCAQMD has jurisdiction over an area of 10,743 square miles consisting of Orange County, the non-desert portions of Los Angeles, Riverside and San Bernardino counties, and the Riverside County portion of the Salton Sea Air Basin and Mojave Desert Air Basin. The SoCAB is a sub-region within SCAQMD's jurisdiction covering an area of 6,745 square miles. While air quality in this area has improved, activity in the basin requires more regulation to meet ambient air quality standards.

The SCAQMD has adopted a series of AQMPs to meet CAAQS and NAAQS. These plans mandate control technology for existing sources, control programs for area sources and indirect sources, a permitting system designed to ensure no net increase in emissions from any new or modified permitted sources of emissions, transportation control measures,

sufficient control strategies to achieve a five percent or more annual reduction in emissions (or 15 percent or more in a three-year period) for VOC, NOx, CO, and PM_{10}, and demonstration of compliance with CARB's established reporting periods for compliance with air quality goals.

The current, EPA-approved SIPs for each federal nonattainment or maintenance pollutant in the SoCAB are summarized below:

- O_3 – 1997 Air Quality Management Plan and 1999 amendments, approved by EPA on April 10, 2000 (65 FR 18903)
- CO – 2005 maintenance plan and request for re-designation to attainment status, approved by EPA on May 11, 2007 (72 FR 26718)
- PM_{10} – 1997 Air Quality Management Plan and supplemental information, approved by EPA on April 18, 2003 (68 FR 19315)
- PM2.5 – No EPA-approved SIP
- NO_2 – SIP approved by EPA on July 24, 1998 (63 FR 39747), based on the 1997 AQMP. In this SIP approval, EPA also re-designated the SoCAB from nonattainment to attainment/maintenance for NO_2.

On June 1, 2007, SCAQMD adopted a comprehensive update, the 2007 AQMP for the SoCAB. The 2007 AQMP outlines air pollution control measures needed to meet federal O_3 and $PM_{2.5}$ standards. The 2007 AQMP was approved by CARB and submitted to EPA for its final approval on September 27, 2007.

4.1.2 Existing Conditions

4.1.2.1 Climate and Atmospheric Conditions

The climate of the SoCAB is determined primarily by terrain and geography. Regional meteorology is dominated by a persistent high pressure area that commonly resides over the eastern Pacific Ocean. Seasonal variations in strength and position of this pressure cell cause changes in area weather patterns. Local climactic conditions are characterized by warm summers, mild winters, infrequent rainfall, moderate daytime on-shore breezes, and moderate humidity. The SoCAB's normally mild climate is occasionally interrupted by periods of hot weather, winter storms, and hot easterly Santa Ana winds.

The SoCAB area has high levels of air pollution, particularly from June through September. Factors leading to high levels of pollution include a large amount of pollutant emissions, light

winds, and shallow vertical atmospheric mixing. These factors reduce pollutant dispersion, exacerbating elevated air pollution levels. Pollutant concentrations in the SoCAB vary by location, season and time of day. Concentrations of O_3, for example, tend to be lower along the coast and in far inland areas of the basin and adjacent desert and higher in and near inland valleys.

Over the past 30 years, substantial progress has been made in reducing air pollution levels in Southern California. Previously, the EPA designated SoCAB as a non-attainment area for all NAAQS except SO_2. The EPA now designates SoCAB as in attainment for NO_2, lead, SO_2, and CO. PM_{10}, $PM_{2.5}$, and O_3 levels, while reduced substantially from their peak, remain above relevant NAAQS and CAAQS.

4.1.2.2 Existing Air Quality Conditions

Air quality conditions for a project area are typically the result of meteorological conditions and existing emission sources in an area.

Monitoring Data – Criteria Pollutants

Air quality data from a monitoring station near the area of analysis is summarized in Table 4-3. This memo used monitoring data from the central Los Angeles station (North Main Street, CARB Number 70087). This station best represents air quality conditions at the project area; or, in the case of ozone, best represents air quality conditions for the region as a whole.

1-hour O_3 CAAQS were exceeded up to 8 times a year between 2006 and 2008 (see Table 4-3). Recorded 8-hour O_3 concentrations exceeded NAAQS up to 3 times a year between 2006 and 2008. Substantial year-to-year variations in monitored O_3 levels are common. No clear trend in O_3 levels is demonstrated by monitoring results from 2006 through 2008.

The 24-hour and annual PM_{10} and annual $PM_{2.5}$ CAAQS were exceeded during the 2006 to 2008 monitoring period. However, the PM_{10} NAAQS was not exceeded (see Table 4-3).

Table 4-3. Summary of Pollutant Monitoring Data Near Study Area

Criteria Air Pollutant	Annual Monitoring Data		
	2006	2007	2008
Carbon Monoxide (CO)			
Highest 1-hour concentration (ppmv)	3.5	3.2	2.9

Table 4-3. Summary of Pollutant Monitoring Data Near Study Area			
Criteria Air Pollutant	**Annual Monitoring Data**		
	2006	**2007**	**2008**

Source: CARB 2009
Notes:
[1] Days above standard = days above 8-hour CAAQS of 9.0 ppmv
[2] Days above standard = days above 8-hour NAAQS of 9 ppmv
[3] Days above standard = days above 1-hour CAAQS of 0.09 ppmv
[4] Different methods of analyzing monitoring pollutants are used by EPA and CARB; therefore, both data are provided, respectively, separated by "/"
[5] Days above standard = days above 8-hour CAAQS of 0.070 ppmv
[6] Days above standard = days above 8-hour NAAQS of 0.075 ppmv
[7] Days above standard = days above 24-hour CAAQS of 50 µg/m3
[8] Most PM measurements are taken every 6 days; therefore, the number of days over the 24-hour standard in any year is estimated mathematically.
[9] Days above standard = days above 24-hour NAAQS of 150 µg/m3
[10] Days above standard = days above 24-hour NAAQS of 35 µg/m3
Key:
** = There was insufficient data available throughout the year to determine the value.*
ppmv = parts per million by volume
CAAQS = California Ambient Air Quality Standard
NAAQS = National Ambient Air Quality Standard
µg/m3 = micrograms per cubic meter

Intersection Analysis – CO Hot Spots

Carbon monoxide pollution can have localized impacts that require additional analysis if a roadway's level of service (LOS) could change or if sensitive populations could be adversely affected. In this case, a CO hot spots analysis, including a microscale analysis for CO concentrations, must be prepared. The SCAQMD requires that the following steps be used to determine if a localized CO impact exists (SCAQMD 1993):

- Determine "No Project" ambient concentration of CO emissions
- Estimate CO emissions from the project by modeling
- Add the "No Project" ambient concentration level of CO emissions to those generated by the project
- Compare the total project impact to the state 1-hour and 8-hour CO standards
- If modeling indicates a CO hot spot could occur, determine if any sensitive receptors are located in the area
- Identify the level of CO emissions at sensitive receptors
- Compare the levels of CO emissions at sensitive receptors to the state 1-hour and 8-hour CO standards

Existing ambient CO concentrations for 1-hour and 8-hour standards are 3.5 ppm and 2.68 ppm respectively. These values represent the maximum concentration observed during the past three years of sampling data. The analysis estimated future background concentrations by multiplying existing ambient background conditions by the ratio of future and current traffic and the ratio of future to current emission factors. This approach follows the requirements of 40 CFR 93.123(c)(2). This study predicts background 1-hour and 8-hour CO concentrations in 2035 of 1.2 ppm and 0.9 ppm respectively.

This study conducted a CO hot spots analysis for five intersections. This study used the screening procedure included in the CO Protocol to identify the worst intersections. The CAL3QHC model was used to estimate existing CO concentrations at each intersection (see Table 4-4). Under existing conditions, none of the study intersections exceed the 1-hour or 8-hour CO CAAQS of 9 and 20 ppm respectively. (The 8-hour CO NAAQS is 35 ppm.)

Sensitive Receptors

In completing the health risk assessment required under CEQA, this study identified sensitive receptors within the project area. Sensitive receptors are typically locations where the elderly, children, or other groups with a greater susceptibility to adverse health effects could be located. These locations include schools, hospitals, convalescent homes, parks, and daycares. Sensitive receptors identified in the project area are listed in Table 4-5.

Table 4-4. Maximum Carbon Monoxide Concentrations at Roadway Intersections – Baseline (2009)					
ID	Intersection	Traffic CO Conc. (ppm)		Max. Conc. (ppm)	
		1-Hour	8-Hour	1-Hour[1]	8-Hour[2]

Existing Operational Emissions

In determining impact significance, CEQA analysis requires comparing future project alternatives to existing conditions. This analysis compiled emissions inventories for the baseline year (2009). These figures were used to calculate the difference between future and existing conditions.

Operational emissions in this project analysis include emissions from traffic VMT and operation of LRT vehicles. Since LRT vehicles would be operated by electricity, there would be no direct emissions of criteria pollutants. Thus, LRT vehicle-related emissions are not further considered for air quality impacts (see chapter 6.4.11 that addresses potential climate-change impacts and indirect emissions of greenhouse gases from proposed project operations).

Emission modeling in this memo considers only passenger vehicles (light-duty automobiles and trucks in the model). This analysis used the EMFAC2007 model to generate emission factors for these vehicle types. Table 4-6 provides a summary of highway traffic emissions in the study area.

Table 4-6. Existing Conditions 2009 Highway Traffic Emissions

Highway Type	Emissions					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
Emission Factor (g/mi)	0.084	2.760	0.266	0.004	0.404	0.075
Daily Emissions (lbs/day)	56,200	1,847,200	178,000	2,700	270,400	49,900
Annual Emissions (tpy)	10,300	337,100	32,500	500	49,300	9,100

Key:
g/mi = grams per mile
lbs/day – pounds per day
tpy = tons per year

Operation of vehicles associated with this project would result in emissions of TACs. Emissions of TACs are summarized in Table 4-7 for informational purposes only. VMT numbers provided by the project traffic consultant consider only light-duty automobiles and trucks. Since the majority of these vehicles are gasoline-fueled, the TAC emission calculations assumed that all emissions would come from gasoline-fueled vehicles.

This analysis used speciation profiles obtained from CARB. The analysis includes emissions from exhaust (VOC profile no. 441; PM profile no. 400), tire wear (PM profile no. 472), brake wear (PM profile no. 473), and paved road dust (PM profile no. 471).

Table 4-7. Existing Conditions 2009 Toxic Air Contaminant Operational Emissions

lbs/yr = pounds per year

5.0 IMPACTS

This section describes the results of the impact analysis conducted for the proposed Regional Connector Transit Corridor project.

5.1 Transportation Conformity

A transportation conformity determination is required for approval, funding, or implementation of FWHA/FTA projects. Transportation conformity provisions apply to emissions of O_3, CO, NO_2, PM_{10}, and $PM_{2.5}$ in nonattainment and maintenance areas. Transportation conformity determinations ensure that projects receiving federal funding or approval are consistent with air quality goals. A conformity determination demonstrates that the total emissions for a project are within emissions budgets established in a SIP.

The current, regional RTIP already includes the Regional Connector Transit Corridor project. As a result, this analysis is not required to demonstrate compliance with emissions budgets. It is necessary, however, to complete an analysis for localized impacts of CO, PM_{10}, and $PM_{2.5}$. As listed in 40 CFR 93 Subpart A, project-level conformity occurs when the following three conditions are met:

- The FHWA/FTA project must not cause or contribute to any new localized CO, PM_{10}, and/or $PM_{2.5}$ violations (§93.116).
- The project must not increase the frequency or severity of any existing CO, PM_{10}, and/or $PM_{2.5}$ violations in nonattainment or maintenance areas (§93.116).
- The project must comply with any PM_{10} and $PM_{2.5}$ control measures in the applicable implementation plan (§93.117).

The EPA published standards in *Transportation Conformity Guidance for Qualitative Hot-spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas* (2006). A PM_{10} or $PM_{2.5}$ hot spots analysis must be completed only for "projects of air quality concern," as defined in 40 CFR 93.123(b)(1). A project of air quality concern is defined as a project that could result in a significant increase in the number of diesel vehicles.

The proposed project would decrease the overall number of vehicles in the region, and it would not cause an increase in diesel vehicles. As a result, the proposed project would neither cause new PM_{10} or $PM_{2.5}$ hot spots nor increase the frequency or severity of existing PM_{10} or $PM_{2.5}$ violations. No localized adverse impacts from CO are expected under this project. The proposed project would implement the various PM_{10} and $PM_{2.5}$ control measures contained in

the RTP and RTIP and meet the requirements of §93.117. No further action is required for transportation conformity.

5.2 Mobile Source Air Toxics

The FHWA published an *Interim Guidance Update on Mobile Source Air Toxic Analyses in NEPA Documents* on September 30, 2009. This guidance document establishes the following tiered approach for analyzing mobile source air toxics (MSAT) in NEPA:

- No analysis for projects with no potential for meaningful MSAT effects
- Qualitative analysis for projects with low potential MSAT effects
- Quantitative analysis to differentiate alternatives for projects with higher potential MSAT effects.

The proposed project would have no MSAT effects because VMT for each of the build alternatives would decrease compared to the No Build Alternative. The proposed project falls within the first tier of MSAT analysis, so no further action is required.

5.3 No Build Alternative

The No Build Alternative assumes none of the project alternatives would be built. This section provides a summary of the emissions associated with the No Build Alternative.

5.3.1 Operational Emissions

The No Build Alternative would not create new emissions or have negative operational air quality impacts. However, the No Build Alternative would not reduce regional VMT-related emissions like other alternatives.

NEPA requires project emissions to be compared to the future No Build Alternative. This analysis calculated operational emissions from predicted VMT under the No Build Alternative. Emissions of CO, NOx, and SO_2 represent emissions from vehicle exhaust only. Emissions of PM_{10} and $PM_{2.5}$ include exhaust, tire wear, brake wear, and paved road dust. VOC emissions include exhaust and evaporative losses. Table 5-1 summarizes operational emissions associated with the No Build Alternative.

Table 5-1. No Build Alternative 2035 Highway Traffic Emissions						
Highway Type	Emissions					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
Emission Factor (g/mi)	0.019	0.867	0.057	0.005	0.424	0.094
Daily Emissions (lb/day)	21,100	962,500	63,300	5,600	470,700	103,800
Annual Emissions (tpy)	3,800	175,700	11,500	1,000	85,900	18,900

5.3.2 Construction Emissions

The No Build Alternative would not result in any construction emissions.

5.3.3 Cumulative Emissions

The No Build Alternative would involve neither construction nor new transit operations; therefore, there would be no cumulative impacts under the No Build Alternative.

5.4 Transportation System Management (TSM) Alternative

5.4.1 Operational Regional Emissions

The TSM Alternative focuses on enhancements to and restructuring of existing transit service in the project area. In addition to provisions in Metro's LRTP, two new shuttle bus routes would link the 7th Street/Metro Center Station to Union Station. The TSM Alternative would not involve construction of tracks or stations outside of projects already approved in the LRTP. The creation of peak hour bus-only lanes would not require new construction. New bus lanes would be created by restricting parking on streets that do not already have dedicated bus lanes.

5.4.1.1 Criteria Pollutant Emissions

Bus Operations

Buses added under the TSM Alternative would be fueled by CNG. Emission factors for CNG buses were estimated from technical studies provided by CARB. Table 5-2 shows emissions from CNG buses.

Table 5-2. TSM Alternative Bus Operations Emissions

Line	Service Line	Emissions (lbs/day)				
		VOC	CO	NOx	SO_2	PM
1	Upper Grand Southbound via Los Angeles	<1	7	14	<1	2
2	Upper Grand Northbound via Los Angeles	<1	7	16	<1	2
3	Upper Grand Southbound via Alameda	<1	8	16	<1	2
4	Upper Grand Northbound via Alameda	<1	8	18	<1	3
5	3rd Street Southbound	<1	17	35	<1	5
6	2nd Street Northbound	<1	18	37	<1	6
	Total	**1**	**65**	**136**	**<1**	**21**

Highway Traffic

The TSM Alternative would indirectly affect emissions from highway traffic. Table 5-3 shows operational emissions from VMT. Operational emissions were calculated using the same methodology as in the No Build Alternative analysis.

Table 5-3. TSM Alternative 2035 Highway Traffic Emissions						
Highway Type	Emissions					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
Emission Factors (g/mi)	0.019	0.867	0.057	0.005	0.424	0.094
Daily Emissions (lbs/day)	21,100	962,000	63,200	5,500	470,500	103,800
Annual Emissions (tpy)	3,800	175,600	11,500	1,000	85,900	18,900

Total Emissions for TSM Alternative

Emissions from operation of buses associated with the TSM Alternative are considered together with highway emissions. The resulting emissions were compared to thresholds of significance for CEQA and NEPA. NOx emissions would exceed NEPA significance criteria. Emissions of other criteria pollutants under this alternative would not exceed CEQA or NEPA thresholds; thus, they would not be significant. Table 5-4 shows total regional operational emissions under this alternative.

Table 5-4. Total Regional Operational Impacts for TSM Alternative						
Type	Emissions (lbs/day)					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
CEQA Analysis						
Bus Operations	1	65	136	<1	21	21
Highway	21,100	962,000	63,200	5,500	470,500	103,800
Total	**21,100**	**962,100**	**63,300**	**5,500**	**470,500**	**103,800**
Existing Conditions	56,200	1,847,200	178,000	2,700	270,400	49,900

5.4.1.2 Toxic Air Contaminant Emissions

The TSM Alternative would result in emissions of TACs from bus operations. This alternative would indirectly result in added TAC emissions from highway vehicles. Emissions under this alternative (emissions from buses and highway traffic) were compared to existing conditions

(2009) for informational purposes only. Since the EMFAC model only provides emission results for criteria pollutants, it is necessary to use published profiles of the individual compounds emitted in the exhaust to create an inventory of TACs.

Table 5-5 shows a summary of project-related emissions. The emission increment (TSM Alternative compared to Existing Conditions) is provided for informational purposes, but is not used for significance determinations as noted in Section 3.1.2.1.

Table 5-5. TSM Alternative 2035 Toxic Air Contaminant Operational Emissions

TAC	CAS	Emissions		Emission Increment	
		(lb/hr)	(lb/yr)	(lb/hr)	(lb/yr)
Volatile Organic Compounds					
1,3-Butadiene	106-99-0	0.011	96	(0.039)	(339)

Selenium	7782-49-2	0.000062	0.54	0.0000081	0.071

Key:
TAC = toxic air contaminant
CAS = Chemical Abstracts Service
lbs/hr = pounds per hour
lbs/yr = pounds per year

5.4.2 CO Hot Spots

This analysis completed a CO hot spots evaluation that calculated localized impacts of CO concentrations at several intersections. A screening level analysis was completed using Appendix A of the CO Protocol to determine five intersections that would be most adversely affected under this alternative. The CAL3QHC model was used to evaluate whether CO

concentrations at these intersections would exceed CAAQS or NAAQS for CO concentrations. Table 5-6 shows the results of the analysis.

Table 5-6. Maximum Carbon Monoxide Concentrations at Roadway Intersections Under TSM Alternative (2035)

ID	Intersection	Traffic CO Conc. (ppm)		Max. Conc. (ppm)		Exceeds Threshold?	
		1-Hr	8-Hr	1-Hr	8-Hr	1-Hr	8-Hr
5	1st Street and Main Street	0.20	0.14	1.40	1.04	No	No
12	2nd Street and Hill Street	0.10	0.07	1.30	0.97	No	No
57	Temple Street and Main Street	0.20	0.14	1.40	1.04	No	No
58	Temple Street and Los Angeles Street	0.10	0.07	1.30	0.97	No	No
60	Temple Street and Alameda Street	0.20	0.14	1.40	1.04	No	No

Notes:
1-Hour CAAQS = 9.0 ppm; 1-Hour NAAQS = 9 ppm
8-Hour CAAQS = 20 ppm; 8-Hour NAAQS = 35 ppm

5.4.3 Construction Emissions

The TSM Alternative would not involve any construction. As a result, there would be no emissions associated with construction.

5.4.4 Cumulative Emissions

Operational emissions associated with the TSM Alternative would not exceed NEPA or CEQA significance thresholds for all criteria pollutants. It is difficult to specify what other projects will be undertaken in 2035. However, this alternative would result in substantial reductions in peak daily emissions of CO, SO_2, and PM_{10}. Impacts from emissions of these pollutants would not be cumulatively significant. However, the federally-approved RTP and RTIP include an electric light rail project like the Regional Connector project. Not developing such a project would result in higher VMT and emissions than listed in the RTP Programmatic Environmental Impact Report. Thus, cumulative impacts could be significant under NEPA.

5.5 At-Grade Emphasis LRT Alternative

Under the At-Grade Emphasis LRT Alternative, about half of the operation of the proposed light rail extension would run at street level. This section summarizes emissions associated with this alternative.

5.5.1 Operational Emissions

Operational emissions associated with the At-Grade Emphasis LRT Alternative include emissions from highway traffic that would exist after this project alternative is operational. The proposed project would provide an alternative to automobile transportation in the region; therefore, it was necessary to evaluate highway traffic to assess how the proposed project would increase or decrease operational emissions from passenger vehicles.

5.5.1.1 Criteria Pollutant Emissions

Table 5-7 shows operational emissions from VMT under this alternative. Emissions of all pollutants would not be significant under a NEPA or CEQA analysis.

Table 5-7. At-Grade Emphasis LRT Alternative 2035 Operational Emissions

Selenium	7782-49-2	0.000062	0.54	0.0000080	0.070

Key:
TAC = toxic air contaminant
CAS = Chemical Abstracts Service
lbs/hr = pounds per hour
lbs/yr = pounds per year

5.5.2 CO Hot Spots

This analysis completed a CO hot spots evaluation that calculated localized impacts of CO concentrations at several intersections. A screening level analysis was completed using Appendix A of the CO Protocol to determine five intersections that would be most adversely affected under this alternative. The CAL3QHC model was used to evaluate whether CO concentrations at these intersections would exceed CAAQS or NAAQS for CO concentrations. Table 5-9 shows the results of the analysis.

5.5.3 Construction Emissions

The At-Grade Emphasis LRT Alternative would result in temporary emissions associated with construction. Construction would occur between and including the years 2014 and 2017.

5.5.3.1 Criteria Pollutants

Regional Construction Emissions

SCAQMD requires an analysis of construction-related emissions. This analysis estimates emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul truck emissions. Table 5-10 shows construction emissions by peak day of operation.

Table 5-9. Maximum Carbon Monoxide Concentrations at Roadway Intersections Under At-Grade Emphasis LRT Alternative (2035)

ID	Intersection	Traffic CO Conc. (ppm)		Max. Conc. (ppm)		Exceeds Threshold?	
		1-Hr	8-Hr	1-Hr	8-Hr	1-Hr	8-Hr
5	1st Street and Main Street	0.20	0.14	1.40	1.04	No	No
12	2nd Street and Hill Street	0.10	0.07	1.30	0.97	No	No
57	Temple Street and Main Street	0.30	0.21	1.50	1.11	No	No
58	Temple Street and Los Angeles Street	0.10	0.07	1.30	0.97	No	No
60	Temple Street and Alameda Street	0.20	0.14	1.40	1.04	No	No

Notes:
1-Hour CAAQS = 9.0 ppm; 1-Hour NAAQS = 9 ppm
8-Hour CAAQS = 20 ppm; 8-Hour NAAQS = 35 ppm

Emissions of VOC, NOx, CO, PM_{10}, and $PM_{2.5}$ would be significant, and mitigation measures would need to be implemented.

Localized Significance Thresholds

This analysis evaluated construction emissions on a regional level and compared them to SCAQMD's LSTs. The analysis used a series of look-up tables for NOx, CO, PM_{10}, and $PM_{2.5}$. These tables show maximum allowable emission levels, which vary based on project location, size (acreage), and distance to the nearest receptor.

Most project construction sites would be approximately one acre in size and located within 25 meters of the nearest receptors. Although receptors in the project area may be closer than 25

meters to construction, it is the minimum distance allowed in the LST. Table 5-11 shows onsite emissions for each construction activity and location.

Table 5-10. At Grade Emphasis LRT Alternative (2014-2017) Maximum Daily Construction Emissions

Location	Daily Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Onsite	281	2,088	1,088	3	131	120
Offsite	8	87	62	<1	21	6
Total	**289**	**2,175**	**1,150**	4	**151**	**126**
Threshold	75	100	550	150	150	55
Significant	Yes	Yes	Yes	No	No	Yes

*Note: Emissions greater than threshold of significance are shown in **bold**.*

Table 5-11. At-Grade Emphasis LRT Alternative Localized Significance Thresholds (LST) for Construction Emissions

ID	Phase	Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	**163**	65	**9**	**8**
2	Site Preparation	52	32	3	3
3	Cut & Cover Along Flower Street	**305**	150	**18**	**17**
4	Cut & Cover Flower/6th Street Station	**240**	127	**16**	**14**
5	U-Portal at Flower	**240**	127	**16**	**14**

Table 5-11. At-Grade Emphasis LRT Alternative Localized Significance Thresholds (LST) for Construction Emissions

ID	Phase	Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
6	Portal NE of Flower & 3rd	**225**	114	**14**	**13**
7	Cut & Cover 2nd/Hope Street Station	**240**	127	**16**	**14**
8	Portal into 2nd Street Tunnel	**274**	145	**17**	**16**
9	Surface Trackwork	**217**	108	**13**	**12**
10	Improvements at Alameda/Temple Streets	**274**	145	**17**	**16**
11	At-Grade Stations	**106**	51	**6**	**6**
12	Operation Systems Installation	**168**	96	**11**	**10**
Allowable Emissions		74	680	5	3

*Note: Emissions greater than threshold of significance are shown in **bold**.*

LST evaluation indicates that NOx, PM_{10}, and $PM_{2.5}$ emissions would be greater than maximum allowable levels during several construction phases. Impacts of these pollutants would have to be mitigated.

5.5.3.2 Toxic Air Contaminants

Construction of the At-Grade Emphasis LRT Alternative would indirectly result in increased emissions of TACs. Projected emissions under this alternative were compared to existing conditions (2009) for CEQA analysis. The analysis includes a Tier 1 HRA, which compares emission levels to published screening limits.

The analysis considered only acute risks because construction impacts are temporary. Speciation profiles from CARB were used to estimate emissions of TACs from construction. Since the OFFROAD model only provides emission results for criteria pollutants, it is necessary to use published profiles of the individual compounds emitted in the exhaust to create an inventory of TACs. The analysis used profiles for diesel vehicle exhaust (profile no.

425) and construction dust (profile no. 420). Although DPM is a toxic air contaminant, it does not cause acute health effects and was not included in the analysis.

Table 5-12 shows a summary of project-related emissions and Tier 1 HRA results. Diesel exhaust does not have an organic profile in CARB's speciation profiles; therefore, the analysis was restricted to inorganic emissions. Impacts from construction emissions under the At-Grade Emphasis LRT Alternative would not be significant under CEQA.

Table 5-12. At-Grade Emphasis LRT Alternative (2014-2017)
Construction Health Risk Assessment

TAC	CAS #	Emissions (lb/hr)	PSL (lb/hr)	PSI
Arsenic	7440-38-2	0.000028	0.00010	0.28
Chlorine	7782-50-5	0.0020	0.11	0.019
Copper	7440-50-8	0.00014	0.050	0.0028
Mercury	7439-97-6	0.00016	0.00090	0.18
Nickel	7440-02-0	0.00011	0.0030	0.035
ASI				0.52
Threshold				1

Key:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant

5.5.4 Cumulative Emissions

Operational emissions associated with the At-Grade Emphasis LRT Alternative would not exceed NEPA or CEQA significance thresholds for all criteria pollutants. It is difficult to specify what other projects will be undertaken in 2035. However, this alternative would result in substantial reductions in peak daily emissions of CO, NOx, SO_2, and PM_{10}. Impacts from emissions of these pollutants would not be cumulatively significant.

5.6 Underground Emphasis LRT Alternative

With the Underground Emphasis LRT Alternative, operation of the proposed light rail extension would run largely underground. This section summarizes emissions associated with this alternative.

5.6.1 Operational Emissions

Operational emissions associated with the Underground Emphasis LRT Alternative include emissions from highway traffic that would exist after this project alternative is operational. The proposed project would provide an alternative to automobile transportation in the region; therefore, it was necessary to evaluate highway traffic to assess how the proposed project would increase or decrease operational emissions from passenger vehicles.

5.6.1.1 Criteria Pollutant Emissions

Table 5-13 shows operational emissions from VMT under this alternative. Emissions of all pollutants would not be significant under a NEPA or CEQA analysis.

Table 5-13. Underground Emphasis LRT Alternative 2035 Operational Emissions

lbs/hr = pounds per hour
lbs/yr = pounds per year

5.6.2 CO Hot Spots

This analysis completed a CO hot spots evaluation that looked at localized impacts of CO concentrations at several intersections. A screening level analysis was completed using Appendix A of the CO Protocol to determine five intersections that could be most adversely affected under this alternative. The CAL3QHC model was used to evaluate whether CO concentrations at these intersections would exceed CAAQS or NAAQS for CO concentrations. Table 5-15 shows the results of the analysis.

Table 5-15. Maximum Carbon Monoxide Concentrations at Roadway Intersections Under Underground Emphasis LRT Alternative (2035)

ID	Intersection	Traffic CO Conc. (ppm)		Max. Conc. (ppm)		Exceeds Threshold?	
		1-Hr	8-Hr	1-Hr	8-Hr	1-Hr	8-Hr
5	1st Street and Main Street	0.20	0.14	1.40	1.04	no	no
12	2nd Street and Hill Street	0.10	0.07	1.30	0.97	no	no
57	Temple Street and Main Street	0.20	0.14	1.40	1.04	no	no
58	Temple Street and Los Angeles Street	0.20	0.14	1.40	1.04	no	no
60	Temple Street and Alameda Street	0.20	0.14	1.40	1.04	no	no

Notes:
1-Hour CAAQS = 9.0 ppm; 1-Hour NAAQS = 9 ppm
8-Hour CAAQS = 20 ppm; 8-Hour NAAQS = 35 ppm

5.6.3 Construction Emissions

The Underground Emphasis LRT Alternative would result in temporary emissions associated with construction. Construction would occur between and including the years 2014 and 2017.

The Underground Emphasis LRT Alternative has four construction sub-alternatives. The proposed 2nd/Hope Street station could be constructed using either SEM or cut & cover. Furthermore, a second proposed station could be built at either Broadway or Los Angeles Street. This emissions analysis evaluates all four construction options.

5.6.3.1 Criteria Pollutants

Regional Construction Emissions

SCAQMD requires an analysis of construction-related emissions. This analysis estimates emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul truck emissions. Table 5-16 shows construction emissions by peak day of operation.

Table 5-16. Underground Emphasis LRT Alternative (2014-2017)
Maximum Daily Construction Emissions

Location	Daily Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Streets Station (SEM) + Broadway Station Option						
Onsite	**300**	**2,247**	**1,189**	4	92	**83**
Offsite	8	89	59	<1	19	6
Total	**308**	**2,336**	**1,249**	4	111	**89**
2nd/Hope Streets Station (Cut & Cover) + Broadway Station Option						
Onsite	**304**	**2,280**	**1,210**	4	93	**84**
Offsite	9	94	62	<1	20	6
Total	**313**	**2,375**	**1,272**	4	113	**90**
2nd/Hope Streets Station (SEM) + Los Angeles Street Station						
Onsite	**300**	**2,247**	**1,189**	4	91	**83**
Offsite	8	85	58	<1	19	5
Total	**308**	**2,332**	**1,247**	4	110	**89**
2nd/Hope Streets Station (Cut & Cover) + Los Angeles Street Station						
Onsite	**304**	**2,280**	**1,210**	4	93	**84**
Offsite	8	91	61	<1	19	6
Total	**313**	**2,371**	**1,270**	4	113	**90**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold**.*

Emissions of VOC, NOx, CO, and $PM_{2.5}$ would be significant, and mitigation measures would need to be employed.

Localized Significance Thresholds

This analysis evaluated construction emissions on a regional level and compared them to SCAQMD's LSTs. The analysis used a series of look-up tables for NOx, CO, PM_{10}, and $PM_{2.5}$. These tables show maximum allowable emission levels, which vary based on project location, size (acreage), and distance to the nearest receptor.

Most project construction sites would be approximately one acre in size and located within 25 meters of the nearest receptors. Although receptors in the project area may be closer than 25 meters to construction, it is the minimum distance allowed in the LST. Table 5-17 shows onsite emissions for each construction activity and location.

LST evaluation indicates that NOx, PM_{10}, and $PM_{2.5}$ emissions would be greater than maximum allowable levels during several construction phases. Impacts of these pollutants would have to be mitigated.

Table 5-17. Underground Emphasis LRT Alternative Localized Significance Thresholds (LST) for Construction Emissions

ID	Phase	Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	**163**	65	**6**	**5**
2	Site Preparation	52	32	2	2
3	Cut & Cover Tunnel - Flower St	**307**	165	**13**	**11**
4	Cut & Cover Flower/5th Street Station	**307**	165	**13**	**11**
5	Approach to 2nd/Hope	**274**	145	**11**	**10**
6	2nd/Hope Station (SEM)	**265**	138	**11**	**10**
7	2nd/Hope Station (Cut & Cover)	**298**	159	**12**	**11**

Table 5-17. Underground Emphasis LRT Alternative Localized Significance Thresholds (LST) for Construction Emissions

Allowable Emissions		74	680	5	3

*Note: Emissions greater than threshold of significance are shown in **bold**.*

5.6.3.2 Toxic Air Contaminants

Construction of the Underground Emphasis LRT Alternative would indirectly result in increased emissions of TACs (Table 5-18). Projected emissions under this alternative were compared to existing conditions (2009) for CEQA analysis. The analysis includes a Tier 1 HRA, which compares emission levels to published screening limits. The analysis considered only acute risks because construction impacts are temporary.

Table 5-19 shows a summary of project-related emissions and Tier 1 HRA results. Diesel exhaust does not have an organic profile in CARB's speciation profiles; therefore, the analysis was restricted to inorganic emissions. Impacts from construction emissions under the Underground Emphasis LRT Alternative would not be significant under CEQA.

Table 5-18. Underground Emphasis LRT Alternative (2014-2017) Toxic Air Contaminant Construction Emissions

TAC	CAS #	Emissions (lbs/hr)			
		Alt 2a	Alt 2b	Alt 2c	Alt 2d

Threshold			1.0			

Key:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant
Note:
Alt 2a = 2nd/Hope Streets Station (SEM) + Broadway Station
Alt 2b = 2nd/Hope Streets Station (Cut & Cover) + Broadway Station
Alt 2c = 2nd/Hope Streets Station (SEM) + Los Angeles Street Station
Alt 2d = 2nd/Hope Streets Station (Cut & Cover) + Los Angeles Street Station

5.6.4 Cumulative Emissions

Operational emissions associated with the Underground Emphasis LRT Alternative would not exceed NEPA or CEQA significance thresholds for all criteria pollutants. It is difficult to specify what other projects will be undertaken in 2035. However, this alternative would result in substantial reductions in peak daily emissions of CO, NOx, SO_2, and PM_{10}. Impacts from emissions of these pollutants would not be cumulatively significant.

5.7 Fully Underground LRT Alternative – Little Tokyo Variation 1

With the Fully Underground LRT Alternative – Little Tokyo Variation 1, operation of the proposed light rail extension would run entirely underground. Under this alternative, opposing light rail train movements in the junction beneath the intersection of 1st and Alameda Streets would occur on the same level. This section summarizes emissions associated with this alternative.

5.7.1 Operational Emissions

Operational emissions associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 include emissions from highway traffic that would exist after this project alternative is operational. The proposed project would provide an alternative to automobile transportation in the region; therefore, it was necessary to evaluate highway traffic to assess how the proposed project would increase or decrease operational emissions from passenger vehicles.

5.7.1.1 Criteria Pollutant Emissions

Table 5-20 shows operational emissions from VMT under this alternative. Emissions of all pollutants would not be significant under a NEPA or CEQA analysis.

Table 5-20. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2035) Operational Emissions

Type	Emissions (lbs/day)					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$

Note: Negative numbers (beneficial impacts) are shown in parentheses.

5.7.1.2 Toxic Air Contaminant Emissions

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would indirectly result in increased emissions of TACs from highway traffic. Emissions under this alternative were compared to existing conditions (2009) for informational purposes only. Since the EMFAC model only provides emission results for criteria pollutants, it is necessary to use published profiles of the individual compounds emitted in the exhaust to create an inventory of TACs.

Table 5-21 shows a summary of project-related emissions. The emission increment (Fully Underground LRT Alternative – Little Tokyo Variation 1) is provided for informational purposes, but is not used for significance determinations as noted in Section 3.1.2.1.

Table 5-21. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2035) Toxic Air Contaminant Operational Emissions

TAC	CAS	Emissions		Emission Increment	
		(lb/hr)	(lb/yr)	(lb/hr)	(lb/yr)

5.7.2 CO Hot Spots

This analysis completed a CO hot spots evaluation that looked at localized impacts of CO concentrations at several intersections. A screening level analysis was completed using Appendix A of the CO Protocol to determine five intersections that could be most adversely affected under this alternative. The CAL3QHC model was used to evaluate whether CO concentrations at these intersections would exceed CAAQS or NAAQS for CO concentrations. Table 5-22 shows the results of the analysis.

5.7.3 Construction Emissions

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in temporary emissions associated with construction. Construction would occur between and including the years 2014 and 2017.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 has two construction sub-alternatives. The proposed 2nd/Hope Street station could be constructed using either SEM or cut & cover. This emissions analysis evaluates both construction options.

Table 5-22. Maximum Carbon Monoxide Concentrations at Roadway Intersections Under Fully Underground LRT Alternative (2035)

ID	Intersection	Traffic CO Conc. (ppm)		Max. Conc. (ppm)		Exceeds Threshold?	
		1-Hr	8-Hr	1-Hr	8-Hr	1-Hr	8-Hr
5	1st Street and Main Street	0.20	0.14	1.40	1.04	no	no
12	2nd Street and Hill Street	0.10	0.07	1.30	0.97	no	no

58	Temple Street and Los Angeles Street	0.20	0.14	1.40	1.04	no	no
60	Temple Street and Alameda Street	0.20	0.14	1.40	1.04	no	no

Note: CO Hot Spots evaluation the same for both variations of Fully Underground LRT Alternative.

5.7.3.1 Criteria Pollutants

Regional Construction Emissions

SCAQMD requires an analysis of construction-related emissions. This analysis estimates emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul truck emissions. Table 5-23 shows construction emissions by peak day of operation.

Table 5-23. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2014-2017) Maximum Daily Construction Emissions

Location	Daily Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Station (SEM)						
Onsite	**367**	**2,596**	**1,474**	5	105	**95**
Offsite	10	104	69	<1	24	7
Total	**377**	**2,699**	**1,542**	5	129	**102**
2nd/Hope Station (Cut & Cover)						
Onsite	**376**	**2,670**	**1,523**	5	108	**98**
Offsite	10	107	71	<1	24	7
Total	**386**	**2,777**	**1,593**	5	133	**105**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold**.*

Emissions of VOC, NOx, CO, and $PM_{2.5}$ would be significant, and mitigation measures would need to be employed.

Localized Significance Thresholds

This analysis evaluated construction emissions on a regional level and compared them to SCAQMD's LSTs. The analysis used a series of look-up tables for NOx, CO, PM_{10}, and $PM_{2.5}$. These tables show maximum allowable emission levels, which vary based on project location, size (acreage), and distance to the nearest receptor.

Most project construction sites would be approximately one acre in size and located within 25 meters of the nearest receptors. Although receptors in the project area may be closer than 25 meters to construction, it is the minimum distance allowed in the LST. Table 5-24 shows onsite emissions for each construction activity and location.

LST evaluation indicates that NOx, PM_{10}, and $PM_{2.5}$ emissions would be greater than maximum allowable levels during several construction phases. Impacts of these pollutants would have to be mitigated.

Table 5-24. Fully Underground LRT Alternative – Little Tokyo Variation 1 Localized Significance Thresholds (LST) for Construction Emissions

ID	Phase	Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	**163**	65	**6**	**5**
2	Site Preparation	52	32	2	2
3	Cut & Cover Tunnel - Flower St	**307**	165	**13**	**11**

		NOx	CO	PM_{10}	$PM_{2.5}$
16	Operation Systems Installation	**168**	96	**6**	**6**
Allowable Emissions		74	680	5	3

*Note: Emissions greater than threshold of significance are shown in **bold**.*

5.7.3.2 Toxic Air Contaminants

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would indirectly result in increased emissions of TACs. Projected emissions under this alternative were compared to existing conditions (2009) for CEQA analysis. The analysis includes a Tier 1 HRA, which compares emission levels to published screening limits. The analysis considered only acute risks because construction impacts are temporary.

Table 5-25 shows a summary of project-related emissions and Tier 1 HRA results. Diesel exhaust does not have an organic profile in CARB's speciation profiles; therefore, the analysis was restricted to inorganic emissions. Impacts from construction emissions under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not be significant under CEQA.

5.7.4 Cumulative Emissions

Operational emissions associated with the Fully Underground LRT Alternative - Little Tokyo Variation 1 would not exceed NEPA or CEQA significance thresholds for all criteria pollutants. It is difficult to specify what other projects will be undertaken in 2035. However, this alternative would result in substantial reductions in peak daily emissions of CO, NOx, SO_2, and PM_{10}. Impacts from emissions of these pollutants would not be cumulatively significant.

Table 5-25. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2014-2017) Toxic Air Contaminant Construction Emissions and HRA

TAC	CAS #	Emissions (lbs/hr)		PSL	PSI	
		Alt 3a	Alt 3b	(lb/hr)	Alt 3a	Alt 3b
Arsenic	7440-38-2	0.000023	0.000024	0.00010	0.23	0.24
Chlorine	7782-50-5	0.0018	0.0019	0.11	0.017	0.018
Copper	7440-50-8	0.00012	0.00012	0.050	0.0024	0.0025
Mercury	7439-97-6	0.00013	0.00014	0.00090	0.15	0.15
Nickel	7440-02-0	0.000088	0.000091	0.0030	0.029	0.030
ASI					0.43	0.44
Threshold					1.0	

Key:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant
Note:
Alt 3a = 2nd/Hope Streets Station (SEM)
Alt 3b = 2nd/Hope Streets Station (Cut & Cover)

5.8 Fully Underground LRT Alternative – Little Tokyo Variation 2

With the Fully Underground LRT Alternative – Little Tokyo Variation 2, operation of the proposed light rail extension would run entirely underground. Under this alternative, tracks at the proposed 2nd/Central Avenue station and the junction beneath the intersection of 1st and Alameda Streets would run on two levels. There would be two single-track portals in the median of 1st Street. This section summarizes emissions associated with this alternative.

5.8.1 Operational Emissions

Operational emissions associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 include emissions from highway traffic that would exist after this project

alternative is operational. The proposed project would provide an alternative to automobile transportation in the region; therefore, it was necessary to evaluate highway traffic to assess how the proposed project would increase or decrease operational emissions from passenger vehicles.

5.8.1.1 Criteria Pollutant Emissions

Table 5-26 shows operational emissions from VMT under this alternative. Emissions of all pollutants would not be significant under a NEPA or CEQA analysis. Emissions of SO_2, PM_{10}, and $PM_{2.5}$ would exceed daily thresholds of significance under CEQA. Emissions of criteria pollutants would not exceed NEPA thresholds and would not be significant.

5.8.1.2 Toxic Air Contaminant Emissions

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would indirectly result in increased emissions of TACs from highway traffic. Emissions under this alternative were compared to existing conditions (2009) for informational purposes only. Since the EMFAC model only provides emission results for criteria pollutants, it is necessary to use published profiles of the individual compounds emitted in the exhaust to create an inventory of TACs.

Table 5-26. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2035) Operational Emissions

Type	Emissions (lbs/day)					
	VOC	CO	NOx	SO_2	PM_{10}	$PM_{2.5}$
CEQA Analysis						
Project Emissions	21,100	961,900	63,200	5,500	470,400	103,800

lbs/hr = pounds per hour
lbs/yr = pounds per year

5.8.2 CO Hot Spots

The CO Hot Spots analysis mirrors that of the Fully Underground LRT Alternative – Little Tokyo Variation 1. Table 5-22 shows the results of the analysis.

5.8.3 Construction Emissions

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in temporary emissions associated with construction. Construction would occur between and including the years 2014 and 2017.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 has two construction sub-alternatives. The proposed 2nd/Hope Street station could be constructed using either SEM or cut & cover. This emissions analysis evaluates both construction options.

5.8.3.1 Criteria Pollutants

Regional Construction Emissions

SCAQMD requires an analysis of construction-related emissions. This analysis estimates emissions from off-road construction equipment, fugitive dust, construction worker

commuting, and haul truck emissions. Table 5-28 shows construction emissions by peak day of operation.

Table 5-28. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2014-2017) Maximum Daily Construction Emissions

Location	Daily Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Streets Station (SEM)						
Onsite	**367**	**2,596**	**1,474**	5	105	**95**
Offsite	10	102	72	<1	25	7
Total	**377**	**2,698**	**1,545**	5	131	**102**
2nd/Hope Streets Station (Cut & Cover)						
Onsite	**176**	**2,670**	**1,523**	5	109	**98**
Offsite	10	107	74	<1	26	7
Total	**386**	**2,777**	**1,597**	5	135	**105**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold**.*

Localized Significance Thresholds

This analysis evaluated construction emissions on a regional level and compared them to SCAQMD's LSTs. The analysis used a series of look-up tables for NOx, CO, PM_{10}, and $PM_{2.5}$. These tables show maximum allowable emission levels, which vary based on project location, size (acreage), and distance to the nearest receptor.

Most project construction sites would be approximately one acre in size and located within 25 meters of the nearest receptors. Although receptors in the project area may be closer than 25 meters to construction, it is the minimum distance allowed in the LST. Table 5-29 shows onsite emissions for each construction activity and location.

Table 5-29. Fully Underground LRT Alternative – Little Tokyo Variation 2 Localized Significance Thresholds (LST) for Construction Emissions

ID	Phase	Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	**163**	65	**6**	**5**
2	Site Preparation	52	32	2	2
3	Cut & Cover Tunnel - Flower St	**307**	165	**13**	**11**
4	Cut & Cover Flower/5th Street Station	**307**	165	**13**	**11**
5	Approach to 2nd/Hope	**225**	114	**9**	**8**
6	2nd/Hope Streets Station (SEM)	**217**	108	**9**	**8**
7	2nd/Hope Streets Station (Cut & Cover)	**298**	159	**12**	**11**
8	TBM Launch Site	**225**	114	**9**	**8**
9	TBM Tunnel - 2nd St	**298**	159	**12**	**11**
10	Cut & Cover - 2nd/Broadway Station	**307**	165	**13**	**11**
11	Cut & Cover Tunnel from TBM	**225**	114	**9**	**8**
12	Cut & Cover 2nd/Central Ave Station	**265**	138	**11**	**10**
13	Cut & Cover to East Portal	**201**	111	**8**	**7**
14	Cut & Cover to North Portal	**275**	161	**11**	**10**
15	1st/Alameda Junction	**217**	108	**9**	**8**
16	Operation Systems Installation	**168**	96	**6**	**6**
Allowable Emissions		74	680	5	3

*Note: Emissions greater than threshold of significance are shown in **bold**.*

LST evaluation indicates that NOx, PM_{10}, and $PM_{2.5}$ emissions would be greater than maximum allowable levels during several construction phases. Impacts of these pollutants would have to be mitigated.

5.8.3.2 Toxic Air Contaminants

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would indirectly result in increased emissions of TACs. Projected emissions under this alternative were compared to existing conditions (2009) for CEQA analysis. The analysis includes a Tier 1 HRA, which compares emission levels to published screening limits. The analysis considered only acute risks because construction impacts are temporary.

Table 5-30 shows a summary of project-related emissions and Tier 1 HRA results. Diesel exhaust does not have an organic profile in CARB's speciation profiles; therefore, the analysis was restricted to inorganic emissions. Impacts from construction emissions under the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not be significant under CEQA.

Table 5-30. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2014-2017) Toxic Air Contaminant Construction Emissions and HRA

TAC	CAS #	Emissions (lbs/hr)		PSL	PSI	
		Alt 4a	Alt 4b	(lb/hr)	Alt 4a	Alt 4b
Arsenic	7440-38-2	0.000024	0.000025	0.00010	0.24	0.25
Chlorine	7782-50-5	0.0019	0.0019	0.11	0.018	0.019
Copper	7440-50-8	0.00012	0.00012	0.050	0.0024	0.0025
Mercury	7439-97-6	0.00013	0.00014	0.00090	0.15	0.15
Nickel	7440-02-0	0.000089	0.000092	0.0030	0.030	0.031
ASI					0.43	0.45
Threshold					1.0	

Key:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)

TAC = toxic air contaminant
Note:
Alt 4a = 2nd/Hope Streets Station (SEM)
Alt 4b = 2nd/Hope Streets Station (Cut & Cover)

5.8.4 Cumulative Emissions

Operational emissions associated with the Fully Underground LRT Alternative - Little Tokyo Variation 2 would not exceed NEPA or CEQA significance thresholds for all criteria pollutants. It is difficult to specify what other projects will be undertaken in 2035. However, this alternative would result in substantial reductions in peak daily emissions of CO, NOx, SO_2, and PM_{10}. Impacts from emissions of these pollutants would not be cumulatively significant.

6.0 POTENTIAL MITIGATION MEASURES

This section describes recommendations for mitigation measures that could be used to reduce significant emissions from project construction and operations.

6.1 Potential Construction Mitigation Measures

Emissions of VOC, NOx, CO, and $PM_{2.5}$ would be significant during construction for all build alternatives and emissions of PM_{10} would be significant during construction for the At-Grade Emphasis LRT Alternative. Exhaust emissions from the operation of off-road vehicles are responsible for most of the emissions during construction. As a result, reducing emissions from these sources is essential.

Off-road engines could be retrofitted with add-on control devices such as catalytic oxidizers and diesel particulate filters, which would typically reduce NOx emissions by up to 40 percent and PM_{10} emissions by 85 percent; however, it would not reduce emissions of VOC and CO. It is expected that $PM_{2.5}$ emissions would be reduced to similar levels as PM_{10}.

To control emissions of other pollutants (VOC and CO), Metro could require contractors to use to use up-to-date (2014 to 2017) equipment during project construction. It is not uncommon for old construction equipment to be used at project sites because diesel engines have long lifetimes and can last over 30 years. Engine technology has improved with time, and requiring construction contractors to use up-to-date (2014 to 2017) engines could significantly reduce emissions.

6.1.1 Regional Construction Emissions

Separate emissions were calculated to evaluate how using up-to-date engines during the year 2014 to 2017 project construction period could reduce emissions of criteria pollutants. The results of this analysis are provided in Table 6-1.

Mitigated emissions of VOC, NOx, and CO still exceed the CEQA thresholds of significance for construction and are therefore significant and unavoidable. Although the regional construction impacts remain significant, the benefits of the project override the temporary adverse effects associated with construction. The proposed Regional Connector Transit Corridor project would improve transportation in the region, helping to remove vehicles from the region's roadways. Operational emissions in the future build alternatives are less than the baseline emissions for several pollutants.

Table 6-1. Mitigated (2014-2017) Maximum Daily Construction Emissions for All Alternatives

Alternative	Mitigated Daily Emissions (lbs/day)					
	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
At-Grade Emphasis LRT Alternative	**119**	**432**	**908**	4	27	12
Underground Emphasis LRT Alternative						
SEM/Broadway	**144**	**473**	**978**	4	27	12
Cut & Cover/ Broadway	**147**	**488**	**998**	4	28	12
SEM/Los Angeles	**144**	**469**	**977**	4	27	12
Cut & Cover/Los Angeles Street	**146**	**485**	**997**	4	28	12
Fully Underground LRT Alternative – Little Tokyo Variation 1						
SEM	**189**	**602**	**1,266**	5	35	16
Cut & Cover	**193**	**626**	**1,304**	5	36	16
Fully Underground LRT Alternative – Little Tokyo Variation 2						
SEM	**188**	**601**	**1,268**	5	37	16
Cut & Cover	**193**	**626**	**1,307**	5	38	16
Threshold	75	100	550	150	150	55

*Note: Emissions greater than threshold of significance are shown in **bold**.*

6.1.2 Localized Significance Thresholds

Mitigated emissions were also compared to the SCAQMD's LST to evaluate significance.

6.1.2.1 At-Grade Emphasis LRT Alternative

Table 6-2 summarizes mitigated emissions for each construction activity and site for the At-Grade Emphasis LRT Alternative.

Table 6-2. At-Grade Emphasis LRT Alternative Localized Significance Thresholds (LST) for Mitigated Construction Emissions

ID	Phase	Mitigated Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	14	51	<1	<1
2	Site Preparation	10	17	<1	<1
3	Cut & Cover Along Flower Street	46	110	1	1
4	Cut & Cover Flower/6th Street Station	45	107	1	1
5	U-Portal at Flower	44	103	1	1
6	Portal NE of Flower & 3rd	36	91	1	1
7	Cut & Cover 2nd/Hope Street Station	45	107	1	1
8	Portal into 2nd Street Tunnel	46	110	1	1
9	Surface Trackwork	34	84	1	1
10	Improvements at Alameda/Temple Streets	47	114	1	1
11	At-Grade Stations	13	39	<1	<1
12	Operation Systems Installation	27	82	1	1
Allowable Emissions		74	680	5	3

Mitigated emissions for each construction site are less than the maximum allowable emissions under the LST methodology. Localized emissions from mitigated construction activities are therefore less than significant for the At-Grade Emphasis LRT Alternative.

6.1.2.2 Underground Emphasis LRT Alternative

Table 6-3 provides a summary of mitigated emissions for each construction activity and site for the Underground Emphasis LRT Alternative.

Table 6-3. Underground Emphasis LRT Alternative Localized Significance Thresholds (LST) for Mitigated Construction Emissions

ID	Phase	Mitigated Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	14	51	<1	<1
2	Site Preparation	10	18	<1	<1
3	Cut & Cover Tunnel - Flower St	58	131	1	1
4	Cut & Cover Flower/5th Street Station	58	131	1	1
5	Approach to 2nd/Hope	47	114	1	1
6	2nd/Hope Streets Station (SEM)	46	107	1	1
7	2nd/Hope Streets Station (Cut & Cover)	56	125	1	1
8	TBM Launch Site	35	87	1	1
9	TBM Tunnel - 2nd St	56	125	1	1
10	Cut & Cover 2nd Street Station (Broadway option)	58	131	1	1
11	Cut & Cover 2nd Street Station (Los Angeles Street option)	58	131	1	1
12	U-Portal at 2nd/Central Streets	46	107	1	1
13	Improvements at 1st/Alameda Streets	36	91	1	1
14	Operation Systems Installation	27	82	1	1
Allowable Emissions		74	680	5	3

Mitigated emissions for each construction site are less than the maximum allowable emissions under the LST methodology. Localized emissions from mitigated construction activities are therefore less than significant for the Underground Emphasis LRT Alternative.

6.1.2.3 Fully Underground LRT Alternative – Little Tokyo Variation 1

Table 6-4 summarizes mitigated emissions for each construction activity and site for the Fully Underground LRT Alternative – Little Tokyo Variation 1.

Table 6-4. Fully Underground LRT Alternative – Little Tokyo Variation 1 Localized Significance Thresholds (LST) for Mitigated Construction Emissions

ID	Phase	Mitigated Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	14	51	<1	<1
2	Site Preparation	10	18	<1	<1
3	Cut & Cover Tunnel - Flower St	58	131	1	1
4	Cut & Cover Flower/5th Street Station	58	131	1	1
5	Approach to 2nd/Hope	36	94	1	1
6	2nd/Hope Streets Station (SEM)	35	88	1	1
7	2nd/Hope Streets Station (Cut & Cover)	56	125	1	1
8	TBM Launch Site	35	87	1	1
9	TBM Tunnel - 2nd St	56	125	1	1
10	Cut & Cover - 2nd/Broadway Station	58	131	1	1
11	Cut & Cover Tunnel from TBM	36	91	1	1
12	Cut & Cover 2nd/Central Ave Station	46	107	1	1
13	Cut & Cover to East Portal	36	94	1	1

Table 6-4. Fully Underground LRT Alternative – Little Tokyo Variation 1 Localized Significance Thresholds (LST) for Mitigated Construction Emissions

ID	Phase	Mitigated Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
14	Cut & Cover to North Portal	58	131	1	1
15	1st/Alameda Junction	35	88	1	1
16	Operation Systems Installation	27	82	1	1
Allowable Emissions		74	680	5	3

Mitigated emissions for each construction site are less than the maximum allowable emissions under the LST methodology. Localized emissions from mitigated construction activities are therefore less than significant for the Fully Underground LRT Alternative – Little Tokyo Variation 1.

6.1.2.4 Fully Underground LRT Alternative – Little Tokyo Variation 2

Table 6-5 summarizes mitigated emissions for each construction activity and site for the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Mitigated emissions for each construction site are less than the maximum allowable emissions under the LST methodology. Localized emissions from mitigated construction activities are therefore less than significant for the Fully Underground LRT Alternative – Little Tokyo Variation 2.

6.2 Potential Operational Mitigation Measures

Operational NOx emissions for the TSM Alternative would be significant under NEPA. Use of alternative fuels for the TSM buses may offset the significance of this impact, but this will need to be confirmed through future modeling. As such, it is assumed that the TSM Alternative's NOx emissions may remain significant after mitigation. Operational emissions were not found to be significant for either CEQA or NEPA for any of the other alternatives. As a result, no further mitigation measures are required for operational emissions.

Table 6-5. Fully Underground LRT Alternative – Little Tokyo Variation 2 Localized Significance Thresholds (LST) for Mitigated Construction Emissions

ID	Phase	Mitigated Maximum Daily Onsite Emissions (lbs/day)			
		NOx	CO	PM_{10}	$PM_{2.5}$
1	Pre-Construction	14	51	<1	<1
2	Site Preparation	10	18	<1	<1
3	Cut & Cover Tunnel - Flower St	58	131	2	1

13	Cut & Cover to East Portal	36	94	1	1
14	Cut & Cover to North Portal	58	131	1	1
15	1st/Alameda Junction	35	88	1	1
16	Operation Systems Installation	27	82	1	1
Allowable Emissions		74	680	5	3

7.0 CONCLUSIONS

This section summarizes conclusions for both NEPA and CEQA based on the air quality impact analysis results.

7.1 No Build Alternative

The No Build Alternative is used to calculate increments among future build alternatives and does not have its own NEPA threshold of significance.

7.2 TSM Alternative

Operational emissions for the TSM Alternative, including both buses and regional traffic, were found to be less than significant for CEQA and significant under NOx for NEPA. The alternative does not include any construction and therefore would have less than significant construction impacts.

7.3 At-Grade Emphasis LRT Alternative

Operational emissions for the At-Grade Emphasis LRT Alternative were less than significant for both CEQA and NEPA. Unmitigated regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would be greater than the significance criteria under CEQA and mitigation would be necessary. Even if mitigation required up-to-date (2014 to 2017) equipment during construction, regional construction emissions would still remain significant and unavoidable.

Although regional construction emissions under the At-Grade Emphasis LRT Alternative would be significant and unavoidable, the net benefits to air quality by reducing regional VMT would override the temporary adverse impacts.

7.4 Underground Emphasis LRT Alternative

Operational emissions for the Underground Emphasis LRT Alternative were less than significant for both CEQA and NEPA. Unmitigated regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would be greater than the significance criteria under CEQA and mitigation would be necessary. Even if mitigation required up-to-date (2014 to 2017) equipment during construction, regional construction emissions would still remain significant and unavoidable. Localized construction emissions would be less than the maximum allowable emissions under the LST methodology and therefore less than significant.

Although regional construction emissions would be significant and unavoidable, the net benefits to air quality by reducing regional VMT under the build alternative would override the temporary adverse impacts.

7.5 Fully Underground LRT Alternative

Operational emissions for the Fully Underground LRT Alternative (Little Tokyo Variations 1 and 2) were less than significant for both CEQA and NEPA. Unmitigated regional construction emissions of VOC, NOx, CO, and $PM_{2.5}$ would be greater than the significance criteria under CEQA and mitigation would be necessary. Even if mitigation required only current year (2014 to 2017) equipment during construction, regional construction emissions would remain significant and unavoidable. Localized construction emissions would be less than the maximum allowable emissions under the LST methodology and therefore less than significant.

Although regional construction emissions would be significant and unavoidable, the net benefits to air quality by reducing regional VMT would override the temporary adverse impacts.

1.0 SUMMARY

This technical memorandum discusses the results of a climate change analysis of the proposed Regional Connector Transit Corridor project completed in compliance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). Potential climate change-related impacts associated with greenhouse gas (GHG) emissions from the proposed construction and operation of the Regional Connector Transit Corridor project are summarized in this section. The analysis considers emissions inventories for electricity used for light rail operations, regional traffic, bus operations, construction, and calculations of potential contributions by build alternatives to GHG reduction.

This analysis considers three common GHG pollutants typically included in mandatory and voluntary reporting programs: carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Non-CO_2 pollutants are modified by global warming potential (GWP) factors that reflect the degree to which these pollutants affect climate change compared to CO_2. The addition of each GHG with its GWP is known as CO_2 equivalent (CO_2e).

This memo discusses potential impacts from both construction activities and operations. For operations-related impacts, the analysis provides a comparison between the climate change conditions that currently exist without the proposed project (i.e., existing conditions in 2009)and climate change conditions projected to occur in the future with implementation of each alternative being considered for the proposed project (i.e., full implementation of each alternative in the future horizon year of 2035). The focus of the operations impact analysis is on the change in vehicle traffic and light rail transit vehicles, and associated air pollutant emissions, that would result from implementation of each alternative. While this type of direct comparison can help characterize how existing climate change conditions may be different in the future with implementation of the proposed project, it is not a true representation of the impacts directly attributable to the project. This is because background traffic conditions will change substantially between 2009 and 2035 due to regional population growth and development that is anticipated to occur irrespective of the Regional Connector Transit Corridor project. A more accurate and meaningful delineation of climate change impacts directly attributable to project-related changes in traffic is achieved through a comparison of a proposed future alternative (2035) and the No Build Alternative (2035).

1.1 Operational Emissions

A summary of operational emissions from regional traffic, compressed natural gas (CNG) buses, and electricity used to power trains and new stations for each alternative is presented in Table 1-1. A summary of incremental emissions as compared to existing conditions (2009) is provided in Table 1-2 for informational purposes only, and a summary of incremental emissions as compared to the No Build Alternative (2035) is provided in Table 1-

3. GHG emissions for each future scenario, including the No Build Alternative, are greater than emissions in 2009 because of a forecasted increase in automobile vehicle miles traveled (VMT) between future conditions and the baseline.

A future increase in emissions beyond those for existing conditions stems from predicted growth in regional traffic as a result of a forecasted increase in population in the region and other factors unrelated to the proposed project. According to the Southern California Association of Government's (SCAG's) Regional Transportation Plan (2008), the SCAG region is the second most populated metropolitan area in the United States.

Half of the population in California lives in the SCAG region, and 1 in 17 people in the United States resides in the area. SCAG predicts that 5.9 million people would be added to the SCAG region's population between 2005 and 2035, bringing the State's population to 24 million people in 2035. As shown in Table 1-3, the project is expected to reduce emissions when compared to the No Build Alternative and would have a beneficial impact on GHG emissions. If not for the project, emissions in the horizon year (2035) would likely be greater than what is currently shown in Table 1-2.

This type of quantitative analysis does not fully show the expected benefits from improved public transit in the region. As shown by the reduction in VMT between the build alternatives and No Build Alternative, increasing public transportation options in an urban area is expected to reduce automobile usage and associated emissions in a four-county region (Los Angeles, Orange, Riverside, and San Bernardino). Studies, including a twenty-year study evaluating land-use development in the vicinity of the San Francisco Bay Area Rapid Transit (BART) system, indicate that growth in commercial, industrial, mixed use, and residential areas may occur near certain transit corridors (Cervero and Landis 1997).

International experience has shown that a high-quality, urban, regional transportation system can promote environmentally sustainable, livable communities, especially when part of wider regional policies such as those that discourage car traffic through a city or promote road pricing (Priemus and Konings 2001). The Regional Connector Transit Corridor project would support development projects stressing density and pedestrian activity along the proposed alignment.

The proposed Regional Connector Transit Corridor project is a key link in the regional light rail network. The proposed project would provide a direct connection from the underground 7th Street/Metro Center Station to the Metro Gold Line, thereby avoiding multiple transfers under the current rail and bus network. Additionally, the proposed project would ultimately improve connections with the Metro Gold Line to the San Gabriel Valley and the Metro Expo Line to Santa Monica as well as additional projects proposed for the region.

The proposed project would increase ridership by improving the light-rail connections across the region. As shown in Figure 1-1, each of the build alternatives is expected to increase the number of transit trips (i.e., bus, urban rail, and commuter rail) as compared to the No Build TSM Alternative. Consequently, automobile-related trips would decrease. This relationship highlights the importance of the Regional Connector Transit Corridor project in reducing regional VMT and encouraging area residents to use transit options other than the automobile. The proposed project is consistent with the overall goals stated in Metro's Baseline Sustainability Report (2009).

The addition of light rail stations can provide benefits to local housing and mixed land uses, providing residents an alternative to automobile transportation. The proposed Regional Connector Transit Corridor project is consistent with the City of Los Angeles' *Green LA Plan* (City of Los Angeles 2007). The Plan seeks to extend the regional rail network to increase regional mobility and as a method to reduce impacts associated with climate change.

Table 1-1. Summary of Operational GHG Emissions for Each Alternative

Alternative	Annual Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[4]
Existing Conditions (2009)[1, 2]	40,552,000	65,100	5,952,000	46,569,100
No Build Alternative (2035)[1, 2]	106,521,100	58,800	9,858,000	116,437,900
TSM Alternative (2035)[3]				
Regional Traffic	106,463,200	58,800	9,858,000	116,380,000
CNG Buses	3,100	500	50	3,650
Total	106,466,300	59,300	9,858,050	116,383,650
At-Grade Emphasis LRT Alternative (2035)[2]				
Light Rail Operation	1,100	1	2	1,100
New Station Operation	100	<1	<1	100
Regional Traffic	106,457,400	58,800	9,858,000	116,374,200
Total	106,458,600	58,800	9,858,000	116,375,400

Table 1-1. Summary of Operational GHG Emissions for Each Alternative

Alternative	Annual Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[4]
Underground Emphasis LRT Alternative (2035)[2]				
Light Rail Operation	1,100	1	2	1,100
New Station Operation	100	<1	<1	100
Regional Traffic	106,455,200	58,800	9,858,000	116,372,000
Total	106,456,400	58,800	9,858,000	116,373,200
Fully Underground LRT Alternative – Little Tokyo Variation 1 (2035)[2]				
Light Rail Operation	1,000	1	2	1,000
New Station Operation	200	<1	<1	200
Regional Traffic	106,453,200	58,800	9,858,000	116,370,000
Total	106,454,400	58,800	9,858,000	116,371,200
Fully Underground LRT Alternative – Little Tokyo Variation 2 (2035)[2]				
Light Rail Operation	1,000	1	2	1,000
New Station Operation	200	<1	<1	200
Regional Traffic	106,453,000	58,800	9,858,000	116,369,800
Total	106,454,200	58,800	9,858,000	116,371,000

Notes:
[1] *Operational emissions only include those associated with regional traffic.*
[2] *Emissions associated with buses not included because the alternatives would not cause a change in bus operation or routes.*
[3] *The TSM Alternative would add bus rapid transit (BRT) lanes and additional bus routes but would not include improvements to the light rail network.*
[4] *Totals may vary slightly due to rounding*

Table 1-2. Summary of Incremental Emissions for Each Alternative as Compared to Existing Conditions (2009)

Alternative	Annual Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total
No Build Alternative	65,969,100	(6,300)	3,906,000	69,868,800
TSM Alternative	65,914,300	(5,800)	3,906,050	69,814,550
At-Grade Emphasis LRT Alternative	65,906,600	(6,300)	3,906,000	69,806,300
Underground Emphasis LRT Alternative	65,904,400	(6,300)	3,906,000	69,804,100
Fully Underground LRT Alternative – Little Tokyo Variation 1	65,902,400	(6,300)	3,906,000	69,802,100
Fully Underground LRT Alternative – Little Tokyo Variation 2	65,902,200	(6,300)	3,906,000	69,801,900

Note: Operational emissions include regional traffic (Los Angeles, Orange, Riverside, and San Bernardino Counties), CNG buses (TSM Alternative only), and light rail plus new stations (excluding No Build and TSM Alternatives). Totals may vary slightly due to rounding.

Table 1-3. Summary of Incremental Emissions for Each Alternative As Compared to No Build Alternative (2035)

Alternative	Annual Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total
TSM Alternative	(54,800)	500	50	(54,250)
At-Grade Emphasis LRT Alternative	(62,500)	1	2	(62,500)
Underground Emphasis LRT Alternative	(64,700)	1	2	(65,700)
Fully Underground LRT Alternative – Little Tokyo Variation 1	(66,700)	1	2	(66,700)

Table 1-3. Summary of Incremental Emissions for Each Alternative As Compared to No Build Alternative (2035)

Alternative	Annual Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total
Fully Underground LRT Alternative – Little Tokyo Variation 2	(66,900)	1	2	(66,900)

Note: Operational emissions include regional traffic (Los Angeles, Orange, Riverside, and San Bernardino Counties), CNG buses (TSM Alternative only), and light rail plus new stations (excluding No Build and TSM Alternatives). Totals may vary slightly due to rounding.

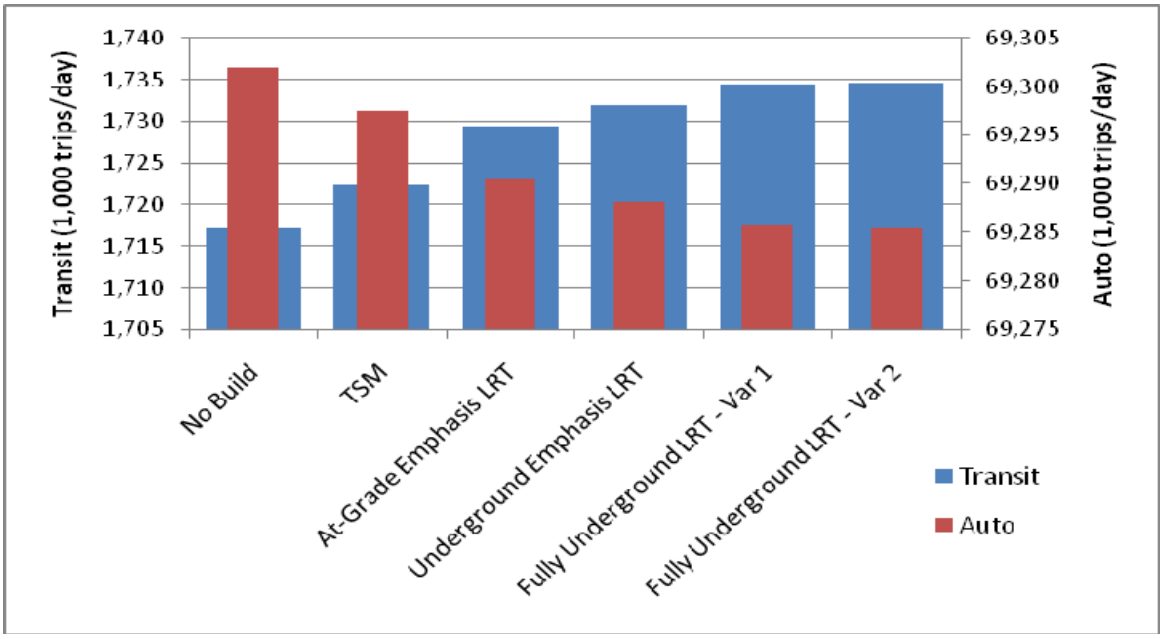

Figure 1-1. Travel Forecasting by Mode Choice (System-Wide Linked Trips)

Key:
TSM = Transportation System Management
LRT = Light rail transit

A 2008 study by Mikhail Chester and Arpad Horvath reviewed the life-cycle impacts of various transit modes including automobiles, buses, rail, and air. The study estimated GHG emissions from the life-cycle of a transit mode, including operations, maintenance, infrastructure, and other emission sources. Figure 1-2 shows the relative GHG emissions by each transit mode.

Light rail transportation, such as the San Francisco Municipal Railway (Muni) and the Massachusetts Bay Transportation Authority Green Line, as shown in Figure 1-2, produces substantially lower emissions than those associated with automobile travel. Based on this study, it would be expected that increases in light rail networks in the Los Angeles region would substantially offset GHG emissions associated with automobile travel.

1.2 Construction Emissions

Construction activities required for all build alternatives, (defined as all alternatives except the No Build Alternative and the TSM Alternative), would result in GHG emissions from diesel-fueled construction equipment, construction worker commuting, and haul trucks. Table 1-4 provides a summary of GHG emissions from these emission sources.

Table 1-4. Summary of Annual Construction GHG Emissions

Alternative	Annual CO_2e Emissions (metric tons per year)					
	2014	2015	2016	2017	Total[1]	Amortized[2]
At-Grade Emphasis LRT Alternative	2,700	23,300	36,500	13,900	76,400	2,500
Underground Emphasis LRT Alternative						
2nd/Hope Street station + 2nd Street station - Broadway Option (SEM)	1,900	17,500	47,300	32,400	99,100	3,300
2nd/Hope Street station + 2nd Street station -Broadway Option (Cut & Cover)	1,900	17,700	48,100	32,900	100,600	3,400
2nd/Hope Street station + 2nd Street station - Los Angeles Street Option (SEM)	1,900	17,500	47,200	32,300	98,900	3,300

Notes:
[1] *Annual emissions from each year of construction (2014-2017) are added to estimate the total project emissions. Totals may vary slightly due to rounding.*
[2] *Total project emissions are divided by 30 (30-year average) in estimating amortized emissions.*

Since construction emissions are temporary, total project construction emissions are amortized over thirty years (defined as a 30-year average), following South Coast Air Quality Management District (SCAQMD) recommendations (SCAQMD 2008). To estimate total project impact, these amortized construction-related emissions are added to the incremental project-related operational emissions for each build alternative. The adjusted total project impact is provided in Table 1-5 as compared to estimated 2009 emissions for informational purposes only and in Table 1-6 as compared to the estimated 2035 No Build condition.

Several build alternatives could be constructed by multiple methods. For example, the proposed 2nd/Hope Street station could be constructed by either the Sequential Excavation Method (SEM) or Cut & Cover method. Certain build alternatives also include a choice of possible station locations. For example, the Underground Emphasis LRT Alterative offers the option for a station at 2nd Street and either Broadway or Los Angeles Street.

As such, multiple construction options are shown in the tables below. The No Build Alternative and the TSM Alternative do not require construction to move forward and are not included in the summary table. Operational impacts for these two alternatives are provided in Table 1-1.

The proposed Regional Connector Transit Corridor project is consistent with SB 375 because it establishes a key part of the regional transportation network that serves to remove vehicles from the roadways. The proposed project decreases VMT and GHG when compared to the No Build Alternative. Although each of the proposed project alternatives here foresees increased GHG emissions when compared to existing conditions, this can be attributed to a forecasted growth in population unrelated to this proposal. The quantitative analysis here does not take into account several additional requirements identified in the Scoping Plan including the Pavley regulations[1] and the low carbon fuel standard[2]. Thus, when the Scoping Plan and SB 375 are fully implemented, regional emissions could be reduced to below existing conditions.

Lastly, no mitigation measures would be required to reduce emissions. The proposed Regional Connector Transit Corridor project is also identified in the SCAG 2008 Regional Transportation Plan, and the Regional Connector Transit Corridor project is consistent with regional and statewide plans to reduce GHG emissions.

[1] The Pavley regulations (Assembly Bill 1493) reduce GHG emissions in new passenger vehicles from 2009 through 2016. The Pavley regulations reflect tailpipe emission standards for specific vehicle model years. The United States Environment Protection Agency (USEPA) decided to grant a waiver of Clean Air Act preemption on June 30, 2009, which allows California to implement the GHG emission standards (74 FR 32744).

[2] The Low Carbon Fuel Standard, adopted by the Office of Administrative Law (OAL) on January 12, 2010, requires a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020 (17 CCR 95480).

2.0 INTRODUCTION

Briefly stated, global climate change (GCC) is a change in the average climatic conditions of the earth, characterized by changes in wind patterns, storms, precipitation, and temperature. The baseline by which these changes are measured originates in historical records identifying temperature changes that have occurred in the past, such as during previous ice ages. Analyzing these records shows a statistically significant difference in the rate and magnitude of GCC in the last 150 years (the Industrial Age) as compared to historical climate change.

The United Nations Intergovernmental Panel on Climate Change (IPCC) calculated GHG emission projections that would be needed to stabilize global temperatures and GCC impacts. The IPCC predicted that the range of global mean temperature increases from 1990 to 2100, given six scenarios, could range from 1.4 to 5.8 degrees Celsius (°C) (IPCC 2001). Regardless of analytical methodology, global average temperature and mean sea level are expected to rise under all scenarios.

Climate models for California project that temperatures in California will increase anywhere from 3 to 10.5 degrees Fahrenheit (°F) (California Climate Change Center 2006). Almost all climate change scenarios include a continuing trend of warming through the end of the 21st century due to substantial amounts of GHG already released and the difficulty of reducing emissions to a level that would stabilize the climate. According to the 2006 California Climate Action Team Report (CalEPA 2006), the following climate change effects are predicted in California over the course of the 21st century.

- A diminishing Sierra snowpack declining by 70 to 90 percent, threatening the State's water supply.
- Increasing temperatures of up to approximately 10 °F under the higher emission scenarios, leading to a 25 to 35 percent increase in the number of days ozone pollution levels are exceeded in most urban areas.
- Coastal erosion along the length of California and seawater intrusion into estuarine areas from a 4- to 33-inch rise in sea level. This would exacerbate flooding in already vulnerable regions.
- Increased vulnerability of forests due to pest infestation and increased temperatures.
- Increased challenges for the State's important agricultural industry from water shortages, increasing temperatures, and saltwater intrusion.
- Increased electricity demand, particularly in the hot summer months.

Temperature increases would lead to adverse environmental impacts in a wide variety of areas, including sea level rise, reduced snowpack resulting in changes to existing water resources, increased risk of wildfires, public health hazards associated with higher peak temperatures, heat waves, and deteriorated air quality.

In December 2008, the California Air Resources Board (CARB) released a Climate Change Scoping Plan (CARB 2008a) outlining the State's strategy to achieve the 2020 GHG emissions limit mandated by Assembly Bill 32 (AB 32). AB 32 requires the State to reduce GHG emissions to 1990 levels by 2020. As is shown in Figure 2-1, GHG emissions in the State are expected to increase by nearly 30 percent between the 2002-2004 levels (average emissions) and 2020 levels under the business-as-usual (BAU) conditions. Transportation emissions are expected to increase nearly 25 percent between now and 2020 in the BAU scenario (i.e., in the absence of AB 32).

In a staff report entitled "California 1990 Greenhouse Gas Emissions Level and 2020 Emissions Limit," CARB estimated the 1990 emission level as approximately 427 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) (CARB 2007a). The State would need to reduce emissions by 169 $MMTCO_2e$ in 2020 as compared to BAU to meet the emission targets; a nearly 30 percent decrease in emissions from BAU.

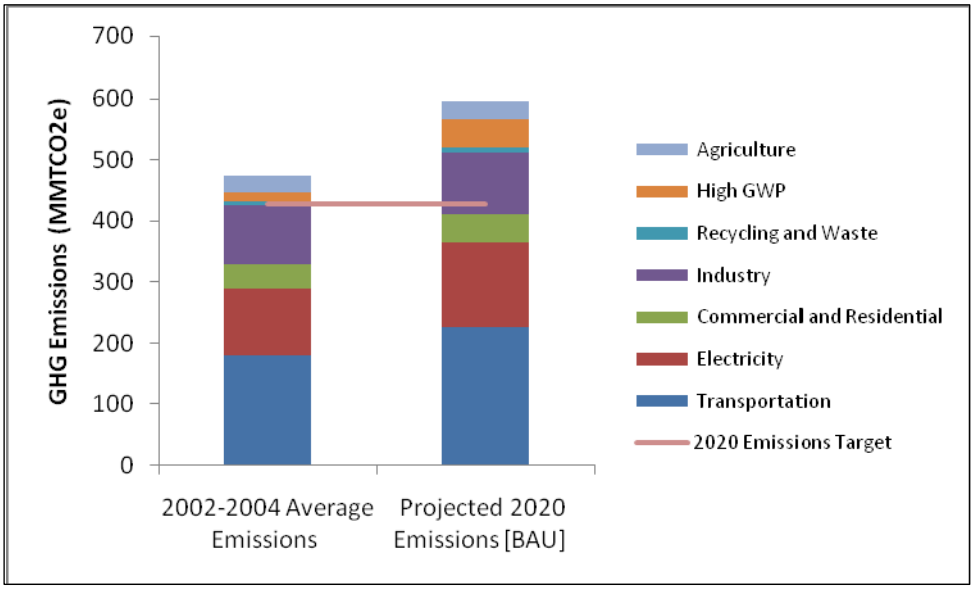

Figure 2-1. Current Emissions Compared to 2020 Business-as-Usual

In its Scoping Plan, CARB proposed a series of measures to reduce GHG emissions, several of which relate to transportation. The California Light-Duty Vehicle GHG Standards ("Pavley Regulations"), for example, are predicted to reduce emissions by 31.7 $MMTCO_2e$ or 18 percent of the total emission reductions included in the Scoping Plan[3]. Other reductions include the Low Carbon Fuel Standard (15 $MMTCO_2e$ reduction), regional transportation-related GHG targets[4] (5 $MMTCO_2e$ reduction), and medium/heavy-duty vehicle reduction measures (1.4 $MMTCO_2e$ reduction).

The measures included in the Scoping Plan are not included in the various models used to quantify emissions in this report. Since it is difficult to quantify the exact amount of emissions reductions the Scoping Plan will achieve by 2035, its effect is discussed only qualitatively. GHG emissions are typically reported in units of $MMTCO_2e$, and it may be difficult to understand the magnitude of such high levels of emissions. To put GHG emissions in perspective, the following examples illustrate measures that would create reductions in one $MMTCO_2e$ (CARB 2007b):

- 216,000 passenger cars not driven for one year
- 179,000 passenger cars and light trucks not driven for one year
- 114 million gallons of gasoline saved
- 13,400 tanker trucks of gasoline saved
- One year of electricity use by 193,000 California households
- The energy savings in one year from replacing 13 million standard light bulbs with compact fluorescent lamps
- 26,000,000 tree seedlings grown for 10 years

[3] The Scoping Plan includes measures to reduce emissions by 174 $MMTCO_2e$, which is slightly above the target reduction goal of 169 MMTCO2e.

[4] This reduction measure is an estimate of reductions that may be achieved from local land use changes. It is not the SB 375 regional target.

3.0 METHODOLOGY FOR IMPACT EVALUATION

The Regional Connector Transit Corridor project would provide a direct link between the Metro Gold Line, Metro Blue Line, and Metro Expo Line in downtown Los Angeles. The project is anticipated to produce regional benefits in the South Coast Air Basin (SCoAB) by increasing regional mobility, minimizing transfers on the LRT system, and allowing connections to future new rail lines. The project is predicted to reduce VMT and associated GHG emissions by providing an alternative to single occupancy vehicle travel.

Mass transit has been identified at the regional, state and national levels as a crucial tool to reduce GHG emissions and climate change. Additionally, Metro has committed to, and is implementing a strong environmental sustainability policy focused on reducing CO_2 emissions through efficient uses of fuels and electricity (Metro 2007). The proposed project, in addition to improving transit access and mobility, would be developed consistent with Metro's sustainability policy.

The following section describes the methodology for analysis of potential project benefits and impacts relating to GHG emissions during both construction and operation.

3.1 Regulatory Framework

The current regulatory setting related to climate change and GHG emissions is summarized below.

3.1.1 Federal

3.1.1.1 Massachusetts et al. v. Environmental Protection Agency et al.

Twelve U.S. states and cities (including California) in conjunction with several environmental organizations, brought suit to force the USEPA to regulate GHGs as a pollutant pursuant to the Federal Clean Air Act (CAA) (Massachusetts et al. v. Environmental Protection Agency et al. [U.S. Supreme Court No. 05–1120]; argued November 29, 2006—decided April 2, 2007). The Court ruled that the plaintiffs had standing to sue, that GHGs fit within the CAA's definition of an air pollutant, and that the USEPA's reasons for not regulating GHGs were insufficiently grounded in the CAA.

3.1.1.2 Mandatory GHG Reporting Rule

On October 30, 2009, the USEPA published the final mandatory greenhouse gas reporting rule in the Federal Register (74 FR 56260). This rule requires suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more of CO_2e per year to submit annual reports to the USEPA. Reporting will start in 2011 for the calendar year 2010 except for vehicle and engine manufacturers who will begin reporting for model year 2011.

3.1.1.3 Endangerment Finding

On December 15, 2009, the USEPA published its endangerment finding for GHGs in the Federal Register (74 FR 66496). The USEPA Administrator determined that six GHGs, taken in combination, endanger both the public health and welfare of current and future generations. Although the endangerment finding discusses the effects of six GHGs, it acknowledges that transportation sources only emit four of the key GHGs: CO_2, CH_4, N_2O, and HFCs. Further, the Administrator found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to air pollution that endangers the public health and welfare under CAA Section 202(a). These findings are expected to pave the way for future regulations to control emissions of GHGs on a nationwide basis.

3.1.1.4 American Clean Energy and Security Act of 2009

On June 26, 2009, the American Clean Energy and Security Act of 2009 (HR 2454) was approved by the House of Representatives. This bill, also known as the Waxman-Markey Bill, requires entities to report their operational emissions if they exceed 10,000 tons (assumed to be metric tons) of CO_2e per year and to enter a cap-and-trade program if they exceed 25,000 tons of CO_2e per year. The cap-and-trade program aims to reduce emissions by 17 percent of 2005 levels by 2020 and by 83 percent of 2005 levels by 2050. The bill is waiting for Senate approval.

3.1.1.5 Clean Energy Jobs and American Power Act

On September 30, 2009, the Clean Energy Jobs and American Power Act (SB 1733) was introduced in the Senate. Also known as the Kerry-Boxer Bill, the bill provides for the establishment of a cap-and-trade system for GHG emissions and sets goals of reducing U.S. emissions by 20 percent from 2005 levels by 2020 and by 83 percent from 2005 levels by 2050. The bill was passed by the Committee on Environment and Public Works on November 5, 2009, but has since been stalled in the Senate.

3.1.2 State

3.1.2.1 California Assembly Bill 1493 (AB 1493)

California Assembly Bill (AB) 1493 required CARB to develop and adopt GHG emission standards for automobiles. The legislature declared in AB 1493 that global warming was a matter of increasing concern for public health and environment in the state. It cited several risks that California faces from climate change, including reduction in the State's water supply, increased air pollution creation by higher temperatures, harm to agriculture, increase in wildfires, damage to the coastline, and economic losses caused by higher food, water, energy, and insurance prices. Further, the legislation stated that technological solutions to reduce GHG emissions would stimulate the California economy and provide jobs.

Assembly Bill 1493 became law in 2002, and CARB enacted subsequent regulations in September 2004. States are prevented from adopting motor vehicle emission standards that are contrary to federal law; however, California is allowed to adopt its own motor vehicle emission standards that are at least as stringent as the federal requirements if the USEPA grants California a waiver request.

Other states can either elect to follow the California standards or continue to follow federal requirements. The USEPA originally declined California's waiver request in March 2008, citing a failure to demonstrate "compelling and extraordinary" conditions that would make the new regulations necessary. The USEPA then reversed its waiver denial on June 30, 2009, granting California authority to implement new standards.

3.1.2.2 California Executive Order S-3-05

California Executive Order S-3-05 established the following GHG emission reduction targets for California:

- Reduce GHG emissions to 2000 levels by 2010;
- Reduce GHG emissions to 1990 levels by 2020; and
- Reduce GHG emissions to 80 percent below 1990 levels by 2050.

3.1.2.3 Global Warming Solutions Act of 2006 (AB 32)

California AB 32, the Global Warming Solutions Act of 2006, codifies the State's GHG emissions target. It requires California to reduce GHG emissions to 1990 levels by 2020 and CARB to enforce a statewide cap on GHG that must be phased in by 2012. AB 32 was passed into on September 27, 2006. Key AB 32 milestones are as follows:

- June 30, 2007—Identification of "discrete" early action GHG emissions reduction measures.
- January 1, 2008—Identification of the 1990 baseline GHG emissions level and approval of a statewide limit equivalent to that level. Adoption of reporting and verification requirements concerning GHG emissions.
- January 1, 2009—Adoption of a scoping plan for achieving GHG emission reductions.
- January 1, 2010—Adoption and enforcement of regulations to implement the "discrete" actions.
- January 1, 2011—Adoption of GHG emission limits and reduction measures by regulation.

- January 1, 2012—GHG emission limits and reduction measures adopted in 2011 become enforceable.

3.1.2.4 Senate Bill 97 (SB 97)

Senate Bill 97 (SB 97) mandates that the Governor's Office of Planning and Research amend the State's CEQA Guidelines to address impacts from GHGs, and these amendments must be adopted by the California Natural Resources Agency. The California Natural Resources Agency adopted CEQA Guidelines Amendments on December 30, 2009. In the CEQA Guideline Amendments, the California Natural Resources Agency recommended the following criteria for determining significance of GHG emissions:

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; or
- The extent to which the project complies with the regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

3.1.2.5 CARB Interim Significance Thresholds

CARB released a Preliminary Draft Staff Proposal for Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the California Environmental Quality Act (CEQA) in October 2008 (CARB 2008b). CARB's guidelines provide recommendations for assessing significance of operational and construction emissions from industrial and commercial/residential projects.

Although CARB's preliminary draft staff proposal suggests a quantitative threshold for assessing impacts from the operation of industrial projects, it prescribes the use of performance standards for construction-related emissions from all types of projects. CARB does not provide specific performance standards to address construction-related impacts. The California Natural Resources Agency is proceeding with amendments to the CEQA Guidelines that would better define the analytical requirements for climate change and GHG emissions in environmental documents (Ito 2009). As a result, CARB is currently taking no further action to define its interim thresholds of significance.

3.1.2.6 Senate Bill 375 (SB 375)

Senate Bill 375 (SB 375) requires CARB to set regional targets for 2020 and 2035 to reduce GHG emissions from passenger vehicles. A regional target will be developed for each of the 18 metropolitan planning organizations (MPOs) in the state; SCAG is the MPO that would have jurisdiction over the Regional Connector Transit Corridor project area. A Regional

Targets Advisory Committee (RTAC) was appointed by CARB to provide recommendations to be considered and methodologies to be used in CARB's target setting process. The final RTAC report was released on January 23, 2009. CARB is required to propose draft targets by June 30, 2010 and adopt final targets by September 30, 2010.

Each MPO is required to develop "Sustainable Community Strategies" (SCS) through integrated land use and transportation planning and to demonstrate an ability to attain the proposed reduction targets by 2020 and 2035. SCAG is proceeding with the SCS process on the tentative assumption that the region will have an approximate reduction target of 2.5 $MMCO_2e$ for 2020 (SCAG 2009). This target is based on the fact that the statewide reduction target is 5 $MMTCO_2e$, and the SCAG region accounts for roughly half of the State's population and emissions.

3.1.3 Local

The SCAQMD Governing Board adopted guidelines relating to GHG significance. The guidelines set a threshold of significance for industrial sources of 10,000 metric tons of CO_2e per year for operational emissions plus construction emissions amortized over 30 years. The guidelines do not provide guidance on non-industrial projects, such as for transportation-related projects.

3.2 Standards of Significance

3.2.1 NEPA Guidance

NEPA does not include specific requirements for analysis of potential impacts related to GCC, and a specific quantitative threshold of significance was not established for this project. However, incremental project emissions were determined for motor vehicles and project electricity use based on the change in VMT between each build alternative and the No Build Alternative. Changes in motor vehicle VMT were determined by the project traffic analysis for each alternative and include the potential project impacts for automobile VMT, transit bus VMT, and operation of light rail trains and new stations.

Although light rail would not contribute to local (direct) emissions, it would generate regional (indirect) emissions from the in-state generation of electricity used to operate the trains and new stations. Changes in the future fuel mix used to produce electricity by the Los Angeles Department of Water and Power (LADWP) were also taken into consideration. For example, LADWP intends to increase its renewable energy portfolio from eight percent in 2008 to 35 percent by 2020; therefore, GHG emissions from the regional generation of electricity would decrease in the future from the decreased reliance on fossil fuels.

As discussed in Section 4.0 below, the EMFAC2007 and OFFROAD2007 models were used to estimate emissions from regional highway traffic. Technical studies published by the CARB were used to estimate emission factors from CNG buses. Emissions from the generation of

electricity were calculated from emission factors obtained from LADWP and the USEPA's Emissions & Generation Resource Integrated Database (eGRID) (USEPA 2009a).

3.2.2 CEQA Guidance

3.2.2.1 South Coast Air Quality Management District (SCAQMD) Guidance

A tiered approach to evaluating the significance of GHG impacts was adopted by the SCAQMD Governing Board on December 5, 2008. The SCAQMD's Interim GHG Significance Threshold Staff Proposal (SCAQMD 2008) states that project GHG emissions analysis should include direct, indirect, and, if possible, life-cycle emissions during construction and operation. The SCAQMD's recommendations regarding the quantification of emissions were followed for this project; however, the SCAQMD interim thresholds are largely geared towards industrial, residential, and commercial projects, and do not specifically address transportation projects. Since a transportation-specific threshold of significance has not been established by the SCAQMD, a quantitative threshold was not established for the proposed project.

3.2.2.2 CEQA Guideline Amendments

In addition to the SCAQMD's guidance document, the California Natural Resources Agency released CEQA Guideline Amendments in December 2009 (Natural Resources Agency 2009). The Office of Administrative Law (OAL) finished its review of the amended CEQA guidelines on February 16, 2010 and submitted the amended CEQA Guidelines to the Secretary of State. The guidelines will be adopted as final on March 18, 2010. In the CEQA Guideline Amendments, the California Natural Resources Agency recommended the following criteria for determining the significance of GHG emissions (14 CCR §15064.4):

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;
- Whether the project emissions exceed a threshold of significance that the lead agency[5] determines applies to the project; or
- The extent to which the project complies with the regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding

[5] The lead agency is defined as "the public agency which has the primary responsibility for carrying out or approving a project which may have a significant effect upon the environment" under CEQA (Pub. Resources Code, §21067). For the Regional Connector Transit Corridor project, the lead agency would be Metro.

compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

The plans addressed in the final bullet can include regional transportation plans, regional blueprint plans, and plans for the reduction of GHG emissions (14 CCR §15125). The CEQA Guidelines identify specific plan elements that must be considered for any plans developed to reduce GHG emissions. At the very least, the plan should do the following (14 CCR §15183.5):

- Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level; and
- Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels.

Although specific quantitative thresholds of significance for CEQA are not provided in any of the referenced guidance documents, incremental project emissions were calculated as the difference between each project alternative as of 2035 and existing conditions (2009). Changes in motor vehicle VMT, transit bus VMT, and operation of light rail vehicles and new stations were included in the analysis.

The Draft 2008 Regional Transportation Plan (RTP) Update Program Environmental Impact Report (PEIR) and Addendum analyzed GHG emissions and included all feasible mitigation measures. The PEIR is therefore consistent with the CEQA significance criteria discussed above. The proposed project was evaluated for compliance with the regional transportation plan (RTP). If the proposed project is found to be consistent with the RTP, then the project would not be significant for GHG emissions.

3.3 Area of Potential Impact

The area of potential impact was defined as the SCoAB, which includes all of Orange County and the urban, non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. Although the area of potential impact is extensive, the analysis focused only on sources that

impact or are impacted by the project with regard to GHGs. Specifically, the analysis included the four-county region to capture the changes in VMT that could occur as a direct result of each project alternative as determined by the project traffic analysis. The analysis also covered emissions from project-related construction sources (construction equipment, haul and delivery trucks, and construction worker vehicles) in the SCoAB, as well as project sources located within construction sites and staging areas of the light rail alternatives.

3.4 Analysis Methodology

Although thresholds of significance for GHG are not well-established, methodologies and protocols for analyzing GHG emissions have been extensively documented and were used in this analysis. The analysis used protocols established by the California Climate Action Registry (CCAR), namely the General Reporting Protocol (CCAR 2009) and the Local Government Operations Protocol (CCAR 2008). Generally, GHG impact analyses follow the same quantification methodologies as air quality studies for criteria pollutants.

Greenhouse gas emissions were calculated for direct and indirect sources of GHG, including engine exhaust and purchased electricity. Emissions were estimated for three GHG pollutants regulated under the Kyoto Protocol: CO_2, CH_4, and N_2O. Although the Kyoto Protocol also regulated three other GHG pollutants (hydrofluorocarbons [HFCs], perfluorocarbons [PFCs], and sulfur hexafluoride [SF_6]), these pollutants are not emitted as products of engine exhaust or purchased electricity and are not analyzed further herein[6]. Emissions were converted to CO_2e using the GWPs in the IPCC's Second Assessment Report and documented in the *Inventory of U.S. Greenhouse Gas Emissions and Sinks* (USEPA 2009b).

Global warming potentials are defined by CARB as the radiative forcing impact (degree of warming to the atmosphere) of one mass-based unit of a given GHG relative to an equivalent unit of CO_2. For example, one ton of CH_4 is equivalent to approximately 21 tons of CO_2 in the atmosphere. Although the IPCC has released several updates to the Second Assessment Report (SAR) since its release in 1996, the international standard is to use the original SAR to maintain consistency with GHG emission inventories already compiled.

3.4.1 Construction Emissions

This analysis followed the SCAQMD's recommendation that construction emissions be amortized over 30 years (defined as life of a project) and added to the operational emissions.

Potential emissions of CO_2, CH_4, and N_2O from construction equipment (e.g., bulldozers, scrapers, graders, off-highway trucks, etc.) were calculated using the OFFROAD model,

[6] Although HFCs may be emitted from mobile sources from air conditioning (e.g., HFC-134a), methods for estimating these emissions are limited and are not included in this evaluation.

developed by CARB, for off-road engine exhaust emissions. Potential emissions of CO_2 and CH_4 were calculated using the EMFAC[7] model for on-road vehicles, and includes construction worker trips to the construction site, on-road haulage trucks, material delivery trucks, and equipment maintenance vehicles. Although N_2O emissions would also occur from the operation of on-road vehicles, the EMFAC model does not currently generate these emissions. Additionally, appropriate sources of GHG emissions were reviewed as part of this analysis to supplement the EMFAC model, as necessary.

3.4.2 Operational Emissions

3.4.2.1 Regional Traffic

Engine exhaust emissions were calculated to quantify predicted reductions in VMT in the region. As with construction emissions, the EMFAC model was used to quantify regional traffic emissions associated with the project. Any increase in transit rider trips to stations proposed under each alternative is assumed to be included in the regional traffic analysis. Regional traffic data was obtained from the project traffic analysis for each alternative.

3.4.2.2 Light Rail and New Station Operations

Although light rail vehicles do not emit GHG, the GHG analyses quantify emissions resulting from the remote generation of electricity to run the light rail vehicles and to power the facilities at the new stations. Emissions were calculated using the most recent LADWP CO_2 emission factor reported to CCAR; CH_4 and N_2O emissions were estimated from the USEPA's eGRID (USEPA 2009a).

Light Rail Operation

Since emission factors are reported in units of grams per mile (g/mi), it was necessary to estimate the total annual mileage associated with the proposed project. Headway information was used to estimate the number of trains that would occur during the year based on the weekday peak, weekday off-peak, and weekend service periods. The single trip distances for each service line were then used with the total number of trains to estimate the annual trip distance for each line. The single trip distances only included new track that would be installed as part of the proposed project.

New Station Operation

Several new stations would be built as part of the proposed project. Emissions associated with electricity at the stations to power lighting, escalators, train control, and general station maintenance were estimated using emission factors from a report prepared by Chester and

[7] The EMission FACtors (EMFAC) model is used to calculate emission rates from on-road motor vehicles in California. It is similar to the USEPA's MOVES2010 model but uses a fleet mix and assumptions specific to California.

Horvath (2008). The emission factors associated with each individual area are provided in units of kilowatts per station; therefore, the number of stations associated with each alternative was used to estimate emissions. Aboveground stations were conservatively estimated to require half the lighting of underground stations and would require minimal station maintenance. The station numbers were adjusted to reflect differences in above- and under-ground stations.

3.4.2.3 Bus Operations

The operating schedule for the proposed bus routes and headway information was used to estimate the number of bus trips that would occur for a weekday peak, weekday off-peak, and weekend service period. Information on the single trip distance for each line was then used to estimate the total annual miles traveled by all of the bus trips associated with the TSM Alternative.

The EMFAC model does not estimate emissions from alternative fuels like CNG; therefore, it was necessary to use research data published by CARB to estimate emissions resulting from the combustion of CNG. CARB provided a list of research reports that contain information on CNG combustion emissions. Several of the research reports contained information that was specific to Metro, predominantly from the New Flyer buses. Average emission factors from these Metro-specific reports were developed to be used in all subsequent calculations.

4.0 AFFECTED ENVIRONMENT

This section describes the existing conditions and affected environment/environmental setting for climate change effects.

4.1 Existing Conditions

Worldwide, California is the 12th to 16th largest emitter of CO_2, and is responsible for approximately two percent of the world's CO_2 emissions (CEC 2006).

As shown in Figure 4-1, transportation is responsible for 39 percent of the State's GHG emissions, followed by electricity generation (22 percent), the industrial sector (20 percent), agriculture and forestry (6 percent), commercial and residential (9 percent), and other sources (4 percent). Passenger vehicles and heavy-duty trucks represent approximately 35 percent of total emissions, with rail contributing only one percent. Rail is therefore a key element in reducing the State's GHG emissions by providing an alternative to passenger vehicles (see Figure 1-1).

Emissions of CO_2 and N_2O are largely byproducts of fossil fuel combustion. Methane, a highly potent GHG, results largely from off-gassing associated with agricultural practices and landfills. Sinks of CO_2 include uptake by vegetation and dissolution into the ocean. California GHG emissions in 2006 totaled approximately 485 $MMTCO_2e$ (CARB 2009).

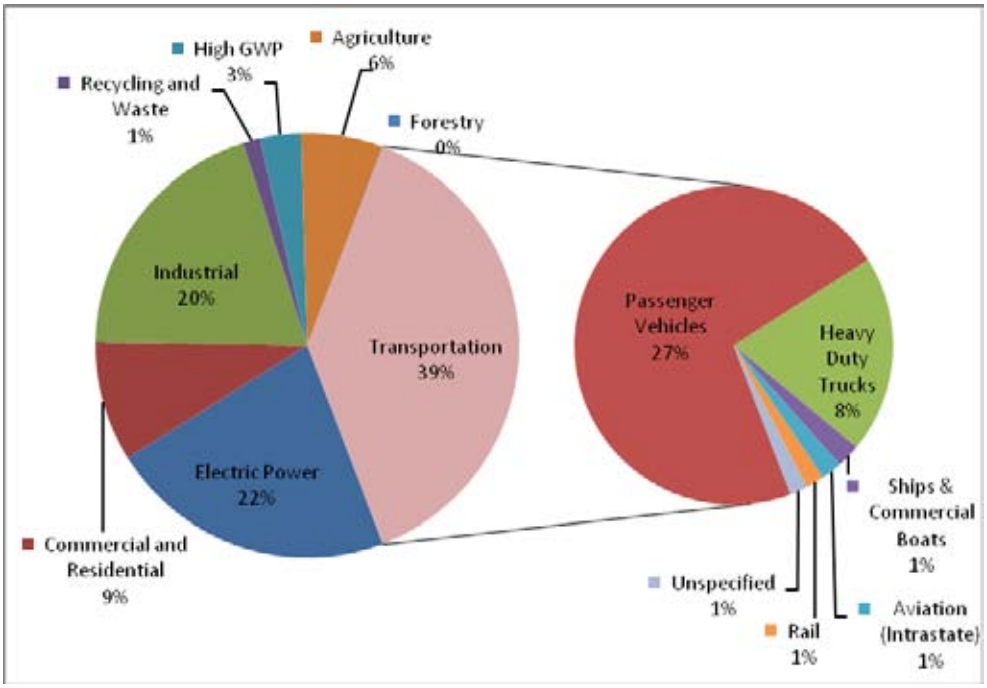

Figure 4-1. California GHG Inventory for 2006

4.1.1 Regional Traffic

As required by CEQA, existing (2009) emissions from regional traffic were estimated in the analysis to compare against future build alternatives. Data on VMT in the region and emission factors from the EMFAC2007 model were used to estimate emissions of GHG. The emissions calculations were based on the total VMT in the region and the average speed on the highway network. Since the EMFAC model only generates emissions of CO_2 and CH_4, the CCAR General Reporting Protocol was used to estimate emissions of N_2O. Table 4-1 summarizes the results of the baseline GHG emissions.

Table 4-1. Existing Conditions: 2009 Annual Highway Traffic GHG Emissions

	CO_2	CH_4	N_2O	Total[2]
Vehicle miles traveled (VMT)	n/a	n/a	n/a	304,212,400
Emission Factor (grams per mile)	365.210	0.028	0.173	N/A
Emissions (metric tons per year)	40,552,000	3,100	19,200	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] (metric tons per year)	40,552,000	65,100	5,952,000	46,569,100

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = not applicable
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary due to rounding*

5.0 IMPACTS

This section analyzes impacts associated with construction and operation of the proposed project alternatives.

5.1 No Build Alternative

The No Build Alternative describes a future condition where none of the alternatives described in this document would be built. This section provides a summary of emissions associated with the No Build Alternative.

5.1.1 Operational Emissions

Under the No Build Alternative, no construction would occur. As a result, no emissions would result from operation of light rail vehicles. Any future increase in emissions under this scenario would result from projected growth in regional traffic.

5.1.1.1 Light Rail Operations

The No Build Alternative assumes that the proposed project would not be built. Thus, no emissions would result from production of electricity needed to operate LRT vehicles or new stations.

5.1.1.2 Regional Traffic

Emissions of GHG that would occur under the No Build Alternative are summarized in Table 5-1. Since the No Build Alternative assumes that the Regional Connector Transit Corridor project would not be built, the GHG emissions reported in this section represent the projected growth of traffic expected to occur in the region of analysis. Emission calculations were based on the total VMT in the region and the average speed on the highway network.

5.1.2 Construction Emissions

The No Build Alternative assumes the proposed project would not be constructed. As a result, no construction emissions would occur under the No Build Alternative.

5.1.3 Cumulative Impacts

The proposed project would not occur under the No Build Alternative. As a result, there would be no project-level emissions associated with the No Build Alternative. Any emissions that would result from regional traffic would also occur with any other project in the area. Thus, emissions would not be cumulatively significant.

Table 5-1. No Build Alternative 2035 Annual Highway Traffic GHG Emissions				
	CO_2	CH_4	N_2O	Total[2]
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,632,600
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,521,100	2,800	31,800	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] (metric tons per year)	106,521,100	58,800	9,858,000	116,437,900
Increment (compared to Existing Conditions [2009]) (metric tons per year)	65,969,100	(6,300)	3,906,000	69,868,800

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = not applicable
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary due to rounding*

5.2 Transportation System Management (TSM) Alternative

The Transportation System Management (TSM) Alternative assumes that the proposed project would not occur. Rather, additional bus lines would be added to improve regional connections across downtown.

5.2.1 Operational Emissions

Emissions from operation of the new buses proposed under the TSM Alternative, and from regional traffic in the project area, were evaluated for operational emissions.

5.2.1.1 Light Rail Operations

An LRT project would not be built under the TSM Alternative. As a result, light rail operational emissions would be zero.

5.2.1.2 Regional Traffic

Emissions of GHG that would occur in the TSM Alternative are summarized in Table 5-2. Since the TSM Alternative assumes that an LRT project would not be built, GHG emissions reported in this section represent the projected growth of traffic in the region of analysis. The emission calculations were based on the total VMT in the region and the average speed on the highway network.

Table 5-2. TSM Alternative 2035 Annual Highway Traffic GHG Emissions

	CO_2	CH_4	N_2O	Total[2]
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,358,400
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,463,200	2,800	31,800	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] (metric tons per year)	106,463,200	58,800	9,858,000	116,380,000

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = not applicable
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary slightly due to rounding*

5.2.1.3 Bus Operation

The TSM Alternative assumes that additional bus lines would be added to the downtown Los Angeles area making connections similar to those under the proposed build alternatives. Information on the methodology used to estimate emissions from bus operations is provided in Section 3.4.2.3. Emissions from the combustion of CNG were estimated for the TSM Alternative. Table 5-3 summarizes estimated emissions associated with bus operation.

5.2.1.4 Total Operational Emissions

Total operational emissions were estimated from CNG bus operation and regional traffic. Emissions were compared to existing conditions (2009) to evaluate significance under CEQA

and to the No Build Alternative (2035) to evaluate significance under NEPA. Total operational emissions are summarized in Table 5-4.

5.2.2 Construction Emissions

The TSM Alternative assumes an LRT project would not be constructed. As a result, no construction emissions would occur under the TSM Alternative.

Table 5-3. TSM Alternative 2035 Bus Operations GHG Emissions

Line #	Service Line	Emissions (metric tons CO_2e per year)			
		CO_2	CH_4	N_2O	Total
1	Upper Grand Southbound via Los Angeles	330	60	6	390
2	Upper Grand Northbound via Los Angeles	350	60	6	420
3	Upper Grand Southbound via Alameda	370	70	6	40
4	Upper Grand Northbound via Alameda	300	70	7	480
5	3rd Street Southbound	800	140	10	960
6	2nd Street Northbound	840	150	20	1,000
Total		3,100	550	50	3,700

Totals may vary slightly due to rounding

5.2.3 Cumulative Emissions

The TSM Alternative would result in a decrease in GHG emissions compared to the No Build Alternative and, because of regional growth, an increase in GHG emissions when compared to existing conditions (2009). The TSM Alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is assumed that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would involve a light rail extension built partly aboveground. This section provides a summary of the emissions potentially associated with this alternative.

5.3.1 Operational Emissions

Operational emissions associated with the At-Grade Emphasis LRT Alternative would include indirect emissions from electricity needed to operate light rail vehicles and the new stations and direct emissions from highway traffic after construction is completed.

Table 5-4. Summary of Total Operational GHG Emissions for the TSM Alternative

Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Regional Traffic	106,463,200	58,800	9,858,000	116,380,000
CNG Buses	3,100	500	50	3,650
Total Emissions	106,466,300	59,300	9,858,050	116,383,650
CEQA Increment[1]	65,914,300	(5,800)	3,906,050	69,814,550
NEPA Increment[2]	(54,800)	500	50	(54,250)

Notes:
[1] *CEQA Increment is defined as the difference between the proposed alternative (2035) and existing conditions (2009).*
[2] *NEPA Increment is defined as the difference between the proposed alternative (2035) and the No Build Alternative (2035).*
[3] *Totals may vary slightly due to rounding*

5.3.1.1 Light Rail Emissions

Emissions from power generation for electricity needed to operate light rail vehicles were estimated from the route distance, headway between trains, and the average energy intensity for the train operation. Based on data from the National Transit Database (NTD 2010) the average energy intensity for the Metro's light rail service is 23 kilowatt-hours per mile (kWh/mi). Additional information on the methodology used to estimate emissions is provided in Section 3.4.2.2.

Since the LADWP is a member of CCAR, data from the 2007 CCAR report was used to estimate the CO_2 emission factor for electricity. Data from the eGRID was used to obtain the emission factors for CH_4 and N_2O, because this information is not available in CCAR reports.

LADWP adopted a Renewable Energy Policy that has a long-term goal to achieve a Renewable Portfolio Standard (RPS) with 35 percent renewable energy by 2020. According to the LADWP's 2008 Green Power Annual Report, LADWP's current energy mix is 8 percent

renewable energy, including wind energy, hydropower, geothermal energy, biomass energy, and solar power. Since the emission factors used in this analysis were from the 2007 CCAR Report, emission factors were adjusted by increasing the renewable energy mix from 8 percent under existing conditions (2009) to 35 percent under future conditions (2035). Table 5-5 provides a summary of estimated emissions from light rail operations.

Table 5-5. At-Grade Emphasis LRT Alternative
2035 Project Area Light Rail Annual GHG Emissions

Alternative	Annual CO_2e Emissions (metric tons per year)			
	CO_2	CH_4	N_2O	Total
Current energy mix with 8% renewable energy	4,800	3	10	4,900
Expected Emissions with 35% Renewable Portfolio Standard	1,100	1	2	1,100

Totals may vary slightly due to rounding

5.3.1.2 New Station Emissions

In addition to emissions associated with propulsion of light rail vehicles, emissions would also be generated from the construction of new stations as part of the proposed project. Emissions from the operation of new stations were estimated based on figures from a similar light rail system, the Muni in San Francisco, as calculated in a study by Chester and Horvath (2008). Additional information on the methodology is provided in Section 3.4.2.2. As with light rail operation, emissions were adjusted by the expected 35 percent RPS that LADWP will achieve by 2035. Emissions are summarized in Table 5-6.

Table 5-6. At-Grade Emphasis LRT Alternative New Station Emissions

Infrastructure	Number of New Stations	Energy per Station (kWh/yr)	CO_2e Emissions (metric tons/yr)			
			CO_2	CH_4	N_2O	Total[3]
Station Lighting[1]	3	2,600	4	<1	<1	4
Station Escalators[2]	2	41,200	50	<1	<1	50
Train Control	4	127,200	300	<1	1	300
Station Maintenance[2]	2	159,700	200	<1	1	200

Table 5-6. At-Grade Emphasis LRT Alternative New Station Emissions						
Infrastructure	Number of New Stations	Energy per Station (kWh/yr)	CO_2e Emissions (metric tons/yr)			
			CO_2	CH_4	N_2O	Total[3]
Total			500	<1	1	500
Total (Adjusted for 35% RPS)			100	<1	<1	100

Notes:
[1] *One of the stations is a street-level platform on a one-way couplet. Electricity usage for station lighting for each platform was assumed to be half an underground station; therefore, the total number of stations estimated at 3.*
[2] *Two stations are underground, whereas the remaining station is at street-level.*
[3] *Totals may vary slightly due to rounding.*

5.3.1.3 Regional Traffic

Emissions of GHG from regional traffic under the At-Grade Emphasis LRT Alternative are summarized in Table 5-7. Emission calculations were based on the total VMT in the region and the average speed on the highway network.

Table 5-7. At-Grade Emphasis LRT Alternative 2035 Annual Highway Traffic GHG Emissions				
	CO_2	CH_4	N_2O	Total
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,330,800
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,457,400	2,800	31,800	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] (metric tons per year)	106,457,400	58,800	9,858,000	116,374,200

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary slightly due to rounding.*

5.3.1.4 Bus Operation

Additional bus routes would not be added as part of this alternative. As a result, CNG bus emissions would be zero and are not included in this section.

5.3.1.5 Total Operational Emissions

Total operational emissions were estimated considering light rail operations and regional traffic. Emissions were compared to existing conditions (2009) to evaluate significance under CEQA and to the No Build Alternative (2035) to evaluate significance under NEPA. Total operational emissions are summarized in Table 5-8.

5.3.2 Construction Emissions

Construction of the At-Grade Emphasis LRT Alternative would result in GHG emissions from diesel-fueled construction equipment. Construction emissions were estimated using the OFFROAD emissions model and the construction schedule. Estimated emissions are provided in Table 5-9. The emissions shown indicate the total project emissions and emissions that have been amortized over 30 years as required by SCAQMD. Section 1.2 provides a summary of amortized construction emissions along with the operational emissions increment.

Table 5-8. Summary of Total Operational GHG Emissions for At-Grade Emphasis LRT Alternative

Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Regional Traffic	106,457,400	58,800	9,858,000	116,374,200
Light Rail	1,100	1	2	1,100
New Stations	100	<1	<1	100
Total Emissions	106,458,600	58,800	9,858,000	116,375,400
CEQA Increment[1]	65,906,600	(6,300)	3,906,000	69,806,300
NEPA Increment[2]	(62,500)	1	2	(62,500)

[1] *CEQA Increment is defined as the difference between the proposed alternative (2035) and existing conditions (2009).*
[2] *NEPA Increment is defined as the difference between the proposed alternative (2035) and the No Build Alternative (2035).*
[3] *Totals may vary slightly due to rounding.*

Table 5-9. At-Grade Emphasis LRT Alternative Annual Construction GHG Emissions (2014-2017)						
Phase	Emissions of CO_2e (metric tons per year)					
	2014	2015	2016	2017	Project	Amortized Emissions
Construction Equipment Emissions (onsite)	2,500	21,700	34,100	13,100	71,400	2,400
Construction Worker Commuting (offsite)	90	400	600	200	1,300	40
Haul Truck Emissions (offsite)	200	1,200	1,800	600	3,800	100
Offsite Subtotal	300	1,600	2,400	800	5,000	200
Total (onsite + offsite)	2,700	23,300	36,500	13,900	76,400	2,500

Totals may vary slightly due to rounding

5.3.3 Cumulative Emissions

The At-Grade Emphasis LRT Alternative would result in a decrease in GHG emissions compared to the No Build Alternative and, because of regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The At-Grade Emphasis LRT Alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

5.4 Underground Emphasis LRT Alternative

Under the Underground Emphasis LRT Alternative, operation of the proposed light rail extension would occur largely underground. This section provides a summary of the emissions associated with this alternative.

5.4.1 Operational Emissions

Operational emissions associated with the Underground Emphasis LRT Alternative would include both indirect emissions from electricity needed to operate light rail vehicles and new stations and direct emissions from highway traffic after construction is completed and the project is implemented.

5.4.1.1 Light Rail Emissions

To calculate indirect emissions from remotely generated electricity, the amount of electricity needed to operate the light rail vehicles was estimated based on the route distance, train headways, and the average energy intensity for train operation. The analysis assumed that LADWP would achieve the RPS of 35 percent renewable energy by 2020. Table 5-10 provides a summary of estimated emissions from light rail operation.

Table 5-10. Underground Emphasis LRT Alternative 2035 Project Area Light Rail Annual GHG Emissions

Alternative	Annual CO_2e Emissions (metric tons per year)			
	CO_2	CH_4	N_2O	Total
Current energy mix with 8% renewable energy	4,800	2	10	4,800
Expected Emissions with 35% Renewable Portfolio Standard	1,100	1	2	1,100

Totals may vary slightly due to rounding.

5.4.1.2 New Station Emissions

In addition to emissions associated with propulsion of light rail vehicles, emissions would be generated from operation of the proposed stations to be constructed. Emissions from the operation of new stations were estimated based on figures from a similar light rail system, the Muni in San Francisco, as calculated in a study by Chester and Horvath (2008). As with light rail operation, the analysis adjusted emissions by the 35 percent RPS that LADWP is expected to achieve by 2035. Emissions are summarized in Table 5-11.

5.4.1.3 Regional Traffic

Emissions of GHG that would occur from regional traffic in the Underground Emphasis LRT Alternative are summarized in Table 5-12. The emission calculations were based on the total VMT in the region and the average speed on the highway network.

5.4.1.4 Bus Operation

Additional bus routes would not be added as part of this alternative. CNG bus emissions would be zero and are not included in this section.

Table 5-11. Underground Emphasis LRT Alternative New Station Emissions						
Infrastructure	Number of New Stations	Energy per Station (kWh/yr)	CO_2e Emissions (metric tons/yr)			
			CO_2	CH_4	N_2O	Total
Station Lighting	3	2,600	4	<1	<1	4
Station Escalators	3	41,200	70	<1	<1	70
Train Control	3	127,200	200	<1	<1	200
Station Maintenance	3	159,700	300	<1	1	300
Total			600	<1	1	600
Total (Adjusted for 35% RPS)			100	<1	<1	100

Totals may vary slightly due to rounding.

Table 5-12. Underground Emphasis LRT Alternative 2035 Annual Highway Traffic GHG Emissions				
	CO_2	CH_4	N_2O	Total[2]
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,320,300
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,455,200	2,800	31,800	N/A
GWP	1	21	300	N/A
CO_2e Emissions[1] (metric tons per year)	106,455,200	58,800	9,858,000	116,372,000

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = Not applicable
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary slightly due to rounding.*

5.4.1.5 Total Operational Emissions

Total operational emissions were estimated from light rail operation and regional traffic. Emissions were compared to existing conditions (2009) to evaluate significance under CEQA and compared to the No Build Alternative (2035) for significance under NEPA. Total operational emissions are summarized in Table 5-13.

5.4.2 Construction Emissions

Construction of the Underground Emphasis LRT Alternative would result in GHG emissions from diesel-fueled construction equipment. Construction emissions were estimated using the OFFROAD emissions model and the proposed construction schedule. The Underground Emphasis LRT Alternative could be realized in several ways. Four scenarios were compared, based on whether SEM or cut & cover is used in construction of the 2nd/Hope Street station and whether the proposed 2nd Street station is built at either Broadway or Los Angeles Street.

Estimated emissions are provided in Table 5-14. The emissions shown indicate the total project emissions and have also been amortized over 30 years as required by the SCAQMD. Section 1.2 provides a summary of amortized construction emissions along with the operational emissions increment.

5.4.3 Cumulative Emissions

The proposed project would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The Underground Emphasis LRT Alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, potential emissions would not be cumulatively significant.

Table 5-13. Summary of Total Operational GHG Emissions for Underground Emphasis LRT Alternative

Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Regional Traffic	106,455,200	58,800	9,858,000	116,372,000
Light Rail	1,100	1	2	1,100
New Stations	100	<1	<1	100

Table 5-13. Summary of Total Operational GHG Emissions for Underground Emphasis LRT Alternative				
Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Total Emissions	106,456,400	58,800	9,858,000	116,373,200
CEQA Increment[1]	65,904,400	(6,300)	3,906,000	69,804,100
NEPA Increment[2]	(64,700)	1	2	(64,700)

Notes:
[1] *CEQA Increment is defined as the difference between the* proposed alternative *(2035) and existing conditions (2009).*
[2] *NEPA Increment is defined as the difference between the* proposed *alternative (2035) and the No Build Alternative (2035).*
[3] *Totals may vary slightly due to rounding.*

5.5 Fully Underground Alternative – Little Tokyo Variation 1

Under Fully Underground LRT Alternative – Little Tokyo Variation 1, the proposed light rail extension would occur entirely underground. Under this alternative, the proposed 2nd Street/Central Avenue station and junction would be on the same level underground. This section summarizes estimated emissions associated with this alternative.

5.5.1 Operational Emissions

Operational emissions associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would include indirect emissions from electricity needed to operate light rail vehicles and new stations and direct emissions from highway traffic after construction is completed and the project is implemented.

Table 5-14. Underground Emphasis LRT Alternative Annual Construction GHG Emissions (2014-2017)

Phase	Emissions of CO_2e (metric tons per year)					
	2014	2015	2016	2017	Project	Amortized Emissions
2nd/Hope Street station + 2nd Street station – Broadway Option (SEM)	1,900	17,500	47,300	32,400	99,100	3,300
2nd/Hope Street station + 2nd Street station - Broadway Option (Cut & Cover)	1,900	17,700	48,100	32,900	100,600	3,400
2nd/Hope Street station + 2nd Street station - Los Angeles Street Option (SEM)	1,900	17,500	47,200	32,300	98,900	3,300
2nd/Hope Street station + 2nd Street station - Los Angeles Street Option (Cut & Cover)	1,900	17,700	48,000	32,800	100,400	3,300

Totals may vary slightly due to rounding

5.5.1.1 Light Rail Emissions

Emissions from power generation for electricity needed to operate light rail trains were estimated based on the route distance, train headways, and the average energy intensity for train operation. The analysis assumed that LADWP would achieve the RPS of 35 percent renewable by 2020. Table 5-15 provides a summary of estimated emissions from light rail operation.

5.5.1.2 New Station Emissions

In addition to emissions associated with propulsion of the light rail vehicles, emissions would also be generated from new stations. Emissions from the operation of stations were estimated based on figures from a similar light rail system, the Muni in San Francisco, as calculated in a study by Chester and Horvath (2008). As with light rail operation, emissions were adjusted by the expected 35 percent RPS that LADWP will achieve by 2035. Emissions are summarized in Table 5-16.

5.5.1.3 Regional Traffic

Emissions of GHG that would occur from regional traffic under the Fully Underground LRT Alternative – Little Tokyo Variation 1 are summarized in Table 5-17. The emission

calculations were based on the total VMT in the region and the average speed on the highway network.

Table 5-15. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2035) Project Area Light Rail Annual GHG Emissions

Alternative	Annual CO_2e Emissions (metric tons per year)			
	CO_2	CH_4	N_2O	Total
Current energy mix with 8% renewable energy	4,600	2	9	4,600
Expected Emissions with 35% Renewable Portfolio Standard	1,000	1	2	1,000

5.5.1.4 Bus Operation

Additional bus routes would not be added as part of this alternative. Therefore, CNG bus emissions would be zero and are not included in this section.

5.5.1.5 Total Operational Emissions

Total operational emissions were estimated from light rail operation and regional traffic. Emissions were compared to existing conditions (2009) to evaluate significance under CEQA and to the No Build Alternative (2035) for significance under NEPA. Total operational emissions are summarized in Table 5-18.

5.5.2 Construction Emissions

Construction of the Fully Underground LRT Alternative – Variation 1 would result in GHG emissions from diesel-fueled construction equipment. Construction emissions were estimated using the OFFROAD emissions model and the proposed construction schedule. Under this alternative, the 2nd/Hope Street station could be constructed either by SEM or cut & cover.

Estimated emissions for both construction methods are provided in Table 5-19. The emissions shown indicate total project emissions and have also been amortized by 30 years as required by the SCAQMD. Section 1.2 provides a summary of amortized construction emissions along with the operational emissions increment.

Table 5-16. Fully Underground LRT Alternative – Little Tokyo Variation 1 New Station Emissions						
Infrastructure	Number of New Stations	Energy per Station (kWh/yr)	CO_2e Emissions (metric tons/yr)			
			CO_2	CH_4	N_2O	Total
Station Lighting	4	2,600	6	<1	<1	6
Station Escalators	4	41,200	90	<1	<1	90
Train Control	4	127,200	300	<1	1	300
Station Maintenance	4	159,700	400	<1	1	400
Total			700	<1	2	700
Total (Adjusted for 35% RPS)			200	<1	<1	200

Table 5-17. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2035) Annual Highway Traffic GHG Emissions				
	CO_2	CH_4	N_2O	Total[2]
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,311,000
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,453,200	2,800	31,800	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] metric tons per year)	106,453,200	58,800	9,858,000	116,370,000

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = not applicable
N_2O = nitrous oxide
Note:

[1] *CO_2e emissions are weighted by the global warming potential (GWP) of each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary slightly due to rounding*

5.5.3 Cumulative Emissions

The proposed alternative would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The Fully Underground Alternative – Little Tokyo Variation 1 is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

Table 5-18. Summary of Total Operational GHG Emissions for Fully Underground LRT Alternative – Little Tokyo Variation 1

Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Regional Traffic	106,453,200	58,800	9,858,000	116,370,000
Light Rail	1,000	1	2	1,000
New Station	200	<1	<1	200
Total Emissions	106,454,400	58,800	9,858,000	116,371,200
CEQA Increment[1]	65,902,400	(6,300)	3,906,000	69,800,100
NEPA Increment[2]	(66,700)	1	2	66,700

Notes:
[1] *CEQA Increment is defined as the difference between the proposed alternative(2035) and existing conditions (2009).*
[2] *NEPA Increment is defined as the difference between the proposed alternative (2035) and the No Build Alternative (2035).*
[3] *Totals may vary slightly due to rounding.*

Table 5-19. Fully Underground LRT Alternative – Little Tokyo Variation 1 Annual Construction GHG Emissions (2014-2017)						
Phase	Emissions of CO_2e (metric tons per year)					
	2014	2015	2016	2017	Project	Amortized Emissions
2nd/Hope Street station (SEM)	1,800	18,400	54,600	40,700	115,400	3,800
2nd/Hope Street station (Cut & Cover)	1,800	18,900	56,000	41,600	118,300	3,900

Totals may vary slightly due to rounding

5.6 Fully Underground Alternative – Little Tokyo Variation 2

Under the Fully Underground LRT Alternative – Little Tokyo Variation 2, the operation of the proposed light rail extension would occur entirely underground. With this alternative, the proposed 2nd/Central Avenue station and junction would be constructed on two levels. Unlike the single, double-track portal imagined in Fully Underground Alternative – Little Tokyo Variation 1, in this alternative, two single-track portals would be built in the median of 1st Street. This section provides a summary of estimated emissions associated with this alternative.

5.6.1 Operational Emissions

Operational emissions associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would include indirect emissions from electricity generation needed to operate light rail vehicles and the stations and direct emissions from highway traffic after construction is completed and the project is implemented.

5.6.1.1 Light Rail and New Station Emissions

Operation of light rail vehicles and stations associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not differ from those estimated under Variation 1. Emissions from Variation 1 should be reviewed for Variation 2.

5.6.1.2 Regional Traffic

Emissions of GHG that would occur from regional traffic in the Fully Underground LRT Alternative – Little Tokyo Variation 2 are summarized in Table 5-20. Emission calculations were based on the total VMT in the region and the average speed on the highway network.

5.6.1.3 Bus Operation

Additional bus routes would not be added as part of this alternative. Therefore, CNG bus emissions would be zero and are not included in this section.

5.6.1.4 Total Operational Emissions

Total operational emissions were estimated from light rail operation and regional traffic. Emissions were compared to existing conditions (2009) to evaluate significance under CEQA and to the No Build Alternative (2035) for significance under NEPA. Total operational emissions are summarized in Table 5-21.

Table 5-20. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2035) Annual Highway Traffic GHG Emissions

	CO_2	CH_4	N_2O	Total[2]
Vehicle Miles Traveled (VMT)	n/a	n/a	n/a	504,310,000
Emission Factor (grams per mile)	578.319	0.015	0.173	N/A
Emissions (metric tons per year)	106,453,000	2,800	31,800	N/A
GWP	1	21	310	N/A
CO_2e Emissions[1] (metric tons per year)	106,453,000	58,800	9,858,000	116,369,800

Key:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
CH_4 = methane
GWP = Global Warming Potential
N/A = not applicable
N_2O = nitrous oxide
Note:
[1] *CO_2e emissions are weighted by the global warming potential (GWP) for each non-CO_2 pollutant (i.e., CO_2e equals emissions of non-CO_2 pollutant x GWP)*
[2] *Totals may vary slightly due to rounding*

5.6.2 Construction Emissions

Construction of the Fully Underground LRT Alternative – Variation 2 would result in GHG emissions from diesel-fueled construction equipment. Construction emissions were estimated using the OFFROAD emissions model and the proposed construction schedule. The 2nd/Hope street station in this build alternative could be constructed by either SEM or cut & cover.

Estimated emissions for both construction methods are provided in Table 5-22. The emissions shown indicate the total project emissions and have also been amortized over 30 years, as required by the SCAQMD. Section 1.2 provides a summary of amortized construction emissions along with the operational emissions increment.

5.6.3 Cumulative Emissions

The proposed project would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). This proposed alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

Table 5-21. Summary of Total Operational GHG Emissions for Fully Underground LRT Alternative – Little Tokyo Variation 2

Mode	Total Operational GHG Emissions (metric tons CO_2e per year)			
	CO_2	CH_4	N_2O	Total[3]
Regional Traffic	106,453,000	58,800	9,858,000	116,369,800
Light Rail	1,000	1	2	1,000
New Station	200	<1	<1	200
Total Emissions	106,454,200	58,800	9,858,000	116,371,000
CEQA Increment[1]	65,902,200	(6,300)	3,906,000	69,800,900
NEPA Increment[2]	(66,900)	1	2	(66,900)

Notes:
[1] *CEQA Increment is defined as the difference between the proposed alternative (2035) and existing conditions (2009).*
[2] *NEPA Increment is defined as the difference between the proposed alternative (2035) and the No Build Alternative (2035).*
[3] *Totals may vary slightly due to rounding.*

Table 5-22. Fully Underground LRT Alternative – Variation 2 Annual Construction GHG Emissions (2014-2017)						
Phase	Emissions of CO_2e (metric tons per year)					
	2014	2015	2016	2017	Project	Amortized Emissions
2nd/Hope Street station (SEM)	1,800	17,600	54,600	40,700	114,800	3,800
2nd/Hope Street station (Cut & Cover)	1,800	18,000	56,100	41,700	117,600	3,900

Totals may vary slightly due to rounding.

6.0 POTENTIAL MITIGATION MEASURES

GHG emissions in each of the build alternatives, and the TSM alternative, are greater than those for existing conditions (see Table 1-2) but less than those for the No Build Alternative (see Table 1-3). The proposed Regional Connector Transit Corridor project is consistent with the requirements of CARB's Scoping Plan and SB 375 by increasing regional transportation capacity and decreasing emissions from passenger vehicles. The proposed alternatives are also consistent with SB 375 and the Regional Connector Transit Corridor project identified in SCAG's 2008 Regional Transportation Plan. Thus, no mitigation measures are required for the proposed project.

7.0 CONCLUSIONS

The build alternatives and the TSM Alternative would cause a decrease in GHG emissions compared to the No Build Alternative and an increase in GHG emissions compared to existing conditions. The build alternatives and the TSM Alternative would be consistent with the requirements of CARB's Scoping Plan and SB 375 to improve mobility in the region and to enhance the regional transportation network infrastructure without encouraging single-vehicle occupancy use.

The increase in GHG emissions among all alternatives in the horizon year (2035) compared to existing conditions is due to increases in the regional VMT from expected growth in the region. This growth is not related to the proposed Regional Connector Transit Corridor project.

Although not reflected quantitatively in this analysis, several of the additional requirements in the Scoping Plan, such as following the Pavley regulations and the low carbon fuel standard, would further reduce GHG emissions. This reduction would occur despite an increase in VMT expected in the region. Therefore, it is expected that GHG emissions would be even less than those calculated in this analysis and, by the horizon year of 2035, could even be less than those for existing conditions.

Since the project is consistent with the area's regional plans, including the Regional Transportation Plan, the project's climate change impacts would not be significant under CEQA. By decreasing the region's GHG emissions, the proposed project's climate change impacts would not be significant under NEPA.

The proposed project would have a net benefit with respect to climate change. Each of the project alternatives decreases overall GHG emissions, including reducing VMT and resulting emissions, when compared to the No Build Alternative (2035). By implementing the proposed project, GHG emissions in the area would be lower than would be expected under a business-as-usual scenario (i.e., No Build Alternative).

1.0 SUMMARY

Noise and vibration impacts may be generated during both construction and operation of the Regional Connector Transit Corridor project. Noise and vibration effects are of concern in residential areas located in proximity to the project. Additionally, vibration impacts may pose a concern for historic properties located very close to construction or operation of the build alternatives. A special vibration analysis would be conducted on fragile and historic structures as is deemed necessary. It is a project goal to prevent damage to any historic structure.

The Regional Connector Transit Corridor project is extremely unlikely to create vibration levels high enough to cause even minor or cosmetic building damage. Vibration may be intrusive to building occupants or interfere with vibration-sensitive equipment; however, a recent Metro study indicates ground-borne vibration (GBV) from train operation would likely be imperceptible at ground elevation. In addition, ground-borne noise (GBN) may be slightly audible at sensitive uses located close to the tracks. This potential impact has also been evaluated.

The No Build Alternative is not expected to change existing noise levels in the project area because traffic in the area is already at or above road capacity and generates substantial noise. New sources of vibration would not be added; therefore, vibration impacts are not expected. The No Build Alternative involves no construction, so there are no noise or vibration impacts predicted for the No Build Alternative.

The Transportation System Management (TSM) Alternative is not expected to change existing noise levels in the project area since traffic is already at or above road capacity and generates substantial noise. Furthermore, buses already operate along the proposed new routes. The high existing ambient noise levels along proposed routes would mask the noise of additional buses associated with this alternative. New sources of vibration would not be added under this alternative so new vibration impacts are not expected. The TSM Alternative may involve minor construction like installation of new bus stop benches and signs. This construction would very short in duration (potentially less than one day) at each potential location and require no heavy equipment. Thus, there would be no negative noise or vibration impacts predicted for the TSM Alternative.

The At-Grade Emphasis LRT Alternative would result in three moderate noise impacts during operation at the following locations: the ground floor of the Kawada Hotel (Site C); the ground floor of the Higgins Building (Site I); and, the ground floor of the New Otani Hotel (Site D). Proposed mitigation measures would reduce noise levels on the ground floor of the Kawada Hotel and the Higgins Building but would not reduce noise to below a moderate impact level. Implementation of proposed mitigation measures would reduce noise levels to below moderate impact levels at the New Otani Hotel. Potential noise impacts associated

with LRT vehicle pass-by would be below a "severe" level; and, therefore, no adverse impact would occur. All other potential noise impacts from operations would be less than significant. Potential adverse vibration impacts from operation are not anticipated for the At-Grade Emphasis Alternative. However, two GBN impacts were identified, which would be mitigated to a level of less than significant if this alternative were selected.

Operation of the Underground Emphasis LRT Alternative would result in moderate noise impacts at the Savoy Condominiums on Alameda and 1st Streets from special track work. Noise impacts associated with special track work would be below "severe" levels. Proposed mitigation measures would further reduce these potential impacts to a "no adverse impact" level. Adverse noise or vibration impacts from operation of the Underground Emphasis LRT Alternative are not anticipated.

The Fully Underground LRT Alternative - Little Tokyo Variations 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in no noise impacts. Adverse vibration impacts from operation of either of these alternatives would not be expected.

Compliance with Section 41.40(a) of the Los Angeles Municipal Code during construction of any of the proposed alternatives would ensure that potential noise and vibration effects do not result in an adverse impact. Sensitive and/or historic buildings within 21 feet of construction activities may be susceptible to vibration damage. Proposed mitigation measures could include conducting a survey of any buildings potentially susceptible to construction vibration. Implementation of proposed mitigation measures described in Section 6.0 would ensure that potential impacts to sensitive and/or historic buildings would be reduced to a less than significant level.

2.0 INTRODUCTION

This Technical Memorandum outlines potential noise and vibration, including ground-borne noise, impacts for the Regional Connector Transit Corridor project alternatives. Noise and vibration impacts may be generated during both construction and operation of the Regional Corridor Connector Transit Corridor project. Noise and vibration effects are of concern in residential areas located in proximity to the project. Additionally, vibration impacts may pose a concern for historic properties within the project area.

This memorandum outlines the methodology and assumptions used to analyze potential effects from noise and vibration generated during construction and operation of the proposed build alternatives. It then analyzes potential noise and vibration impacts associated with each of the alternatives. Potential mitigation measures are discussed to mitigate potential impacts.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section discusses regulatory standards relevant to noise and vibration impacts analysis and discusses the methodology used to evaluate impacts.

3.1 Standards of Significance

3.1.1 Noise Standards

The noise impact analysis for this project is based on criteria defined in the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment* (U.S. Department of Transportation 2006). The standards are based on community reaction to noise and evaluate potential changes to existing noise using a sliding scale. If existing noise is already high, a potential project is more limited in the amount of noise it can create.

Table 3-1 and Figure 3-1 show the FTA noise criteria used to determine "moderate" and "severe" levels of impact. Under NEPA a "severe" level of impact is considered an adverse effect.

CEQA Guidelines Appendix G states that a significant adverse effect from noise may exist if the project would result in:

- Exposure of persons to or generation of noise levels exceeding standards established in the local general plan or noise ordinance, or applicable standards of other agencies
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project

Neither CEQA nor the City of Los Angeles provides quantitative thresholds for a substantial noise impact or a significant adverse vibration impact. This analysis applies FTA criteria to determine the threshold for significance.

In an urban setting, a change of 1 dBA or less is generally not detectable by the human ear while a change of 3 dBA will be noticeable to most people. A change of 5 dBA is readily perceived. A change of 10 dBA, up or down, is typically perceived as a doubling or halving of an urban noise level respectively.

Some land use types are more sensitive to noise than others. For example, parks, churches, and residences are typically more noise-sensitive than industrial and commercial areas. The FTA noise impact criteria classify sensitive land uses into three categories:

- Category 1: Buildings or parks where low noise is an essential element of their purpose (e.g., amphitheaters and concert pavilions)
- Category 2: Buildings where people normally sleep, including residences, hospitals, and hotels where nighttime sensitivity is assumed to be of utmost importance
- Category 3: Institutional land uses with primarily daytime uses that depend on low noise as an important part of operations (e.g., schools, libraries, churches, theaters, and places of study)

As shown in Figure 3-1, the FTA criteria specify two levels of impact, severe and moderate. The level of severity affects potential mitigation requirements for the project.

Severe noise impact is considered an adverse effect as this term is used in NEPA and implementing regulations. Severe noise impacts represent the most compelling need for mitigation. Before mitigation measures are considered, alternative project locations/alignments must be evaluated to determine whether it is feasible to avoid creating severe impacts altogether.

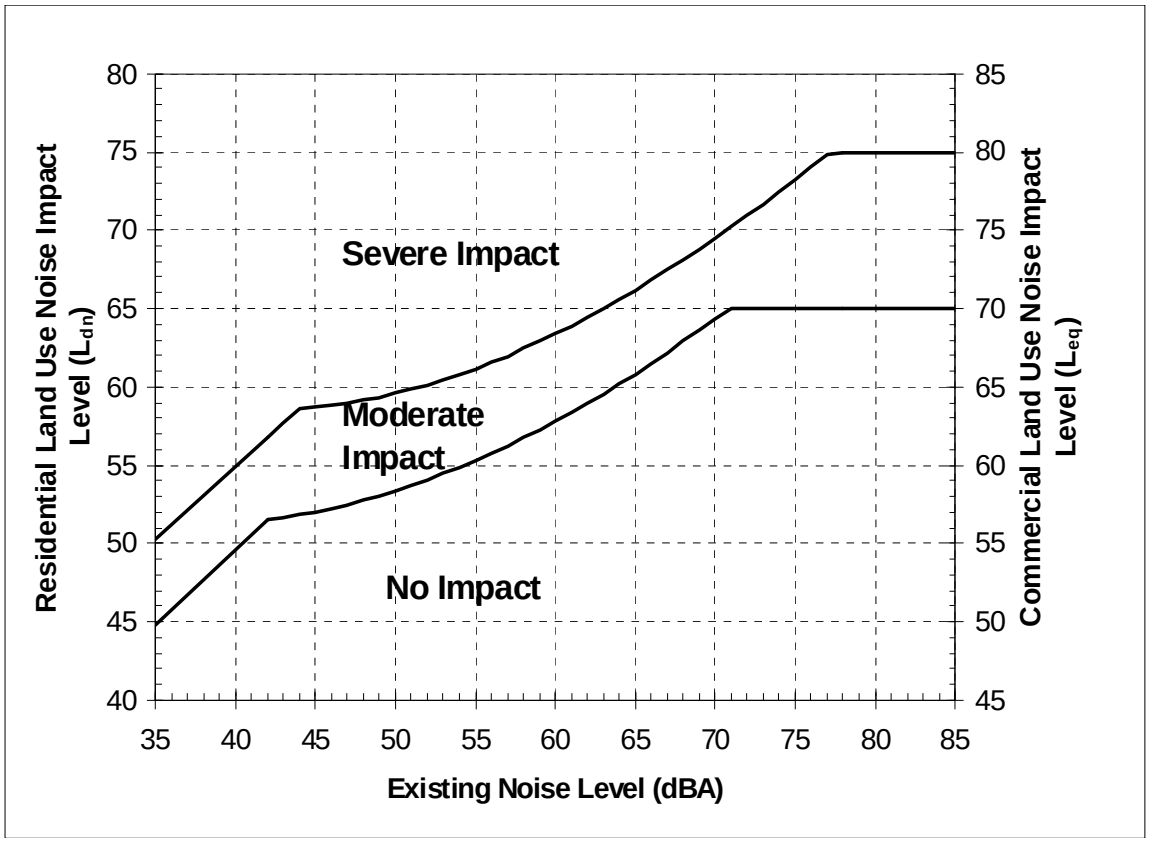

Figure 3-1. Noise Impact Criteria for Transit Projects

If it is not practical to avoid severe impacts by changing the location or design of the project, mitigation measures must be considered. Severe impacts have the greatest adverse effect on the community. Barring extenuating circumstances, there is a presumption by the FTA that mitigation measures would be incorporated into a project with a potential severe noise impact.

Moderate noise impacts also require consideration and adoption of mitigation measures when reasonable. When considering adoption of mitigation measures, factors to be considered include the predicted increase over existing noise levels, the type and number of noise-sensitive land uses affected, existing outdoor/indoor sound insulation, community views, special protection provided by law, and cost-effectiveness of mitigation measures.

Noise impact criteria for transit operations are summarized in Table 3-1. The first column shows existing noise exposure, and the remaining columns show additional noise exposure caused by a potential transit project which is used to determine the level of impact. The future noise exposure would be the combination of existing noise exposure and the additional noise exposure caused by the Regional Connector Transit Corridor project. As the existing noise exposure increases in a particular location the amount of the allowable increase in the overall noise exposure caused by the project decreases.

3.1.2 Vibration Standards

FTA has developed impact criteria for ground-borne vibration (GBV) and ground-borne noise (GBN) due to transit project construction and operation of transit vehicles (U.S. Department of Transportation 2006). Ground-borne noise is created when a vibration source such as a train pass-by causes vibration of floors and walls in nearby buildings resulting in a low frequency rumble sound within the building. Such a rumble is noise radiated from the motion of room surfaces. In essence, the room surfaces act like a loudspeaker. Impacts of ground-borne noise are particularly important for underground transit operations. At-grade and above ground transit operations create airborne noise in greater amounts through other processes, so ground-borne noise is typically less of a specific concern for these type of operations.

There appears to be a relationship between the number of perceived vibration events and the degree of annoyance caused by the vibration. It is intuitive to expect that more frequent vibration events, or events that last longer, will be more annoying to building occupants. There is currently no clear basis for defining an optimal trade-off between frequency and intensity of vibrations in minimizing annoyance. However, FTA guidelines do address vibration frequency by applying different levels of annoyance criteria based on number of transit vibration events per day.

Ground-borne vibration from transit vehicle operations should be characterized in terms of the root mean squared (RMS) vibration velocity amplitude. A one-second RMS time constant

is assumed. The amplitude or strength of vibration is expressed as a velocity level in units of VdB.

Source: Transit Noise and Vibration Impact Assessment, FTA, May 2006
Notes: [1] Ldn is used for land uses where nighttime sensitivity is a factor; Daytime Leq is used for land uses involving only daytime activities.

A different analysis is used for vibration from construction activities that could cause damage to sensitive buildings. When assessing the potential for building damage, GBV is usually expressed in terms of the peak particle velocity (PPV) in units of inches per second. The threshold of vibration perception for most humans is around 65 to 70 VdB. Levels in the 70 to 75 VdB range are often noticeable but acceptable. Levels greater than 80 VdB are often considered unacceptable.

Table 3-2 summarizes the FTA impact criteria for GBV. Some buildings, such as concert halls, television and recording studios, and theaters, can be very sensitive to vibration but are

not included in the three listed categories. These types of buildings, noted in Table 3-3, usually warrant special attention during the environmental review and engineering/pre-construction phases of a project. Table 3-2 and Table 3-3 list impact criteria for transit operations. Following FTA guidance, some criteria in Table 3-2 may also be used to assess human annoyance caused by vibration from construction activities.

Table 3-2. FTA Ground Borne Vibration (GBV) and Ground-Borne Noise (GBN) Impact Criteria for General Assessment

Land Use Category	GBV Impact Levels (VdB re: 1 Micro-inch/sec)			GBN Impact Levels (dB re: 20 micro-Pascals)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations	65 VdB[4]	65 VdB[4]	65 VdB[4]	N/A[4]	N/A[4]	N/A[4]
Category 2: Residences and buildings where people normally sleep	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use	75 VdB	78 VdB	83 VdB	40 dBA[5]	43 dBA[5]	48 dBA[5]

Source: Transit Noise and Vibration Impact Assessment (U.S. Department of Transportation 2006)

Notes:[1] "Frequent Events" are defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.

[2] "Occasional Events" are defined as between 30 and 70 vibration events of the same source per day. Most commuter rail lines produce at least this many events.

[3] "Infrequent Events" are defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.

[4] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Buildings used for vibration-sensitive manufacturing or research will require detailed evaluation to define acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.

[5] Vibration –sensitive equipment is generally not sensitive to ground-borne noise.

In addition to human annoyance from transit operations, FTA guidelines also address the potential for construction-activity-induced vibration to damage buildings. The potential for GBV to cause damage to a building varies by the type of materials and structural techniques used to construct each building. FTA vibration damage criteria for various structural categories are listed in Table 3-4.

FTA guidelines suggest minimum safe distances between construction equipment and buildings based on the types of construction equipment and the category of a building (see Table 3-4). Minimum safe distances between construction and nearby buildings are presented in Table 3-5. For example, minimum safe distance between the most invasive method of construction (impact pile driving) and a Category IV building (the most vibration sensitive type of building) would be at least 136 feet. Conversely, a small bulldozer could safely operate less than five feet from a Category I building (the least vibration-sensitive type of building). Ground-borne noise (GBN) from at-grade or open excavation construction activities is rarely a concern because the airborne noise from the activity would likely dominate the noise environment. While not generally likely, some GBN from underground construction activity such as tunneling could occasionally be audible. However, this GBN would be temporary and of short duration as the construction activity moved along the project alignment.

Table 3-3. FTA Ground Borne Vibration (GBV) and Ground-Borne Noise (GBN) Impact Criteria for Special Buildings

Type of Building or Room	GBV Impact Levels (VdB re: 1 micro inch/sec)		GBN Impact Levels (dB re: 20 micro Pascals)	
	Frequent Events	Occasional or Infrequent Events[2, 3]	Frequent Events[1]	Occasional or Infrequent Events[2, 3]
Concert Halls	65 VdB	65 VdB	25 dBA	25 dBA
Television Studios	65 VdB	65 VdB	25 dBA	25 dBA

This project will not involve impact or sonic pile driving or large vibratory rollers. As a result, the minimum safe distance between construction activities and buildings would never exceed 37 feet for this project. Distances in Table 3-5 are approximations based on typical equipment and construction activities and the general classification of structures.

Table 3-5. Calculated "Minimum Safe Distances" from Construction Equipment to Reduce Potential for GBV Damage (ft)

3.2 Evaluation Methodology

3.2.1 Transit Operations Noise

Analysis of potential project-related noise levels for the build alternatives was based on FTA reference sound levels (U.S. Department of Transportation 2006) and sound level data from current Metro Blue and Gold Line operations. This analysis used the project assumptions about how the project would be operated (speed, headways, and schedule) in estimating ridership, fare revenue, and other impacts.

This noise impact analysis compared potential project-related noise levels from each alternative with existing noise levels. The change in cumulative noise levels under each alternative was analyzed under FTA criteria. Appropriate and reasonable mitigation measures are identified in Section 6.0.

Noise from light rail transit operations is generated from the following sources: the interaction of wheels on track, motive power, signaling and warning systems, platform announcements, and the operation of traction power substations (TPSS). Furthermore, steel wheels on rails generate three different types of noise: trackwork noise from wheel squeal on a tightly-curved track, noise from wheels on crossovers or turnouts, and noise from rolling of the wheel over continuous rail. For at-grade portions of build alternatives, this analysis also considered noise from train horns and warning bells near at-grade crossings and stations.

To assess potential noise impacts, long-term (24-hour) measurements of existing ambient noise were conducted near residences and other buildings where people normally sleep (Figure 4-1). Short-term (15-minute) noise measurements were also taken to determine existing noise levels near recreational, institutional, and commercial land uses with primarily daytime and evening non-sleep activities.

If significant, adverse noise impacts were found to be likely under a project alternative, mitigation measures were identified and evaluated for feasibility and reasonableness. Proposed mitigation measures are intended to reduce potential noise impacts to below a significant level.

3.2.2 Transit Operations Vibrations

Vibration impacts from light rail transit operations are generated by motions and actions at the wheel/rail interface. The smoothness of these motions and actions is influenced by wheel and rail roughness, transit vehicle suspension, train speed, track construction (including types of fixation and ballast) the location of switches and crossovers, and the geologic strata (layers of rock and soil) underlying the track and found between the track and sensitive buildings.

Vibration from passing trains has a small potential to traverse geologic strata and negatively impact near-by sensitive buildings. However, the principal concern with light rail transit

vibration is potential annoyance to building occupants. It is extremely unlikely that GBV from transit operations would cause any damage to buildings.

The potential for vibration and ground-borne noise impacts resulting from the build alternatives was determined using the vibration assessment information and procedures contained in Chapters 7, 8, and 10 of the FTA's guidance manual for a general vibration assessment (U.S. Department of Transportation 2006). Standard transfer mobility functions used to determine the ground attenuation of vibration were based on FTA reference data (U.S. Department of Transportation 2006). The conversion from vibration level to ground-borne noise level was accomplished by selecting one of three conversion factors in the FTA manual depending on the frequency content (spectrum) of the vibration generated by the transit vehicles, whether the system is at-grade or a subway, and the local soil characteristics. The spectrum used for the GBN impact analyses was measured from the transit vehicles operating on the Metro Gold Line, which the Regional Connector would join. The spectrum is provided in Appendix 9.2 (ATS Consultants). The spectrum indicates a definite low frequency bias, and selection of the 'low frequency" conversion factor of -50 dB would be reasonable. However, to provide a very conservative analysis, the "typical" conversion factor of -35 dB was used to calculate the GBN level. Note that the vibration levels in the Appendix 9.2 reflect a train traveling 50 miles-per-hour whereas the Regional Connector trains would be travelling at a maximum of 35 miles-per-hour and would generate lower vibration levels.

All estimates of GBV from the potential project alignments were projected to the foundations of the nearest building. The vibration estimates do not include adjustments for a building's specific reaction to ground-borne vibration. Predicted GBV and GBN levels were compared to FTA criteria to determine potential impacts.

If significant or adverse vibration or ground-borne noise levels were found to be likely for a project alternative, mitigation measures were identified and evaluated for feasibility and reasonableness. Mitigation measures would reduce potential adverse impacts to below a significant or adverse level.

3.2.3 Construction Noise and Vibration

The construction noise and vibration analysis used the description of construction methods described in the Construction Technical Memorandum. The analysis considered both daytime and nighttime construction activities using the procedures presented in Chapter 12 of the FTA guidance manual (U.S. Department of Transportation 2006).

4.0 AFFECTED ENVIRONMENT

4.1 Area of Potential Effect

When considering build alternatives with at-grade segments, this analysis follows the FTA guidelines that specify the size of an area where potential noise effects from a new project should be screened (U.S. Department of Transportation 2006). The relevant area for rail rapid transit systems with at-grade facilities is 350 feet from at-grade tracks where there are buildings between the source and the receiver and 700 feet from tracks in unobstructed areas. For rail rapid transit stations, the distances are 100 feet with an obstruction between the receiver and noise source and 200 feet with no obstruction, respectively. For parking facilities the distances are 75 feet and 125 feet, respectively, and for yards and shops the distances are 650 feet and 1000 feet, respectively (U.S. Department of Transportation 2006).

For underground subway systems, screening distances are much smaller. When considering underground portions of the build alternatives, this study assessed the potential for vibration and ground-borne noise impacts at vibration-sensitive uses within 150-200 feet (vertical, diagonal, or horizontal as appropriate) of proposed track alignments. Thus, the Disney Concert Hall was only analyzed for vibration effects because all of the alternatives are below grade in the vicinity of the Disney Hall (site DH) and there is no potential for airborne noise impact.

4.2 Existing Conditions

Figure 4-1 shows FTA land use categories within the project area. Table 4-1 lists noise sensitive uses within the screening distance for the build alternatives. This analysis identified noise-sensitive land uses at twelve locations along the proposed alternative alignments and near proposed station locations (Figure 4-1). Noise levels were measured at nine locations to establish the existing noise environment for the overall project alignments. The measurements included seven 24 hour and three short-term, 10 minute measurements. All noise measurements were conducted consistent American National Standards Institute (ANSI) procedures for community noise measurements.

The project area of potential effect for noise lies within the urban core of the City of Los Angeles. Existing noise levels are typical of an urban environment. The average day-night noise level (Ldn) ranges from 69 to 74 dBA. Figure 4-1 and Table 4-1 show existing noise levels by location. Noise levels and noise sensitive land uses are described by street segment along the proposed alignments. Noise monitoring notes are provided in Appendix 9.1.

Noise levels were measured at four locations along Flower Street, Sites 1, 2, A and B shown on Figure 4-1.

A 24-hour measurement was conducted at Site A on the pool deck of the Westin Bonaventure. The pool deck sits four floors above Flower Street and is the closest open area to hotel rooms.

An Ldn of 71 dBA and a peak-hour Leq of 68 dBA was measured at 6:00 a.m. Noise levels are dominated by traffic noise from Flower and 5th Streets.

Table 4-1. Noise Sensitive Land Use within Screen Distance

Name	Location	Build Alternative within Screen Distance

Notes: ALRT = At-Grade Emphasis LRT Alternative; ULRT = Underground Emphasis LRT Alternative; FULRT = Fully Underground LRT Alternatives – including both Little Tokyo Variation 1 and Little Tokyo Variation 2.

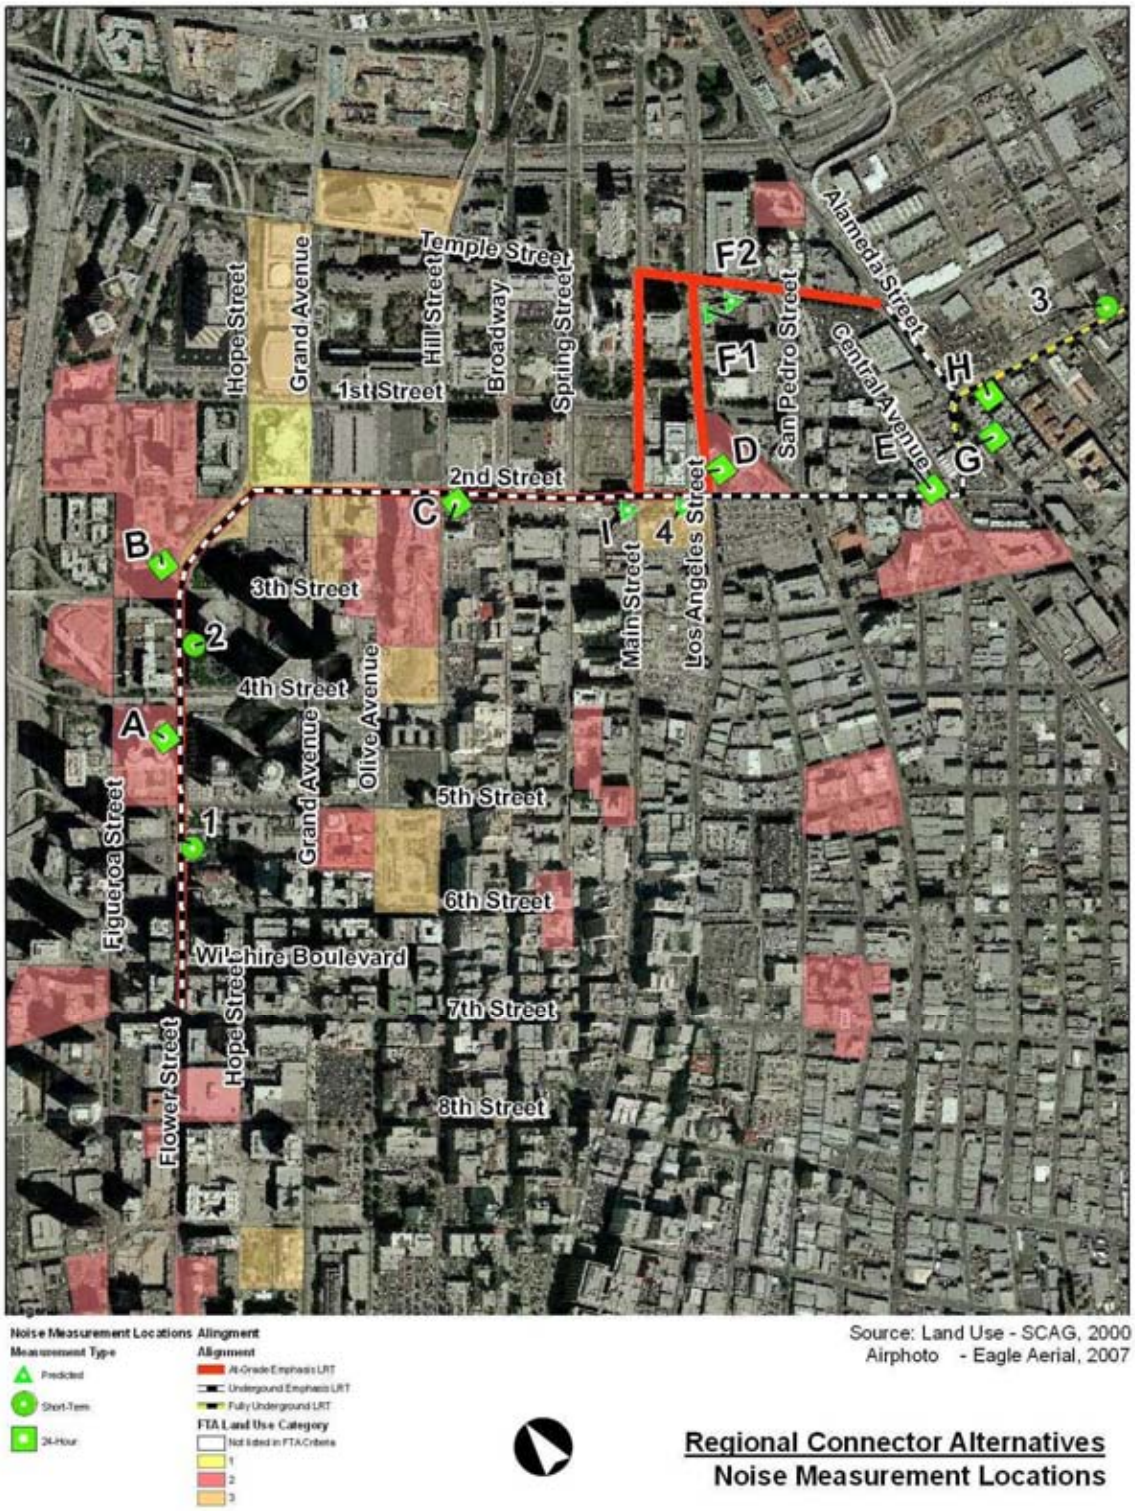

Figure 4-1. Noise Measurement Locations (Site #)

A 24-hour measurement was obtained at Site B outside the ground-floor condominiums of the Bunker Hill Towers at Flower and 3rd Streets. An Ldn of 74 dBA and a peak-hour Leq of 72 dBA were measured at 8:00 a.m. Noise levels are dominated by traffic noise from Flower and 3rd Streets.

A short-term (10-minute) measurement was conducted at Site 1 from the park area outside of the Los Angeles Library on Flower Street. A one-hour Leq of 67 was measured at 2:00 p.m. This analysis estimates a peak-hour Leq of 68 dBA at this location. This was estimated by comparing the short-term measurement to the 24-hour measurement obtained at the Westin Bonaventure. Noise levels are dominated by traffic noise from Flower and 5th Streets.

A short-term measurement was conducted at Site 2 in the Bank of America Building Plaza. The plaza is located five floors above Flower Street at the same level as the tennis courts of the World Trade Center located on the north side of Flower Street. A one-hour Leq of 61 was measured at 1:15 p.m. The peak hour Leq at Site B is estimated at 63 dBA. Noise levels are dominated by traffic noise from Flower Street.

Noise measurements were obtained at two locations along 2nd Street, Sites C and E and existing conditions were estimated at Site I, as shown on Figure 4-1.

A 24-hour measurement was conducted at Site C on the roof of the Kawada Hotel at the intersection of 2nd and Hill Streets. An Ldn of 70 dBA and a peak hour Leq of 70 dBA were measured at 4:00 p.m. Noise levels are dominated by traffic noise from 2nd and Hill Streets.

A 24-hour measurement was conducted at Site E on the roof of the Hikari Loft Apartments at the intersection of 2nd Street and Central Avenue. A 24-hour Ldn of 69 dBA and a peak hour Leq of 71 dBA were measured at 7:00 p.m. Noise levels are dominated by traffic noise from 2nd and Alameda Streets and Central Avenue.

Site I is located at the Higgins Building at the northwest corner of 2nd and Main Streets. This building houses residential lofts. Existing noise levels could not be accurately measured due to construction at Saint Vibiana and on Main Street. Noise levels for Site I were estimated based on the measurements at Sites C and D.

Site 4 lies on 2nd Street between Main and Los Angeles Streets. This site includes Saint Vibiana and the Los Angeles Library, Little Tokyo Branch. Existing noise levels could not be accurately measured due to construction at Saint Vibiana and on Main Street. Peak hour noise levels were estimated based on the measurements at Site D on the southeast corner of 2nd and Los Angeles Streets.

Category 1, 2 or 3 (i.e., potentially sensitive) land uses do not exist on Main Street, so no measurements were conducted there.

On Los Angeles Street, one sensitive land use was observed at Site D. A 24-hour measurement was conducted at Site D on the ground level of the New Otani Hotel midway between 2nd and 1st Streets. This location most approximated noise levels in the tower that houses guest rooms. An Ldn of 73 dBA and a peak hour Leq of 73 dBA were measured at 7:00 a.m. and 6:00 P.M, respectively. The garden terrace on the 4th floor was not used as a measurement location because other noise sources (e.g., waterfalls, piped in music) masked street noise. Noise levels are dominated by traffic noise from Los Angeles Street.

On Temple Street, sensitive land uses exist at Sites F and F1 where the Metropolitan Detention Center is located. Due to construction on Temple Street, and actives at the jail, representative existing noise levels could not be measured. Noise levels for Sites F and F1 were estimated based on measurements at Sites D and H.

One noise measurement was conducted on Alameda Street at Site G. A 24-hour measurement was conducted at ground level to approximate noise in certain units of the Savoy Condominiums where traffic noise levels are dominated by street traffic on Alameda Street. An Ldn of 73 dBA and a peak hour Leq of 75 dBA were measured at 7:00 p.m.

Two noise measurements were conducted on 1st Street, represented by Sites H and 3. A 24-hour measurement was conducted at Site H at ground level to approximate noise in certain condo units in the Savoy Condominium building where noise levels are dominated by the traffic on 1st Street and train noise from Metro Gold Line operations. An Ldn of 72 dBA a peak hour Leq of 72 dBA were measured at 7:00 p.m.

A short-term measurement was conducted at ground level at Site 3, on East 1st street, between Garey and Vignes Streets. This location approximates existing noise effects on the meeting room and meditation area of the Los Angeles Hompa Hongwanji Temple. Ambient noise levels at Site 3 are dominated by traffic on 1st Street and train noise from the Metro Gold Line operations. A one-hour (non-peak) Leq of 66 was measured at 2:00 p.m. At the time of this measurement, lane closures were in effect along 1st Street. This resulted in a lower ambient Leq than would have been expected if all lanes were open. Based on the long-term measurement at site H, the peak hour Leq at Site 3 was calculated at 70 dBA.

5.0 IMPACTS

Potential noise and vibration impacts from transit operations and construction are analyzed and compared to the existing conditions as described in Section 4.0. Operation noise and vibration sources could include the movement of vehicles along each alignment (pass-by), noise from warning signals, locations of special trackwork, ventilation related noise, and operation of traction power substations.

The analysis of construction effects is based on Section 3 of the Construction Staging Plan from the *Traffic Handling and Construction Staging Report* (CDM 2009). Potential construction noise and vibration under the build alternatives could result in a non-permanent impact on sensitive receivers. Construction noise and vibration is generally not considered a significant impact since it is temporary and occurs mainly in the daytime. However, some receivers that are currently adversely impacted by traffic noise could also be adversely impacted by project construction noise. Some receivers could periodically perceive low levels of vibration and ground-borne noise during construction.

Each of the build alternatives would utilize different construction methods, so each alternative would potentially generate different levels of construction noise and vibration. The *Traffic Handling and Construction Staging Report* estimates a four- to five-year construction period with surface street disruption of approximately 24 to 48 months for all build alternatives (CDM 2009).

5.1 No Build Alternative

5.1.1 Transit Operations Noise

Automobile traffic would be the only likely source of increased noise levels under the No Build Alternative. However, traffic in the project area is already at or above road capacity, so increases in automobile traffic volumes are not expected to change existing 24-hour (Ldn) noise levels. If congestion increased, traffic speeds would decline, and noise levels increases would be correspondingly low. In sum, no significant noise impacts are anticipated for the No Build Alternative.

5.1.2. Transit Operations Vibration

Under the No Build Alternative, there would not be any new sources of vibration proposed by this project and there would be no increase in vibration levels over existing sources of vibration. No adverse vibration impacts would be anticipated from operation of the No Build Alternative.

5.1.3 Construction Noise and Vibration

There would be no major construction activities under the No Build Alternative; therefore, no construction noise and vibration impacts would be anticipated.

5.2 Transportation System Management (TSM) Alternative

5.2.1 Transit Operations Noise

The TSM Alternative would have no significant noise impacts. This alternative would add bus routes along Alameda, Temple, 2nd, 3rd, 5th, 7th, Flower, Figueroa, and Olive Streets and Grand Avenue. Intersections would be modified to shorten bus commutes. Bus service frequency would increase from 10-minute to 5-minute headways during peak periods and from 20-minute to 10-minute headways during off-peak periods.

Existing environmental noise levels along the proposed bus routes are 69 to 74 dBA Ldn. The FTA's General Transit Noise Assessment provides a reference sound exposure level of 84 dBA for a bus pass-by at 50 feet at 50 mph. Based on this estimate, noise levels resulting from the proposed doubling of bus traffic are predicted to be 47 to 61 dBA Ldn. Existing noise levels are substantially higher and would mask the noise of additional buses. Under FTA criteria, the potential increase in noise from this alternative would result in no significant noise impacts.

5.2.2 Transit Operation Vibrations

Under the TSM Alternative, there are no new sources of vibration proposed. Operation of additional buses along the proposed route would not result in a noticeable increase in vibration levels over levels generated by existing buses. As a result, no adverse vibration impacts are anticipated from operation of the TSM Alternative.

5.2.3. Construction Noise and Vibration

There would be no major construction activities under the TSM Alternative; therefore, no construction noise and vibration impacts would be anticipated.

5.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

5.3.1 Transit Operations Noise

Operation of the At-Grade Emphasis LRT Alternative could generate six potential sources of noise impacts: pass-by from LRT vehicles, warning signals for at-grade crossings, areas of special trackwork, grade separations, ventilation shafts, and traction power substations (TPSS). Table 5-1 illustrates potential noise impacts under this alternative.

5.3.1.1 Pass-by Impacts From LRT Vehicles

Noise modeling for the At-Grade Emphasis LRT Alternative assumes a three-car train with 2.5-minute headways during peak hours (6:00 a.m. to 9:00 a.m. and 3:00 p.m. to 7:00 p.m.) and 5-minute headways during off peak hours (5:00 a.m. to 6:00 a.m., 9:00 a.m. to 3:00 p.m., and 7:00 p.m. to 1:00 a.m.). There would be no regularly planned service between 1:00 a.m. and 5:00 a.m. However, Metro may run trains later during special events like New Years Eve. The model assumes trains will travel at 35 MPH along Flower and Temple Streets and 25 MPH along 2nd, Main, and Los Angeles Streets.

This analysis predicts three potential moderate level noise impacts from LRT vehicle pass-bys under this alternative. Two impacts would occur on 2nd Street on the ground floor of the Kawada Hotel and the Higgins Building. One impact would occur on Los Angeles Street on the ground floor of the New Otani Hotel (Table 5-1).

5.3.1.2 Impacts From At-Grade Crossing Warning Signals

Warning signals near at-grade rail crossings that include bells and train horns could generate noise impacts and increase potential impacts caused by LRT pass-bys.

The At-Grade Emphasis LRT Alternative would make LRT trains run with existing traffic signals. Warning signals would not be regularly used by LRT trains. The California Public Utility Commission (CPUC) must approve this plan; still, no noise impacts from at-grade warning signals are expected to result under this alternative.

5.3.1.3 Impacts From Special Trackwork

The At-Grade Emphasis LRT Alternative would require special trackwork for turnouts and crossovers. Turnouts, also known as switches, allow trains to move from one track to another. Train movement from the mainline to maintenance and storage yards would utilize turnouts. Crossovers allow trains to move between parallel tracks. They allow a single train to run alternately in both directions. The junction between the Regional Connector and the Gold Line would also include switches.

Noise from switches or crossovers comes from a small gap in the central part of the switch known as a frog. When crossing this gap, train noise levels could increase up to 6 dBA locally.

The At-Grade Emphasis LRT Alternative would have two areas of special trackwork: an at-grade crossover on 2nd Street near Broadway and an at-grade junction near Temple Street and Alameda to connect to the Metro Gold Line tracks.

Noise-sensitive land uses do not exist near areas of special trackwork. The closest noise-sensitive land use to special trackwork is the Geffen Contemporary at the Museum of Contemporary Art (MOCA), which is located at the intersection of Alameda and Temple Streets approximately 200 feet south of the proposed alignment. Noise impacts from special trackwork are not predicted at the Geffen Contemporary at MOCA.

5.3.1.4 Impacts From Grade Separation of Alameda and 1st Street

Under this alternative, a proposed pedestrian overpass and a vehicular underpass would be constructed at Alameda and 1st Streets to provide a grade separation between trains, vehicles, and pedestrians. Traffic on Alameda, Temple and 1st Streets would not change and, therefore, traffic noise levels along Alameda Street from 2nd to 1st Streets are not expected to increase as a result of this alternative.

5.3.1.5 Impacts From Ventilation Shafts

Under this alternative, both normal and emergency ventilation would be supplied to underground segments of the alignment by fans. Potential noise associated with ventilation systems would include pass-by noise from trains transmitted through vent shafts to the street, normal fan operation, and testing of emergency ventilation fans.

Vent shafts and emergency ventilation fans would be designed in accordance with Metro system-wide design criteria noise guidelines for residential areas. These guidelines suggest a ceiling of 60 dBA for train pass-by noise and 50 dBA for fan noise at a distance of 50 feet or to the nearest residential building, whichever is closer. The predicted noise level associated with the proposed ventilation shafts would be 50 dBA at 50 feet or the nearest residential building. Under this alternative, noise levels associated with ventilation would be far lower than current ambient noise levels at Flower and 2nd Streets.

Noise associated with vent shafts would not exceed FTA noise impact criteria, and no significant, adverse noise impact would occur.

5.3.1.6 Impacts From Traction Power Substation (TPSS)

As part of the At-Grade Emphasis LRT Alternative, TPSSs would be installed at the proposed 2nd/Hope Street station and in the Los Angeles Times' parking structure at 2nd and Spring Streets. Each TPSS would be designed in accordance with the Metro system-wide design criteria noise guideline of 50 dBA at 50 feet or the nearest residential building, whichever is closer. The operating noise level for the TPSS would be substantially lower than existing ambient noise levels and LRT pass-by noise. Noise generated by TPSS would not exceed FTA noise impact criteria, and no, significant, adverse noise impact would occur.

Table 5-1. At-Grade Emphasis LRT Predicted Noise Levels and Operational Impacts

Notes: [1] Land use category descriptors are as follows: FTA Category 1 = buildings or parks where low noise levels are an essential element of their purpose; FTA Category 2 = residences and other buildings where people sleep, such as hotels, apartments and hospitals; and FTA Category 3 = institutional land uses with primarily daytime and evening use, including schools, libraries and churches.

[2] Ldn is used for land uses with nighttime sensitivity to noise and for residential areas where FTA rather than FHWA noise procedures are applicable. Peak-hour Leq is used for commercial, industrial, and other land uses that do not have nighttime noise sensitivity.

[3] SF = Single family residential; MF = Multi-family residential

5.3.2 Transit Operations Vibration

The At-Grade Emphasis LRT Alternative would have two potential sources of vibration impacts during operations: transit vehicle pass-bys and special trackwork.

5.3.2.1 Pass-by Impacts From LRT Vehicles

Vibration modeling for the At-Grade Emphasis LRT Alternative uses the same assumptions about train traffic as the noise impact analysis. Based on FTA's generalized ground surface vibration curves, no adverse vibration impacts are predicted, but ground-borne noise impact at Site C and Site D is predicted from LRT vehicle pass-bys under this alternative (U.S. Department of Transportation 2006) (See Table 5-2).

Table 5-2. At-Grade Emphasis LRT Predicted Vibration and GBN Levels and Operational Impacts

Site #	FTA Land Use Category 1	FTA Vibration Level Criteria (VdB)	FTA GBN Level Criteria (dBA)[2]	Predicted Project Vibration Levels (VdB)	Predicted Project GBN Levels (dBA)[3]	Vibration and GBN Impact

DH	Special Buildings	65	25	57	22	No Impact

Source: Parsons Brinckerhoff, Inc., 2009
Notes: [1] Land use category descriptors: FTA Category 1 = buildings or parks where quiet is an essential element of their purpose; FTA Category 2 = residences and other buildings where people sleep, such as hotels, apartments and hospitals; FTA Category 3 = institutional land uses with primarily daytime and evening use, including schools, libraries and churches. [2] Impact criteria is for frequent events. [3] Based on more conservative "typical" vibration spectra.

5.3.2.2 Impacts from Special Trackwork

The At-Grade Emphasis LRT Alternative would require special trackwork at two locations as described in Section 5.3.1.3. The areas of special trackwork are not located near any vibration-sensitive land uses. The closest vibration-sensitive land use to the special trackwork is the Geffen Contemporary at the MOCA, which is located at the intersection of Alameda and Temple Streets, approximately 200 feet south of the proposed alignment. Thus, adverse vibration impacts from special trackwork are not predicted under this alternative.

5.3.3 Construction Noise and Vibration

Under the At-Grade Emphasis LRT Alternative, the following construction activities would have the most potential for noise and vibration impacts: cut and cover construction of a tunnel on Flower Street; cut and cover construction of the proposed Flower/6th/5th Street station; cut and cover construction of the proposed 2nd/Hope Street station; and re-grading of Alameda Street near the junction at Alameda and Temple Streets. These four activities have the most potential for noise impacts because of their duration and their proximity to noise-sensitive land uses.

Construction activities, relevant construction equipment and related noise levels for this alternative are shown in Table 5-3.

The *Regional Connector Transit Corridor Description of Construction* states that "Pre-auguring would likely be necessary for installation of the soldier piles, to eliminate impact pile driving which would cause vibration and noise." In pre-auguring, holes for piles would be drilled before they are cast in place. As a result, pile drivers and hoe rams would not be used during construction of this alternative, and no adverse construction vibration impacts related to impact-type equipment are anticipated.

5.3.3.1 Construction Noise

To insure noise impacts are minimized during construction, all construction activities shall conform to the provisions in Section 41.40(a) of the City of Los Angeles Municipal Code. The code states that engaging in construction, repair, or excavation work, with any construction device, or job-site delivery of construction materials without a Police Commission-issued Variance or Permit would constitute a violation:

- Between the hours of 9:00 p.m. and 7:00 a.m.
- In any residential zone, or within 500 feet of land so occupied, before 8:00 a.m. or after 6:00 p.m. on any Saturday, or at any time on any Sunday
- In a manner as to disturb the peace and quiet of neighboring residents or any reasonable person of normal sensitiveness residing in the area.

The contractor would also be responsible for complying with the applicable local ordinance as it applies to all equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the contractor. The Los Angeles Municipal Code section 41.40(a) does not set acceptable noise level limits for either daytime or nighttime construction activities. If a noise variance is required, the noise variance will set the acceptable noise level limits.

Typical types of mitigation measures and Best Management Practices the contractor can use to meet the acceptable limits include, but are not limited to, the following:

- placement of temporary noise barriers around the construction site;
- placement of localized barriers around specific items of equipment or smaller areas;
- use of alternative back-up alarms/warning procedures;
- higher performance mufflers on equipment used during nighttime hours; and
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators.

Table 5-3. Construction Activity and Equipment Typical Noise Levels in dBA at 50 feet from Source for the At-Grade Emphasis LRT Alternative

Activity	Duration (months)	Construction Equipment				
		Concrete Truck	Dozer	Excavator	Crane	Drill Rig

Operating Systems Installation	TBD	TBD	TBD	TBD	TBD	TBD

5.3.3.2 Construction Vibration

GBV can cause damage to buildings depending on the building type (i.e., building materials and structural techniques) (see Table 3-4). This analysis calculates a "minimum safe distance" (with respect to vibration level) between construction equipment and buildings under various scenarios (See Table 3-5). Using the minimum safe distance for Category IV buildings of 0.12 inch/sec Peak Particle Velocity (PPV) to identify potential impacts, will insure that the potential "worst case" is identified, even for very sensitive or historic buildings. Minimum safe working distances will account for the most sensitive buildings under the strongest potential vibration impact scenarios.

For the At-Grade Emphasis Alternative, pre-auguring of soldier piles at cut and cover sections would eliminate the need for impact pile driving. Equipment such as large bulldozers and drill rigs would be the main construction vibration sources. For the surface trackwork sections on 2nd, Main, Los Angeles, and Temple Streets, drill rigs for installation of the poles to hold catenary wires would be the largest source of vibration. Large bulldozers and drill rigs would operate intermittently during construction and would not be used every day. Track construction could begin simultaneously at several locations in the project area and would be brought to completion at approximately the same time. Construction activities would not dwell in one location for the entire duration of construction.

A survey of structures within 21 feet of potential vibration-producing construction activities would be conducted. The survey would assess the building categories and the potential for GBV to cause damage. The survey would also help to establish baseline, pre-construction conditions for historic or other sensitive buildings. During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken to evaluate soil, groundwater, seismic, and environmental conditions along the alignment.

During construction of this alternative, building protection measures would be applied. Measures could include underpinning, soil grouting, or other forms of ground improvement, and use of lower vibration equipment or construction techniques. Additionally, a geotechnical and vibration monitoring program would be used to protect identified historic and sensitive structures.

Mitigation measures identified in Section 6.3 would reduce construction-related vibration impacts to historic and sensitive buildings, located within 21 feet of the anticipated vibration-producing construction activity, to a less than significant level.

Large bulldozer and drill rigs, the main construction vibration sources, could exceed levels specified in FTA annoyance criteria for sensitive receptors (See Table 3-2). However, perceptible vibration from construction equipment would be short-term and intermittent. Therefore, perceptible vibration from these pieces of construction equipment is considered an "infrequent event," less than 30 times a day as defined by FTA. Sensitive receptors located along the alignment are considered Category 2 and Category 3 land uses under the FTA annoyance criteria. Short-term vibration levels during construction could exceed the annoyance impact limits for infrequent events if specific construction activities were within 20 feet of a Category 2 land use and within 16 feet of a Category 3 land use. However, taking into account a 10 dBA reduction in vibration for coupling to building foundation loss (Table 10-1, FTA, 2006), occupants would not be subject to vibration annoyance impacts. It should be noted, large bulldozers and drill rigs would operate intermittently and would not be used every day of construction. In addition, construction of the alignment would not dwell in one location for the entire duration of construction. Therefore, vibration impacts (including ground-borne noise) associated with large bulldozer and drill rigs would be less than significant. Implementation of mitigation measures identified in Section 6.1.3 would further reduce impacts below the level of less than significant.

5.4 Underground Emphasis LRT Alternative

5.4.1 Transit Operations Noise

The Underground Emphasis LRT Alternative would involve the same six potential sources of noise impacts during operations as the At-Grade Emphasis LRT Alternative. These include pass-by noise from LRT vehicles, warning signals near at-grade crossings, special trackwork,

grade separations, ventilation shafts, and TPSSs. Table 5-4 illustrates potential noise impacts under this alternative.

5.4.1.1 Pass-by Impacts From LRT Vehicles

Noise modeling for the Underground Emphasis LRT Alternative assumes a three-car train with 2.5-minute headways during peak hours (6:00 a.m. to 9:00 a.m. and 3:00 p.m. to 7:00 p.m.) and 5-minute headways during off peak hours (5:00 a.m. to 6:00 a.m., 9:00 a.m. to 3:00 p.m., and 7:00 p.m. to 1:00 a.m.). There would be no regularly planned service between 1:00 a.m. and 5:00 a.m. The analysis assumed a speed of 30 MPH for all segments of the Underground Emphasis LRT alternative.

The Underground Emphasis LRT Alternative would run in a tunnel from the 7th Street/Metro Center Station to a portal between Central Avenue and Alameda Street. Thus, the only areas with potential noise impacts are the Hikari Lofts at the intersection of 2nd Street and Central Avenue and the Savoy Condominiums on Alameda Street, between 2nd and 1st streets. Based on FTA criteria, no noise impacts are predicted from LRT vehicle pass-bys (See Table 5-4).

5.4.1.2 Impacts From At-Grade Crossing Warning Signals

Warning signals near at-grade rail crossings include bells and train horns and could generate noise impacts, which could increase impacts caused by LRT pass-bys. Under this alternative, LRT vehicles would run underground except crossing Alameda and 1st Streets. The LRT vehicles would run with existing traffic signals on 1st Street and would be separated from traffic on Alameda Street. Therefore, pending CPUC approval, the project would not include the use of warning signals or gates and would not create noise impacts from at-grade warning signals.

5.4.1.3 Impacts from Special Trackwork

The Underground Emphasis LRT Alternative would require special trackwork for crossovers or switches. Like the At-Grade Emphasis LRT Alternative, trains in the Underground Emphasis LRT Alternative would produce noise as they cross switches. Potential noise levels would increase up to six dBA in the vicinity of a switch.

This alternative would have four areas of special trackwork, including an underground crossover north of the proposed Flower/5th/4th Street Station; a set of switches between the proposed underground stations at Flower/5th/4th and 2nd/Hope Street to allow for a pocket track; an underground crossover near the proposed station on 2nd Street (the exact location would depend on which option is chosen); and the at-grade junction near Alameda and 1st Street to connect to the Gold Line tracks. The junction near Alameda and 1st Streets are near the Savoy Condominiums and would be predicted to cause a moderate noise impact at the Condominiums (see Table 5-5).

5.4.1.4 Impacts from Grade Separation of Alameda and 1st Street

Under this alternative, traffic on Alameda Street would be grade separated from the LRT tracks. The traffic capacity of Alameda, Temple, and 1st Streets would remain the same. Therefore, traffic noise levels along Alameda Street from 2nd to 1st Streets would not be expected to increase compared to the No Build Alternative.

5.4.1.5 Impacts from Ventilation Shafts

Under this alternative, both normal and emergency ventilation would be supplied to underground segments of the alignment by fans. Potential noise associated with ventilation systems would include pass-by noise from trains transmitted through vent shafts to the street, normal fan operation, and testing of the emergency ventilation fans.

Vent shafts and emergency ventilation fans would be designed in accordance with Metro system-wide design criteria noise guidelines for residential areas. These guidelines suggest a ceiling of 60 dBA for train pass-by noise and 50 dBA for fan noise at a distance of 50 feet or to the nearest residential building, whichever is closer. Noise levels associated with ventilation would be far lower than current ambient noise levels in areas above underground segments. Noise associated with vent shafts would not exceed FTA noise impact criteria, and no significant, adverse noise impact would occur.

5.4.1.6 Impacts from Traction Power Substations (TPSS)

As part of the Underground Emphasis LRT Alternative, TPSSs would be installed underground near the proposed Flower/5th/4th Street station and the proposed 2nd Street station. Even though each TPSS would be located underground, they would be designed in accordance with the Metro System-wide design criteria noise guideline of 50 dBA at 50 feet or the nearest residential building, whichever is closer. Noise generated by TPSSs would not exceed the FTA noise impact criteria, and no significant, adverse noise impact would occur.

5.4.2. Transit Operations Vibration

The Underground Emphasis LRT Alternative has the same two potential sources of vibration impacts during operations as the At-Grade Emphasis LRT Alternative: pass-by vibration from LRT vehicles and areas of special trackwork.

5.4.2.1 Pass-by Impacts From LRT Vehicles

Vibration modeling for the Underground Emphasis LRT Alternative used the same assumptions about train traffic as the noise impact analysis. Based on FTA criteria, no adverse vibration impacts are predicted from LRT vehicle pass-bys (Table 5-6).

5.4.2.2 Impacts from Special Trackwork

The Underground Emphasis LRT Alternative would require special trackwork in four locations as described in Section 5.4.1.3.

The switches on Alameda and 1st Streets are near the Savoy Condominiums (Site H) and the Japanese American National Museum (JANM). Based on FTA's general vibration assessment guidelines, special trackwork for this alternative would add 10 db to the vibration level for LRT vehicle pass-by. The resulting predicted vibration level would be 68 VdB, which remains under the FTA threshold of 72 VdB. The GBN levels would be 33 dBA, which is below the FTA criterion of 35 VdB. Thus, no adverse vibration or ground-borne noise impacts from special trackwork are predicted for the Underground Emphasis LRT Alternative.

5.4.3 Construction Noise and Vibration

Considering the Underground Emphasis LRT Alternative, the following construction activities would have the most potential for noise and vibration impacts: cut and cover construction of a tunnel on Flower Street; cut and cover construction of the proposed Flower/5th/4th Street station; cut and cover construction of the approach the proposed 2nd/Hope Street station and the station itself; construction of either of the proposed 2nd Street station alternatives (Los Angeles Street or Broadway Options); grade separation at the junction of 1st and Alameda Streets; and, tunnel boring machine (TBM) tunneling beneath 2nd Street with a launch site near either 2nd Street and Central Avenue or the proposed 2nd/Hope Street station. These eight activities have the most potential for noise and vibration impacts due to the duration and their proximity to sensitive land uses.

5.4.3.1 Construction Noise

Construction activities, relevant construction equipment, and related noise levels for this alternative are shown in Table 5-7.

To insure noise impacts are minimized during construction, all construction activities shall conform to the provisions in Section 41.40(a) of the City of Los Angeles Municipal Code. The code states that engaging in construction, repair, or excavation work, with any construction device, or job-site delivery of construction materials without a Police Commission-issued Variance or Permit would constitute a violation:

- Between the hours of 9:00 p.m. and 7:00 a.m.
- In any residential zone, or within 500 feet of land so occupied, before 8:00 a.m. or after 6:00 p.m. on any Saturday, or at any time on any Sunday
- In a manner as to disturb the peace and quiet of neighboring residents or any reasonable person of normal sensitiveness residing in the area.

The contractor would also be responsible for complying with the applicable local ordinance as it applies to all equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the contractor. The Los Angeles Municipal Code section 41.40(a) does not set acceptable noise level limits for either daytime or nighttime construction activities. If a noise variance is required, the noise variance will set the acceptable noise level limits.

Typical types of mitigation measures and Best Management Practices the contractor can use to meet the acceptable limits include, but are not limited to, the following:

- Placement of temporary noise barriers around the construction site;
- Placement of localized barriers around specific items of equipment or smaller areas;

- Use of alternative back-up alarms/warning procedures;
- Higher performance mufflers on equipment used during nighttime hours; and
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators.

5.3.3.2 Construction Vibration

GBV can cause damage to buildings depending on the building type (i.e., building materials and structural techniques) (see Table 3-4). This analysis calculates a "minimum safe distance" (with respect to vibration level) between construction equipment and buildings under various scenarios (see Table 3-5). Minimum safe working distances would account for the most sensitive buildings under the strongest potential vibration impact scenarios.

Potential noise from TBM operations at the launch site, where bored material is hauled out, treated and removed, is listed in Table 5-7. Noise levels for the TBM are not listed for the alignment sections between the TBM launch and recovery sites. The TBM produces little to no noise that reaches surface land uses when it is operating underground. Additionally, the TBM is slow moving and causes very little vibration and related ground-borne noise to the surrounding area.

According to one study, peak particle vibration velocities from tunnel construction (in soft ground) lie in the range from 0.0024 to 0.0394 inches per second PPV at a distance of 33 feet from the vibration source (Verspohl 1995). Another study measured vibration velocities in the range of 0.0157 to 0.0551 inches per second at the same 33 foot distance from the source (New 1990). These PPV vibrations may also be expressed as RMS vibration velocity levels ranging from 56 to 83 VdB. Given this range of potential vibration impacts, and the distance below grade that tunnel boring would occur, vibration produced by a TBM would be well below the FTA threshold for Category IV buildings of 0.12 inches per second PPV.

For the Underground Emphasis LRT Alternative, pre-auguring of soldier piles at cut and cover sections would eliminate the need for impact pile driving. As a result, pile drivers and hoe rams would not be used during construction of this alternative. Equipment such as large bulldozers and drill rigs would be the main construction vibration sources. Large bulldozers and drill rigs would operate intermittently during construction and would not be used every day. Track construction could begin simultaneously at several locations in the project area and would be brought to completion at approximately the same time. Construction activities would not dwell in one location for the entire duration of construction.

A survey of structures within 21 feet of potential vibration-producing construction activity locations would be conducted. The survey would assess the building categories and the potential for GBV to cause damage. The survey would also help to establish baseline, pre-construction conditions for historic or other sensitive buildings. During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken to evaluate soil, groundwater, seismic, and environmental conditions along the alignment.

During construction of this alternative, building protection measures would be applied. Measures could include underpinning, soil grouting, or other forms of ground improvement, and use of lower vibration equipment or construction techniques. Additionally, a geotechnical and vibration monitoring program would be used to protect identified historic and sensitive

structures. Mitigation measures identified in Section 6.4 would reduce construction-related vibration impacts to historic and sensitive buildings, located within 21 feet of the anticipated vibration-producing construction activity, to a less than significant level.

Large bulldozer and drill rigs, the main construction vibration sources, could exceed levels specified in FTA annoyance criteria for sensitive receptors (See Table 3-2). However, perceptible vibration from construction equipment would be short-term and intermittent. Therefore, perceptible vibration from these pieces of construction equipment is considered an "infrequent event," occurring less than 30 times a day as defined by FTA. Sensitive receptors located along the alignment are considered Category 2 and Category 3 land uses under the FTA annoyance criteria. Short-term vibration levels during construction could exceed the annoyance impact limits for infrequent events if specific construction activities were within 20 feet of a Category 2 land use and within 16 feet of a Category 3 land use. However, taking into account a 10 dBA reduction in vibration for coupling to building foundation loss (Table 10-1, FTA, 2006), sensitive receivers would not be subject to vibration annoyance impacts. It should be noted, large bulldozers and drill rigs would operate intermittently and would not be used every day of construction. In addition, construction of the alignment would not dwell in one location for the entire duration of construction. Therefore, vibration impacts (including ground-borne noise) associated with large bulldozer and drill rigs would be less than significant. Implementation of mitigation measures identified in Section 6.1.3 would further reduce impacts below the level of less than significant.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Little Tokyo Variation 2

5.5.1 Transit Operations Noise

The Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 are expected to have identical noise impacts and are analyzed together. These alternatives would have the same six potential sources of noise impacts during operations as the Underground Emphasis LRT Alternative. These include pass-by noise from LRT vehicles, warning signals near at-grade crossings, areas of special trackwork, grade separation, ventilation shafts, and TPSSs. Table 5-8 illustrates potential noise impacts of these alternatives.

5.5.1.1 Pass-by Impacts From LRT Vehicles

Noise modeling for the Fully Underground LRT alternatives assumes a three-car train with 2.5-minute headways during peak hours (6:00 a.m. to 9:00 a.m. and 3:00 p.m. to 7:00 p.m.) and 5-minute headways during off peak hours (5:00 a.m. to 6:00 a.m., 9:00 a.m. to 3:00 p.m., and 7:00 p.m. to 1:00 a.m.). There would be no regularly planned service between 1:00 a.m. and 5:00 a.m. The model assumed a speed of 30 MPH for all segments of the Fully Underground LRT Alternative - Little Tokyo Variations 1 and 2.

Both of the Fully Underground LRT Alternatives would run in an underground tunnel from the 7th Street/Metro Center Station to a portal between Rose and Garey Streets, north of Temple Street, just east of Alameda Street. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would also exit to the east through a portal on 1st Street east of Alameda Street. The Fully Underground LRT Alternative - Little Tokyo Variation 2 would also exit through two portals located between Alameda and Vignes Streets on 1st Street. Thus, the only area under these alternatives with potential noise impacts would be the Los Angeles Hompa Hongwanji Temple at the intersection of 1st and Vignes Streets. LRT vehicle pass-bys would not result in significant, adverse noise impacts under these alternatives (see Table 5-8).

5.5.1.2 Impacts from At-Grade Crossing Warning Signals

Warning signals near at-grade rail crossings include bells and train horns and could generate noise impacts and increase potential impacts caused by LRT pass-bys.

Under the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2, LRT vehicles would run underground. They rise out of portals east of Alameda Street to connect to existing at-grade tracks of the Gold Line. These alternatives would not add any additional warning signals and would not create noise impacts from at-grade warning signals.

5.5.1.3 Impacts from Special Trackwork

Like other build alternatives, the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would require special trackwork for crossovers and junctions. Trains under these alternatives would produce noise as they cross switches. Noise levels would increase up to 6 dBA in the vicinity of a switch.

Three areas of special trackwork would exist under these alternatives: an underground crossover just north of the proposed station at Flower/5th/4th, an underground crossover near 2nd Street and Broadway, and the underground junction that allows trains to connect to the Gold Line tracks. The exact configuration of the underground junction would depend on which variation of the Fully Underground LRT Alternative were to be constructed. In addition, both alternatives would include switches at the connection to the Gold Line tracks over US 101 north of Temple and just east of Alameda.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would also include switches on 1st Street between Hewitt and Garey Streets during construction. These switches might be used for operation. These switches would be located within 70 feet of the Los Angeles Hompa Hongwanji Temple but the noise analysis predicts that there would not be an adverse noise impact at this receptor (see Table 5-9).

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would also include switches located between Garey and Vignes Streets. The switches would also be located within 70 feet of the Los Angeles Hompa Hongwanji Temple but would only be used during construction.

The switches for Fully Underground LRT Alternative – Little Tokyo Variation 2 are not predicted to cause an adverse noise impact at the Temple (See Table 5-10).

5.5.1.4 Impacts from Ventilation Shafts

Under both the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative –Little Tokyo Variation 2, both normal and emergency ventilation would be supplied to underground segments of the alignment by fans. Potential noise associated with ventilation systems would include pass-by noise from trains transmitted through vent shafts to the street, normal fan operation, and testing of the emergency ventilation fans.

Vents and emergency ventilation fans would be designed in accordance with Metro system-wide design criteria noise guidelines for residential areas. These guidelines suggest a ceiling of 60 dBA for train pass-by noise and 50 dBA for fan noise at a distance of 50 feet or to the nearest residential building, whichever is closer. Under the Fully Underground LRT alternatives, noise levels associated with ventilation would be lower than current ambient noise levels in areas above underground segments of the alignment. Noise associated with vent shafts would not exceed FTA noise impact criteria, and no significant, adverse noise impact would occur.

5.5.1.5 Impacts from Traction Power Substations (TPSS)

As part of Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2, TPSSs would be installed underground at the proposed Flower/5th/4th Street station and the proposed 2nd Street/Broadway station. Each TPSS would be designed in accordance with the Metro system-wide design criteria noise guideline of 50 dBA at 50 feet or the nearest residential building, whichever is closer. The operating noise level for the TPSSs would be substantially lower than existing ambient noise levels and LRT pass-by noise. Noise generated by TPSSs would not exceed the FTA noise impact criteria, and no, significant, adverse noise impact would occur.

5.5.2. Transit Operations Vibration

The Fully Underground LRT Alternative - Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2 would have similar potential vibration (including ground-borne noise) impacts and the results of the analysis are reported together. These alternatives would involve two potential sources of vibration impacts during operations: pass-by vibration from LRT vehicles and areas of special trackwork.

5.5.2.1 Pass-by Impacts From LRT Vehicles

Vibration modeling for Fully Underground LRT Alternative - Little Tokyo Variations 1 and 2 used the same assumptions about train traffic as the noise impact analysis. Based on FTA criteria, no vibration (including ground-borne noise) impacts are predicted from LRT vehicle pass-bys under these alternatives (see Table 5-11).

5.5.2.2 Impacts from Special Trackwork

Fully Underground LRT Alternative - Little Tokyo Variations 1 and 2 would require special trackwork as described in Section 5.5.1.3.

FTA's general vibration assessment guideline suggests special trackwork will increase vibration levels for LRT vehicle pass-by by 10 db. Because of the depth of the track at underground locations this would not result in an adverse impact to sensitive receptors. At the switches along 1st Street, the predicted vehicle pass-by vibration level at Sites H and 3 would be 68 VdB, which is still below the FTA criterion of 72 VdB. The GBN levels would be 33 dBA, which is below the FTA criterion of 35 VdB. Thus, no adverse vibration or ground-borne noise impacts from special trackwork are predicted for these alternatives.

Table 5-11. Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 Predicted Vibration Levels (VdB) and Ground-Borne Noise Levels (dBA) and Impacts

[2] Impact criteria is for frequent events. [3] Based on more conservative "typical" vibration spectra, [4] with special track work.

5.5.3 Construction Noise and Vibration

Construction-related noise and vibration impacts would be nearly identical under the Fully Underground LRT Alternative – Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2, and the results of the analysis are presented together.

Under these alternatives, the following construction activities would have the most potential for construction-related noise and vibration impacts: cut and cover construction of a tunnel at Flower Street; cut and cover construction of the proposed Flower/5th/4th street station; cut and cover construction of the approach to the proposed 2nd/Hope Street station and the station itself; construction of the proposed 2nd Street /Broadway station; construction of the proposed 2nd Street/Central Avenue station; and, TBM tunneling beneath 2nd Street and the launch site near either 1st and Alameda Streets or the proposed 2nd/Hope Street station. These eight activities have the most potential for noise and vibration impacts due to their duration and their proximity to noise sensitive land uses.

5.5.3.1 Construction Noise

Table 5-12 lists the construction activities, and the construction equipment expected to be used during each construction activity, and the related noise levels anticipated for the Fully Underground LRT Alternative - Little Tokyo Variations 1 and 2.

To insure noise impacts are minimized during construction, all construction activities shall conform to the provisions in Section 41.40(a) of the City of Los Angeles Municipal Code. The code states that engaging in construction, repair, or excavation work, with any construction device, or job-site delivery of construction materials without a Police Commission-issued Variance or Permit would constitute a violation:

- Between the hours of 9:00 p.m. and 7:00 a.m.
- In any residential zone, or within 500 feet of land so occupied, before 8:00 a.m. or after 6:00 p.m. on any Saturday, or at any time on any Sunday
- In a manner as to disturb the peace and quiet of neighboring residents or any reasonable person of normal sensitiveness residing in the area.

The contractor would also be responsible for complying with the applicable local ordinance as it applies to all equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the contractor. The Los Angeles Municipal Code section 41.40(a) does not set acceptable noise level limits for either daytime or nighttime construction activities. If a noise variance is required, the noise variance will set the acceptable noise level limits.

Typical types of mitigation measures and Best Management Practices the contractor can use to meet the acceptable limits include, but are not limited to, the following:

- Placement of temporary noise barriers around the construction site;
- Placement of localized barriers around specific items of equipment or smaller areas;
- Use of alternative back-up alarms/warning procedures;
- Higher performance mufflers on equipment used during nighttime hours; and
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators.

5.5.3.2 Construction Vibration

GBV can cause damage to buildings depending on the building type (i.e., building materials and structural techniques) (see Table 3-4). This analysis calculates a "minimum safe distance" (with respect to vibration level) between construction equipment and buildings under various scenarios (see Table 3-5). Minimum safe working distances would account for the most sensitive buildings under the strongest potential vibration impact scenarios.

Potential noise from TBM operations at the launch site, where bored material would be hauled out, treated and removed, is listed in Table 5-12. Noise levels for the TBM are not listed for the alignment sections between the TBM launch and recovery sites. When it is operating underground, the TBM produces little to no noise that reaches surface land uses. Additionally, the TBM is slow moving and causes very little vibration to the surrounding area.

According to one study, peak particle vibration velocities from tunnel construction (in soft ground) lie in the range from 0.0024 to 0.0394 inches per second PPV at a distance of 33 feet from the vibration source (Verspohl 1995). Another study measured vibration velocities in the range of 0.0157 to 0.0551 inches per second at the same 33 feet distance from the source (New 1990). These PPV vibrations may also be expressed as RMS vibration velocity levels ranging from 56 to 83 VdB. Given this range of potential vibration impacts, and the distance below grade that tunnel boring would occur, vibration produced by a TBM would be well below the FTA threshold for Category IV buildings of 0.12 inches per second PPV.

For the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2, pre-auguring of soldier piles at cut and cover sections would eliminate the need for impact pile driving. As a result, pile drivers and hoe rams would not be used during construction of this alternative. Equipment such as large bulldozers and drill rigs would be the main construction vibration sources. Large bulldozers and drill rigs would operate intermittently during construction and would not be used every day. Track construction could begin simultaneously at several locations in the project area and would be brought to completion at approximately the same time. Construction activities would not dwell in one location for the entire duration of construction.

A survey of structures within 21 feet of potential vibration-producing construction activity locations would be conducted. The survey would assess the building categories and the potential for GBV to cause damage. The survey would also help to establish baseline, pre-construction conditions for historic or other sensitive buildings. During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken to evaluate soil, groundwater, seismic, and environmental conditions along the alignment.

During construction of this alternative, building protection measures would be applied. Measures could include underpinning, soil grouting, or other forms of ground improvement, and use of lower vibration equipment or construction techniques. Additionally, a geotechnical

and vibration monitoring program would be used to protect identified historic and sensitive structures.

Mitigation measures identified in Section 6.5 would reduce construction-related vibration impacts to historic and sensitive buildings, located within 21 feet of the anticipated vibration-producing construction activity, to a less than significant level.

Large bulldozer and drill rigs, the main construction vibration sources, could exceed levels specified in FTA annoyance criteria for sensitive receivers (see Table 3-2). However, perceptible vibration from construction equipment would be short-term and intermittent. Therefore, perceptible vibration from these pieces of construction equipment is considered an "infrequent event," occurring less than 30 times a day as defined by FTA. Sensitive receptors located along the alignment are considered Category 2 and Category 3 land uses under the FTA annoyance criteria. Short-term vibration levels during construction could exceed the annoyance impact limits for infrequent events if specific construction activities were within 20 feet of Category 2 land uses or within 16 feet of Category 3 land uses. However, taking into account a 10 dBA reduction in vibration for coupling to building foundation loss (Table 10-1, FTA, 2006), sensitive receivers would not be subject to vibration annoyance impacts. It should be noted, large bulldozers and drill rigs would operate intermittently and would not be used every day of construction. In addition, construction of the alignment would not dwell in one location for the entire duration of construction. Therefore, vibration impacts associated with large bulldozer and drill rigs would be less than significant. Implementation of mitigation measures identified in Section 6.1.3 would further reduce impacts below the level of less than significant.

6.0 MITIGATION MEASURES

The following mitigation measures could be implemented to avoid or minimize potentially impacts identified in Section 5.0.

6.1 No Build Alternative

Noise and vibration impacts are not anticipated for the No Build Alternative; therefore, no mitigation is proposed.

6.2 Transportation Management (TSM) Alternative

Noise and vibration impacts are not anticipated for the TSM Alternative; therefore, no mitigation is proposed.

6.3 At-Grade Emphasis LRT Alternative

LRT vehicle pass-bys associated with operation of the At-Grade Emphasis LRT Alternative would result in moderate noise impacts at the following locations: Site C, the ground floor of the Kawada Hotel; Site I, ground floor of the Higgins Building; and Site D, the ground floor of the New Otani Hotel (see Figure 4-1).

The alignment under this alternative would run in the middle of the street with traffic, so sound walls could not be used to reduce noise levels. However, wheel skirts could be included on LRT vehicles to reduce wayside noise levels by at least 2 dBA. Wheel skirts would reduce noise levels to below a moderate impact at the New Otani Hotel. Wheel skirts would improve noise levels, but not reduce them to below a moderate impact, at the ground floor of the Kawada Hotel and the Higgins Building.

No vibration impacts from operations are anticipated for the At-Grade Emphasis LRT Alternative; therefore, no mitigation is proposed.

Ground-borne noise impacts are predicted at sites C and D. The ground-borne noise levels are both predicted to be 35 dBA, equal to the impact criterion level. These predicted levels do not reflect any adjustment of the vibration levels to account for expected attenuation from the building's foundation coupling loss. Use of High-Resilience rail fasteners in these two area would reduce the ground-borne noise levels to below the 35 dBA criterion. If the At-Grade Emphasis is chosen as the preferred alternative, a more detailed study of the geologic conditions should be done to confirm the ground-borne noise levels.

If a noise variance from Section 41.40(a) of the Los Angeles Municipal Code is required, the variance will specify acceptable noise level limits. The contractor could use the following measures to meet relevant construction-related noise limits:

- Place of temporary noise barriers around the construction site.
- Placement of localized barriers around specific items of equipment or smaller areas
- Use of alternative back-up alarms/warning procedures
- Higher performance mufflers on equipment used during nighttime hours
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators

During the construction phase of this alternative, sensitive or historic buildings within 21 feet of construction may be susceptible to vibration damage. A survey of structures within 21 feet of anticipated vibration-producing construction activity would be conducted. The survey would classify buildings by category of sensitivity and note the potential for GBV to cause damage to buildings.

The survey would be used to establish baseline, pre-construction conditions for historic or other sensitive buildings. If the survey of relevant structures finds buildings susceptible to vibration damage, a monitoring plan would be developed. This plan would ensure that construction-induced vibration would not damage historic buildings.

Mitigation measures would further reduce annoyance to sensitive receptors caused by GBV. All or a combination of the following measures may be used to mitigate adverse noise and vibration impacts:

- When feasible, maintain distances greater than those provided in Table 5-2 to avoid potential construction-related vibration damage.
- When feasible, use construction equipment or less vibration intensive techniques near vibration sensitive locations.
- When feasible, route heavily laden vehicles away from vibration-sensitive locations.
- Operate earthmoving equipment as far as possible from vibration-sensitive locations by site layout considerations.
- Sequence construction activities that produce vibration such as demolition, excavation, earthmoving, and ground impacting so that the vibration sources do not operate simultaneously.
- When feasible, avoid nighttime construction activities that produce noticeable vibration.

- Use as small an impact device (i.e. hoe ram, pile driver) as possible to accomplish necessary tasks.
- When feasible, select non-impact demolition and construction methods such as saw or torch cutting and removal for off-site demolition, and use chemical splitting, or hydraulic jack splitting, instead of high impact methods.
- Use building protection measures such as underpinning, soil grouting, or other forms of ground improvement.
- Avoid using pavement breakers and vibratory rollers and packers near sensitive uses.

6.4 Underground Emphasis LRT Alternative

Under this alternative, a moderate noise impact from operation was predicted at the Savoy Condominiums on Alameda and 1st Streets. The noise impact would be due to track switches near the intersection of 1st and Alameda Streets. However, a spring-rail or movable frog switch could be used at this location to reduce potential noise by covering the gap in the central part of the switch. Using this measure would reduce switch noise to a FTA criteria level of no impact.

No vibration or ground-borne noise impacts from operations are anticipated for the Underground Emphasis LRT Alternative; therefore, no mitigation is proposed.

If a noise variance from Section 41.40(a) of the Los Angeles Municipal Code is required, the variance will specify acceptable noise level limits. The contractor could use the following measures to meet relevant construction-related noise limits:

- Placement of temporary noise barriers around the construction site
- Placement of localized barriers around specific items of equipment or smaller areas
- Use of alternative back-up alarms/warning procedures
- Higher performance mufflers on equipment used during nighttime hours
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators

During the construction phase of this alternative, sensitive or historic buildings within 21 feet of construction may be susceptible to vibration damage. A survey of structures within 21 feet of anticipated vibration-producing construction activity would be conducted. The survey would classify buildings by category of sensitivity and note the potential for GBV to cause damage to buildings.

The survey would be used to establish baseline, pre-construction conditions for historic or other sensitive buildings. If the survey of relevant structures finds buildings susceptible to vibration damage, a monitoring plan would be developed. This plan would ensure that construction-induced vibration would not damage historic buildings.

Mitigation measures would further reduce annoyance to sensitive receptors caused by GBV. All or a combination of the following measures may be used to mitigate adverse noise and vibration impacts:

- When feasible, maintain distances greater than those provided in Table 5-2 to avoid potential construction-related vibration damage.
- When feasible, use construction equipment or less vibration intensive techniques near vibration sensitive locations.
- Use as small an impact device (i.e. hoe ram, pile driver) as possible to accomplish necessary tasks.
- When feasible, route heavily laden vehicles away from vibration-sensitive locations.
- Operate earthmoving equipment as far as possible from vibration-sensitive locations by site layout considerations.
- Sequence construction activities that produce vibration such as demolition, excavation, earthmoving, and ground impacting so that the vibration sources do not operate simultaneously.
- When feasible, avoid nighttime construction activities that produce noticeable vibration.
- When feasible, select non-impact demolition and construction methods such as saw or torch cutting and removal for off-site demolition, and use chemical splitting, or hydraulic jack splitting, instead of high impact methods.
- Use building protection measures such as underpinning, soil grouting, or other forms of ground improvement.
- Avoid using pavement breakers and vibratory rollers and packers near sensitive uses.

Source: Parsons Brinckerhoff, 2009

Notes: [1] Land use category descriptors: FTA Category 1 = buildings or parks where low noise levels are an essential element of their purpose; FTA Category 2 = residences and other buildings where people sleep, such as hotels, apartments and hospitals; FTA Category 3 = institutional land uses with primarily daytime and evening use, including schools, libraries and churches.

[2] Ldn is used for land uses with nighttime sensitivity to noise and for residential areas where FTA rather than FHWA noise procedures are applicable. Peak-hour Leq is used for commercial, industrial, and other land uses that do not have nighttime noise sensitivity.

6.5 Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2

Under these alternatives, no noise or vibration or ground-borne noise impacts from project operations would require mitigation measures.

If a noise variance is required from Section 41.40(a) of the Los Angeles Municipal Code, the variance will specify acceptable noise level limits. As with other build alternatives, the contractor could use the following measures to meet relevant construction-related noise limits:

- Placement of temporary noise barriers around the construction site
- Placement of localized barriers around specific items of equipment or smaller areas
- Use of alternative back-up alarms/warning procedures
- Higher performance mufflers on equipment used during nighttime hours
- Portable noise sheds for smaller, noisy, equipment, such as air compressors, dewatering pumps, and generators

During the construction phase of this alternative, sensitive or historic buildings within 21 feet of construction may be susceptible to vibration damage. A survey of structures within 21 feet of anticipated vibration-producing construction activity would be conducted. The survey would classify buildings by category of sensitivity and note the potential for GBV to cause damage to buildings.

The survey would be used to establish baseline, pre-construction conditions for historic or other sensitive buildings. If the survey of relevant structures finds buildings susceptible to vibration damage, a monitoring plan would be developed. This plan would ensure that construction-induced vibration would not damage historic buildings.

Mitigation measures would further reduce annoyance to sensitive receptors caused by GBV. All or a combination of the following measures may be used to mitigate adverse noise and vibration impacts:

- When feasible, maintain distances greater than those provided in Table 5-2 to avoid potential construction-related vibration damage.
- When feasible, use construction equipment or less vibration intensive techniques near vibration sensitive locations.

- Use as small an impact device (i.e. hoe ram, pile driver) as possible to accomplish necessary tasks.
- When feasible, route heavily laden vehicles away from vibration-sensitive locations.
- Operate earthmoving equipment as far as possible from vibration-sensitive locations by site layout considerations.
- Sequence construction activities that produce vibration such as demolition, excavation, earthmoving, and ground impacting so that the vibration sources do not operate simultaneously.
- When feasible, avoid nighttime construction activities that produce noticeable vibration.
- When feasible, select non-impact demolition and construction methods such as saw or torch cutting and removal for off-site demolition, and use chemical splitting, or hydraulic jack splitting, instead of high impact methods.
- Use building protection measures such as underpinning, soil grouting, or other forms of ground improvement.
- Avoid using pavement breakers and vibratory rollers and packers near sensitive receptors.

7.0 CONCLUSIONS

7.1 No Build Alternative

Adverse noise and vibration impacts are not anticipated for the No Build Alternative.

7.2 Transportation System Management (TSM) Alternative

Adverse noise and vibration impacts are not anticipated for the TSM Alternative.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

Noise impacts in the entire project area associated with LRT vehicle pass-by would be below severe impact levels. Thus, no significant adverse noise impacts would result. Significant adverse vibration impacts from operations are not anticipated for the At-Grade Emphasis Alternative.

LRT vehicle pass-bys associated with operation of the At-Grade Emphasis LRT Alternative would result in moderate noise impacts at three locations and ground-borne noise impacts at two locations. Implementation of mitigation measures would reduce potential noise levels to below a moderate impact at one location. Mitigation measures would improve noise levels at two other locations. Implementation of vibration mitigation measures would reduce potential ground-borne noise levels to no impact. At all locations, potential impacts would be less than the "severe" impact threshold, therefore, there would be no significant adverse impacts from transit operations.

Construction of this alternative would comply with Section 41.40(a) of the Los Angeles Municipal Code. Thus, noise and vibration levels associated with construction of this alternative would not result in a significant adverse impact. Sensitive or historic buildings within 21 feet of construction may be susceptible to vibration damage. Mitigation measures would ensure a less than significant adverse impact to these sensitive land uses.

7.3.2 CEQA Determinations

Three moderate noise impacts from LRT vehicle pass-bys are predicted for the At-Grade Emphasis LRT Alternative. However, moderate noise impacts at these locations would not result in a substantial permanent increase in ambient noise levels. Coupled with mitigation measures, noise impacts would be less than significant. All other noise and vibration impacts from operations would be less than significant.

Mitigation measures would reduce potential noise and vibration impacts from construction to less than significant levels in the entire project area.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Under this alternative, moderate noise impacts from operations are predicted at one location. Since these impacts would fall below the "severe" impact level, no significant adverse effect would result under NEPA. Significant adverse noise or vibration and ground-borne noise impacts from operation of the Underground Emphasis LRT Alternative are not anticipated.

Construction of this alternative would comply with Section 41.40(a) of the Los Angeles Municipal Code. Thus, noise and vibration levels associated with construction of this alternative would not result in a significant adverse impact. Sensitive or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Mitigation measures would ensure a less than significant adverse impact to these sensitive land uses.

7.4.2 CEQA Determinations

Moderate noise impacts are predicted at one location. Under CEQA, such impacts are not considered significant. All other noise and vibration impacts from operation of the Underground Emphasis LRT Alternative would be less than significant.

Mitigation measures would reduce potential noise and vibration impacts from construction to less than significant levels in the entire project area.

7.5 Fully Underground LRT Alternative – Little Tokyo Variations 1 & 2

7.5.1 NEPA Findings

Significant adverse noise or vibration and ground-borne noise impacts from operation of the Fully Underground LRT Alternative - Little Tokyo Variations 1 or 2 are not anticipated.

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 or Little Tokyo Variation 2, would comply with Section 41.40(a) of the Los Angeles Municipal Code. Thus, noise and vibration levels associated with construction of this alternative would not result in a significant adverse impact. Sensitive or historic buildings within 21 feet of the construction may be susceptible to vibration damage. Mitigation measures would ensure a less than significant adverse impact to these sensitive land uses. All other noise and vibration impacts associated with construction would be less than significant.

7.5.2 CEQA Determinations

Potential noise and vibration impacts from operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 or Little Tokyo Variation 2 would be less than significant.

Mitigation measures would reduce potential noise and vibration impacts from construction to less than significant levels in the entire project area.

1.0 SUMMARY

The project area does not support sensitive ecosystems or special-status species because of its heavily urbanized condition. Potential impacts to ecosystems and biological resources are limited to potential disturbance of migratory birds that may nest in large, mature trees along the proposed alignments. Active bird nests are protected from harm under the Migratory Bird Treaty Act.

In addition, certain native tree species located along the proposed alignments are protected under the City of Los Angeles Native Tree Protection Ordinance. Compliance with this ordinance would be required if native trees are to be removed or trimmed.

The proposed build alternatives present a potential impact by removing mature trees that provide nesting habitat. Mitigation measures to address this impact could include nest surveys and creating buffer zones around active nests if construction were to occur during nesting season. Additionally, the City of Los Angeles tree protection ordinance requires removed trees to be replaced at a ratio of 2:1 for protected tree species and 1:1 for non-protected species. The proposed build alternatives would also include the planting of new trees at stations and along the corridor related to urban design improvements and landscaping intrinsic to the project. Implementation of these measures would reduce potential impacts to biological resources to a less than significant level.

2.0 INTRODUCTION

This technical memorandum discusses potential impacts on biological resources from constructing and operating the proposed Regional Connector Transit Corridor project. The potential impact area is within 0.25 mile of either side of the proposed alignments for each alternative.

The proposed Regional Connector Transit Corridor project traverses the highly developed central downtown area. As such, biological resources are limited to landscaped areas where mature trees or other vegetation could support wildlife species that are adapted to the urban environment. In particular, migratory birds (including raptors) may use mature trees within the project area for nesting, and are protected under federal, state, and local laws. In addition, native trees are protected under a local ordinance.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section describes the regulatory framework for protection of ecosystems and biological resources, the standards of significance that are applied to impact evaluations, the area of potential effect, and the methodology used to evaluate potential impacts of each alternative.

3.1 Regulatory Framework

Biological resources within the project area - including within 0.25 mile of each proposed alignment, stations, and maintenance facility sites - are protected by federal, state, and local laws and policies. These are described in the following paragraphs.

3.1.1 Federal

3.1.1.1 Endangered Species Act

The Endangered Species Act and subsequent amendments provide for conservation of endangered and threatened species and the ecosystems upon which they depend. Section 7 of the Endangered Species Act requires federal agencies to aid in the conservation of listed species, and to ensure that the activities of federal agencies will not jeopardize the continued existence of listed species or adversely modify designated critical habitat. At the federal level, the U.S. Fish and Wildlife Service and the National Oceanic and Atmospheric Administration are responsible for administration of the Endangered Species Act.

3.1.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) decrees that all migratory birds and their parts (including eggs, nests, and feathers) are fully protected. Nearly all native North American bird species are protected by the act. Under the act, taking, killing, or possessing migratory birds is unlawful. "Take" is defined under the federal and state acts to include: 1) actions that harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect listed wildlife, or 2) actions that may result in significant habitat modification or degradation, or that significantly impair essential behavioral patterns (including breeding, feeding, or sheltering).

Projects likely to result in taking of birds protected under the Migratory Bird Treaty Act require the issuance of take permits from the U.S. Fish and Wildlife Service. Activities requiring such a permit include destruction of migratory bird nesting habitat during the nesting season, when eggs or young are likely to be present. Under the act, surveys are required to determine if nests will be disturbed. If a nest would be disturbed, a buffer area with a specified radius around the nest would be established to avoid disturbance or intrusion until the young have fledged and left the nest. If not otherwise specified in the permit, the size of the buffer area would vary with species and local conditions (e.g., presence of busy roads), and would be based on the professional judgment of a monitoring biologist.

3.1.2 State

3.1.2.1 California Endangered Species Act

The California Department of Fish and Game is responsible for administration of the California Endangered Species Act. Unlike the federal Endangered Species Act, there are no state agency consultation procedures under the California Endangered Species Act.

For projects that affect both state and federal listed species, compliance with the federal Endangered Species Act will satisfy the California Endangered Species Act if the California Department of Fish and Game determines that the federal incidental take authorization is "consistent" with the California Endangered Species Act. Projects that result in a "take" of a state-only listed wildlife species require a take permit under the California Endangered Species Act. The federal and/or state acts also lend protection to species that are considered rare enough by the scientific community and trustee agencies to warrant special consideration, particularly with regard to protection of isolated populations, nesting or den locations, communal roosts, or other essential habitat.

3.1.2.2 California Fish and Game Code, Migratory Bird Protection

Sections 3500 through 3705 of the California Fish and Game Code regulate the taking of migratory birds and their nests. These codes prohibit the taking of nesting birds, their nests, eggs, or any portion thereof during the nesting season. Typically, the breeding/nesting season is from March 1 through August 30. Depending on each year's seasonal factors, the breeding season can start earlier and/or end later.

3.1.3 Local

3.1.3.1 City of Los Angeles General Plan

The City of Los Angeles General Plan Conservation Element sets forth objectives and policies to protect biological resources, including endangered species and habitats (City of Los Angeles 2001). For endangered species, the General Plan states the following objective:

> *Protect and promote the restoration, to the greatest extent practical, of sensitive plant and animal species and their habitats.*

Policies to achieve this objective include:

- Continue to require evaluation, avoidance, and minimization of potential significant impacts, as well as mitigation of unavoidable significant impacts on sensitive animal and plant species and their habitats and habitat corridors relative to land development activities.

- Continue to administer City-owned and managed properties so as to protect and/or enhance the survival of sensitive plant and animal species to the greatest practical extent.
- Continue to support legislation that encourages and facilitates protection of endangered, threatened, sensitive, and rare species and their habitats and habitat corridors.

For habitats, the General Plan objective is to:

> *Preserve, protect, restore and enhance natural plant and wildlife diversity, habitats, corridors and linkages so as to enable the healthy propagation and survival of native species, especially those species that are endangered, sensitive, threatened or species of special concern.*

Established policies regarding protection of habitats include:

- Continue to identify significant habitat areas, corridors, and buffers and to take measures to protect, enhance, and/or restore them.
- Continue to protect, restore, and/or enhance habitat areas, linkages, and corridor segments, to the greatest extent practical, within City-owned or managed sites.
- Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive, and rare species.
- Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.

3.1.3.2 City of Los Angeles Native Tree Protection Ordinance

The City of Los Angeles passed a Native Tree Protection Ordinance (Ordinance No. 177,404) to slow the decline of native tree habitat; this ordinance became law on April 23, 2006. The Native Tree Protection Ordinance:

- Protects all native oak tree species (Quercus Spp) (excluding scrub oak), Western Sycamore (Platanus Racemosa), California Bay (Umbellularia Californica), and California Black Walnut (Juglans Californica).
- Applies to protected trees 4 inches or greater in diameter at 4.5 feet above ground (multiple trunk trees are calculated by cumulative diameter).
- Applies to protected trees on private lots.

- Requires that a report showing the location of each protected tree in a project area, whether each tree is to be retained, relocated, or removed, and the proposed replacement measures be submitted by a registered consulting arborist, landscape architect, or pest control advisor who is also a certified arborist.

Protected tree removal requires a removal permit by the Board of Public Works. Any act that may cause the failure or death of a protected tree requires inspection by the City's Urban Forestry Division. Removed trees are to be replaced at a ratio of 2:1 for protected species and 1:1 for non-protected species. Saplings to large box trees can be used for mitigation, depending on what has the best chance of survival for a particular project. Replacement trees are required to be at least 1 inch in diameter, 1 foot above the base, and at least 7 feet in height. The code allows replacement trees to be of different species if protected species are not available; however, a greater number of replacement trees would likely then be required. Although the law does not require a permit for pruning protected trees, the City recommends that a certified arborist be consulted to ensure that the pruning of protected trees is performed properly.

3.2 Standards of Significance

The National Environmental Policy Act (NEPA) requires an evaluation of potential impacts to federally listed endangered species, the ecological importance and distribution of affected species, and the intensity of potential impacts from the project alternatives, including the No Build Alternative. The NEPA process is considered the framework for compliance with federal laws for the protection of endangered species and biological resources, including the Endangered Species Act and Executive Order 11990, Protection of Wetlands.

California Environmental Quality Act (CEQA) thresholds with regard to biological resources are identified in Section C of the *Los Angeles CEQA Thresholds Guide.* The *Los Angeles CEQA Thresholds Guide* (page C-6) states that a project would normally have a significant impact on biological resources if it could:

- Result in the loss of individuals, or reduction of existing habitat, of a state or federal listed endangered, threatened, rare, protected, or candidate species, or a Species of Special Concern, or federally listed critical habitat;
- Result in the loss of individuals, reduction of existing habitat of a locally designated species, or reduction in a locally designated natural habitat or plant community;
- Interfere with wildlife movement/migration corridors that may diminish the chances for long-term survival of a sensitive species;
- Result in alteration of an existing wetland habitat; or

- Interfere with habitat such that normal species' behaviors are disturbed (e.g., from introducing noise or light) to a degree that may diminish the chances for long-term survival of a sensitive species.

In addition, Appendix G of the *CEQA Guidelines* indicates that a project would have a significant effect on the environment if it would:

- Fundamentally conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

3.3 Area of Potential Effect

To evaluate potential impacts to ecosystems/biological resources, an area within 0.25 mile of either side of the proposed alignments for each of the project alternatives was evaluated (Figure 3-1). This is a conservative approach for evaluating potential impacts to biological resources such as disturbance of nesting birds. Since the alignments differ among alternatives, the area of potential impact also varies.

3.4 Evaluation Methodology

The evaluation methodology included a review of the California Natural Diversity Database (CNDDB) to identify sensitive plants and animals potentially occurring in the project area. All of the project alternatives are located within the United States Geological Survey (USGS) Los Angeles 7.5-minute quadrangle. A 7.5-minute quadrangle is an area that spans 7.5 minutes of latitude and 7.5 minutes of longitude, which ranges from 64 square miles at latitude 30 degrees north to 49 square miles at latitude 49 degrees north. The Los Angeles 7.5-minute quadrangle is approximately 60 square miles.

A field review of parks and other public open spaces within 0.25 mile of either side of the proposed alignments was also conducted, and included visual observation and photographic documentation of all parks, open space areas, and mature trees within the project area.

Results of this field survey were used to determine whether biological resources (including sensitive ecological areas, wetlands, wildlife migratory corridors, and/or habitat conservation areas) occur within the project area and if those areas could potentially support any of the sensitive species identified by the CNDDB. If the project could potentially impact biological resources, through effects on species or habitat, there could be a potential for adverse impacts.

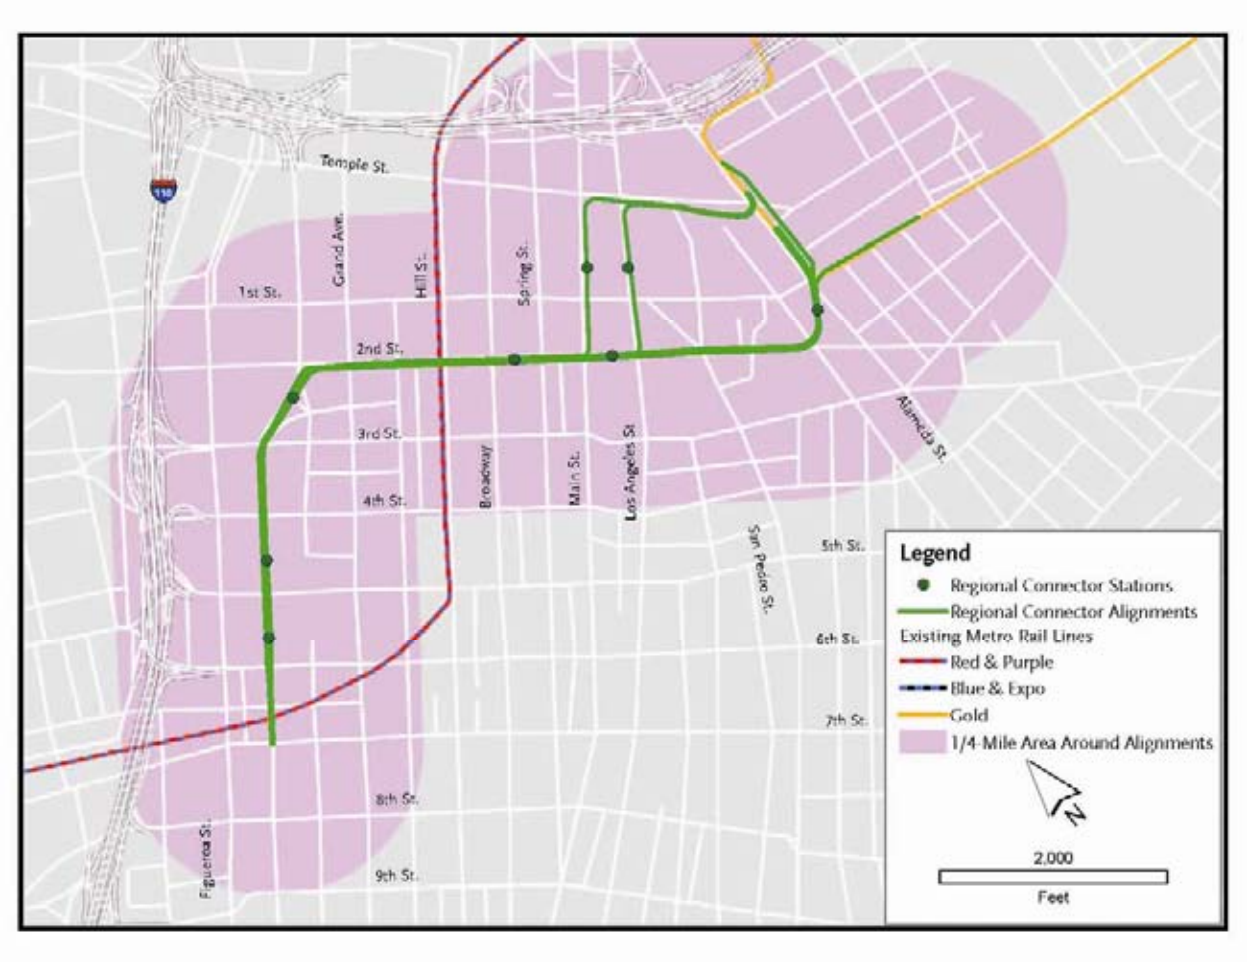

Figure 3-1. Area of Potential Effect

4.0 AFFECTED ENVIRONMENT

4.1 Existing Conditions in the Project Area

Due to its densely developed and urbanized nature, the project area provides little opportunity for wildlife species or other biological resources to exist. There are no Habitat Conservation Plans for this area, and no Significant Ecological Area was located within 0.25 mile of either side of the proposed alignments (City of Los Angeles 2001). There are no wildlife corridors within this area to support movement of wildlife species. There are no wetlands, oak woodlands, or coastal sage scrub habitat within the project area. The Los Angeles River, which is contained within a concrete channel through the downtown area, is located more than 0.25 mile away from the project area.

Table 4-1 presents special-status wildlife and plant species and ecosystems (plant communities) listed on the CNDDB as potentially occurring within the USGS Los Angeles 7.5-minute quadrangle in which the project area is located. The CNDDB search reported all species found somewhere within the approximately 60-square-mile quadrangle. As the project area is only approximately 1.6 square miles, it represents a very small portion of the quadrangle and provides little habitat, as determined during the field survey.

Table 4-1. Ecosystems and Special-Status Wildlife and Plant Species Potentially in the Project Area

Common Name	Scientific Name	Status
Ecosystems (Vegetation Communities)		
Walnut Forest	Walnut Forest	None
Birds		
Burrowing Owl	Athene cunicularia	SC[1]
Southwestern Willow Flycatcher	Empidonax traillii extimus	FE[2], CE[3]
Mammals		
Hoary Bat	Lasiurus cinereus	None
Western Mastiff Bat	Eumops perotis californicus	SC[1]
Big Free-tailed Bat	Nyctinomops macrotis	SC[1]

Table 4-1. Ecosystems and Special-Status Wildlife and Plant Species Potentially in the Project Area

Common Name	Scientific Name	Status
American Badger	Taxidea taxus	SC[1]
Reptiles		
Coast (San Diego) Horned Lizard	Phrynosoma coronatum (blainvillii population)	SC[1]
Plants		
Los Angeles Sunflower	Helianthus nuttallii ssp. parishii	PEC[4]
Greata's Aster	Symphyotrichum greatae	NVEC[5]
Davidson's Saltscale	Atriplex serenana var. davidsonii	FEC[6]
Parish's Gooseberry	Ribes divaricatum var. parishii	PEC[4]
Orcutt's Linanthus	Linanthus orcuttii	NVEC[5]
Prostrate Vernal Pool Navarretia	Navarretia prostrata	SEC[7]
Mesa Horkelia	Horkelia cuneata ssp. puberula	SEC[7]
Plummer's Mariposa-Lily	Calochortus plummerae	FEC[6]

[3] CE – California Endangered (California Department of Fish and Game).
[4] PEC – Presumed Extinct in California (California Native Plant Society).
[5] NVEC - Not Very Endangered in California (California Native Plant Society).
[6] FEC - Fairly Endangered in California (California Native Plant Society).
[7] SEC - Seriously Endangered in California (California Native Plant Society).

A field survey of the project area was conducted on May 17, 2009. Based on this survey's observations, there is no evidence of habitat within the project area to support the sensitive species and vegetation community identified by the CNDDB as potentially occurring within the Los Angeles quadrangle.

However, mature trees were observed along the proposed alignments and within roadway medians. Due to their mobility, some migratory bird species may utilize these mature trees

during migration. While unlikely, there is potential for migratory birds, including raptors, to utilize these mature trees for breeding.

Approximately 25 large trees, including palms and pine trees, are located around the Los Angeles Public Library near the corner of 5th and Flower Streets. In addition, three large pine trees are within the center median of Los Angeles Street, and several large fern pines are located along 2nd Street between Main and Los Angeles Streets.

Due to the high level of disturbance in this urban setting, there is only a minimal potential for Red-tailed hawk, Great-horned owl and other raptors to nest in these trees. However, Great horned owls may be more likely to select buildings in urban settings as nest sites. Smaller songbird species, including Lesser goldfinch, House finch, Western scrub jay, Bushtit, Northern mockingbird, and American robin, may also nest in these trees. While native songbirds may nest in these mature trees, the native bird species tend to preferentially select native plant species for nesting substrates when they are available.

Approximately 15 mature palm trees are located on 4th Street across from the Library. Several more palms are located along Main Street near 2nd Street. Large palms also exist in the area in front of City Hall at 201 N. Los Angeles Street. Many resident and migratory bird species in Los Angeles are known to nest in palm trees, including Hooded orioles, Barn owls, and Northern flicker.

California Sycamore, a native tree species protected under the City of Los Angeles Native Tree Protection Ordinance, is found in several locations within the project area:

- Near the corner of 5th and Flower Streets
- Along 2nd Street between Hill Street and Broadway
- Along Main Street between 2nd and 1st Streets

Table 4-2 shows trees that were identified in the project area through the field survey. All of the proposed alignments of the underground alternatives affect the same number of trees in the same locations and are shown only once in Table 4-2. The number of trees that occur along the alignments of the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2 are essentially the same. However, the Underground Emphasis LRT Alternative has the potential to affect a greater number of trees east of Los Angeles Street than either of the Fully Underground LRT Alternatives as shown in Table 4-2. This is because the Underground Emphasis LRT Alternative includes an underpass along Alameda Street and the Los Angeles Street option for a potential station along 2nd Street.

Table 4-2. Trees Potentially Affected by the Build Alternatives

Location	At-Grade Emphasis LRT		Underground Alternatives[9]	
	Native (CA sycamores)	Palms and other mature non-native trees	Native (CA sycamores)	Palms and other mature non-native trees
Los Angeles Library (at Flower and 5th Streets) [1]	10	25	10	15
Flower Street to 2nd Street	0	15	0	0
Flower Street where alignment turns [2]	5	25	5	25
Along 2nd Street to Los Angeles Street[3]	20	35	0	0
Underground station at 2nd Street - Broadway [4]	0	0	10	15
Underground Emphasis LRT station at 2nd Street - Los Angeles Street Option [5]	0	0	10	25
Main Street (At-Grade Emphasis LRT only) [6]	20	40	0	0
Los Angeles Street (At-Grade Emphasis LRT only) [7]	5	35	0	0
Temple Street (At-Grade Emphasis LRT only) [8]	0	15	0	0
2nd Street east of Los Angeles Street (Underground Emphasis LRT only)	0	0	5	35
At-grade tracks along Alameda and underpass (Underground Emphasis LRT only)	0	0	0	15

Table 4-2. Trees Potentially Affected by the Build Alternatives				
Location	**At-Grade Emphasis LRT**		**Underground Alternatives[9]**	
Fully Underground LRT station at 2nd Street and Central Avenue				7[10]
Fully Underground LRT portals east of Alameda Street – Variations 1 and 2	0	0	0	0[11]
Totals				
At-Grade Emphasis LRT Alternative	60	190	N/A	N/A
Underground Emphasis LRT Alternative	N/A	N/A	40	130
Fully Underground LRT Alternatives	N/A	N/A	25	62

[1] The station at this location is underground for the build alternatives, but the potential impact is calculated based on the at-grade construction footprint.
[2] The station footprints are identical for the build alternatives since alignments are located underground.
[3] Alignments are along 2nd Street but impacts are different depending on whether proposed LRT is at-grade or underground.
[4] No station proposed at this location for the At-Grade Emphasis LRT Alternative.
[5] No station proposed at this location for the At-Grade Emphasis LRT Alternative or the Fully Underground LRT Alternatives.
[6] Table lists existing sycamores and mature non-native trees along Main Street.
[7] Large pines located in the center median, other trees located along Los Angeles Street.
[8] Inventory includes large ficus, etc. along Temple Street.
[9] Underground alternatives include the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2.
[10] Includes trees on the west side of Alameda between 1st and 2nd Streets that may be affected and one mature cherry tree on Central Avenue that could be impacted if the building containing the Weyland's Brewery is removed.
[11] There are several small trees along 1st Street that are much less than 4" dbh.

5.0 IMPACTS

5.1 No Build Alternative

5.1.1 Direct Impacts

Since there would be no construction under the No Build Alternative, there would be no direct impacts to ecosystems or biological resources in the project area.

5.1.2 Indirect Impacts

The No Build Alternative would not result in indirect impacts to ecosystems or biological resources.

5.1.3 Cumulative Impacts

Since the No Build Alternative would not result in direct or indirect impacts to ecosystems or biological resources, there would be no cumulative impacts.

5.2 Transportation System Management (TSM) Alternative

5.2.1 Direct Impacts

The two new express shuttle bus lines created under the TSM Alternative would not require construction that would directly impact ecosystems or biological resources in the project area.

5.2.2 Indirect Impacts

There would be no indirect impacts to ecosystems or biological resources from the TSM Alternative.

5.2.3 Cumulative Impacts

Since the TSM Alternative would not result in direct or indirect impacts to ecosystems or biological resources, there would be no cumulative impacts.

5.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

5.3.1 Direct Impacts

During construction of the At-Grade Emphasis LRT Alternative, some mature trees located along the proposed alignment could be removed or disturbed. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removing or disturbing this vegetation during the nesting season could directly impact the habitat and any bird species that are present.

There are currently 250 mature trees in the area that could potentially be affected by construction, and a subset of these trees could be removed or disturbed during construction

of the At-Grade Emphasis LRT Alternative. Of this total, 60 trees are native California sycamore trees, a protected species.

It is unknown at this time exactly how many trees could be affected. As project design progresses and construction plans are finalized, it may be possible to minimize the number of affected trees by avoidance or fencing. Potential mitigation measures are described in Section 6 and include compliance with the Native Tree Protection Ordinance. Compliance with the Native Tree Protection Ordinance, including replacement of this protected species at a 2:1 ratio, would reduce this potential impact to a less than significant level.

Additionally, as an integral part of the project, station landscaping and urban design along the entire alignment would include planting new trees. Street restoration plans would also include planting new trees; the type of trees would be determined in consultation with the City, the community, and designers. Therefore, after mitigation, the build alternatives could result in a net increase in total tree inventory.

5.3.2 Indirect Impacts

Direct impacts to birds and their habitat by removing or disturbing mature trees have the potential to cause indirect impacts elsewhere. If birds are forced to relocate to new areas during the nesting season, increased competition for food and nesting habitat would be a potential indirect impact.

However, because the downtown area provides only low quality habitat for migratory birds, these potential impacts are not considered to be significant because only a small number of birds (if any) could be displaced. Further, mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce potential indirect impacts to a less than significant level.

5.3.3 Cumulative Impacts

The project area is expected to experience growth in the future, and construction activities associated with future projects have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures for any potential impacts to biological resources, particularly migratory birds, as required under either the MBTA or the California Fish and Game Code. Therefore, there would be no cumulative impacts from the At-Grade Emphasis LRT Alternative with respect to biological resources.

5.4 Underground Emphasis LRT Alternative

5.4.1 Direct Impacts

Construction of the Underground Emphasis LRT Alternative could require removal or disturbance of mature trees located along the proposed alignment, although less so than

under the At-Grade Emphasis LRT Alternative. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removing or disturbing this vegetation during the nesting season could directly impact the habitat and any bird species that are present.

There are currently 170 mature trees in the area that could potentially be affected by construction, and a subset of these trees could be removed or disturbed during construction of the Underground Emphasis LRT Alternative. It is unknown at this time exactly how many trees could be affected. As project design progresses and construction plans are finalized, it may be possible to minimize the number of affected trees by avoidance or fencing.

Potential mitigation measures include compliance with the Native Tree Protection Ordinance and are described in Section 6. These mitigation measures would be implemented to ensure that potential impacts from tree disturbance or removal would be reduced to a less than significant level.

An estimated 40 native California sycamore trees occur in the potential area of impact and could be affected by this alternative. As project design progresses, it may be possible to minimize the number of sycamores affected by avoidance or fencing. Potential mitigation measures include compliance with the Native Tree Protection Ordinance and are described in Section 6. Compliance with the Native Tree Protection Ordinance, including replacement of this protected species at a 2:1 ratio, would reduce this potential impact to a less than significant level.

Additionally, as an integral part of the project, station landscaping and urban design along the entire alignment would include planting new trees. Street restoration plans would include planting new trees; the type of trees would be determined in consultation with the City, the community, and designers. Therefore, after mitigation, the build alternatives could result in a net increase in total tree inventory.

5.4.2 Indirect Impacts

Indirect impacts to birds at some distance from the project area could occur if mature trees are removed or disturbed during the nesting season. If birds are forced to relocate to new areas, increased competition for food and nesting habitat would be an indirect impact. This impact would not be significant because the project area provides only low quality habitat for a small number of migratory birds and only a small number of birds (if any) could be displaced. Mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce these potential indirect impacts to a less than significant level.

5.4.3 Cumulative Impacts

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season.

Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds under either the MBTA or the California Fish and Game Code. Therefore, there would be no cumulative impacts from the Underground Emphasis LRT Alternative with respect to biological resources.

5.5 Fully Underground LRT Alternative- Little Tokyo Variation 1

5.5.1 Direct Impacts

The Fully Underground LRT Alternative- Little Tokyo Variation 1 has the potential to affect fewer trees compared to the Underground Emphasis LRT Alternative. The vehicle underpass along Alameda Street between Temple and 2nd Streets proposed for the Underground Emphasis LRT Alternative has the potential to affect more trees than the Fully Underground LRT Alternative alignment. As no mature trees or other biological resources were observed in the area north and east of 1st and Alameda Streets, there are no additional direct impacts related to the Fully Underground LRT Alternative – Little Tokyo Variation 1. The same mitigation measures described in Section 6 would be required to reduce these potential impacts to a less than significant level.

There are several cherry trees along 1st Street and Central Avenue; most are much less than 4 inches dbh. If the entire block bounded by 1st, 2nd, and Alameda Streets and Central Avenue is required for construction and additional buildings must be removed, then there is the potential that one additional cherry tree that is slightly larger than 4 inches dbh in the sidewalk on Central Avenue might be removed. This effect would be less than significant.

5.5.2 Indirect Impacts

As with the other build alternatives, indirect impacts to migratory birds from the Fully Underground LRT Alternative- Little Tokyo Variation 1 would not be significant because the project area provides only low quality habitat for a small number of migratory birds and only a small number of birds (if any) could be displaced. Mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce these potential indirect impacts to a less than significant level.

5.5.3 Cumulative Impacts

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds either under the MBTA or the California Fish and Game Code. Therefore, there would be no cumulative impacts from the Fully Underground LRT Alternative- Little Tokyo Variation 1 with respect to biological resources.

5.6 Fully Underground LRT Alternative- Little Tokyo Variation 2

5.6.1 Direct Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would have the same potential to cause direct impacts by removing or disturbing mature trees as would the Fully Underground LRT Alternative- Little Tokyo Variation 1. Implementing the same mitigation measures described in Section 6 would be required to reduce these potential impacts to a less than significant level.

If the entire block bounded by 1st, 2nd, and Alameda Streets and Central Avenue is required for construction and additional building must be removed, then there is the potential that one additional cherry tree in the sidewalk on Central Avenue might be removed. This effect would be less than significant.

5.6.2 Indirect Impacts

As with the other build alternatives, indirect impacts to migratory birds from the Fully Underground LRT Alternative- Little Tokyo Variation 2 would not be significant because the project area provides only low quality habitat for a small number of migratory birds and only a small number of birds (if any) could be displaced. Mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce these potential indirect impacts to a less than significant level.

5.6.3 Cumulative Impacts

Construction activities associated with future projects within the project area have the potential to affect migratory birds if nesting habitat is disturbed during the breeding season. Other ongoing and future construction projects would be required to implement mitigation measures to address any potential impacts to migratory birds under either the MBTA or the California Fish and Game Code. Therefore, there would be no potential cumulative impacts from the Fully Underground LRT Alternative- Little Tokyo Variation 2 with respect to biological resources.

6.0 POTENTIAL MITIGATION MEASURES

Federal and state migratory bird protection would require mitigation measures to address potential impacts to nesting bird species from the potential disturbance of trees within the proposed build alternative alignments. Trees that could potentially be disturbed include: 1) a portion of the approximately 250 trees located within the proposed alignment and station footprints for the At-Grade Emphasis LRT Alternative, and 2) the approximately 170 trees located within the proposed alignment and station footprints for all of the underground alternatives. The following potential mitigation measures would apply to all of the proposed build alternatives.

The first potential mitigation would be to avoid tree disturbances as much as possible. As project design progresses, it may be possible to reduce the number of trees potentially disturbed by avoidance or fencing. It may also be possible to reduce the scale of disturbance by trimming individual trees instead of removing them completely.

The second potential mitigation would be to time necessary tree removal and trimming activities to seasons outside of the bird breeding season, which can extend from February 1 to August 31.

If it is not feasible to avoid tree removal and trimming related to construction during the breeding bird season from February 1 to August 31, breeding bird surveys would be conducted as recommended by the California Department of Fish and Game. Two biological surveys would be conducted, one 15 days and a second 72 hours prior to construction activities that would remove or disturb suitable nesting habitat. The surveys would be performed by a biologist with experience conducting breeding bird surveys.

The biologist would prepare survey reports documenting the presence or absence of active nests of any protected native bird in the habitat to be removed and any other such habitat within 300 feet of the construction work area (or within 500 feet for raptors). If an active nest is located, construction within 300 feet of the nest (or 500 feet for raptor nests) would be postponed until the nest is vacated, juveniles have fledged, and there is no evidence of a second attempt at nesting.

If construction of the project requires removing any of the native trees located along the proposed alignment and stations for any of the build alternatives (including the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT, or either of the two Fully Underground LRT Alternative variations), a removal permit would be required from the Los Angeles Board of Public Works in accordance with the City of Los Angeles Native Tree Protection Ordinance. The tree removal permit may require replanting of native trees within the project area or at another location within the City of Los Angeles to mitigate for the removal of these trees. The City's ordinance requires replacement of protected trees at a 2:1

ratio and other trees at a 1:1 ratio. If construction would require pruning of any protected native tree, the pruning would be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.

Additionally, as an integral part of the project, station landscaping and urban design along the entire alignment would include planting new trees. Street restoration plans would include planting new trees; the type of trees would be determined in consultation with the City, the community, and designers. If landscaping and/or street trees planted as part of another Metro transit project are disturbed by this project, they would be replaced to the extent feasible. Therefore, after mitigation, the build alternatives could result in a net increase in total tree inventory.

7.0 CONCLUSIONS

7.1 No Build Alternative

There would be no impact from the No Build Alternative to ecosystems and biological resources.

7.2 TSM Alternative

There would be no significant impact from the TSM Alternative to ecosystems and biological resources.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

Implementation of mitigation measures to address potential impacts to migratory birds and compliance with the Native Tree Protection Ordinance would result in no significant adverse impact on ecosystems and biological resources from the At-Grade Emphasis LRT Alternative.

7.3.2 CEQA Determinations

Mitigation measures would reduce potential impacts to ecosystems and biological resources from the At-Grade Emphasis LRT Alternative to a less than significant level.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Implementation of mitigation measures would result in no significant adverse impact to ecosystems and biological resources from the Underground Emphasis LRT Alternative.

7.4.2 CEQA Determinations

With mitigation, potential impacts to ecosystems and biological resources would be less than significant.

7.5 Fully Underground LRT Alternative- Little Tokyo Variation 1

7.5.1 NEPA Findings

Implementation of mitigation measures would result in no significant adverse impact on ecosystems and biological resources from the Fully Underground LRT Alternative- Little Tokyo Variation 1.

7.5.2 CEQA Determinations

Implementation of mitigation measures would reduce potential impacts to ecosystems and biological resources from the Fully Underground LRT Alternative- Little Tokyo Variation 1 to a less than significant level.

7.6 Fully Underground LRT Alternative- Little Tokyo Variation 2

7.6.1 NEPA Findings

By implementing mitigation measures, no significant adverse impact on ecosystems and biological resources would occur from the Fully Underground LRT Alternative- Little Tokyo Variation 2.

7.6.2 CEQA Determinations

Implementation of mitigation measures would reduce potential impacts to ecosystems and biological resources from the Fully Underground LRT Alternative- Little Tokyo Variation 2 to a less than significant level.

1.0 SUMMARY

This technical memorandum presents an evaluation of the potential impacts related to the geologic conditions of the Regional Connector project area, including the general topography, geologic materials, faults, seismicity, and potential hazardous materials. The regulatory framework and a discussion of potential impacts related to these conditions are presented.

The project alignment is not located within the Alquist-Priolo Earthquake Fault zone. No adverse effects are anticipated related to geotechnical, subsurface, or seismic hazards from the No Build Alternative or the TSM Alternative. However, ground shaking would be expected during a seismic event on one of the nearby faults. There is some potential for adverse impacts related to liquefaction or seismically-induced settlement along portions of all of the build alternatives (the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2), but there would be no potential for adverse impacts related to fault rupture, landslides, flooding, seiches, or tsunamis for any of these alternatives. In addition to the seismic hazards, there would be a potential for ground loss due to tunneling for the Underground Emphasis LRT Alternative, and the Fully Underground LRT Alternative – Little Tokyo Variation 1 and Little Tokyo Variation 2.

A geotechnical investigation would be performed during preliminary design along the preferred alignment to supplement and provide site specific data to facilitate design for maintaining the integrity of existing structures under static and seismic loading and operational demands. Although portions of the alignment would be constructed in potential liquefaction zones, none are expected to result in or exacerbate geologic hazards. The subway tunnels and the stations would be located at depths generally below soils prone to liquefaction, and would be subject to standard design specifications to keep potential risks of damage from liquefaction to an acceptable level.

Potential ground loss due to tunneling and settlement of adjacent structures (including historical buildings)would be mitigated with a number of measures including: a preconstruction survey to establish baseline conditions; ground improvement such as grouting along the alignment and adjacent structures potentially affected by the tunneling work; instrumentation and monitoring during tunneling; requirements on the contractor to use earth pressure balance or slurry shield tunnel boring machine and method of operation based on the anticipated ground conditions; and limiting potential settlement to below an acceptable threshold value established during final design.

While there would be no impacts related to hazardous materials from the No Build Alternative or the TSM Alternative, there is potential for direct, indirect, and cumulative impacts from the build alternatives. These impacts relate primarily to the potential for release of hazardous materials encountered in soil and/or groundwater during construction at properties of

concern along the proposed alignments. These hazardous materials include petroleum gases in the subsurface associated with oil deposits in the project area. Impacts may also occur from release of fibers from asbestos-containing materials or lead-based paint during building demolition, or the accidental release of construction-related hazardous materials such as fuels.

Compliance with applicable laws and regulations as well as implementation of best management practices (BMPs) regarding the use, storage, and transport of hazardous materials and wastes would ensure these potential impacts would be less than significant.

In addition, mitigation would be required to address the potential presence of hazardous subsurface gases along the proposed alignment during both construction and operation. Testing and abatement of asbestos containing materials and lead-based paint would also be implemented. With mitigation, impacts related to hazards and hazardous materials would be less than significant.

2.0 INTRODUCTION

Geology, soils, seismicity, and hazardous materials are factors that determine design criteria for the development of transit improvements, particularly when subsurface or aerial stations or structures are involved. In addition, downtown Los Angeles has a long history of residential, commercial, and industrial land uses which entailed the use, handling, storage, and disposal of hazardous materials. If releases of hazardous materials have occurred at properties located along or near the proposed Regional Connector alignments, there is a potential to encounter contaminated soil and/or groundwater during construction. Naturally-occurring hazardous materials may also be present within the project area from the oil- and/or gas-bearing geologic formations that underlie Los Angeles. These natural hazards include methane and hydrogen sulfide gas. Other hazards include the potential for release of construction-related hazardous materials and the introduction of electromagnetic fields (EMF). This technical memorandum presents an evaluation of potential impacts geology, soils, seismicity, and hazardous materials would have on the project and proposed mitigation measures to address these impacts.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

The following sections present brief discussions of the regulatory framework applicable to the jurisdictions located within the project area.

3.1.1 Federal

3.1.1.1 Geology, Soils, and Seismicity

There are no specific federal regulations related to the geologic hazards of soils and seismicity.

3.1.1.2 Hazardous Materials Resources

The United States Environmental Protection Agency (USEPA) is the lead federal agency responsible for enforcing federal regulations regarding hazardous materials. The primary legislation governing hazardous materials includes the Resource Conservation and Recovery Act (RCRA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Superfund Amendments and Reauthorization Act (SARA).

3.1.1.2.1 RCRA

RCRA regulates the generation, transportation, treatment, storage and disposal of hazardous waste through comprehensive life cycle or "cradle to grave" tracking requirements. These include maintaining inspection logs of hazardous waste storage locations, records of quantities being generated and stored, and manifests of pick-ups and deliveries to licensed treatment/storage/ disposal facilities. RCRA also identifies standards for treatment, storage, and disposal.

3.1.1.2.2 CERCLA

CERCLA, also known as Superfund, created a tax on the chemical and petroleum industries to provide for response and cleanup of hazardous substances that may endanger public health or the environment. CERCLA established requirements for abandoned hazardous waste sites and provided for liability of persons responsible for releases of hazardous waste at these sites.

3.1.1.2.3 SARA

SARA amended CERCLA to increase state involvement and required Superfund actions to consider state environmental laws and regulations. SARA also established a regulatory program for underground storage tanks (USTs) and the Emergency Planning and Community Right-to-Know Act (EPCRA).

3.1.1.2.4 Toxic Substances Control Act (TSCA)

TSCA established the mechanisms by which USEPA tracks, screens, and tests industrial chemicals currently produced or imported into the United States that may pose an environmental or human-health hazard. TSCA addresses the production, importation, use, and disposal of specific chemicals including polychlorinated biphenyls (PCBs), asbestos, radon and lead-based paint.

3.1.1.2.5 Federal Occupational Safety and Health Act

The Occupational Safety and Health Administration (OSHA) administers this legislation which requires special training of handlers of hazardous materials, notification to employees who work in the vicinity of hazardous materials, acquisition from the manufacturer of material safety data sheets which describe the proper use of hazardous materials, and training of employees to remediate any hazardous material accidental releases.

This legislation regulates lead and asbestos as it relates to employee safety through a set of notification and corrective action requirements, warning signs and labels, controlled access, use of protective equipment, demolition/renovation procedures, housekeeping controls, training, and in certain cases, air monitoring and medical surveillance to reduce potential exposure. This legislation also requires contractors conducting lead-based paint and asbestos surveys and removal to be certified by the California Occupational Safety and Health Administration (Cal OSHA).

3.1.2 State

3.1.2.1 Geology, Soils, and Seismicity

The principal state guidance relating to geologic hazards is contained in the Alquist-Priolo Act (P.R.C. 2621 et seq.) and the Seismic Hazards Mapping Act of 1990 (P.R.C. 2690-2699.6). The Alquist-Priolo Act prohibits the location of most types of structures for human occupancy across active traces of faults in earthquake fault zones, shown on maps prepared by the state geologist, and regulates construction in the corridors along active faults (earthquake fault zones). Earthquake Fault Zones are regulatory zones around active faults designated by the State. The zones vary in width, but average about one-quarter mile wide.

The Seismic Hazards Mapping Act of 1990 focuses on hazards related to strong ground shaking, liquefaction, and seismically-induced landslides. Under its provisions, the state is charged with identifying and mapping areas at risk of strong ground shaking, liquefaction, landslides, and other corollary hazards. The maps are to be used by cities and counties in preparing their general plans and adopting land use policies to reduce and mitigate potential hazards to public health and safety.

Pursuant to the Surface Mining and Reclamation Act (P.R.C. 2710 et seq.), the State Mining and Geology Board identifies, in adopted regulations, areas of regional significance that are

known to contain mineral deposits judged to be important in meeting the future needs of the area (P.R.C. 2426 and 2790; Title 14 P.C.R. 3350, et seq.). The State Mining and Geology Board also adopts state policy for the reclamation of mined lands and certifies local ordinances for the approval of reclamation plans as being consistent with state policies (P.R.C. 2755-2764, 2774 et seq.).

3.1.2.2 Hazardous Materials Resources

The California Department of Toxic Substances Control (DTSC) and the Regional Water Quality Control Board (RWQCB) are the state agencies primarily responsible for the regulation of hazardous materials in California. DTSC is responsible for the management of hazardous substances and oversees the investigation and remediation of contaminated sites. The Los Angeles RWQCB is primarily responsible for the protection of groundwater and surface water resources from hazardous materials in the project area.

3.1.2.3 California Hazardous Waste Control Law, California Health and Safety Code, Division 20, Chapter 6.5

This state legislation is the basic hazardous waste statute in California and is administered by DTSC. Similar to but more stringent than RCRA, this law applies to a broader range of hazardous wastes and requires recycling and waste reduction programs.

3.1.2.4 Carpenter-Presley-Tanner Hazardous Substances Account Act, California Health and Safety Code, Division 20, Chapter 6.8

This legislation authorizes DTSC and RWQCB to require, oversee, and recover costs for the remediation of sites where contamination of soil and water present a hazard to human health or the environment.

3.1.2.5 State California Occupational Safety and Health Act

Cal OSHA regulates worker safety similar to federal OSHA but also requires preparation of an Injury and Illness Prevention Program, an employee safety program of inspections, procedures to correct unsafe conditions, employee training, and occupational safety communication. In addition, Cal OSHA regulations indirectly protect the general public by requiring construction managers to post warnings signs, limit public access to construction areas, and obtain permits for work considered to present a significant risk of injury, such as excavations greater than five feet.

3.1.2.6 Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

The California Environmental Protection Agency (Cal EPA) adopted regulations in 1996 to establish a Unified Hazardous Waste and Hazardous Materials Management Regulatory Program and designated local agencies called Certified Unified Program Agencies (CUPAs).

These local agencies have jurisdiction to manage hazardous substances with respect to the following:

- Hazardous waste generators and hazardous waste onsite treatment;
- Underground Storage Tanks ;
- Aboveground storage tanks;
- Hazardous materials release response plans and inventories (business emergency plans), including Unified Fire Code hazardous materials management plans and inventories; and
- Risk management and accidental release prevention programs.

The CUPA with local jurisdiction over the proposed project area is the Los Angeles County Fire Department, Health Hazardous Materials Division.

3.1.2.7 Waters Bill of 1985 (Business Emergency Plan/Hazardous Materials Business Plan)

Administered by the CUPA, this State legislation requires facilities which meet minimum hazardous materials use/storage thresholds to file a Business Emergency Plan (BEP), or a Hazardous Materials Business Plan (HMBP), which includes a complete inventory of the hazardous materials being used and stored on a site. Employee training and emergency response plans and procedures for the accidental release of hazardous materials are also included in a BEP.

3.1.2.8 La Follette Bill of 1986 (Risk Management Plan)

Administered by the CUPA, this State legislation requires preparation of a Risk Management Plan (RMP) for commercial operations which use hazardous materials at defined thresholds. The RMP includes management, engineering and safety studies, and plans for physical improvements to minimize accidental hazardous materials releases. It is implemented via fire inspections, plan checking, BEP/HMBP disclosure requirements, and filing of the RMP (updated every three years).

3.1.2.9 South Coast Air Quality Management District (SCAQMD) Rule 1403

This State legislation regulates asbestos as a toxic material and controls the emission of asbestos from demolition and renovation. Rule 1403 establishes requirements for surveying structures and procedures for the removal, handling, storage, and disposal of asbestos-containing materials.

3.1.3 Local

Local jurisdictions, departments, and documents that regulate and oversee issues related to geology, soils, seismicity, and hazardous materials within the study area are listed below.

Geology, Soils, and Seismicity:

- The 1996 City of Los Angeles General Plan, Safety Element
- The City of Los Angeles Department of Building and Safety
- The 1990 Los Angeles County General Plan, Seismic Safety Element
- The County of Los Angeles Department of Public Works

Hazardous Materials:

- The City of Los Angeles Department of Building and Safety
- The City of Los Angeles Bureau of Sanitation, Industrial Waste Management Division
- The City of Los Angeles Fire Department, Hazardous Materials Divisions
- The City of Los Angeles Fire Department, Underground Storage Tank Division
- Uniform Fire Code
- Los Angeles Municipal Code- Methane and Methane Buffer Zones

3.2 Standards of Significance

Standards of significance provide thresholds for determining whether potential impacts are more than insignificant.

3.2.1 National Environmental Policy Act (NEPA)

NEPA does not have specific requirements related to geologic hazards or soils. NEPA requires an evaluation of potential impacts related to hazardous materials, which may be categorized in two different ways. First, there is potential for hazardous materials associated with previous land use to pose an impact for the proposed project. Second, there is potential for the proposed project to generate hazardous material impacts to the surrounding human and natural environments. Impacts associated with hazardous materials may occur during construction or operation of the project.

3.2.2 California Environmental Quality Act (CEQA)

Potential impacts related to geology, soils, and seismicity are addressed in the *Los Angeles CEQA Threshold Guide* under Section E, Geology. There are four areas of study relative to geology: E.1 geologic hazards, E.2 sedimentation and erosion, E.3 landform alteration, and E.4 mineral resources. The first three areas of study are addressed in this section. Mineral resources are not expected to be considered in the Draft Environmental Impact Statement (DEIS)/Draft Environmental Impact Report (DEIR) as they are not known to be present in the downtown Los Angeles project area. The *Los Angeles CEQA Threshold Guide* (2006, page E.1-4) states that a project would normally have a significant geologic hazard impact if it would:

- Cause or accelerate geologic hazards which would result in substantial damage to structures or infrastructure, or expose people to substantial risk of injury.

The *Los Angeles CEQA Thresholds Guide* (page E.2-3) states that a project would normally have a significant sedimentation and erosion impact if it would:

- Constitute a geologic hazard to other properties by causing or accelerating instability from erosion; or

- Accelerate natural processes of wind and water erosion and sedimentation, resulting in sediment runoff or deposition which would not be contained or controlled on-site.

Additionally, the *Los Angeles CEQA Thresholds Guide* (page E.3-2) states that a project would normally have a significant landform alteration impact if:

- One or more distinct and prominent geologic or topographic features would be destroyed, permanently covered or materially and adversely modified. Such features may include, but are not limited to, hilltops, ridges, hill slopes, canyons, ravines, rock outcrops, water bodies, streambeds, and wetlands.

The *Los Angeles CEQA Thresholds Guide* addresses impacts with respect to hazards under Section F, including F.1 Risk of Upset/Emergency Preparedness and F.2 Human Health Hazards. The *Los Angeles CEQA Thresholds Guide* (page F.1-2) states that a project would normally have a significant impact with respect to hazards if it would:

- Create a significant hazard to the public or environment through the routine transport, storage, use, or disposal of hazardous materials;

- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;

- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and, as a result, create a significant hazard to the public or the environment; or
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

3.3 Evaluation Methodology

The method for assessing impacts involved reviewing and examining the project corridor for known geologic hazards and hazardous materials. Documents reviewed included, but were not limited to: the safety elements of the general plans for the City and County of Los Angeles; official Alquist-Priolo Earthquake Fault Zone Maps; official Seismic Hazard Zone Maps, geologic and topographic maps, and other publications by the California Geological Survey (CGS, previously California Division of Mines and Geology (CDMG)), United States Geological Survey, and California Division of Oil and Gas). If proposed stations or structures are located within or adjacent to geologic hazard areas or areas that are impacted by hazardous materials, there would be a potential for impact that would require additional geotechnical studies and may require enhanced design to eliminate or mitigate the potential hazards.

In general, impacts related to hazardous materials associated with current or previous land use are most relevant to the project alternatives that entail property acquisition and/or construction and thus have the potential to encounter hazardous materials, including contaminated soil and/or groundwater that may exist in the area of potential impact. The appropriate significance criteria as listed below were considered to determine the potential for each alternative to generate hazardous materials impacts.

The project build alternatives that entail property acquisition and/or construction (the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2), have the potential to encounter hazardous materials that may exist in soil and/or groundwater. The methodology used to evaluate potential hazardous materials impacts associated with these alternatives entailed gathering information from a variety of sources to identify potential or existing conditions that would present environmental health and safety concerns within 0.25 mile of each side of the proposed alignments. These information sources included:

- Regulatory databases - The regulatory database search included local, state, and federal environmental databases for hazardous waste facilities, underground storage

tank leak sites, former dry cleaners, chemical spill sites, county, state or federally directed waste cleanup sites, and other relevant environmental data.

- Regulatory agency files - For sites where hazardous materials may be a potential concern, supplemental information, such as investigation data, was gathered from regulatory agency files.
- Historical environmental information - This information was obtained from Sanborn fire insurance maps, historical aerial photographs, and historical topographic maps of the area of potential impact.
- Methane zones - Information on known methane zones was based on the City of Los Angeles Methane and Methane Buffer Zones map. This information will be supplemented as needed with field assessments of methane concentrations and pressure from geotechnical borings in the area of potential impact.
- Oil and natural gas - An analysis of potential hazards from known oil fields and oil or gas wells (active or abandoned) was based on California Department of Oil, Gas and Geothermal Resources maps and records reviews.
- Other hazardous materials - Potential impacts due to the presence of lead-based paint, asbestos containing materials, electromagnetic fields, and other hazards were evaluated.

In addition, a site reconnaissance was performed to observe surface conditions along the proposed alignments associated with the build alternatives.

A detailed evaluation of the results of the site reconnaissance and information gathered from the sources listed above is presented in the Hazardous Materials Investigation and Analysis report (CDM 2009). The Hazardous Materials Investigation and Analysis report identifies the sites located along the proposed alignments or on surrounding properties and provides a determination regarding the level of concern associated with environmental contaminants and/or naturally occurring hazardous substances that are known or suspected to exist at each site. Potential impacts from these sites were then evaluated for this section using the significance criteria described in Section 3.2.

4.0 AFFECTED ENVIRONMENT

4.1 Regional Setting

The proposed Regional Connector Transit Corridor project alignment is located in the northern portion of the Los Angeles Basin. This basin is a major elongated northwest-trending structural depression that has been filled with sediments up to 13,000 feet thick since middle Miocene time. On a regional scale, the project area lies within the northernmost portion of the Peninsular Ranges geomorphic provinces near its boundary with the Transverse Ranges geomorphic provinces. The Peninsular Ranges province is characterized by elongated northwest-trending mountain ridges separated by sub-parallel, sediment-filled valleys. This province is bounded by the San Jacinto fault zone to the east, the Pacific Ocean Coastline to the west, and the Transverse Ranges geomorphic province to the north. In contrast, the Transverse Ranges are characterized by east-west trending geologic structures and mountain ranges that include the Santa Ynez, San Gabriel, San Bernardino, and Santa Monica Mountains, and associated valleys. The Transverse Ranges province is a composite structural block bounded by the Big Pine fault on the north, the San Andreas fault zone to the east, the Pacific Ocean to the west, and the Malibu Coast, Santa Monica, Hollywood, Raymond, Sierra Madre, and Cucamonga faults to the south.

4.2 Regional Geology

The proposed project alignments will traverse the southeastern end of the Elysian Park Hills and the ancient floodplain of the Los Angeles River. The Elysian Hills comprise the low-lying hills west of the Los Angeles River and southeast of the eastern end of the Santa Monica Mountains. The Hollywood fault separates the northern end of the Elysian Hills from the Santa Monica Mountains. The Elysian Hills are comprised largely of Miocene age sedimentary rocks with Pliocene-age rocks flanking the southeastern edges of the hills. Previous geologic mapping identified several major geologic structures within the Elysian Hills, including the Elysian Park anticline and northwest trending faults. The southern limb of the anticlinorium contains apparent secondary folds of relatively shorter wavelength and lesser continuity of fold axes. In the vicinity of the proposed project alignments, bedding within the Fernando and Puente formations strike approximately east-west to slightly north of east and dips moderately to steeply to the south. The regional geology in the project vicinity is shown on Figure 4-1.

The geomorphology along the proposed alignments ranges from gently sloping alluvial floodplain surfaces to hillside slopes of moderate relief and grade. The steepest slopes along the alignment surface are between 3rd Street at Flower Street and Olive Street at 2nd Street. A review of the historical United States Geological Survey (USGS) topographic map of the Hollywood and Los Angeles Quadrangles shows a relatively narrow alluvial valley following Flower Street from 6th Street up-gradient to 3rd Street, then diverging to the northwest towards Glendale Boulevard (west of the SR 110 Harbor Freeway). This alluvial valley appears to be a

tributary drainage course to an ancestral course of the Los Angeles River (i.e., prior to channelization of the modern Los Angeles River). The Los Angeles River floodplain covers the broad, gently sloping, alluvial terrain east of the Bunker Hill area. Artificial fill of variable thickness underlies the proposed alignment near the surface. Fill materials consist of mixtures of sand, silt, clay, with variable amounts of construction debris. Deep areas of fill to depths of approximately 25 feet below ground surface are present at abandoned tunnels and storm drain excavations that have been backfilled.

The historical high groundwater in the vicinity of the alignment ranged between 30 to 70 feet below the existing grade based on available historic borehole data presented in the Seismic Hazard Evaluation reports of the Los Angeles and Hollywood 7.5-Minute Quadrangles (CDMG 1998a and b). Additional groundwater information has been presented in the Water Resources Technical Memorandum.

4.3 Faulting and Seismicity

4.3.1 General Setting

The primary seismic considerations are surface rupture of the earth materials along fault traces and damage to structures due to seismically-induced ground shaking. There are numerous faults in Southern California including active, potentially active, and inactive faults. The fault classification system is based on criteria adopted by the CGS for the Alquist-Priolo Earthquake Zoning Program. An active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault is a fault that has demonstrated surface displacement of Quaternary age deposits (last 1.6 million years). Inactive faults have not moved in the last 1.6 million years. Active and potentially active faults that are located within ten miles of the alignment are discussed below with respect to their known activity status and location relative to the proposed alignments along Flower Street to 2nd Street.

Based on review of the available data, no known Holocene Active or Latest Pleistocene Active faults trend through the project area. The project area is not located within a currently established Alquist-Priolo earthquake fault zone for surface fault rupture and the proposed alignment does not traverse any known active fault. The location of the project area in relation to known faults is shown in Figure 4-2.

4.3.2 Active Faults

The Holocene active fault with surface expression closest to the project area is the Hollywood fault, located approximately 4.3 miles to the northwest of the proposed alignment. Active blind thrust faults in vicinity of the site are discussed separately below. Holocene Active faults within ten miles of the planned alignment include the Raymond fault (4.9 miles northeast of proposed alignment), the Newport-Inglewood fault zone (7.0 miles west-northwest of

proposed alignment), Verdugo fault (7.1 miles north-northeast of the proposed alignment) and the Santa Monica fault (9.2 miles west of the proposed alignment).

The active Hollywood fault trends east-west along the base of the Santa Monica Mountains from the West Beverly Hills Lineament in the West Hollywood-Beverly Hills area to the Los Feliz area of Los Angeles. The fault is a groundwater barrier within Holocene sediments. Studies by several investigators have indicated that the fault is active based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies. Although the Hollywood fault is considered active by the State Geologist, an Alquist-Priolo Earthquake Fault Zone has not yet been established for the Hollywood fault due to its poorly defined location along its length. For planning purposes, the City of Los Angeles considers the Hollywood fault active, and the CGS includes the fault in its database of seismic sources.

4.3.2.1 Potentially Active Faults

The inferred trace of the MacArthur Park fault is located approximately 0.5 mile southeast of the proposed alignment. The fault has not been definitively proven to exist. It is inferred west of downtown Los Angeles and has been located based on south-facing scarps, truncated drainages, and other geomorphic features. The Eagle Rock fault, a late Pleistocene active fault is located approximately eight miles to the northeast.

4.3.2.2 Blind Thrust Fault Zones

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than three kilometers. These faults do not present a potential surface fault rupture hazard; however, they are considered active and potential sources for future earthquakes. The nearest thrust is the Elysian Park Thrust. Previously defined as the Elysian Park Fold and Thrust Belt, the Elysian Park Thrust was thought to extend northwesterly from the Santa Ana Mountains to the Santa Monica Mountains, extending westerly to parallel the Santa Monica-Hollywood and Malibu Coast faults. The Elysian Park Thrust is now believed to be smaller, only underlying the central Los Angeles Basin.

The Elysian Park Thrust underlies the project area approximately six to nine miles below ground surface. Like other blind thrust faults in the Los Angeles area, the Elysian Park Thrust is not exposed at the surface and does not present a potential surface rupture hazard. However, the Elysian Park Thrust should be considered an active feature capable of generating future earthquakes with associated significant ground shaking and possible deformation of the near surface materials.

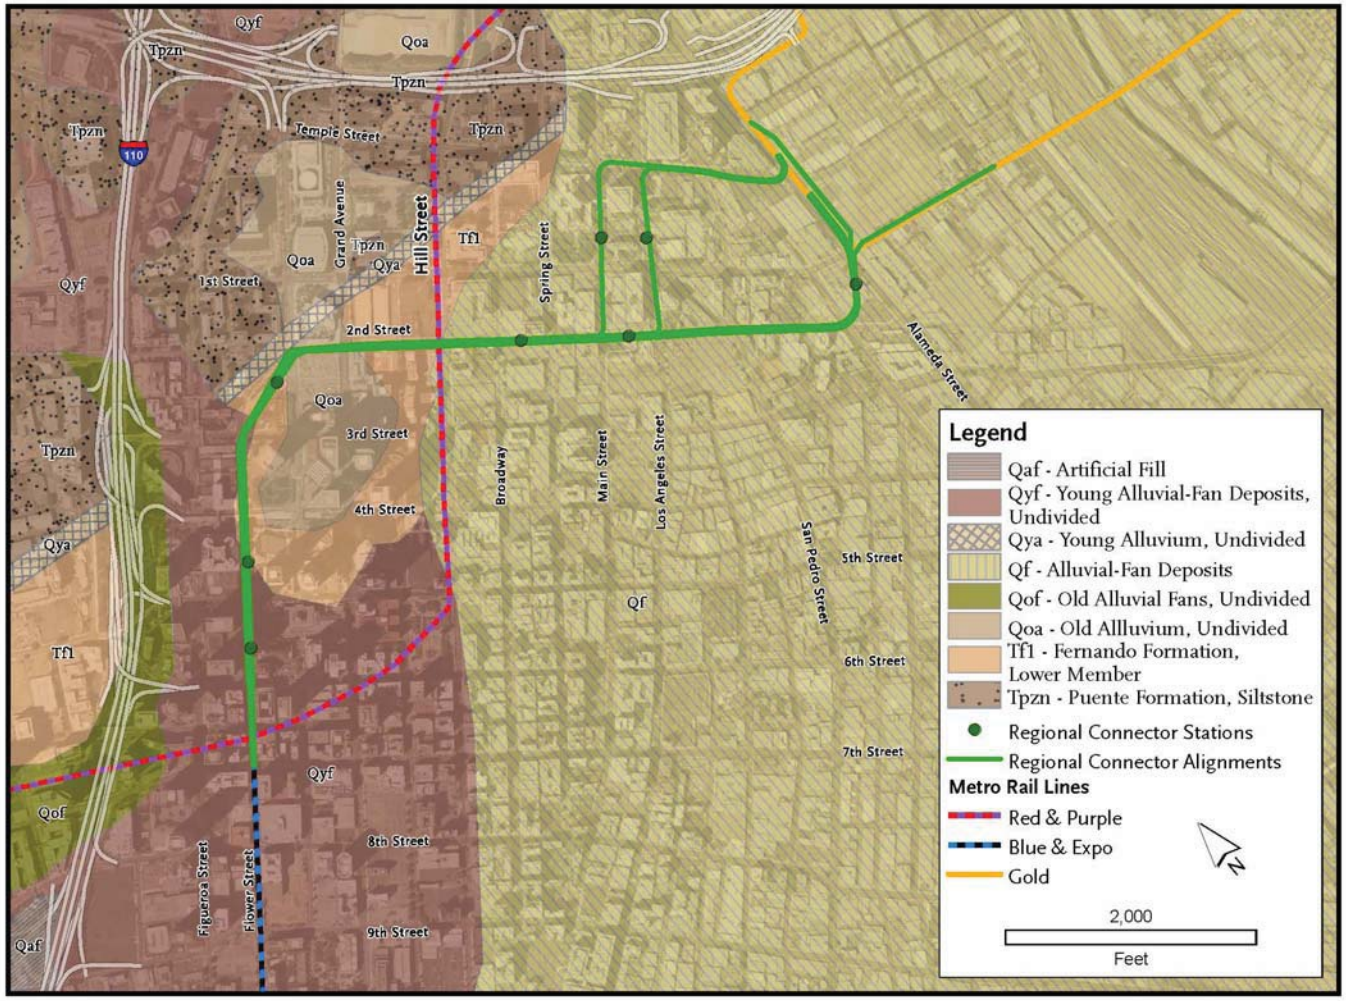

Figure 4-1. Regional Geology

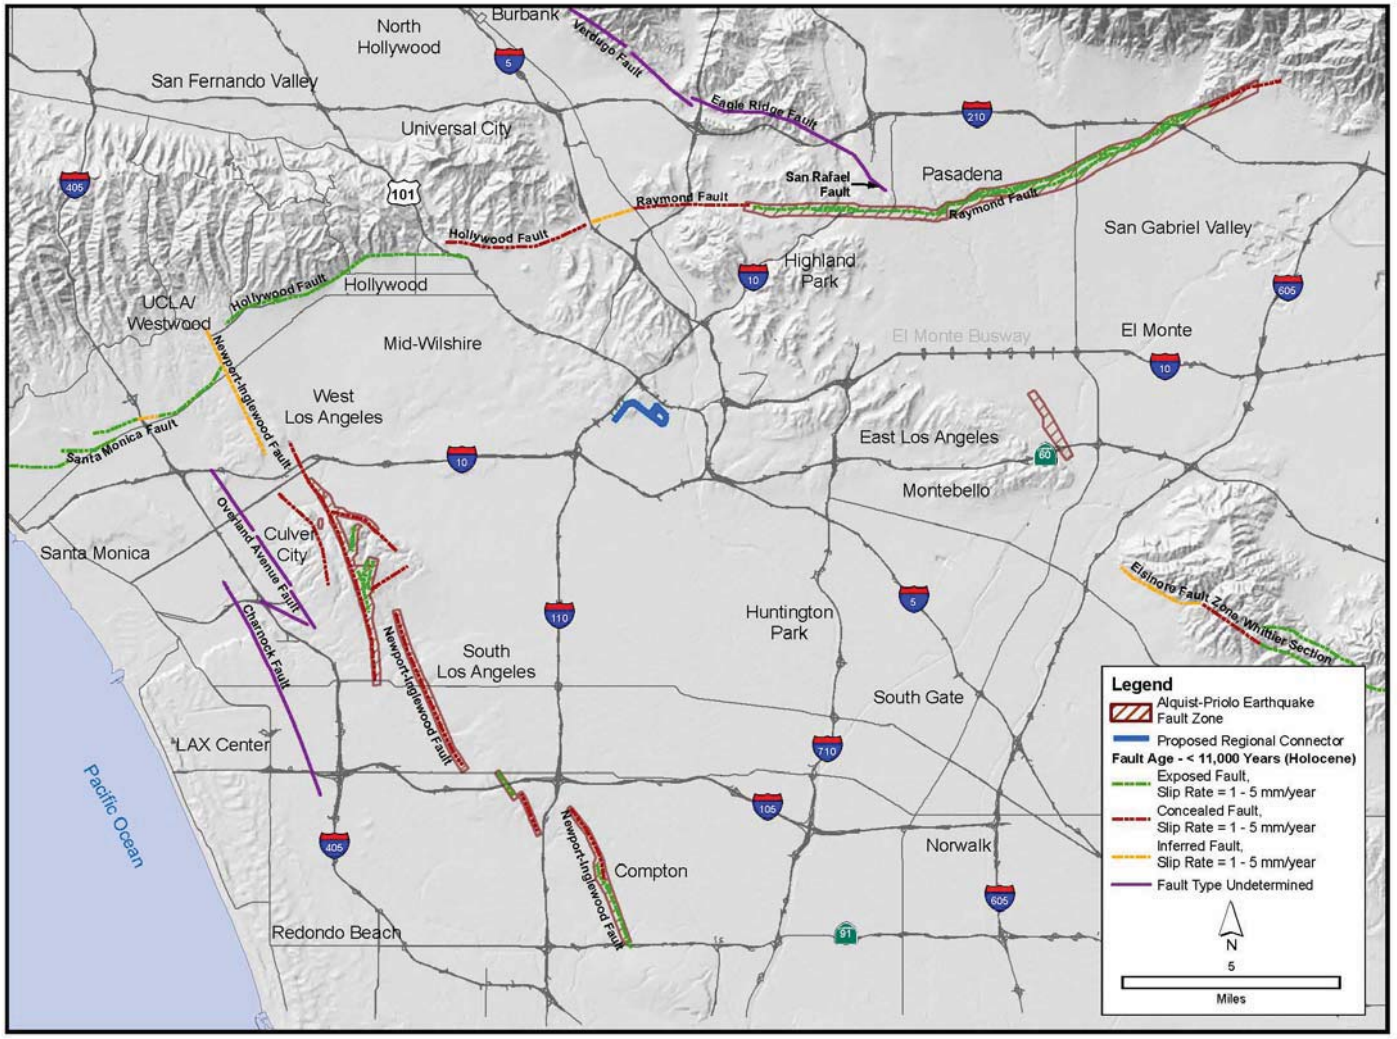

Figure 4-2. Regional Faults and Alquist-Priolo Earthquake Fault Zones

In addition, the Elysian Park fault, a blind thrust fault, is located northeast of and at a shallower depth than the Elysian Park Thrust. The up-dip edge of the blind thrust fault tip is located about 0.6 miles north of downtown Los Angeles. The estimated, average recurrence-interval for events of the Elysian Park fault ranges from 500 to 1,300 years, with an estimated moment magnitude of up to 6.7. Evidence to define the activity of the Elysian Park fault is lacking; however, given the history of seismic events on blind thrust faults in the greater Los Angeles area (i.e. Whittier Narrows and Northridge earthquakes) and proximity to the project area of this newly defined fault, the Elysian Park fault is considered active for planning and design of the project.

4.3.2.3 Coyote Pass Escarpment

The Coyote Pass Escarpment is a gentle south-facing, east-west trending topographic lineament that forms the southern flank of the Repetto Hills, from the Los Angeles River channel eastward to the Monterey Park area. The escarpment is an area of young, near-surface, monoclinal folding believed to be a result of fault rupture on the Elysian Park Thrust and/or the shallower Elysian Park fault. Although the trend of the escarpment beneath the floodplain, west of the Los Angeles River has not been well defined, it has been inferred that the escarpment may align in the subsurface with the MacArthur Park escarpment, located west of SR 110. Recent investigations of the Coyote Pass Escarpment indicate that the Elysian Park fault is active. Future fault rupture at depth along the Elysian Park fault and/or the Elysian Park Thrust could result in near-surface folding of the alluvial sediments and underlying bedrock in the area of the escarpment. Thus, no ground rupture is anticipated along the Coyote Pass Escarpment, but there is a potential for ground deformation (active folding) of the bedrock and the overlying alluvial sediments along the mapped location of the escarpment.

The deterministic ground motions were estimated using the Next Generation Attenuation (NGA) relationships of Abrahamson and Silva (2008), Boore and Atkinson (2008), Campbell and Bozorgnia (2008), and Chiou and Youngs (2008) with the program EZ-Frisk by Risk Engineering (2009). EZ-FRISK uses the relationships developed by Wells and Coppersmith (1994) and others to obtain estimates of earthquake magnitude from rupture size. The fault data used in the analyses were obtained from the United States Geological Survey (USGS, 2002) fault model included with the EZ-Frisk program. The Modified Mercalli Intensities were determined in accordance with Wald, et al. (1999).

Table 4-1 is a summary of the active faults, the approximate distance to the proposed project alignment, the maximum earthquake magnitude, peak ground acceleration (PGA), and the estimated site intensity near the intersection of Flower and 5th Streets. All sources were reviewed for the seismic hazards study and were incorporated for the ground motion study.

Table 4-2 is a summary of the active faults, the approximate distance to the proposed project alignment, the maximum earthquake magnitude, PGA, and the estimated site intensity near the proposed 2nd/Hope Street station under Bunker Hill.

Table 4-3 is a summary of the active faults, the approximate distance to the proposed project alignment, the maximum earthquake magnitude, PGA, and the estimated site intensity near the intersection of 2nd Street and Central Avenue.

4.3.2.4 Ground Shaking

Seismic hazards that could affect the project alignment include ground shaking from an earthquake along one of the several major active faults in the region. The magnitude of ground shaking is generally characterized by using the peak ground acceleration (PGA).

The PGA for several return periods commonly used for subway projects were developed using the average of the ground motions obtained from the Next Generation Attenuation relationships of Abrahamson and Silva (2008), Boore and Atkinson (2008), Campbell and Bozorgnia (2008), and Chiou and Youngs (2008) with the program EZ-Frisk. The average shear wave velocities over the upper 30 meters were determined from previous reviews of the local geology and previous shear wave velocity measurements taken at the site. For the depth to rock with a shear wave velocity of 1,000 meters per second 1 kilometer was used and 3 kilometers was used for the depth to bedrock with a shear wave velocity of 2,500 meters per second. Each ground motion attenuation relationship was integrated to three standard deviations beyond the median. EZ-FRISK uses the relationships developed by Wells and Coppersmith (1994) and others to obtain estimates of earthquake magnitude from rupture size. The average results are presented in Table 4-4.

Table 4-4. Potential Ground Motion Along Project Alignment

Event	Ground Acceleration (g)		
	Flower/5th	Bunker Hill	2nd/Central
Most Probable Event	0.181	0.168	0.187
Operable Design Earthquake	0.308	0.296	0.311
Design Basis Earthquake	0.452	0.446	0.452
Upper Bound Earthquake	0.582	0.586	0.578
Maximum Design Earthquake	0.737	0.755	0.730
Maximum Considered Earthquake	0.789	0.813	0.780

Source: EZ-Frisk by Risk Engineering (2009).

The results of the analysis indicate the PGA with a 10 percent probability of exceedance in 50 years (recurrence interval of 475 years) is approximately 0.45g. This level of ground motion is considered the Design Basis Earthquake. The PGA with a 10 percent probability of exceedance in 100 years (recurrence interval of 949 years) is approximately 0.58g, which is considered the Upper Bound Earthquake. The design criteria used by the Los Angeles County Metropolitan Transportation Authority (Rail and Transit Design Criteria and Standards, 1996) requires that for important structures such as those comprising this project, special earthquake protection criteria be followed: "The guiding philosophy of earthquake design for the Metro Rail projects is to provide a high level of assurance that the overall system will continue to operate during and after an Operating Design Earthquake." Operating

procedures assume safe shut down and inspection before returning to operation. "Further, the system design will provide a high level of assurance that public safety will be maintained during and after a Maximum Design Earthquake." The Operating Design Earthquake is defined as the earthquake event with a 40 percent probability of exceedance in 100 years (recurrence interval of 200 years). Such event can reasonably be expected to occur during the 100-years design life of the project. The Maximum Design Earthquake is defined as the earthquake event with a 5 percent probability of exceedance in 100 years, which corresponds to an average recurrence interval of 2,000 years.

Other criteria for the seismic design of the project are the Most Probable Event and the Maximum Considered Earthquake. The Most Probable Event is defined as the earthquake event with a 50 percent probability of exceedance in 50 years (recurrence interval of 75 years). The Maximum Considered Earthquake is defined as the earthquake event with a 2 percent probability of exceedance in 50 years which corresponds to an average recurrence interval of 2,500 years. The 2007 California Building Code (CBC) uses the Maximum Considered Earthquake as the basis for seismic design requirements. In general, the PGA is lower for an event with a higher probability of occurrence under the same return period.

4.3.2.5 Liquefaction

Liquefaction-induced ground failure has historically been a major cause of earthquake damage in Southern California. Significant damage to roads, utilities, pipelines, and buildings during the 1971 San Fernando and 1994 Northridge earthquakes was caused by liquefaction-induced ground displacement. Localities most susceptible to liquefaction-induced ground displacement are underlain by loose, water-saturated, granular sediment within 50 feet of the ground surface. Liquefaction susceptibility generally decreases as the percentage of clay size particles in the soil increases and/or the coarse sand and gravel content increases. In portions of the project area, sediments susceptible to liquefaction comprise the young (Holocene to late Holocene age) alluvial fan deposits and young (Holocene) alluvial floodplain sediments. The older alluvial deposits are generally medium dense to dense and are considered by the CGS (California Geological Survey, previously California Division of Mines and Geology 1998a, 1998b) to have a low liquefaction susceptibility. The CGS has prepared seismic hazard maps for the Los Angeles Basin. The maps delineate liquefaction zones which have been defined by the CGS as areas where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacement such that mitigation would be required.

The CGS uses criteria developed by the Seismic Hazard Mapping Act Advisory Committee in delineating liquefaction zones on the seismic hazard maps. In areas of limited or no geotechnical data, susceptibility zones are evaluated using a combination of geologic considerations. The CGS has rated the liquefaction susceptibility for the Holocene age sediments in the project area as high, if saturated within 40 feet of the ground surface and, if not saturated, the susceptibility is rated as low. In contrast, the liquefaction susceptibility of

older alluvial sediments (terrace deposits) is rated as low or not likely irrespective of ground-water levels.

In this framework, the CGS has identified a portion of the proposed alignment with Holocene sediments along Flower St. between Wilshire Boulevard and 2nd Street to be within a potential liquefaction zone. Likewise, the CGS has identified Holocene sediments along 2nd Street between Hill and San Pedro Streets to be within a potential liquefaction zone, as depicted in Figure 4-3. Young (Holocene age) deposits along the alignment, where present, are on the order of five to 35 feet thick. Preliminary proposed alignment profiles indicate that tunnel crown elevations would be below the young alluvial deposits that are rated as highly susceptible to liquefaction. For proposed station locations with shallow groundwater and younger alluvial deposits, station walls may have to be designed for greater than usual lateral earth pressures to account for liquefaction potential. The risk of settlement beneath the planned stations due to liquefaction is considered remote due to the depth of the Fernando formation beneath the Holocene alluvium at proposed station depths.

4.3.2.6 Settlement

Seismically-induced settlement consists of compression of the dry soils above groundwater and liquefaction-induced settlement of the liquefiable soils below groundwater. These settlements occur primarily within the loose to moderately dense sandy soils due to volume reduction during or shortly after an earthquake event.

Most of the artificial fill along the proposed project alignment is expected to be undocumented. In addition, a portion of the alluvial soils along the alignment are anticipated to be loose to medium dense. Accordingly, the portions of the proposed alignment mapped within the liquefiable zone and underlain by undocumented fill have the potential to experience seismically-induced settlement.

In addition to seismically-induced settlement, the upper soils along the proposed project alignment consist of predominately alluvial soils with some undocumented fill and have the potential to settle due to ground loss during tunnel construction. The majority of the tunnel would be constructed within the bedrock of the Fernando/Puente Formation and below groundwater with an Earth Pressure Balance (EPB) or a slurry Tunnel Boring Machine (TBM). The potential to cause ground loss and associated ground settlement with such machines are less likely. If such settlement occurred, it could adversely affect the overlying roadway and structures located over the distressed areas.

4.3.2.7 Landslides

Landslides and slope failures were significant contributing factors that lead to Los Angeles becoming one of the first municipalities in the nation to adopt hillside-grading ordinances. Rapid uplift of the mountainous areas of Los Angeles from past and ongoing tectonic movements gives rise to a geologic setting conducive to mass wasting. The variable nature of

sediments and rocks exposed throughout Los Angeles and the slope conditions created by uncontrolled grading have led to frequent landslides of a variety of types. The hillside areas of Los Angeles, especially the central and eastern Santa Monica Mountains, have geologic and topographic conditions that are conducive to the development of surficial and gross landslides. The City of Los Angeles Department of Building and Safety regulates construction and development in hillside areas of Los Angeles. As part of the City of Los Angeles Building Code and review process, the City has established a Hillside Ordinance, which specifies that a geologic report is required for proposed construction within hillside areas.

The proposed project alignment is not located within the earthquake-induced landslide zone according to the State of California Seismic Hazard Zones for the Hollywood and Los Angeles Quadrangles. However, the northwest portion of the project area in the vicinity of the proposed 2nd/Hope Street station (the area east of the US 101/SR 110 interchange) is within the Hillside Ordinance area according to the City of Los Angeles Seismic Safety Element (1996). The construction of the proposed station should address temporary slope stability as appropriate and the shoring system should be designed to address such sloping condition and any potential for instability. Given that the proposed station would be below grade and located predominately in bedrock, the risk for such a hazard to affect the site is considered low.

4.3.2.8 Flooding

According to the City of Los Angeles Seismic Safety Element (1996), a limited portion of the eastern edge of the proposed alignment near the intersection of Alameda and 1st Streets is within the mapped Inundation Hazard Area. However, the majority of the build alternatives' alignments (At Grade Emphasis LRT Alternative, Underground Emphasis LRT Alternative, Fully Underground LRT Alternative – Little Tokyo Variation 1, and Fully Underground LRT Alternative – Little Tokyo Variation 2) are not located in areas mapped with the potential to be susceptible to flooding. The proposed alignment is located in an urbanized area composed mainly of impervious surfaces that include well-developed drainage infrastructure. The proposed project would neither significantly increase impervious surfaces nor increase the risk of flooding.

Earthquake-induced flooding can be caused by failure of dams or other water retaining structures due to an earthquake. Due to the absence of such structures in the vicinity of the alignment, the potential for such hazards to affect the project is considered low.

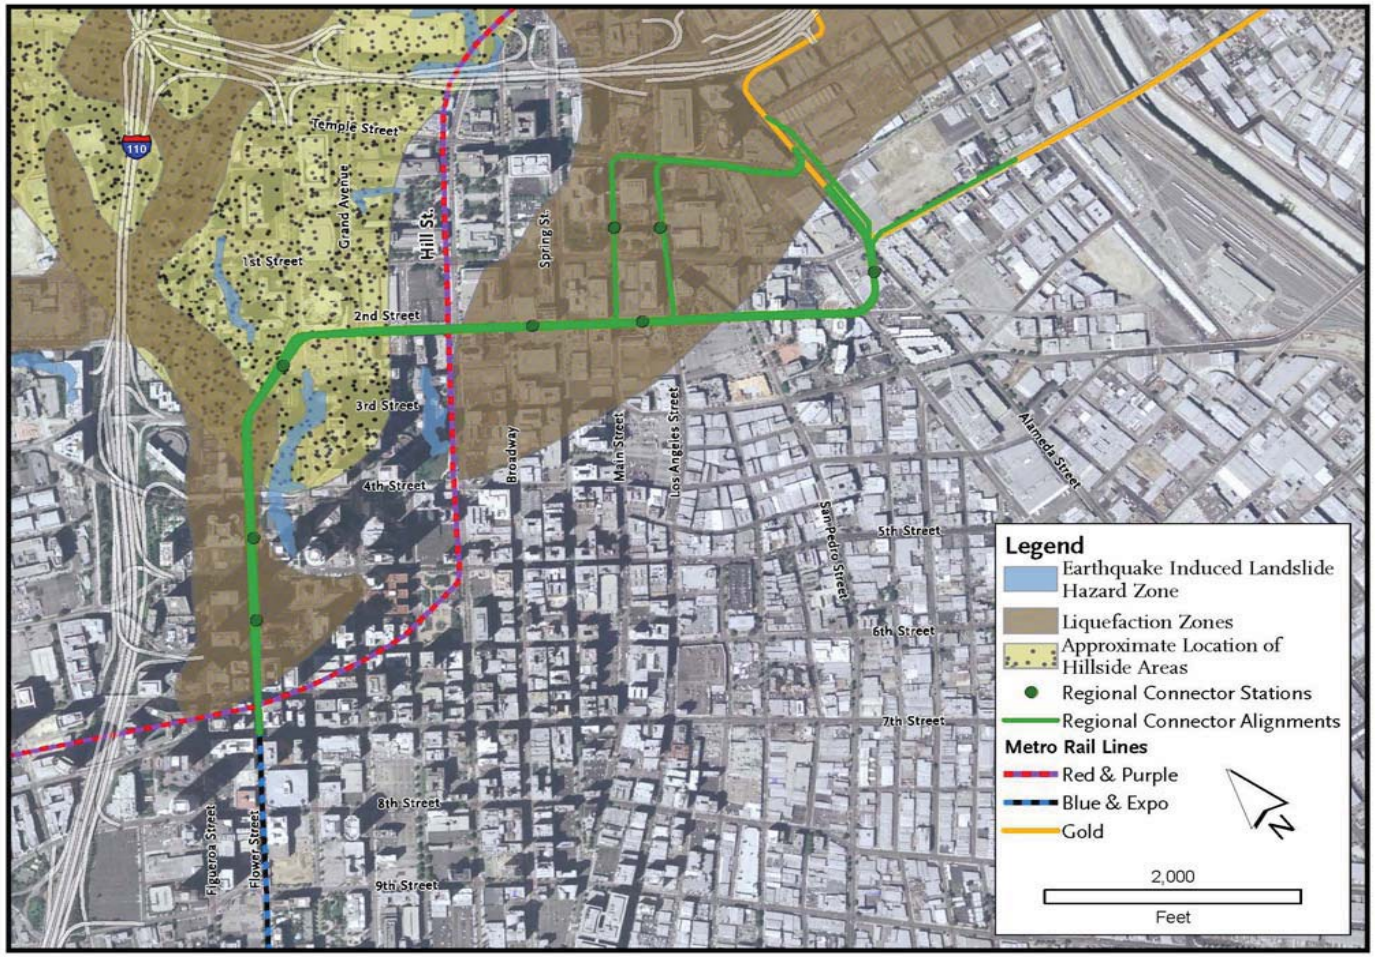

Figure 4-3. Liquefaction and Landslide Hazards

4.3.2.9 Seiches and Tsunamis

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. Tsunamis are tidal waves generated in large bodies of water by fault displacement or major ground movement such as submarine landslides.

According to the City of Los Angeles Seismic Safety Element (1996) and the County of Los Angeles Seismic Safety Element (1990), the project area is more than 10 miles from the ocean and is not located within areas potentially impacted by either tsunamis or seiches.

4.4 Mineral Resources

Regarding the loss of mineral resources, the project area traverses areas underlain by geologic materials such as sand and gravel that may be considered mineral resources and could be used as construction aggregates. However, these materials have not been previously mined along the project alignment. Furthermore, mining of these materials in an urbanized environment is not considered economical. However, there is a potential for re-use of excavated material as fill.

4.5 Hazardous Materials

Environmental Data Resources (EDR) conducted a search of regulatory databases, including federal, state, and local environmental records as well as historical mapping. Thirty federal, 11 state and local, and several proprietary and tribal environmental databases were accessed by EDR for the project (EDR 2009). A total of 178 listed sites were identified within the federal records databases, 732 listed sites were present within the state and local databases, and six potential coal gas plant sites were listed in the EDR proprietary Manufactured Gas Plants database for the search area (CDM 2009). Of those, a total of 69 listed sites are located along the proposed alignments for any of the build alternatives, while a total of 136 sites are located within 0.25 mile of the proposed alignments.

The database search results include facilities that handle hazardous materials but have not necessarily had a release to the environment. Additionally, many sites are documented as closed cases where past satisfactory remediation has occurred. These listings do not represent a potential concern for the proposed project and were eliminated from further evaluation.

In some instances, more information was requested from regulatory agencies to determine the current status of a site. In addition, Sanborn fire insurance maps, maps of the Union Station Methane Buffer Zone and Methane Zone and the Los Angeles City Methane Buffer Zone, and oil well construction and abandonment records provided additional information used to determine which sites pose a potential concern with respect to hazardous materials.

The Hazardous Materials Investigation and Analysis (CDM 2009) classifies properties of concern as High, Moderate, or Low based on the following criteria:

- High - sites with known/probable soil, groundwater, or soil gas contamination that have not been remediated, or where remediation is incomplete or undocumented. Other considerations include the type and mobility of any contamination, distance to a project, groundwater impacts, and the location with respect to the inferred or known direction of groundwater flow.

- Moderate – sites with known/potential soil, groundwater, or soil gas contamination and where remediation is in progress, contaminants do not appear to pose a concern for a project, or where construction would occur within mapped Methane Buffer Zones. Sites may also be considered a Moderate level of concern based on the type and intensity of former land use (e.g., chemical manufacturers, machine shops, gas stations, etc.), even though they did not otherwise have an environmental database listing.

- Low – sites that are not likely or are less likely to impact soil and/or groundwater that would be encountered during construction of a project. These may include sites having permitted air toxic emissions or some sites with spills or leaks to the environment that were subsequently remediated and have received case closure.

Table 4-5 lists the properties of high or moderate concern as identified by CDM (2009). Properties are listed in order of their location, beginning at the 7th Street/Metro Center Station and ending at the project terminus near the Metro Gold Line Little Tokyo/Arts District Station. These properties of concern are presented graphically in Figure 4-4.

In addition to hazardous materials that are known or suspected to exist at the properties listed in Table 4-5, other hazardous materials may be present (CDM 2009). Transformers located above and below grade along the alignments may contain PCBs. Lead may also be present in surface soil from historic emissions of leaded fuel from vehicles on adjacent roadways. Since most soil along the proposed alignment is covered by asphalt or concrete, exposure to these hazardous materials is unlikely. However, buildings along the proposed alignments that were constructed prior to 1979 may contain asbestos and buildings constructed prior to 1978 may contain lead-based paint that could be released during demolition. These hazardous materials would present a concern for the proposed project, as exposure to these materials at certain levels may cause adverse health effects to workers and the general public.

Standards have been established to address the presence of asbestos-containing materials and lead-based paint in buildings to protect public health from exposure during building demolition or renovation. The National Emission Standards for Hazardous Air Pollutants

(NESHAP) for Asbestos, under Section 112 of the Clean Air Act, establishes work practices to minimize the release of asbestos fibers in compliance with federal regulations in 40 CFR Part 61, Subpart M. Likewise, federal regulations under section 403 of the TSCA, as amended by the Residential Lead-Based Paint Hazard Reduction Act of 1992, established standards for lead-based paint in pre-1978 housing in 40 CFR Part 745. Properties constructed before 1978 would be of particular concern for the possible presence of lead based paints and those constructed before 1979 for asbestos containing materials. In compliance with these regulations, lead and asbestos surveys would be conducted prior to demolition and construction, when the locally preferred alternative (LPA) is known.

Table 4-5. Properties of High/Moderate Concern

Address	Name	Description/Level of Concern
404 S. Figueroa Street	Westin Bonaventure Hotel	Tetrachloroethene (PCE) leaked into soil and shallow groundwater. Investigation and monitoring is ongoing. Groundwater plume may be controlled by building acting as a barrier. HIGH
715 W. 3rd Street	Central Plants, Inc.	No identified leaks or spills; however, the facility is actively conducting water treatment for commercial heating and cooling water, has four fuel USTs, and stressed vegetation was observed near Flower Street. MODERATE
1031 W. 2nd Street	76 Service Station No. 250122	Former service station located about 1,350 feet west and up-gradient of the project with total petroleum hydrocarbons-gasoline (TPH-g), benzene, and other contaminants in groundwater. A remediation program for soil and groundwater has been completed; however, work is still being conducted to delineate the south-southwestern extent of the plume. MODERATE
108 N. Fremont Street	Fire Station No. 3	TPH-g and other contaminants in soil and groundwater generally up-gradient of the project. Although the site is 1,450 feet from the project, the case is currently listed as open and in the process of referral for further remediation. MODERATE

Table 4-5. Properties of High/Moderate Concern		
Address	**Name**	**Description/Level of Concern**
111 N. Hope Street	Los Angeles Department of Water and Power (LADWP)	The site is located approximately 650 feet up-gradient of the project, and volatile organic compounds (VOCs) were previously detected in a groundwater monitoring well installed near the down-gradient edge of the plume beneath the proposed project alignment. Subsequent monitoring did not detect contaminants; however, the project will pass through a portion of the plume that may not have been fully characterized. More information is needed to determine concentration and extent of VOCs. MODERATE
Methane Buffer Zone between the World Trade Center and Disney Hall	Los Angeles City Oil Field	Project crosses through the Methane Buffer Zone where toxic or potentially explosive gasses may be encountered. MODERATE
111 E. 1st Street	Los Angeles City Hall South	Records revealed three historical UST leaks, however, their status is undocumented. Site currently has six USTs. MODERATE
151 Judge John Aiso Street	Parker Center Los Angeles Police Department (LAPD)	Records report the discovery of a diesel leak into soil in 1990, followed by a site assessment. A citation was issued in 2008 for non-submittal of data regarding the leak to the State in electronic format. Although it may have been mitigated, the status of the remediation is unknown. MODERATE
120 S. San Pedro Street	Union Bank of California	Open site assessment for a diesel leak into soil reported in 2005. HIGH
300 block of E. 2nd Street	Various	Historical (1950s and 1960s) activities included two chemical manufacturers, a gas station, gas and oil tanks, an autobody shop, sheet metal shops and a machine shop. MODERATE

Table 4-5. Properties of High/Moderate Concern		
Address	**Name**	**Description/Level of Concern**
401 E. 2nd Street	Unknown	Disposed of 30 tons of contaminated soil. Regulatory status unknown. MODERATE
Methane Zone, Oil Field near eastern terminus of project	Union Station Oil Field and Methane Zone	Project enters the oil field and associated Methane Zone. Hydrogen sulfide gas was reported in groundwater and as gas north of 1st Street and west of the Los Angeles River. MODERATE

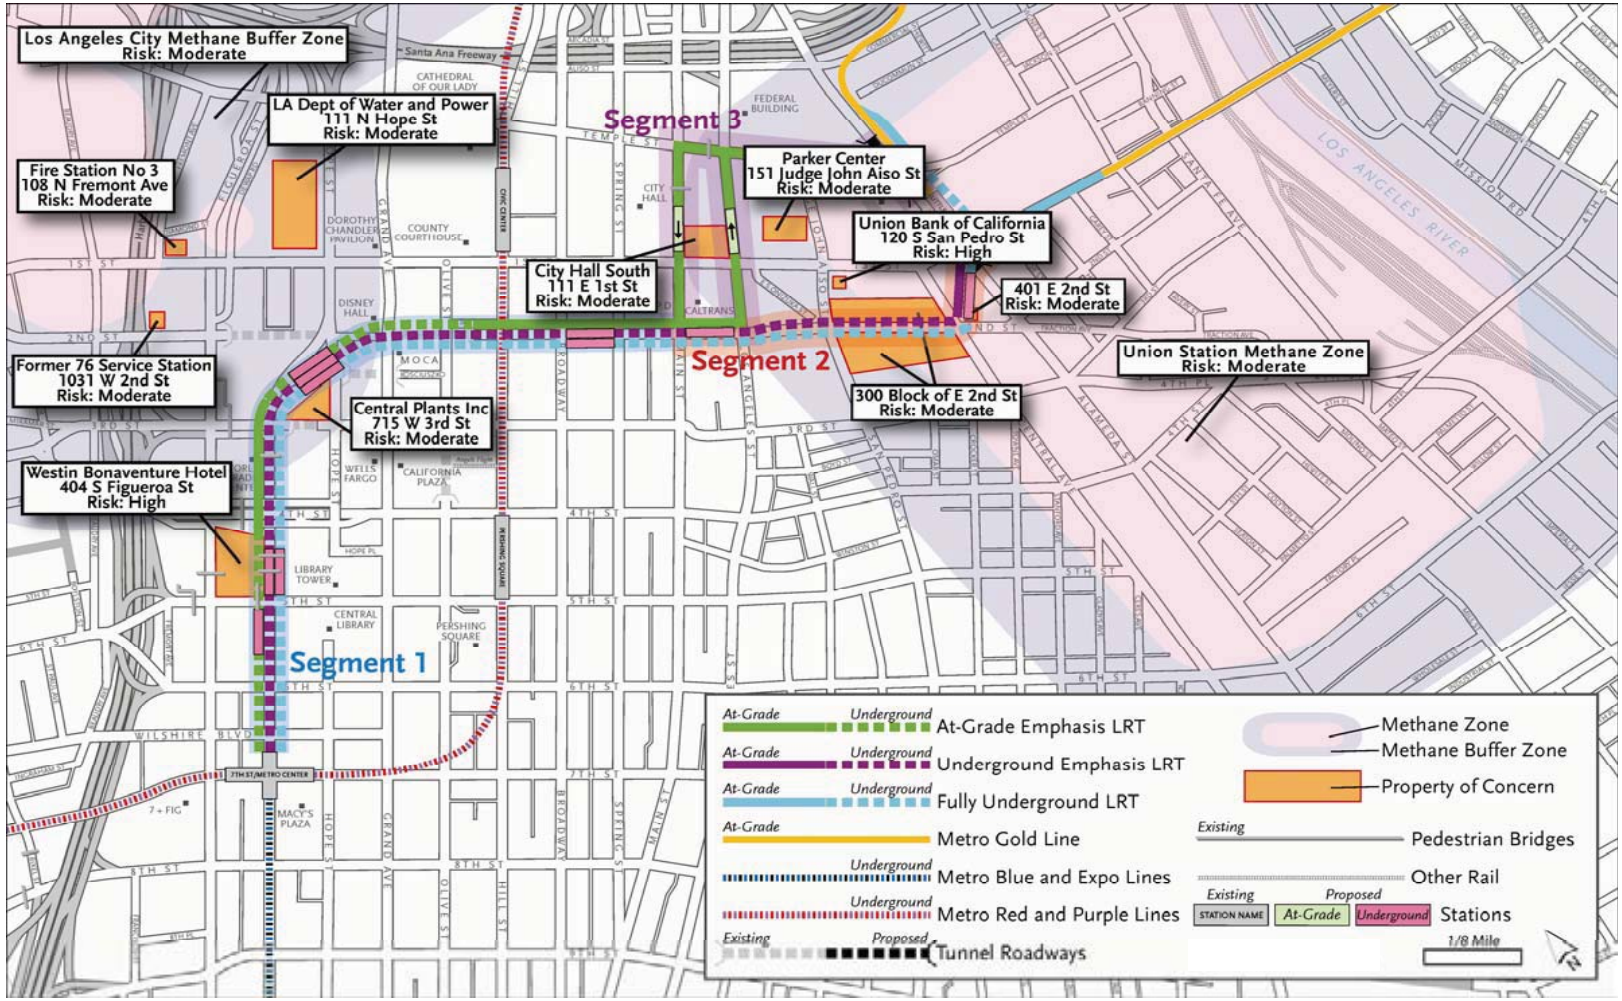

Figure 4-4. Known or Suspected Hazardous Materials in Soil and/or Groundwater within 0.25 Miles of Proposed Alignments

5.0 IMPACTS

5.1 No Build Alternative

5.1.1 Geotechnical, Subsurface, and Seismic Hazards

The No Build Alternative would not include any activities that would result in the potential for risk of fault rupture, liquefaction, seismically-induced settlement, landslides, flooding, seiches or tsunamis. Therefore, the No Build Alternative would not result in adverse effects related to geotechnical, subsurface, or seismic hazards.

5.1.2 Hazardous Materials

5.1.2.1 Direct Impacts

Under the No Build Alternative, there would be no construction and therefore no potential to encounter hazardous materials in soil and/or groundwater in the project area. There would be no construction-related hazardous materials usage, storage, or transport, and no potential for impacts to human health or the environment from the accidental release of hazardous materials. In addition, current operations with respect to hazardous materials would not change, and there would be no impairment of adopted emergency response plans or emergency evacuation plans. Therefore, there would be no direct impacts associated with hazardous materials from the No Build Alternative.

5.1.2.2 Indirect Impacts

The No Build Alternative would not result in indirect impacts with respect to hazardous materials, as there would be no construction or change in existing operations.

5.1.2.3 Cumulative Impacts

Since there would be no direct or indirect impacts from the No Build Alternative, there would also be no cumulative impacts.

5.2 Transportation System Management (TSM) Alternative

5.2.1 Geotechnical, Subsurface, and Seismic Hazards

The TSM Alternative would not include any activities that would result in the potential for risk of fault rupture, liquefaction, seismically-induced settlement, landslides, flooding, seiches or tsunamis. Therefore, no adverse effects related to geotechnical, subsurface or seismic hazards would occur.

5.2.2 Hazardous Materials

5.2.2.1 Direct Impacts

The TSM Alternative would not require construction that could encounter hazardous materials in soil and/or groundwater or release hazardous materials to the environment. Changes in operation under the TSM Alternative would not change the existing types of hazardous materials used, stored, or transported. Operation of the TSM Alternative would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school, and would not impair adopted emergency response plans and emergency evacuation plans. Therefore, there would be no direct impacts associated with hazardous materials from the TSM Alternative.

5.2.2.2 Indirect Impacts

Under the TSM Alternative, there would be no indirect impacts with respect to hazardous materials, as there would be no potential to encounter hazardous materials in soil and/or groundwater, and no change in the types, usage, storage, or transport of hazardous materials during operation.

5.2.2.3 Cumulative Impacts

Since there would be no direct or indirect impacts from the TSM Alternative, there would also be no cumulative impacts.

5.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

Due to the nature of earth impacts, all impacts in this report pertain primarily to construction activities. Only earthquakes (seismic hazards) concern operations. It should be noted that approximately 45 percent of the At-Grade Emphasis LRT Alternative would be underground primarily along Flower Street.

5.3.1 Geotechnical, Subsurface, and Seismic Hazards

The At-Grade Emphasis LRT Alternative does not cross any known fault. However, the At-Grade Emphasis LRT Alternative is potentially susceptible to liquefaction in portions of the proposed alignment along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. The portions of the alignment within the mapped liquefiable zone and underlain by undocumented fill may be susceptible to seismically-induced settlement. In addition, the northwest portion of the project area at the proposed 2nd/Hope Street station (in the area east of the US 101/SR 110 interchange) is within the Hillside Ordinance area. The proposed station would be below grade and located predominately in bedrock, therefore, the potential for a landslide hazard to affect the site is low. However, temporary slope stability during station construction would be evaluated and shoring would be designed to incorporate such slope conditions as appropriate.

The majority of the At-Grade Emphasis LRT Alternative is not located in an area mapped with the potential to be susceptible to flooding. The alignment is located in an urbanized area covered with impervious surfaces and includes a well-developed drainage infrastructure. The proposed project would not increase the risk of flooding. There is also no potential for seiches and tsunamis, as the alignment is more than 10 miles from the Pacific Ocean and there are no reservoirs nearby.

Therefore, there is limited potential for adverse effects related to liquefaction and seismically-induced settlement for portions of the At-Grade Emphasis LRT Alternative, but no potential for adverse impacts related to active or potentially active faults, landslides, flooding, seiches, or tsunamis.

The proposed construction would have the potential for adverse impacts related to ground settlement and differential settlement on adjacent structures including historical buildings. Further evaluation and survey would be performed during design to establish building types, existing conditions, and to develop criteria to limit potential movement to acceptable threshold values. Protection of buildings could involve design of adequately rigid excavation support systems, underpinnings, and/or ground improvements to minimize settlement to tolerable limits. In addition, a preconstruction survey of the adjacent structures and all historical buildings in the vicinity would be conducted to establish a baseline to measure potential construction-induced damage against. Construction monitoring would be required during construction to ascertain that movement does not exceed the threshold values.

With mitigation, potential effects related to geologic, subsurface, or seismic hazards would be reduced to a less than significant level.

5.3.2 Hazardous Materials

5.3.2.1 Direct Impacts

5.3.2.1.1 Hazardous Materials Encountered in Soil and/or Groundwater During Construction

During construction of the At-Grade Emphasis LRT Alternative, there is the potential to encounter hazardous materials along the proposed alignment (Figure 4-4). For both the at-grade and underground sections of this alternative, construction would entail the disturbance of soil and/or shallow groundwater. Construction of the at-grade portions of the alignment would entail clearing and grading of shallow soil, during which shallow groundwater could also be encountered. The underground portions of the At-Grade Emphasis LRT Alternative along Flower Street (approximately 45 percent) would require trenching or tunneling, and as a result would encounter deeper soils and groundwater. See Appendix A for a description of proposed construction activities.

Known and/or suspected soil and/or groundwater contamination exists at properties directly within and near to the proposed alignment, as listed in Table 4-5 above. As recommended by CDM (2009), additional data gathering and/or site specific soil, groundwater, and/or soil gas investigation activities (e.g., Phase II ESA testing), may be necessary at these properties to further delineate potential areas of contamination and guide construction activities.

Along with the concerns presented in Table 4-5, lead may be present in surface soils along the proposed alignment from historical vehicle emissions, and PCBs may exist in surface or subsurface soils from leaking transformers located above or below grade. During construction, release of these hazardous materials in contaminated soil and/or groundwater could result in exposure to workers, the public, and sensitive receptors, such as schools within 0.25 mile. This could occur through the release of dust or vapors from exposed soil and/or groundwater. Until further study is conducted, the actual levels of hazardous materials that could be encountered in soil and/or groundwater during construction are unknown.

Compliance with the federal, state, and local laws and regulations regarding hazardous materials described in Section 3.1 would be required during construction of the At-Grade Emphasis LRT Alternative. Since 45 percent of the alternative would be located underground, dewatering may be necessary during the construction process. Groundwater encountered during construction dewatering would require testing and either on-site treatment and discharge in accordance with applicable standards or transport to a treatment and/or disposal facility. Additional details about dewatering are provided in the Water Resources Technical Memorandum. A Contaminated Soil/Groundwater Management Plan would be implemented during construction to establish procedures for sampling, analysis, and proper handling, storage, transport, and disposal of contaminated materials in coordination with the appropriate regulatory agency. This mitigation measure is described further in Section 6.0.

In addition, mitigation would be required to reduce potential impacts to construction workers from encountering contamination during construction. As described in Section 6.0, a Worker Health and Safety Plan would be implemented prior to the start of construction to establish procedures to be followed if contamination is encountered. This would include required training prior to start of work, personal protective equipment, and emergency procedures.

5.3.2.1.2 Accidental Release of Construction-Related Hazardous Materials

There is the potential for hazardous materials, such as fuels and hydraulic oil used for construction equipment, to be accidentally released during construction. Further, construction of the At-Grade Emphasis LRT Alternative would involve the use, storage, and transport of hazardous materials, such as fuels, paints, lubricating fluids, and solvents for maintenance. As such, there is the potential for direct impacts from an accidental release.

To reduce potential impacts from accidental release of construction-related hazardous materials, the construction contractor would be required to implement best management practices (BMPs) for handling hazardous materials in compliance with existing regulations. These BMPs would include the following:

- Requirements for proper use, storage, and disposal of chemical products and hazardous materials used in construction;
- Spill control and countermeasures, including employee spill prevention/response training;
- Vehicle fueling procedures to avoid overtopping construction equipment fuel tanks;
- Procedures for routine maintenance of construction equipment, including the proper containment and removal of grease and oils; and
- Procedures for the proper disposal of discarded containers of fuels and other chemicals.

The implementation of these BMPs would ensure that potential direct impacts from the accidental release of hazardous materials and/or wastes used or generated during construction are less than significant.

5.3.2.1.3 Accidental Release of Hazardous Materials During Operation

Compliance with hazardous materials laws and regulations would be required during operation as well, including hazardous materials inventory and emergency response planning, risk planning and accident prevention, employee hazard communication, public notification of potential exposure to specific chemicals, and storage of hazardous materials. Adherence to existing laws and regulations would reduce the potential for these direct impacts to a less than significant level. Further, if long-term operation of the underground portions of the alignment requires groundwater to be collected and discharged, compliance with discharge permit standards would be required.

5.3.2.1.4 Hazards Associated with Subsurface Oilfield Gases

The proposed alignment would traverse methane zones and methane buffer zones associated with oil deposits in the vicinity, as shown in Figure 4-4. Excavation within these zones may encounter naturally occurring hydrocarbon gases, including hydrogen sulfide and methane. Hydrogen sulfide is highly toxic and could result in human health effects to individuals who are exposed, particularly construction workers. Methane is explosive if allowed to accumulate and could cause harm to workers and the public if an explosion occurred during construction or operation. Mitigation, as described in Section 6.0, would be required to reduce these impacts to a less than significant level.

5.3.2.1.5 Release of Asbestos Fibers and/or Lead-Based Paint Particles

If construction of the At-Grade Emphasis LRT Alternative requires building demolition, release of hazardous materials including asbestos fibers and lead-based paint particles could occur. Mitigation, as described in Section 6.0, would be required to reduce this potential direct impact.

5.3.2.1.6 Hazards Associated with Electromagnetic Fields (EMFs)

Operation of the At-Grade Emphasis LRT Alternative would introduce new sources of low level EMFs associated with the overhead catenary lines and traction power substations. Compared to overhead power lines which use 400 kV, the LRT would use 0.6 kV and produce very weak EMFs. Therefore, potential impacts from exposure to EMFs would not be anticipated. However, mitigation, as described in Section 6.0, would ensure that impacts would be less than significant.

5.3.2.2 Indirect Impacts

During long-term operation of the At-Grade Emphasis LRT Alternative, there is the potential for the below-grade portions of the alignment to act as a preferential pathway for existing groundwater contamination to move to areas distant from the project. Mitigation measures incorporated into the engineering design would include the use of impermeable grout where necessary to fill the gap between the tunnel and the surrounding earth and ensure the tunnel does not contribute to the spread of contaminated groundwater.

In addition, construction could involve the transport of soil or other media contaminated with hazardous materials to a disposal facility located away from the project area. As such, there is potential for indirect impacts from the accidental release of these hazardous materials. Compliance with existing laws and regulations regarding transport and disposal of hazardous materials would reduce this impact to a less than significant level.

5.3.2.3 Cumulative Impacts

There is the potential for cumulative impacts associated with hazards and hazardous materials from the At-Grade Emphasis LRT Alternative. A number of related construction projects have been identified and some of those projects could involve ground-disturbing construction where there is potential to encounter hazardous materials in soil and/or groundwater. In addition, other construction activities in the project area may entail building demolition, with the potential for release of asbestos fibers from asbestos containing materials and lead particles from lead-based paint. The additive effect of on-going and future activities could result in cumulative impacts to human health or the environment through release of hazardous materials. While these construction activities would require compliance with applicable hazardous waste laws and regulations, mitigation would also be required to ensure cumulative impacts would be less than significant.

5.4 Underground Emphasis LRT Alternative

Due to the nature of earth impacts, all impacts in this report pertain primarily to construction activities. Only earthquakes (seismic hazards) concern operations.

5.4.1 Geotechnical, Subsurface, and Seismic Hazards

The Underground Emphasis LRT Alternative does not cross any known fault; however, there is the potential for liquefaction in portions of the proposed alignment along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. In the portions of the proposed alignment within a mapped liquefiable zone and underlain by undocumented fill, there would be limited potential for adverse effects from liquefaction and seismically-induced settlement. In addition, the northwest portion of the project area (east of the US 101/SR 110 interchange) is within the Hillside Ordinance area, where there is a potential for landslides. As discussed in Section 5.3.1, the potential for landslide hazards to affect the site is considered low because the proposed 2nd/Hope Street station would be embedded below grade and located predominately in bedrock. However, temporary slope stability during station construction would be evaluated and the shoring would be designed to incorporate slope conditions as appropriate.

A limited portion at the eastern edge of the alignment near the intersection of 1st and Alameda Streets is within the mapped Inundation Hazard Area. However, the majority of the Underground Emphasis LRT Alternative is not located in an area mapped with the potential to be susceptible to flooding. The alignment is located in an urbanized area covered with impervious surfaces and includes a well-developed drainage infrastructure. The proposed project would not increase the risk of flooding. There is also no potential for seiches and tsunamis, as the alignment is more than 10 miles from the Pacific Ocean and there are no reservoirs nearby.

The Underground Emphasis LRT Alternative alignment is overlain by alluvial soils and undocumented fill that are potentially susceptible to ground loss associated with tunnel construction (see discussion in Section 4.3.2.5). Therefore, there is the potential for adverse effects related to liquefaction, seismically-induced settlement, ground loss due to tunnel construction, and landslides for portions of the Underground Emphasis LRT Alternative, but no potential for adverse impacts related to active or potentially active faults, flooding, seiches, or tsunamis.

The proposed tunneling would have the potential for adverse impacts related to ground settlement and differential settlement immediately above the alignment as well as adjacent structures including the historical buildings. In general, settlement is greatest at the ground surface directly above the alignment and decreases away from the centerline. Further evaluation and site-specific survey would be performed on the affected adjacent buildings located within the influence zone during design to establish criteria to limit potential

movement to acceptable threshold values. Potential mitigation methods are discussed in Section 6 of this document. Ground improvement would be required in advance of tunneling to provide adequate support and to minimize settlement. In addition, a preconstruction survey of adjacent structures and all historical buildings in the vicinity would be conducted to establish a baseline against which to measure potential construction-induced damage. Construction monitoring would be required during construction to ascertain the criteria are met.

With mitigation, potential effects related to geologic, subsurface, or seismic hazards would be reduced to a less than significant level.

5.4.2 Hazardous Materials

5.4.2.1 Direct Impacts

5.4.2.1.1 Hazardous Materials Encountered in Soil and/or Groundwater During Construction

As with the At-Grade Emphasis LRT Alternative, there is the potential to encounter hazardous materials along the proposed alignment for the Underground Emphasis LRT Alternative (Figure 4-4). Construction of the Underground Emphasis LRT Alternative would entail trenching or tunneling along most of the proposed alignment, during which contaminated soil and/or groundwater could be encountered. See Appendix A for a description of proposed construction activities. As listed in Table 4-5, known and/or suspected soil and/or groundwater contamination exists at properties directly within and near to the proposed alignment for the Underground Emphasis LRT Alternative. In addition, lead may be present in surface soils from historical vehicle emissions, and PCBs may exist in surface or subsurface soils from leaking transformers located above or below grade. If released, there is potential for impacts to human health and the environment from these hazardous materials. Until further study is conducted, the actual levels of hazardous materials that could be encountered in soil and/or groundwater during construction are unknown.

Compliance with the federal, state, and local laws and regulations regarding hazardous materials described in Section 4.1 would be required during construction of the Underground Emphasis LRT Alternative. Groundwater encountered during construction dewatering would require testing and either on-site treatment and discharge in accordance with applicable standards or transport to a treatment and/or disposal facility. Additional details about dewatering are provided in the Water Resources Technical Memorandum. A Contaminated Soil/Groundwater Management Plan would be implemented during construction to establish procedures for sampling, analysis, and proper handling, storage, transport, and disposal of contaminated materials in coordination with the appropriate regulatory agency. This mitigation measure is described further in Section 6.0.

In addition, mitigation would be required to reduce the potential impacts to construction workers from encountering contamination during construction. As described in Section 6.0, a Worker Health and Safety Plan would be implemented prior to the start of construction activities to establish procedures to follow if contamination is encountered. This would include required training prior to start of work, personal protective equipment, and emergency procedures.

5.4.2.1.2 Accidental Release of Construction-Related Hazardous Materials

There is also the potential for hazardous materials, such as fuels and hydraulic fluids used for construction equipment, to be accidentally released during construction. Since construction of the Underground Emphasis LRT Alternative would involve the use, storage, and transport of hazardous materials, such as fuels, paints, lubricating fluids, and solvents for maintenance, there is the potential for direct impacts from an accidental release.

To reduce potential impacts from the accidental release of construction-related hazardous materials, the construction contractor would be required to implement BMPs for handling hazardous materials in compliance with existing regulations. These BMPs would include the following:

- Requirements for proper use, storage, and disposal of chemical products and hazardous materials used in construction;
- Spill control and countermeasures, including employee spill prevention/response training;
- Vehicle fueling procedures to avoid overtopping construction equipment fuel tanks;
- Procedures for routine maintenance of construction equipment, including the proper containment and removal of grease and oils; and
- Procedures for the proper disposal of discarded containers of fuels and other chemicals.

The implementation of these BMPs would ensure that potential direct impacts from the accidental release of hazardous materials and/or wastes used or generated during construction and are less than significant.

5.4.2.1.3 Accidental Release of Hazardous Materials During Operation

During operation, adherence to hazardous materials laws and regulations would require proper inventory and storage of hazardous materials, accident prevention and emergency response planning, employee training and public health hazard notification. If long-term operation of the underground portions of the alignment requires groundwater to be collected

and discharged, compliance with discharge permit standards would be required. Compliance with existing laws and regulations would reduce the potential for these direct impacts to a less than significant level.

5.4.2.1.4 Hazards Associated with Subsurface Oilfield Gases

The Underground Emphasis LRT Alternative would be located within methane zones and methane buffer zones associated with oil deposits, as shown in Figure 4-4. Excavation within these zones may encounter naturally occurring hydrogen sulfide and/or methane, which could result in the potential for harm to workers and the public. Mitigation measures, as described in Section 6.0, would be required to reduce these potential impacts to a less than significant level.

5.4.2.1.5 Release of Asbestos Fibers and/or Lead-Based Paint Particles

Since construction of the Underground Emphasis LRT Alternative would require building demolition, release of hazardous materials including asbestos fibers and lead-based paint particles could occur. Mitigation, as described in Section 6.0, would be required to reduce this potential direct impact to a less than significant level.

5.4.2.1.6 Hazards Associated with Electromagnetic Fields (EMF)

Operation of the Underground Emphasis LRT Alternative would introduce new sources of low level EMFs associated with the overhead catenary lines and traction power substations. The LRT would use only 0.6 kV compared to overhead power lines which use 400 kV. As a result, EMFs produced by the LRT would be very weak, and potential impacts from exposure to EMFs are not anticipated. In addition, most of the alignment would be underground further limiting potential exposure to adjacent land uses. Mitigation, as described in Section 6.0, would ensure impacts would be less than significant.

5.4.2.2 Indirect Impacts

During operation of the Underground Emphasis LRT Alternative, gaps between the tunnel and the surrounding earth could serve as preferential pathways for the migration of groundwater contamination. This would be mitigated to a less than significant level during the engineering process. For example, specifications for impermeable grouting materials to fill the gap between the tunnel and the surrounding earth could be designed to reduce this potential impact.

If, during construction, soil or other media contaminated with hazardous materials is transported to a disposal facility located away from the project area, there would be the potential for indirect impacts from the accidental release of these hazardous materials. Compliance with existing laws and regulations regarding transport and disposal of hazardous materials would reduce this impact to a less than significant level.

5.4.2.3 Cumulative Impacts

There is the potential for cumulative impacts associated with hazards and hazardous materials from the Underground Emphasis LRT Alternative. Construction associated with on-going and future projects in the project area could result in cumulative impacts to human health or the environment through release of hazardous materials encountered in soil and/or groundwater, or released during building demolition. Compliance with applicable hazardous waste laws and regulations, along with the mitigation measures described in Section 6.0, would ensure these potential cumulative impacts would be less than significant.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Due to the nature of earth impacts, all impacts in this report pertain primarily to construction activities. Only earthquakes (seismic hazards) concern operations.

5.5.1 Geotechnical, Subsurface, and Seismic Hazards

Similar to the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1 does not cross any known fault; however, there is the potential for liquefaction in portions of the proposed alignment along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. In the portions of the proposed alignment within a mapped liquefiable zone and underlain by undocumented fill, there would be limited potential for adverse effects from liquefaction and seismically-induced settlement (See discussion in Section 4.3.2.5). In addition, the northwest portion of the project area (east of the US 101/SR 110 interchange) is within the Hillside Ordinance area, where there is a potential for landslides. As discussed in Section 5.3.1, the potential for landslide hazards to affect the site is considered low because the proposed 2nd/Hope Street station would be embedded below grade and located predominately in bedrock. However, temporary slope stability during station construction would be evaluated and shoring would be designed to incorporate slope conditions as appropriate.

A limited portion at the eastern edge of the alignment near the intersection of 1st and Alameda Streets is within the mapped Inundation Hazard Area. However, the majority of the Fully Underground LRT Alternative – Little Tokyo Variation 1 is not located in an area mapped with the potential to be susceptible to flooding. The alignment is located in an urbanized area covered with impervious surfaces and includes a well-developed drainage infrastructure. The proposed project would not increase the risk of flooding. There is also no potential for seiches and tsunamis, as the alignment is more than 10 miles from the Pacific Ocean and there are no reservoirs nearby.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment is overlain by alluvial soils and undocumented fill that are potentially susceptible to ground loss associated with tunnel construction.

Therefore, there is the potential for adverse effects related to liquefaction, seismically-induced settlement, ground loss due to tunnel construction, and landslides for portions of the alignment, but no potential for adverse impacts related to active or potentially active faults, flooding, seiches, or tsunamis.

The proposed tunneling would have the potential for adverse impacts related to ground settlement and differential settlement immediately above the alignment as well as adjacent structures including the historical buildings. In general, settlement is greatest at the ground surface directly above the alignment and decreases away from the centerline. Further evaluation and site-specific survey would be performed on the affected adjacent buildings located within the influence zone during design to establish criteria to limit potential movement to acceptable threshold values. Potential mitigation methods are discussed in Section 6 of this document. Ground improvement would be required in advance of tunneling to provide adequate support and to minimize settlement. In addition, a preconstruction survey of adjacent structures and all historical buildings in the vicinity would be conducted to establish baseline against construction-induced damage. Construction monitoring would be required during construction to ascertain the criteria are met.

With mitigation, potential effects related to geologic, subsurface, or seismic hazards would be reduced to a less than significant level.

5.5.2 Hazardous Materials

5.5.2.1 Direct Impacts

5.5.2.1.1 Hazardous Materials Encountered in Soil and/or Groundwater During Construction

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, there is potential to encounter hazardous materials along the proposed alignment. This potential would be similar to that discussed above for the Underground Emphasis LRT Alternative, except that the Fully Underground LRT Alternatives would extend north and east of 1st and Alameda Streets (Figure 4-4), and thus would entail a slightly longer alignment along which trenching or tunneling would occur.

Since the same properties where there is known and/or suspected soil and/or groundwater contamination would be affected by the Fully Underground LRT Alternative – Little Tokyo Variation 1 as by the Underground Emphasis LRT Alternative, impacts associated with encountering this contamination during construction would be the same. Further, there would be the same potential for lead and PCBs to be present in soils along the proposed alignment. Additional investigation would be needed to determine the actual levels of hazardous materials that could be encountered in soil and/or groundwater during construction.

Compliance with the federal, state, and local laws and regulations regarding hazardous materials described in Section 3.1 would be required during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1. A Contaminated Soil/Groundwater Management Plan and a Worker Health and Safety Plan would be put in place prior to the start of construction activities to establish procedures to follow if contamination is encountered. These mitigation measures are described further in Section 6.0.

5.5.2.1.2 Accidental Release of Construction-Related Hazardous Materials

As with the other alternatives, there is the potential for construction-related hazardous materials, such as fuels and hydraulic fluids, to be accidentally released during construction. The construction contractor would be required to implement BMPs to reduce these potential impacts by handling hazardous materials in compliance with existing regulations.

5.5.2.1.3 Accidental Release of Hazardous Materials During Operation

During operation, there could be direct impacts from the accidental release of hazardous materials. To reduce the potential for these impacts, compliance with hazardous materials laws and regulations would be required. If groundwater would be collected and discharged under this alternative, compliance with discharge permit standards would be required.

5.5.2.1.4 Hazards Associated with Subsurface Oilfield Gases

As shown on Figure 4-4, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be partially located within methane zones and methane buffer zones, which could result in the potential for harm to workers and the public. Mitigation measures, as described in Section 6.0, would be required to reduce these potential impacts to a less than significant level.

5.5.2.1.5 Release of Asbestos Fibers and/or Lead-Based Paint Particles

During construction, there would be potential for release of hazardous materials including asbestos fibers and lead based paint particles. Mitigation, as described in Section 6.0, would be required to reduce this potential direct impact to a less than significant level.

5.5.2.1.6 Hazards Associated with Electromagnetic Fields (EMF)

As with the other alternatives, operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would introduce new low level sources of EMFs. As the alternative would be located entirely underground and the new EMFs would be very weak, potential impacts from exposure to EMFs are not anticipated. Mitigation, as described in Section 6.0, would ensure potential impacts would be less than significant.

5.5.2.2 Indirect Impacts

Indirect impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 could occur if preferential pathways for the migration of contaminated groundwater were created during construction. As with the other alternatives, this potential impact would be mitigated

through proper engineering practices. Compliance with existing laws and regulations regarding transport and disposal of hazardous materials would reduce potential impacts from the accidental release of hazardous materials during transport to a less than significant level.

5.5.2.3 Cumulative Impacts

Cumulative impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 could occur if there were a release of hazardous materials during on-going and future projects in the project area that result in cumulative impacts to human health or the environment. Compliance with applicable hazardous waste laws and regulations, along with the mitigation measures described in Section 6.0, would ensure these potential cumulative impacts would be less than significant.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The alignment for the Fully Underground LRT Alternative – Little Tokyo Variation 2 is essentially the same as that for the Fully Underground LRT Alternative – Little Tokyo Variation 1. The alignment for this alternative is about a block longer along 1st Street. The design differences between the two alternatives in the vicinity of Alameda and First Streets would not result in different potential impacts with respect to geotechnical, subsurface, and seismic hazards or hazardous materials.

As described in Section 5.5.1, with mitigation, potential effects related to geotechnical, subsurface, or seismic hazards would be less than significant.

As described in Section 5.5.2, there would be some potential for direct, indirect, and cumulative effects related to hazardous materials. The potential impacts would be the same as described in Section 5.5.2 and with mitigation these potential impacts would be less than significant.

6.0 POTENTIAL MITIGATION MEASURES

6.1 Potential Construction Mitigation Measures

A geotechnical investigation would be performed during design for the proposed at-grade and below-grade structures and improvements. The investigation would supplement and provide site specific data to facilitate final design for maintaining the integrity of existing structures under static and seismic loading and operational demands. Although portions of the alignment would be constructed in potential liquefaction zones, none are expected to result in or exacerbate geologic hazards. The proposed subway tunnels and stations would be located at depths below soils prone to liquefaction, and be subject to standard design specifications. Higher design earth pressures would be applied to below grade structures within liquefaction zones during the construction process to keep potential risks of damage from liquefaction and seismically-induced settlement to an acceptable level.

For the any of the build alternatives, the potential for ground movement associated with cut and cover construction and potential ground loss due to tunneling could be mitigated by the following mitigation measures:

- Design criteria would be established during project design that requires the construction contractor to limit movement to less than an acceptable threshold value as a performance standard. This acceptable threshold standard would be a function of several factors including but not limited to the type of structure and its existing condition. Additional data and survey information would be gathered during preliminary engineering for each building to enable assessment of the tolerance of the subject structures. In addition, standard threshold criteria and guidelines published by agencies and for similar type of structures would be reviewed. Additional geotechnical studies would be performed to define the nature of the soils and to refine the means of achieving the performance specification.

- Require ground improvement such as grouting or other methods to fill voids where appropriate and offset potential settlement when excess material has been removed during excavation. The criteria for requiring grouting or ground improvement would be based on the additional data collection and reviews as noted above and the acceptable threshold value.

- Grout tunnel alignment in advance to provide adequate soil support and minimize settlement as geotechnical conditions require.

- Monitor settlement along project alignment using a series of measuring devices above the route of the alignment. Leveling surveys would be conducted prior to tunneling, to monitor for possible ground movements.

- Conduct a preconstruction survey of buildings to establish a baseline to measure potential construction-induced damage against.

- Describe and define tunnel construction monitoring requirements. In addition, provisions could be included to use the Earth Pressure Balance or Slurry TBM for tunnel construction to minimize ground loss. During tunnel construction, the soils encountered will be monitored relative to anticipated soil conditions as described in a Geotechnical Baseline Report.

For the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2, a Contaminated Soil/Groundwater Management Plan would be implemented during construction to establish procedures to follow if contamination is encountered. The Plan would be prepared during the Final Design phase of the project, and the construction contractor would be held to the level of performance specified in the Plan. The Plan would include the following:

- Notification procedures and contact information for appropriate regulatory agencies;

- Procedures for sampling and analysis of soil and/or groundwater known or suspected to be impacted by hazardous materials;

- Procedures for the proper handling, storage, transport, and disposal of contaminated soil and/or groundwater, in consultation with regulatory agencies;

- Dust control measures (e.g., soil wetting, wind screens, etc.) for contaminated soil;

- Groundwater collection, treatment and discharge procedures and applicable standards.

In addition, a Worker Health and Safety Plan would be implemented prior to the start of construction activities. All workers would be required to review, receive training if necessary, and sign the plan prior to starting work. The Plan would, at a minimum, identify the following:

- Properties of concern and the nature and extent of contaminants that could be encountered during excavation activities;

- All appropriate worker, public health, and environmental protection equipment and procedures;

- Emergency response procedures, including most direct route to a hospital; and

- Site Safety Officer.

During construction of the underground portions of the build alternatives, mitigation would be required to address the potential for the creation of a preferential pathway and resulting spread of existing groundwater contamination. This could entail the use of impermeable grout where necessary to fill the gap between the tunnel and the surrounding earth along underground portions of the alignment where groundwater contamination exists.

To reduce potential impacts from subsurface gases associated with oilfields in the vicinity of the project area, mitigation measures would be implemented during construction of the underground portions of the build alternatives to address both exposure to toxic gases and the risk of explosion. This would be particularly important in methane zones and methane buffer zones, but testing would be required in all underground segments, as oilfield gases could occur outside of mapped zones. Specific precautions to protect workers and the public from exposure to toxic gases would be required, and specialized excavation methods would be needed to prevent explosion. Prior to building demolition, surveys of asbestos containing materials and lead-based paint would be conducted. If necessary, destructive sampling would be used. All asbestos containing materials and lead-based paint would be removed or otherwise abated prior to demolition. Removal and abatement activities would comply with all applicable laws, regulations, and rules.

6.2 Potential Operational Mitigation Measures

Mitigation would be required to address the potential for intrusion of subsurface gases in the underground portions of any of the build alternatives. Compliance with the Los Angeles City Municipal Code would be necessary for all structures within Methane and/or Buffer zones. The code requires gas concentration/pressure testing on a specified frequency and, based on the results, appropriate mitigation measures or controls to be included in the design. These mitigation measures may include the use of gas-impermeable liners and venting to reduce or eliminate gas intrusion into stations and along the length of the underground segments. The design, construction, and use of this technology have been successfully employed by Metro for various Red Line segments.

Although potential impacts related to the very weak EMFs that would be created by the build alternatives would not be anticipated, additional evaluation of sensitive receptors, including residences, schools, hospitals, day care facilities, and convalescent homes, within 100 feet of the proposed alignments would be warranted. Projected EMF levels produced by the LRT would be compared with International Radiation Protection Association guidelines. If these guidelines are exceeded, mitigation would be implemented to ground or block EMFs or modify the LRT power requirements.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Finding

There would be no adverse impacts from the No Build Alternative with respect to geotechnical, subsurface, seismic hazards or hazardous materials.

7.1.2 CEQA Determination

The No Build Alternative would have no impacts related to geotechnical subsurface, seismic hazards, or hazardous materials.

7.2 TSM Alternative

7.2.1 NEPA Finding

There would be no adverse impacts from the TSM Alternative with respect to geotechnical, subsurface, seismic hazards, or hazardous materials.

7.2.2 CEQA Determination

There would be no impacts related to geotechnical, subsurface, seismic hazards, or hazardous materials from the TSM Alternative.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Finding

There is the potential for adverse impacts with respect to liquefaction, seismically-induced settlement, and hazardous materials for portions of the At-Grade Emphasis LRT Alternative. Mitigation would be required to reduce these impacts to a less than significant level.

7.3.2 CEQA Determination

Potential impacts associated with liquefaction, seismically-induced settlement, landslides, flooding, and hazardous materials could occur during construction and operation of the At-Grade Emphasis LRT Alternative. Compliance with federal, state, and local laws and regulations regarding hazardous materials would reduce many of these impacts to a less than significant level. In addition, implementation of mitigation measures would be required to address specific issues (e.g., liquefaction, settlement, potential presence of subsurface gases, asbestos containing materials and lead based paint) to a less than significant level.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Finding

The Underground Emphasis LRT Alternative would have the potential for adverse impacts with respect to liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials. Mitigation would be required to reduce these impacts to a less than significant level.

7.4.2 CEQA Determination

Potential impacts associated with liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials could occur during construction and operation of the Underground Emphasis LRT Alternative. Many of these impacts would be addressed with adherence to federal, state, and local laws and regulations regarding hazardous materials. However, mitigation would be required to address specific issues, including potential ground loss due to tunnel construction, liquefaction hazard, presence of subsurface gases, asbestos containing materials, and lead based paint. With mitigation, potential impacts would be less than significant.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Finding

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have the potential for adverse impacts with respect to liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials. Mitigation would be required to reduce these impacts to a less than significant level.

7.5.2 CEQA Determination

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have potential impacts associated with liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials during construction and operation. With mitigation, potential impacts would be less than significant.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Finding

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have the potential for adverse impacts with respect to liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials. Mitigation would be required to reduce these impacts to a less than significant level.

7.6.2 CEQA Determination

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have potential impacts associated with liquefaction, seismically-induced settlement, ground loss due to tunneling, and hazardous materials during construction and operation. With mitigation, potential impacts would be less than significant.

APPENDIX A

DESCRIPTION OF CONSTRUCTION ACTIVITIES FOR BUILD ALTERNATIVES

Table A-1. At-Grade Emphasis LRT Alternative: Construction Activity Summary

Activity	Description	Estimated Duration (Months)	Equipment							Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	Remarks (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional											
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	Earthwork (Cy)	Concrete (Cy)			
Pre-construction Activities	Survey, install geotechnical instrumentation, pothole, photo/ video documentation	4 to 6						x	x	n/a	n/a	5	10 to 20	
Site Preparation	Mobilize equipment, relocate utilities, secure staging areas along Flower Street, Hope Street, Gen. Thaddeus Kosciuszko Way, Main Street, Los Angeles Street, Temple Street, and Alameda Street	6 to 12	x	x	x	x				<1,000	<500	10	20 to 30	Utility relocation requires pavement breaker, jackhammers
Cut and Cover Tunnel Along Flower Street	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, remove obstructions such as tiebacks, construct tunnel structure, break into existing 7th Street/Metro Center Station, backfill	24 to 48	x	x	x	x	x	x	x	70,000	12,000	20 to 30	20 to 30	Flower Street closure until top deck is in place ~ 2 to 4 month closure at 2-block segments
Cut and Cover Station at Flower/ 6th/5th Street	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, remove obstructions such as tiebacks, construct station structure, backfill	24 to 48	x	x	x	x	x	x	x	50,000	9,500	20 to 30	20 to 30	5 - 10 concrete trucks per day during concrete pour, 5 - 10 trucks for material delivery during station construction
U-Portal at Flower between 4th and 3rd Streets	Shore and construct U-section portal at Flower Street	12 to 18	x	x	x	x	x	x	x	20,000	3,500	20 to 30	20 to 30	

Table A-1. At-Grade Emphasis LRT Alternative: Construction Activity Summary

Activity	Description	Estimated Duration (Months)	Equipment							Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	Remarks (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional											
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	Earthwork (Cy)	Concrete (Cy)			
Portal northeast of Flower and 3rd		TBD								10,600	4,000	20 to 30	20 to 30	
Cut and Cover Station at 2nd/Hope Streets	Construct station at Bunker Hill using cut and cover, construct portal and surface tracks west of the station, shore and break into existing 2nd Street tunnel, construct tunnel entry structure	24 to 48	x	x	x	x	x	x	x	55,000	17,500	20 to 30	20 to 30	
Portal into 2nd Street Tunnel		TBD								40,000	11,700	TBD	TBD	
Surface Trackwork	Install tracks and catenary poles in 2nd Street tunnel and at grade along 2nd, Main. Los Angeles, Temple, and Alameda Streets	12 to 18	x	x	x	x	x		x	10,000	8,000	5 to 10	5 to 10	
Improvements at Alameda / Temple Streets	Shore and excavate Alameda Street to create depressed roadway, construct pedestrian bridge, complete surface tracks and tie-in	24 to 36	x	x	x	x	x	x	x	65,000	12,000	15 to 20	20 to 30	
At-Grade Stations	Construct at-grade stations at Main/1st Street and at Los Angeles/1st Street	12 to 18	x	x	x	x	x	x	x	< 1000	1,500	5 to 10	5 to 10

Activity	Description	Estimated Duration (Months)	Equipment							Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	Remarks (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional											
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	Earthwork (Cy)	Concrete (Cy)			
Operating Systems Installation	Install power poles and overhead wires along alignment and power substations at the station locations.		x	x	x	x	x	x	x	TBD	TBD	TBD	TBD	

Note: For all concreting operations, there will be occasional large pours of several hundred yards that could require more than 10 trucks. These are typically scheduled at night to ensure adequate concrete supply and to avoid traffic.

Table A-2. Underground Emphasis LRT Alternative: Construction Activities Summary

Activity	Description	Estimated Duration	Equipment										Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	REMARKS (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (Cy)	Concrete (Cy)			
Pre-construction Activities	Survey, install geotechnical instrumentation, pothole, photo/ video documentation	4 to 6 months						x	x				n/a	n/a	5	10 to 20	
Site Preparation	Mobilize equipment, demolish existing buildings at portal site, clear and grub construction yard, relocate storm drain and other utilities, prepare TBM entry pit, secure staging areas along Flower and 2nd Streets, stabilize critical building foundations if needed	12 to 18 months	x	x	x	x							1,000	1,000	10 to 20	20 to 30	2nd Street closure for entry pit, 2 months
Cut and Cover Tunnel Along Flower Street	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, remove obstructions such as tiebacks, construct tunnel structure, break into existing 7th Street/Metro Center Station, backfill	24 to 48 months	x	x	x	x	x	x	x				280,000	27,750	20 to 30	20 to 30	Flower Street closure until top deck is in place 2 to 3 months per 2 block segment
Cut and Cover Station at Flower/ 5th/4th Street	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, remove obstructions such as tiebacks, construct station structure, backfill	24 to 48 months	x	x	x	x	x	x	x				105,000	26,000	15 to 20	20 to 30	Flower Street closure until top deck is in place ~2 to 3 months 5 to 10 concrete trucks/day during pour

Table A-2. Underground Emphasis LRT Alternative: Construction Activities Summary

Activity	Description	Estimated Duration	Equipment										Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	REMARKS (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (Cy)	Concrete (Cy)			
Cut and Cover Appurtenances at 2nd/Hope Street Station SEM Option	Construct shafts for mining equipment, complete cut and cover station entrances, construct emergency and ventilation shafts, construct pedestrian bridge	24 to 48 months	x	x	x	x	x	x	x				30,000	5,500	15 to 20	20 to 30	Chiller building underpinning may be needed
SEM Station at 2nd/Hope Streets	Mine and stabilize station excavation, construct station, stabilize adjacent building foundations if needed	24 to 48 months	x	x	x	x	x		x				50,000	8,250	10 to 15	20 to 25	
Cut-and-Cover Station at 2nd/Hope Streets	Mine and stabilize station excavation, construct station, stabilize adjacent building foundations if needed	24 to 48 months	x	x	x	x	x		x		x	x	147,500	17,250	20 to 30	20 to 30	
TBM Tunnel between Central Ave. and Bunker Hill	Bore tunnels with TBM recovering machine at Bunker Hill or Central Avenue, haul away cuttings, provide grouting if needed, remove TBM machine and backfill entry pit	24 to 48 months	x	x	x	x	x		x	x		x	120,000	Precast Segments	35 to 70	15 to 20	Tunnel boring production estimated 12 to 18 months Grouting may be needed at Higgins Building
Cut and Cover Station at 2nd/ Broadway option	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, construct station structure, backfill	24 to 48 months	x	x	x	x	x	x	x				200,000	47,250	15 to 20	15 to 20	2nd Street closed until top deck in ~ 2 to 3 mo 5 to 10 concrete trucks/day during pour
Cut and Cover Station at 2nd/ Los Angeles Street option	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, construct station structure, backfill	24 to 48 months	x	x	x	x	x	x	x				175,000	48,500	15 to 20	15 to 20	2nd Street closed until top deck in ~ 2 to 3 mo 5 to 10 concrete trucks/day during pour

Table A-2. Underground Emphasis LRT Alternative: Construction Activities Summary

Activity	Description	Estimated Duration	Equipment										Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	REMARKS (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (Cy)	Concrete (Cy)			
Cut and Cover Tunnel and U-Portal at 2nd and Central	Complete cut and cover section at end of TBM, construct U-section portal	12 to 24 months	x	x	x	x	x	x	x				20,000	7,500	5 to 10	15 to 20	2nd Street/ Central Avenue temporarily closed ~ 2mo, then East half of Central Avenue permanently closed
TBM Launch Site		2 to 4 months	x	x	x	x	x	x	x				20,000	n/a	5 to 10	15 to 20	
Improvements at Alameda / 1st Street	Shore and excavate Alameda Street to create depressed roadway, construct pedestrian bridge, complete surface tracks and tie-in	24 to 36 months	x	x	x	x	x		x				65,000	12,000	15 to 20	20 to 30	Alameda and 1st Streets closed until deck is in place and while bridge is erected ~ 12 to 18 mo.
Operating Systems Installation	Install power poles and overhead wires along alignment and power substations at the station locations.		x	x	x	x	x	x	x	TBD	TBD	TBD	TBD				

Notes: Earthwork quantities include bulking factor of 1.3
For underground station construction, Concrete volume and truck trips are tbd; 5 to 10 trucks per day can be assumed during concrete pour periods. 5 to 10 trucks per day during material delivery
For all concreting operations during station construction, there will be occasional large pours of several hundred yards that could require more than 10 trucks. These are typically scheduled at night to ensure adequate concrete supply and to avoid traffic.
Truck trip estimates assume full production; full production would not occur through the entire estimated duration

Cut and Cover Tunnel from TBM to 2nd Street/ Central Avenue Station	Install soldier beam or other suitable wall systems, excavate possibly without top deck, dewater, construct the station structure, backfill. As conditions permit within the vacant lot, construct in open sloped excavation with dewatering and backfill	12 to 24 months	x	x	x	x	x	x	x				20,000	N/A	15 to 20	15 to 20	

Table A-3. Fully Underground LRT Alternative – Little Tokyo Variation 1: Construction Activities Summary

Activity	Description	Estimated Duration	Equipment										Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	REMARKS (notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (Cy)	Concrete (Cy)			
Open Cut Station at 2nd Street/ Central Avenue	Install soldier beam or other suitable wall systems, excavate possibly without top deck, dewater, construct the station structure, backfill. As conditions permit within the vacant lot, construct in open sloped excavation with dewatering and backfill	18 to 36 months	x	x	x	x	x	x	x				55,000	N/A	20 to 30	15 to 20	
Cut and Cover from 2nd Street/ Central Avenue to East Portal	Install soldier beam or other suitable wall systems, excavate to place top deck (or without deck at the portal), excavate, dewater, construct structure, backfill	12 to 24 months	x	x	x	x	x	x	x				45,000	N/A	15 to 20	15 to 20	
Cut and Cover from 2nd Street/ Central Avenue to North Portal	Install soldier beam or other suitable wall systems, excavate to place top deck or without deck at portal, excavate, dewater, construct structure, backfill	12 to 24 months	x	x	x	x	x	x	x				95,000	N/A	15 to 20	15 to 20	
Improvements at Alameda / 1st /Temple Streets	Roadway re-alignment, MSE Wall reconstruction, utility relocation, other associated works	12 to 24 months	x	x	x	x	x		x				TBD	TBD	15 to 20	20 to 30	

Table A-3. Fully Underground LRT Alternative – Little Tokyo Variation 1: Construction Activities Summary

Activity	Description	Estimated Duration	Equipment										Estim. Quantities		Est. Truck Trips/ Day	Est. No. Of Workers/ Day	REMARKS (notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (Cy)	Concrete (Cy)			
Operating Systems Installation	Install power poles and overhead wires along alignment and power substations at the station locations.		x	x	x	x	x	x	x	TBD	TBD	TBD	TBD				

Notes: Earthwork quantities include bulking factor of 1.3
For underground station construction, Concrete volume and truck trips are tbd; 5 to 10 trucks per day can be assumed during concrete pour periods. 5 to 10 trucks per day during material delivery
For all concreting operations during station construction, there will be occasional large pours of several hundred yards that could require more than 10 trucks. These are typically scheduled at night to ensure adequate concrete supply and to avoid traffic.
Truck trip estimates assume full production; full production would not occur through the entire estimated duration

Table A-4. Fully Underground LRT Alternative – Little Tokyo Variation 2: Construction Activities Summary

ACTIVITY	DESCRIPTION	ESTIMATED DURATION	EQUIPMENT										ESTIM. QUANTITIES		Est. Truck Trips/ Day	Est. No. of Workers/ Day	REMARKS (Notes on type and duration of potential higher impact conditions such as street closures, building operation interruption, etc.)
			Conventional							Tunneling							
			Haul Truck	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed	TBM	Roadheader	Conveyor	Earthwork (CY)	Concrete (CY)			
Pre-construction Activities	Survey, install geotechnical instrumentation, pothole, photo/ video documentation	4 to 6 months						x	x				n/a	n/a	5	10 to 20	
Site Preparation	Mobilize equipment, demolish existing buildings at portal site, clear and grub construction yard, relocate storm drain and other utilities, prepare TBM entry pit, secure staging areas along Flower and 2nd Streets, stabilize critical building foundations if needed	12 to 18 months	x	x	x	x							1,000	1,000	10 to 20	20 to 30	2nd Street closure for entry pit, 2 months
Cut and Cover Tunnel Along Flower Street	Install soldier beam or other suitable wall systems, excavate to place top deck, excavate, dewater, remove obstructions such as tiebacks, construct tunnel structure, break into existing 7th Street/Metro Center Station, backfill	24 to 48 months	x	x	x	x	x	x	x				280,000	27,750	20 to 30	20 to 30	Flower Street closure until top deck is in place 2 to 3 months per 2 block segment

1.0 SUMMARY

This section discusses the Regional Connector Transit Corridor project in relation to surface and groundwater resources, the local drainage system, potential flooding and safety issues, and water quality. Existing conditions for these resources are described as well as the current applicable regulatory setting and potential impacts and mitigation from construction and operation of the proposed alternatives.

The area of potential impact for water resources differs slightly based on whether surface or groundwater resources are being analyzed. For surface water resources and surface water quality, existing conditions and impacts are considered within the Los Angeles River Watershed and the Los Angeles River Watershed Management Area. Groundwater resources and groundwater quality are evaluated in the context of the Central groundwater sub-basin of the Coastal Plain of Los Angeles which underlies the project area.

The Regional Connector project area is located in the middle of downtown Los Angeles, in an urban setting with mostly impervious land cover. Stormwater runoff is directed to existing drainage infrastructure, some of which runs directly underneath the proposed alignments. This local drainage infrastructure comprises a small part of the city's storm drain and flood protection system. Stormwater runoff in the project area is contaminated with common urban pollutants such as oil, grease, and heavy metals. These pollutants, in turn, have created poor water quality conditions in the main surface water feature near the project area, the Los Angeles River. Additionally, the large amount of impervious land cover in this area greatly reduces the amount of percolation to groundwater that can occur. The Regional Connector project alternatives would not significantly change the amount of impervious cover in the project area, nor would they result in adverse changes to the existing drainage system or the flow of runoff from the project area.

The City of Los Angeles receives its municipal water from a mixture of ground and surface water resources. In dry years, groundwater can account for as much as 30 percent of the city's supply; however, no production wells are located within the project area. The tunneling methods used in construction would not require the use of water and would therefore, not affect groundwater and/or municipal and industrial water supplies.

The No Build and Transportation System Management (TSM) Alternatives would result in no direct or indirect impacts to water resources in the project area. In addition, these alternatives would not result in any cumulative impacts to water resources in the Los Angeles River Watershed or to groundwater resources in the sub-basin.

Construction and operation of any of the build alternatives would potentially result in impacts to water resources. Construction activities including the excavation of tunnels have the potential to result in the generation of contaminated groundwater that requires disposal as

well as the release of construction-related contaminants to groundwater. In order to assess the potential risks and impacts associated with tunnel construction, subsurface (geotechnical) investigations would be undertaken to evaluate soil, groundwater, seismic, and environmental conditions along the proposed alignment. Based on the findings from these investigations, design and construction methods would be developed to reduce potential impacts to a less than significant level. More detail about these potential impacts and best management practices that would be employed to reduce their significance is discussed in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum. If encountered during construction or operations of the proposed project, contaminated groundwater would be treated and disposed of in coordination with local regulatory agencies and all applicable water quality regulations. Potential impacts and mitigation measures related to subsidence from groundwater dewatering are addressed in further detail in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum.

Overall, implementation of the build alternatives would not result in significant impacts to surface or groundwater resources, water quality, and/or flooding and water-related safety issues. During both construction and operation, compliance with applicable local, state, and federal guidelines and regulations would ensure the maintenance of water quality standards. Additionally, implementation of best management practices (BMPs) including soil stabilization and erosion control measures; storage of materials and equipment in a manner that reduces the potential for spills or leaks to enter the storm drain system; and, the development and implementation of a spill prevention and cleanup plan, would further ensure that potential impacts to water resources are reduced to a less than significant level.

2.0 INTRODUCTION

Surface and groundwater quality can be potentially affected by construction activities such as grading and excavation which can lead to increased sedimentation. Construction staging areas can also generate increased stormwater runoff, which, if not properly dealt with, can lead to increases in erosion. Additionally, construction projects that result in increases in impervious surface area can lead to larger quantities and velocities of stormwater runoff, which in turn can result in detrimental impacts to water quality as well as drainage infrastructure. When analyzing project impacts, it is also necessary to consider impacts to flood plains, flood control facilities, and public safety in relation to the construction of publicly used structures in floodplain areas.

This section analyzes potential impacts to water resources and hydrology in the project area for each of the four alternatives as well as cumulative impacts potentially arising from other development and transportation projects in the general project vicinity. Mitigation measures for any identified significant impacts are proposed.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Federal Regulatory Framework

3.1.1 Clean Water Act

The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into waters of the U.S. and gives the U.S. Environmental Protection Agency (USEPA) the authority to implement pollution control programs such as setting wastewater standards for industries. In certain states such as California, the USEPA has delegated authority to state agencies.

All point sources that discharge into waters of the United States must obtain a NPDES permit under provisions of Section 402 of the CWA. In California, the State Water Resources Control Board (SWRCB) and RWQCBs are responsible for the implementation of the NPDES permitting process at the state and regional levels, respectively.

The NPDES permit process provides a regulatory mechanism for the control of point source discharges – a municipal or industrial discharge at a specific location or pipe – to surface waters of the U.S. Two exceptions that are regulated under the NPDES program are: 1) diffuse source discharges caused by general construction activities of over one acre, and 2) stormwater discharges in municipal stormwater systems as a separate system in which runoff is carried through a developed conveyance system to specific discharge locations. The NPDES program regulates pollution generated by runoff from construction activities, industrial activities, and urban land uses, including runoff from streets. Federal stormwater regulations require municipalities to obtain NPDES permits for stormwater discharges from municipal storm drains to surface waters. In 1990, the USEPA established final regulations for stormwater discharges through the implementation of Section 402(p) of the CWA. The two permits that enforce Section 402(p), the General Industrial Permit and the General Construction Permit, are a major attempt to control non-point source pollutants in urban runoff that discharge to a local storm drain system and then into receiving waters. Applicable permits are discussed in further detail in the discussion in Section 3.3.

Projects involving construction activities (e.g., clearing, grading, or excavation) involving land disturbance greater than one acre must file a Notice of Intent (NOI) with the LARWQCB (Region 4) to indicate their intent to comply with the State General Permit for Stormwater Discharges Associated with Construction Activity (Construction General Permit). The Construction General Permit establishes conditions to minimize sediment and pollutant loading and requires preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) prior to construction. The SWPPP is intended to help identify the sources of sediment and other pollutants, and to establish BMPs for stormwater and non-stormwater source control and pollutant control.

Section 303(d) of the 1972 CWA requires states, territories, and authorized tribes to develop a list of water quality-impaired segments of waterways. The 303(d) list includes water bodies that do not meet water quality standards for the specified beneficial uses of that waterway, even after point sources of pollution have installed the minimum required levels of pollution control technology. The law requires that these jurisdictions establish priority rankings for water bodies on their 303(d) lists and implement a process, called Total Maximum Daily Loads (TMDLs), to meet water quality standards (USEPA 2002).

The TMDL process is a tool for implementing water quality standards and is based on the relationship between pollution sources and in-stream water quality conditions. The TMDL establishes the maximum allowable loadings of a pollutant that can be assimilated by a water body while still meeting applicable water quality standards. The TMDL provides the basis for the establishment of water quality-based controls. These controls should provide the pollution reduction necessary for a water body to meet water quality standards. A TMDL is the sum of the allowable loads of a single pollutant from all contributing point and nonpoint sources. The TMDL's allocation calculation for each water body must include a margin of safety to ensure that the water body can be utilized for its State-designated uses. Additionally, the calculation also must account for seasonal variation in water quality (USEPA 2002).

TMDLs are intended to address all significant stressors which cause or threaten to cause impairments to beneficial uses, including point sources (e.g., sewage treatment plant discharges), nonpoint sources (e.g., runoff from fields, streets, range, or forest land), and naturally occurring sources (e.g., runoff from undisturbed lands). TMDLs may be based on readily available information and studies. In some cases, complex studies or models are needed to understand how stressors are causing water body impairment. In many cases, simple analytical efforts provide an adequate basis for stressor assessment and implementation planning. TMDLs are developed to provide an analytical basis for planning and implementing pollution controls, land management practices, and restoration projects needed to protect water quality. States are required to include approved TMDLs and associated implementation measures in State water quality management plans. Within California, TMDL implementation is through regional Basin Plans.

TMDL Implementation Plans provide a schedule for responsible jurisdictions to implement BMPs to comply with pollutant reduction schedules.

3.1.2 National Flood Insurance Program (NFIP)

In order to determine the necessity to comply with the Federal Emergency Management Agency's (FEMA) NFIP regulations, FEMA issues countywide Flood Insurance Rate Maps (FIRMs) delineating the limits of FEMA-defined flood zones throughout the county. Flood zones are defined as follows:

- Moderate to Low Risk Areas: Zones B, C, and X are defined as areas outside the one percent annual chance floodplain and no Base Flood Elevations or depths are shown within this zone;

- High Risk Areas:

    - Zone A is defined as areas with a one percent annual chance of flooding; however, detailed analyses are not performed for these areas and no depths or base flood elevations are shown on FIRMs;

    - Zones AE and A1-A30 are defined as areas with a one percent chance of flooding where base flood elevations are derived from detailed analyses and shown at selected intervals on FIRMs;

    - Zone AH is defined as areas with a one percent chance of shallow flooding, usually in the form of a pond with an average depth of one to three feet. Base flood elevations are derived from detailed analyses and shown at selected intervals on FIRMs; and,

    - Zone AO is defined as river or stream flood hazard areas and areas with a one percent or greater chance of shallow flooding each year, usually in the form of sheet flow, with an average depth of one to three feet. Average flood depths are derived from detailed analyses and shown within these zones.

Volume 44 of the Code of Federal Regulations (CFR) Sections 59-65 sets the minimum basic NFIP floodplain management building requirements. These include:

- Ensure that proposed building sites will be reasonably safe from flooding, and that all new construction and substantial improvements in flood prone areas be properly designed and adequately anchored; constructed with materials resistant to flood damage; and, constructed with equipment and other service facilities that are designed or located to prevent water from entering components during flood conditions;

- All buildings constructed within a riverine floodplain (FEMA Flood Zones: A, AO, AH, AE, and A1 through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective FIRM;

- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any *development* must not increase base flood elevation levels. The term *development* means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials. A

hydrologic and hydraulic analysis must be performed prior to the start of development and must demonstrate that the development would not cause any rise in base flood levels;

- All buildings constructed within a coastal high hazard area, (any of the "v" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structure (excluding the pilings and columns) is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components; and,

- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision.

3.2 State Regulatory Framework

3.2.1 Porter-Cologne Water Quality Control Act

The *Porter-Cologne Water Quality Control Act* of 1969 (Act) established the principal California program for water quality control. The Act authorizes the SWRCB to adopt, review, and revise all policies for all waters of the U.S. (including both surface and groundwater); regulates discharges to surface and groundwater; and directs the RWQCB to develop regional Basin Plans. Section 13170 of the *California Water Code* also authorizes the SWRCB to adopt water quality control plans on its own initiative. The Act also divides the State of California into nine Regional Water Quality Control Board (RWQCB) areas. Each RWQCB implements and enforces provisions of the CWA subject to policy guidance and review by the SWRCB. The project area is located in the LARWQCB Regional 4, the Los Angeles Region.

A key tool to preserving and enhancing the water quality of surface and groundwater resources throughout the state is the development of *Basin Plans* by the RWQCBs. Basin Plans: 1) designate beneficial uses for surface and ground waters, 2) set narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state's antidegradation policy, and 3) describe implementation programs to protect all waters in the region (LARWQCB 1995). Basin plans and the triennial review of these plans by the SWRCB is necessary for compliance with CWA Section 303 (40 CFR 131); however, none of the basin plans contain a comprehensive list of priority toxic pollutant criteria to satisfy CWA section 303.

3.2.2 State Antidegradation Policy

In accordance with the federal Antidegradation Policy, the state policy was adopted by the SWRCB to maintain high quality waters in California. This state policy establishes ambient water quality criteria for priority toxic pollutants. Implemented by the RWQCBs, the policy is necessary to achieve the federal CWA's goals and objectives. In addition, the policy protects bodies of water where the existing water quality is higher than necessary for the protection of present and anticipated beneficial uses. Toxic pollutants regulated under the policy can be attributed to, among other sources, industrial and municipal discharges. The numeric criteria are important in deriving water quality based effluent limits in National Pollutant Discharge Elimination System (NPDES) permits as well as wasteload allocations for total maximum daily loads (TMDLs) (40 CFR 131).

3.2.3 National Pollutant Discharge Elimination System (NPDES)

In accordance with CWA Section 402(p), which regulates municipal and industrial stormwater discharges under the NPDES program, the State Water Resources Control Board (SWRCB) adopted a Construction General Permit applicable to all stormwater discharges associated with construction activity. The Construction General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit, Order No. 99-08-DQW) applies to stormwater discharges from construction sites that disturb land equal to or greater than one acre. The Los Angeles RWQCB (LARWQCB) adopted a new Construction General Permit on September 2, 2009 (Construction General Permit Order 2009-0009-DWQ). The new permit goes into effect on July 1, 2010 and all discharges will be required to obtain coverage under it. The new Order has similar requirements to the current permit, but it specifies more minimum BMPs that were previously only required as elements of the SWPPP or suggested by guidance.

Construction activity subject to this permit includes clearing, grading, and ground disturbances such as stockpiling or excavation. The Construction General Permit requires dischargers to:

- Develop and implement a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP includes plans for minimizing, mitigating and monitoring possible impacts from construction-related contamination of surface waters. In addition, the SWPPP must list BMPs that will be used to limit impacts from stormwater runoff and the placement of BMPs.
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the United States.
- Perform inspections of all BMPs

In order to obtain coverage under the Construction General Permit, the permit applicant must submit a Notice of Intent (NOI) to the SWRCB and prepare and implement a SWPPP. Since construction of the Regional Connector would disturb more than one acre, it would be subject to these permit requirements.

3.3 Regional/Local Regulatory Framework

3.3.1 Los Angeles Regional Water Quality Control Board (LARWQCB)

3.3.1.1 NPDES Permits

The LARWQCB is responsible for issuing the Los Angeles County Municipal Stormwater Permit (Order No. 01-182, NPDES No. CAS0041, amended by Regional Order R4-2007-0042 on August 9, 2007). The existing permit covers the Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los County Flood Control District. The permit covers the permittees for contributions to discharges of stormwater and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles Region. Discharges are covered under countywide waste discharge requirements (WDRs) contained in Order No. 96-054 adopted by the LARWQCB in 1996. These WDRs also serve as the NPDES permit for discharge of municipal stormwater.

The MS4 permit requires permittees to implement a Standard Urban Stormwater Management Plan (SUSMP) that designates BMPs that must be used in specified categories of development to treat stormwater runoff, control peak flow discharges, and reduce post-project discharge of pollutants from stormwater conveyance systems.

In addition to the Municipal NPDES Permit issued by the LARWQCB, General NPDES Permit CAG994004 Discharges of Groundwater from Construction Dewatering to Surface Waters, allows for the discharge of treated or untreated groundwater generated from dewatering activities when such discharges will not cause state or federal water quality objectives to be exceeded. This permit would apply to the proposed alternatives with the potential for dewatering.

WDRs for General Waste Discharge Requirements for Specified Discharges to Groundwater in Santa Clara and Los Angeles River Basins (Order No. 93-010)

This WDR allows for the discharge of water resulting from the following activities that may occur as part of the proposed project: construction dewatering, dust control application, and subterranean seepage dewatering.

The WDR requires that wastewater be analyzed prior to being discharged in order to determine if it contains pollutants in excess of the applicable Basin Plan Water Quality

Objectives. Additionally, any wastewater that might be encountered and subsequently discharged to groundwater would need to comply with applicable water quality standards.

Due to the potential for construction dewatering activities and potential subterranean seepage dewatering during operation, this WDR could apply to some of the proposed alternatives.

WDRs for Discharge of Non-Hazardous Contaminated Soils and Other Wastes in Los Angeles River and Santa Clara River Basins (Order No. 91-93)

The purpose of this WDR is to protect waters of the State from contamination due to disposal of soils contaminated with moderate concentrations of petroleum hydrocarbons, heavy metals and other wastes. The permit allows the disposal of up to 100,000 cubic yards of nonhazardous contaminated soils and other wastes for a maximum period of 90 days. This WDR requires that waste used as soil backfill shall not contain any substance in concentrations toxic to human, animal, plant, or aquatic life. The Construction General Permit allows for temporary stockpiling of nonhazardous, contaminated soils until they can be appropriately disposed of or reused, per permit conditions. Due to the project area's long history of commercial and industrial uses, there is significant potential for subsurface hazardous materials to be found in the project area.

3.3.1.2 Basin Plan

The Basin Plan that applies to the project area is the *Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (LARWQCB 1995). This plan sets forth the regulatory water quality standards for surface waters and groundwater within the region. The water quality standards address both the designated beneficial uses for each water body and the water quality objectives to meet them. Where multiple designated beneficial uses exist, water quality standards are written to protect the most sensitive use.

3.3.1.3 Total Maximum Daily Loads (TMDLs)

In accordance with the federal CWA and the state Porter-Cologne Water Quality Control Act, TMDLs have been developed and incorporated into the Basin Plan for some pollutants identified on the 303(d) list as causing contamination in the Los Angeles River Watershed. The Los Angeles River has TMDLs for metals, trash, and nutrients (Resolution Numbers 2007-014, 2007-012, and 2003-016).

3.3.1.4 Standard Urban Stormwater Mitigation Plan (SUSMP)

As part of the Los Angeles County Municipal NPDES Permit, the permittees implemented a stormwater quality management program. The goal of this program is to accomplish the requirements of the NPDES permit and reduce the amount of pollutants in stormwater and urban runoff. The SUSMP is one specific requirement of the stormwater quality management program. The SUSMP outlines the necessary BMPs which must be incorporated into design

plans for projects and/or development related activities that include vehicle or equipment maintenance areas (Los Angeles County DPW 2002).

3.3.2 County and City of Los Angeles

3.3.2.1 Los Angeles County General Plan

The Los Angeles County General Plan (1986) contains the following policies related to water resources, water quality, and flood hazards:

- Restrict urban development in flood prone areas;
- Conserve the available supply of water and protect water quality;
- Full compliance with all NPDES permits;
- Full compliance with all approved TMDL implementation and compliance plans for impaired water bodies;
- Protect groundwater recharge and watershed areas; and,
- Encourage the maintenance, management, and improvement of groundwater supplies.

3.3.2.2 Los Angeles County Code

Los Angeles County's Stormwater Ordinance regulates discharges to the storm drain system, runoff management requirements, and violations of the ordinance (Chapter 12.80, Parts 3-5). Applicable sections include:

- Prior to construction activity, all stormwater and runoff pollution mitigation measures must be implemented as required by applicable permits (Section 450); and,
- All BMPs required by applicable construction activity permits must be in effect during the term of the project (Section 510).

3.3.2.3 City of Los Angeles General Plan

Water resources and flood hazard goals and policies are addressed in the city's Infrastructure Systems and Safety Elements of the General Plan (City of Los Angeles 1996). Policies are generally geared towards the protection of water quality, risk reduction in relation to flooding hazards, and compliance with all applicable state and federal regulations.

3.3.2.4 City of Los Angeles Specific Plan for the Management of Flood Hazards (Ordinance No. 172081)

The City of Los Angeles has more stringent floodplain management building requirements than those required by the federal government. Ordinance number 172081 defines Special Flood Hazard Areas as those designated as A, AO, AE, AH, AI-30, A-99, AR, AR/A1-30, AR/AE, AR/AO, AR/AH, AR/A, V, VE and VI-30 Zones on the Los Angeles Flood Hazard Map. The proposed alternative alignments of the Regional Connector project are not located within any of these zones.

3.3.2.5 Los Angeles Department of Water and Power (LADWP)

As the water supply authority for the project area, LADWP prepared an Urban Water Management Plan to promote effective management of its water resources. The plan outlines the strategies that will be used to meet the City's current and future water needs, within the following categories that may apply to the proposed project:

- Protect existing water supplies from contamination and clean up groundwater supplies; and,
- Maintain the structural integrity of the Los Angeles Aqueduct and in-City water distribution systems.

3.4 Standards of Significance

3.4.1 NEPA Guidance

The Federal Transit Administration (FTA) NEPA guidance acknowledges that mass transportation projects have the potential to impact water quality by increasing runoff or altering surface or sub-surface drainage patterns (FTA 2009). In order to address potential impacts, this environmental document discusses:

- Activities that could generate wastewater and the provisions for containing these possible pollutants; and
- The project's potential for increasing runoff, and measures that will be used to reduce runoff or prevent pollutants from entering stormwater systems.

3.4.2 CEQA Guidance

The following significance criteria were developed based on guidance from Appendix G of the state CEQA Guidelines (2009) and the City of Los Angeles CEQA Thresholds Guide (2006). The proposed project alternatives would be determined to result in a significant impact to hydrology and water quality if they would:

- Violate any applicable water quality standards or waste discharge requirements, including those defined in Section 13050 of the California Water Code (CWC);
- Affect the rate or change the direction of movement of existing groundwater contaminants, or expand the area affected by contaminants;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table;
- Substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality;
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss, injury or death involving flooding; or
- Cause inundation by dam failure, seiche, tsunami, or mudflow.

3.4.3 City of Los Angeles Bureau of Engineering

Drainage and flood control structures and improvements in the City of Los Angeles are subject to review and approval by the City of Los Angeles Bureau of Engineering. The City uses a 50-year design storm for flood control design purposes, which is a predicted storm event that is considered to be conservative. A potential impact from the project alternatives would be considered to be significant if flooding during the 50-year design storm event would have the potential to harm people or damage property or sensitive biological resources.

3.5 Evaluation Methodology

In order to determine alternative-specific impacts to hydrology and water quality, existing data on hydrology, drainage patterns, water quality, and flooding hazards was evaluated. Existing water quality conditions and identified beneficial uses in the watershed were assessed. Other issues considered include impacts to aquifer recharge, and possible groundwater contamination resulting from operation of the proposed alternatives.

Construction and operation phases of the proposed project were analyzed for compliance with applicable regulations that function to maintain and improve current water quality conditions. Construction and operation activities were also assessed in order to determine their possible impact on existing drainage patterns and the exposure of people and/or property to water-related hazards.

To determine potential environmental impacts, regulatory requirements and laws were reviewed at the federal, state, and local level. The Clean Water Act (CWA), regulated through the United States Environmental Protection Agency (USEPA), provides the legal framework for several water quality regulations that are important in this analysis. In California, the USEPA has delegated responsibility of the primary regulations to the state. Applicable regulations would include:

- The National Flood Insurance Act through examination of the most current FEMA issued Flood Insurance Rate Maps (FIRMs);
- The National Pollutant Discharge Elimination System (NPDES) General Construction Permit (issued by the State Water Resources Control Board (SWRCB));
- The Los Angeles County Municipal Stormwater Discharge Permit issued by the Los Angeles Regional Water Quality Control Board (LARWQCB), and the Standard Urban Stormwater Management Plan (SUSMP);
- The LARWQCB Basin Plan, the California Toxics Rule, the California Nonpoint Source Pollution Control Plan, and the State Antidegradation Policy.

Two NPDES permits that pertain to proposed project alternatives are the NPDES General Industrial Permit and the General Construction Permit. Each of the alternatives was analyzed for potential construction-related surface water sedimentation generated by erosion and runoff from proposed staging areas and for potential increases in impervious surface area and associated potential increases in post-construction stormwater runoff volumes.

In the case that a potentially significant impact would be anticipated, proposed mitigation measures were developed consistent with NPDES permit regulations.

Hydrology and water quality impacts are analyzed for direct, indirect, and cumulative impacts. Cumulative impacts refer to two or more individual effects which, when considered together, are considerable, or which compound or increase other environmental impacts. Cumulative effects include both direct and indirect effects as well as past and reasonably foreseeable future actions in combination with the actions of other projects. Potential cumulative impacts to water resources are discussed in terms of their potential severity as well as the likelihood of their occurrence. Based in part on guidance from the Council on Environmental Quality

(CEQ) for the analysis of the significance of cumulative impacts, the same standards used to measure direct and indirect impacts will apply to the analysis of cumulative impacts.

In addition, the City of Los Angeles CEQA Guide (2006) describes appropriate considerations for cumulative impact analysis methodology for water resources. The city's guidelines rely on the same impact assessment methodology and standards of significance as those that are used to measure potential direct and indirect impacts to water resources. The guide states that related projects located in the same defined resource area should be analyzed for any potential combined effect. The specific standards that were used to measure the significance of a potential impact are described in Section 3.4.

4.0 AFFECTED ENVIRONMENT

The proposed alternatives are located in the Los Angeles River Watershed Management Area (WMA). The Los Angeles River Watershed covers an area of over 834 square miles from the eastern portions of the Santa Monica Mountains, Simi Hills, and the Santa Susana Mountains in the west to the San Gabriel Mountains in the east. While the upper portion of the watershed is covered by forest and open space, approximately 474 square miles of the watershed is highly developed with commercial, industrial, and residential uses.

4.1 Municipal Water Supply

The Los Angeles Department of Water and Power (LADWP) is responsible for supplying, treating, and distributing water for domestic and industrial uses in the project area. The City of Los Angeles obtains its water supply from local wells in the Los Angeles ground water basin, the Los Angeles aqueducts, and by purchasing water from the Metropolitan Water District (MWD) (City of Los Angeles Planning Department 1995). Water distributed by the MWD comes from the Colorado River and from the State Water Project. In addition to these sources, some wastewater within the LADWP service area is reclaimed for reuse for irrigation, industrial use, and groundwater recharge (Los Angeles Grand Avenue Authority 2006).

Groundwater is a major component of the water supply in the Los Angeles metropolitan area. Local groundwater resources provide about 15 percent of the total water supply. In drought years this number can be as large as 30 percent (City of Los Angeles 2005a). The city owns water rights in the Upper Los Angeles River Area groundwater basin in addition to the supply that comes from the Central and West Coast sub-basins of the Coastal Plain of Los Angeles Groundwater Basin (City of Los Angeles and USACE 2007). On average, about 86 percent of the groundwater supply comes from the Upper Los Angeles River Area groundwater basin (City of Los Angeles 2005a).

4.2 Surface Water Hydrology

4.2.1 Regional Surface Water Setting and Conditions

The Los Angeles River originates at the western end of the San Fernando Valley at the confluence of Arroyo Calabasas and Bell Creek. The six major tributaries along the river include Tujunga Wash, Burbank Western Storm Drain, Verdugo Wash, Arroyo Secco, Rio Hondo, and Compton Creek. The Rio Hondo is hydraulically connected to the San Gabriel River Watershed because flows from the San Gabriel River are routed to Whittier Narrows Reservoir and through the Rio Hondo during larger flood events (City of Los Angeles 2005a). The project area is considered to be located in the middle reach of the Los Angeles River basin (the reach between U.S. Highway 101 and the confluence with the Rio Hondo River). Figure 4-1 depicts a regional view of the project area in the Los Angeles River watershed.

The climate of the project area is mild with an average annual temperature of 74.9 degrees Fahrenheit and an average annual rainfall is 14.5 inches. However, rainfall amounts can vary significantly, sometimes exceeding 30 inches in an extreme wet year (City of Los Angeles 2005a). Nearly all precipitation occurs from December to March. Precipitation during the summer months is infrequent, and periods of no rain for several months are common (City of Los Angeles Bureau of Engineering 2001). Topography throughout the coastal plain area is generally defined by gradually sloping land from the foothills of the San Gabriel Mountains to the Pacific Ocean. Ground elevations range from 10,000 feet in the San Gabriel Mountains, to 330 feet near the Los Angeles River's confluence with the Arroyo Secco, to mean sea level at the mouth of the Los Angeles River.

The proposed project alternatives are located in the Los Angeles-San Gabriel Hydrologic Unit and more specifically within the Los Angeles River Watershed Management Area (Figure 4-1). Encompassing a total of 824 square miles, the Los Angeles River watershed is one of the largest watersheds in the region and one of the most diverse in terms of land use patterns. Approximately 324 square miles of the watershed are covered by open space or forest areas including the area near the headwaters in the Santa Monica, Santa Susana, and San Gabriel Mountains. The remainder of the watershed is highly developed (LARWQCB 2007). Table 4-1 summarizes major land use patterns in the Los Angeles River Watershed and Figure 4-2 shows this information graphically. In addition to the Los Angeles River in the vicinity of the proposed project, other surface water bodies consist of two small lakes located more than a mile from the vicinity of the proposed alignments.

4.2.2 Local Surface Water Setting and Conditions

The proposed project alignment encompasses an area of approximately 1,200 acres in the central downtown area of Los Angeles. No surface water bodies are located directly in the project area. The closest surface water feature is the Los Angeles River which runs approximately 0.5 miles east of Alameda Street, which is near the project area's eastern boundary. Land use along this part of the river is comprised of industrial, residential, and commercial, including major refineries and petroleum products storage facilities, major freeways, and rail lines (LARWQCB 2007). Due to the impervious surfaces related to development in the project area, surface water runoff and peak runoff rates have increased. Another reason for the increase in peak runoff rates in the coastal plain areas stems from the elimination of natural ponding areas and improved hydraulic efficiency of water carriers such as streets and storm drains systems.

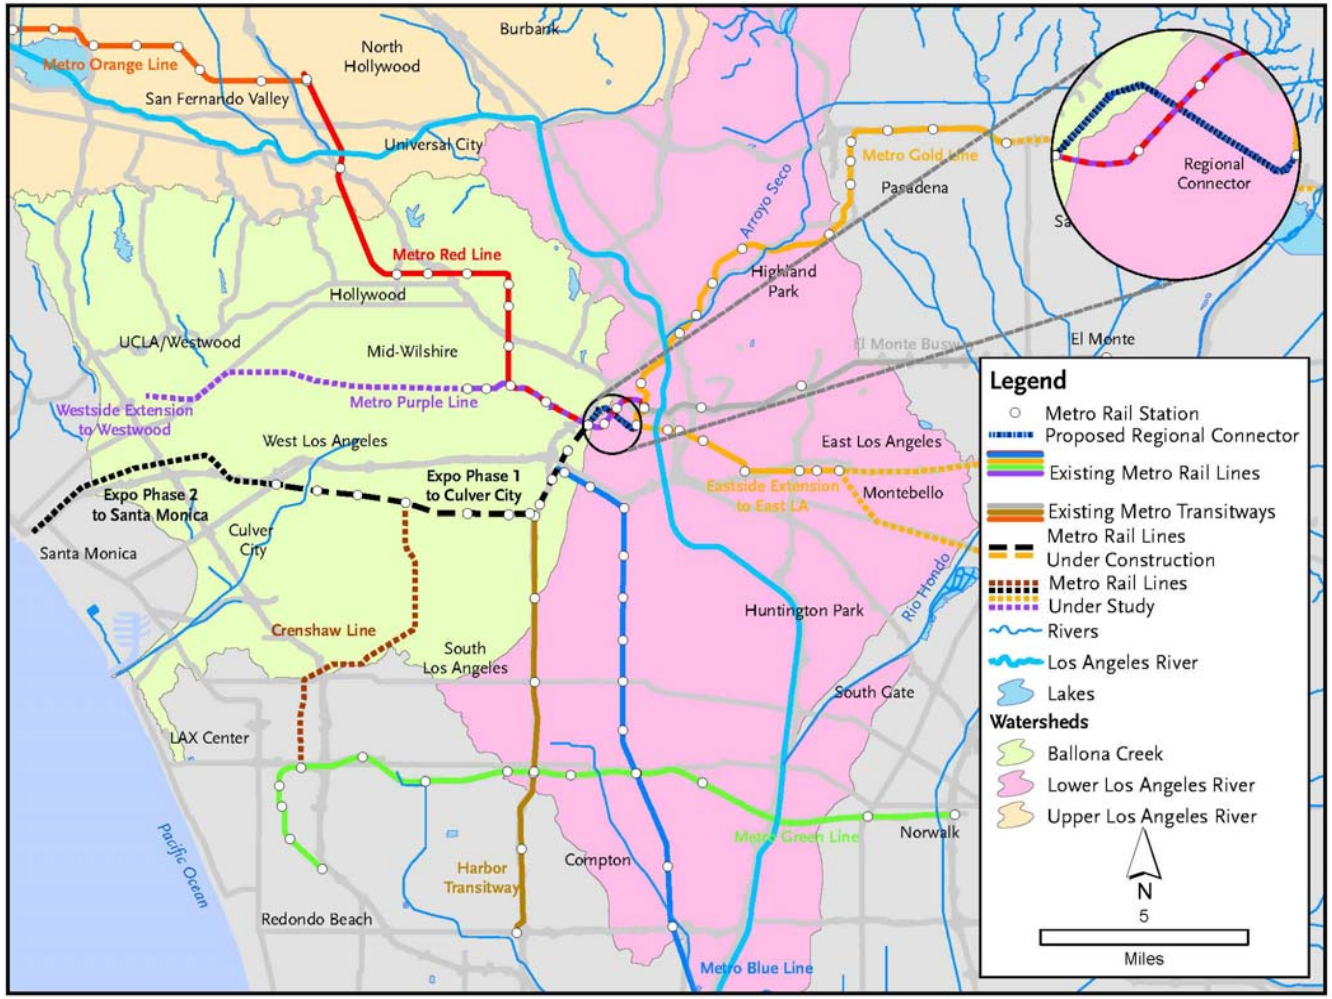

Figure 4-1. Regional View of the Los Angeles River Watershed

Table 4-1. Land Use Summary in the Los Angeles River Watershed Management Area (WMA)	
Land Use Type	**Land Use Areas (acres)**
Commercial	18,500
Industrial	12,500
Multifamily Housing	13,750
Single-Family (high, mid, and low-density	83,530
Transportation/Utilities/Mixed	14,800
Water	400
Open Space/Agriculture	41,500
Other	20
Total (in acres)	**185,000**

Source: City of Los Angeles 2005b

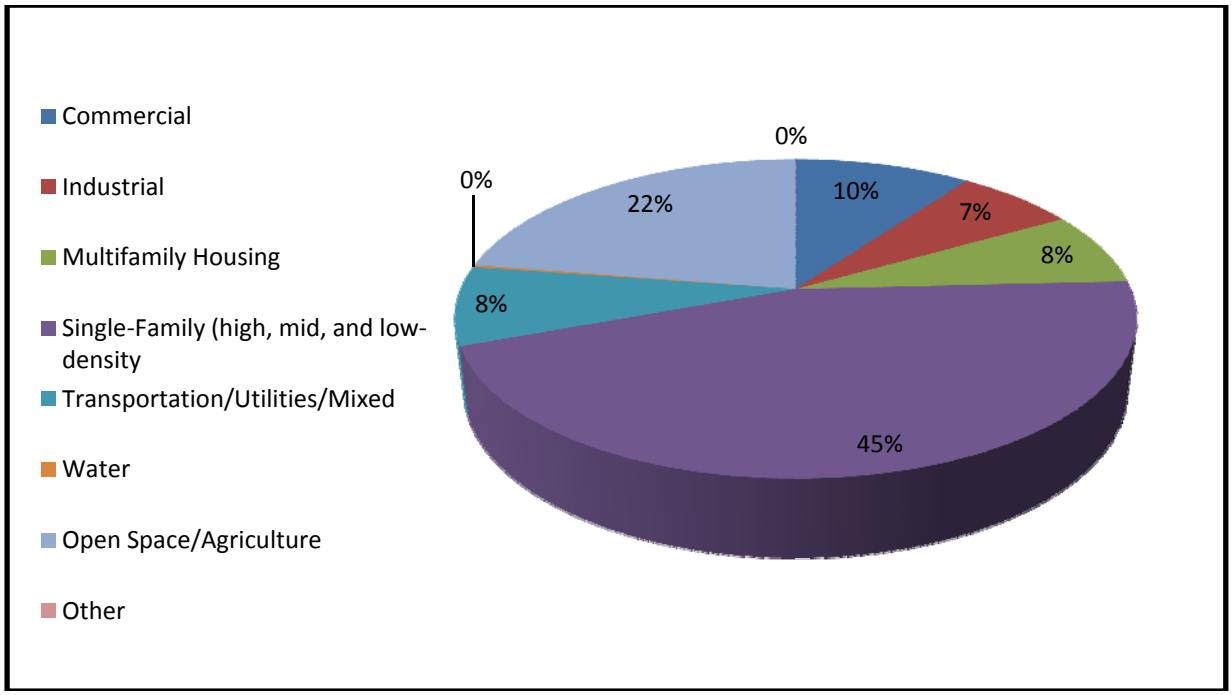

Figure 4-2. Land Use in the Los Angeles River Watershed Management Area

4.3 Groundwater

The Los Angeles Coastal Plain Groundwater Basins underlie the project area. These groundwater basins are incorporated into the Coastal Plain Hydrographic Subunit. The Coastal Plain Hydrographic Subunit contains the Central, West Coast, Santa Monica, and Hollywood Basins. The Central Sub-basin, one of the most important basins in the hydrographic subunit, directly underlies the project area (City of Los Angeles Planning Department 1995). The Central Basin extends over much of the Coastal Plain and holds most of its groundwater. The basin underlies the service areas of the Metropolitan Water District member agencies, the Central Basin Municipal Water District (Central Basin MWD), West Basin Municipal Water District (West Basin MWD), the City of Compton, the City of Los Angeles, and the City of Long Beach (MWD of Southern California 2007). Total water storage in the basin is 13.8 million acre feet and the natural safe yield is 125,805 acre feet per year. The depth of the Central Basin is between 1,600 and 2,200 feet (MWD of Southern California 2007). The Central Basin is further divided into the Los Angeles Forebay, the Montebello Forebay, and the Whittier and Central Basin Pressure Areas. The proposed project is located within the Los Angeles Forebay Area.

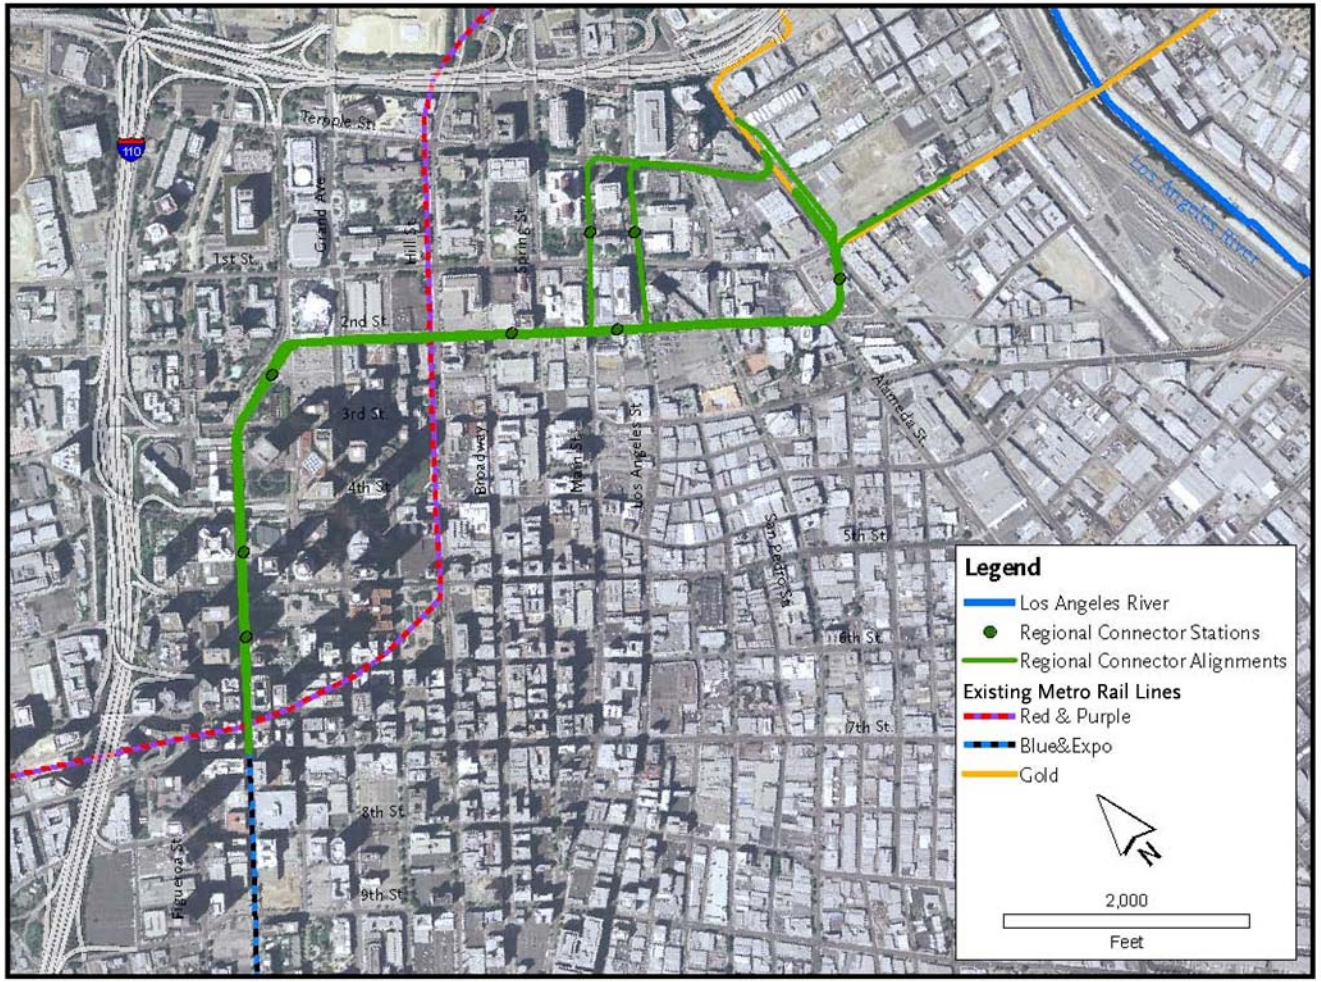

Figure 4-3. Location of the Los Angeles River Relative to the Project Location

Groundwater resources are replenished in the Central Basin through surface and subsurface flow and by direct percolation of precipitation, stream flow, and applied water in the forebay areas (DWR 2004). Natural replenishment of groundwater happens in the forebay areas where permeable sediment is exposed at ground surface (DWR 2004). For the Central Sub-basin, this takes place largely in the Whittier Narrows area near the Rio Hondo, east of the project area by approximately 10 miles. Percolation and groundwater replenishment in the Los Angeles Forebay is limited due to the large amount of paving and urban development throughout the City of Los Angeles (DWR 2004).

The Los Angeles Forebay Area extends generally in a fan pattern around the Los Angeles River. The project area is underlain by the more shallow aquifers of the Lakewood Formation (including the Semiperched, the Gaspur, the Exposition, the Gardena, and the Gage aquifers). The main source of potable groundwater in the Central Basin is from the deeper aquifers of the San Pedro Formation (including the Lynwood, Silverado and Sunnyside Aquifers). The shallower aquifers locally produce smaller volumes of potable water. With water bearing units ranging in thickness from up to 180 feet (Semiperched and Gaspur aquifers) to up to 280 feet (Lakewood Formation), these shallow aquifers extend to depths of 100 feet above mean sea level (msl) to almost 600 feet below msl (800 feet below ground surface). The deeper water bearing units of the San Pedro Formation are up to 800 feet thick and extend up to 2,200 feet below msl. In the Forebay Area, many of the aquifers merge and allow for direct recharge into the deeper aquifers (MWD of Southern California 2007). As described above, land use in the vicinity of the proposed project is highly impervious; therefore, recharge to groundwater in this area is minimal. Historically, Central Basin water levels ranged from a high of about 160 feet above msl in the northeast portion of the basin to a low of about 90 feet below msl in the Long Beach area.

Exploratory borings in the vicinity of the proposed alternatives have discovered groundwater along Flower Street between 7th and 2nd Streets at depths ranging from approximately 15 to 35 feet below ground surface. Other borings made adjacent to Flower Street between 2nd and 5th Streets discovered groundwater at depths between approximately 18 to 27 feet below the ground surface. In the area of Hill and Alameda Streets, borings reported groundwater seepage at depths between approximately 14 to 36 feet (Metro 2008). From these preliminary borings, it appears that groundwater is perched on the underlying San Fernando formation bedrock. Perched groundwater is groundwater that is separated from the water table and is often formed in response to water that collects during rain events or is in the process of being recharged by percolation from nearby surface water or other perched water zones.

In addition to setting beneficial uses for inland surface water resources such as the Los Angeles River, the LARWQCB sets beneficial uses for groundwater in the Central Basin. Designated beneficial uses consist of both municipal and domestic supplies as well as agricultural and industrial uses (LARWQCB 1995). Contamination in the Central Basin limits

the uses of groundwater from the basin (City of Los Angeles Planning Department 1995). Groundwater quality in the project area is described in more detail in Section 4.7.2.

4.4 Drainage

The project area is part of the Los Angeles River Basin, which includes the coastal areas of Los Angeles County south of the divide of the San Gabriel Mountains and Santa Susana Mountains, plus a small part of the coastal portion of Ventura County south of the divide of the Santa Monica Mountains (City of Los Angeles Planning Department 1995).

For planning purposes, the City of Los Angeles divides the Los Angeles River Basin into three drainage areas: the Upper Los Angeles River Area, the Santa Monica Bay area, and the Central area. The three major rivers that drain the basin include the Los Angeles River, the Rio Hondo, and the San Gabriel River. The Los Angeles River is the closest surface water feature to the project area. This river drains the San Fernando Valley, flowing southward through the Coastal Plain where it is joined by the Rio Hondo 12 miles upstream from the Pacific Ocean (City of Los Angeles Planning Department 1995). Figure 4-4 shows the drainage pattern of these surface water resources in the proximity of the project area.

Drainage in the immediate project area generally flows southeast towards the Los Angeles River. Storm drain pipes along the backbone of the project area range in size from 12 to 84 inches in diameter (CDM 2009). Along Alameda Street, pipes are generally 72 to 84 inches in diameter and flow south to Traction Avenue before turning east to the discharge point into the Los Angeles River. Storm drain pipes along Temple, North Main, and Los Angeles Streets are generally smaller ranging in size from 12 to 36 inches in diameter (CDM 2009). Drainage along 2nd Street flows directly southeast through a large box culvert to the intersection of Traction and Alameda. From the intersections of 2nd and Flower Streets and 4th and Flower Streets, drainage converges at the intersection of 3rd and Flower Streets before heading east to the Los Angeles River. From the intersection of 4th and Flower Streets, drainage flows south before discharging into the Los Angeles River east of the proposed project site.

Runoff rates and volumes have increased in the City of Los Angeles, and more specifically in the project area due to urbanization and increased impervious cover associated with large areas of asphalt, concrete, buildings, and other land uses which concentrate storm runoff. Due to previous flood control projects, almost all local streams and rivers (including the Los Angeles River) have been channelized and/or culverted in the urban areas and they now serve primarily as storm runoff channels.

Storm drains within the city are constructed and maintained by both the City and the Los Angeles County Flood Control District. The Los Angeles County Flood Control District constructs the major storm drains and open flood control channels, and the City constructs

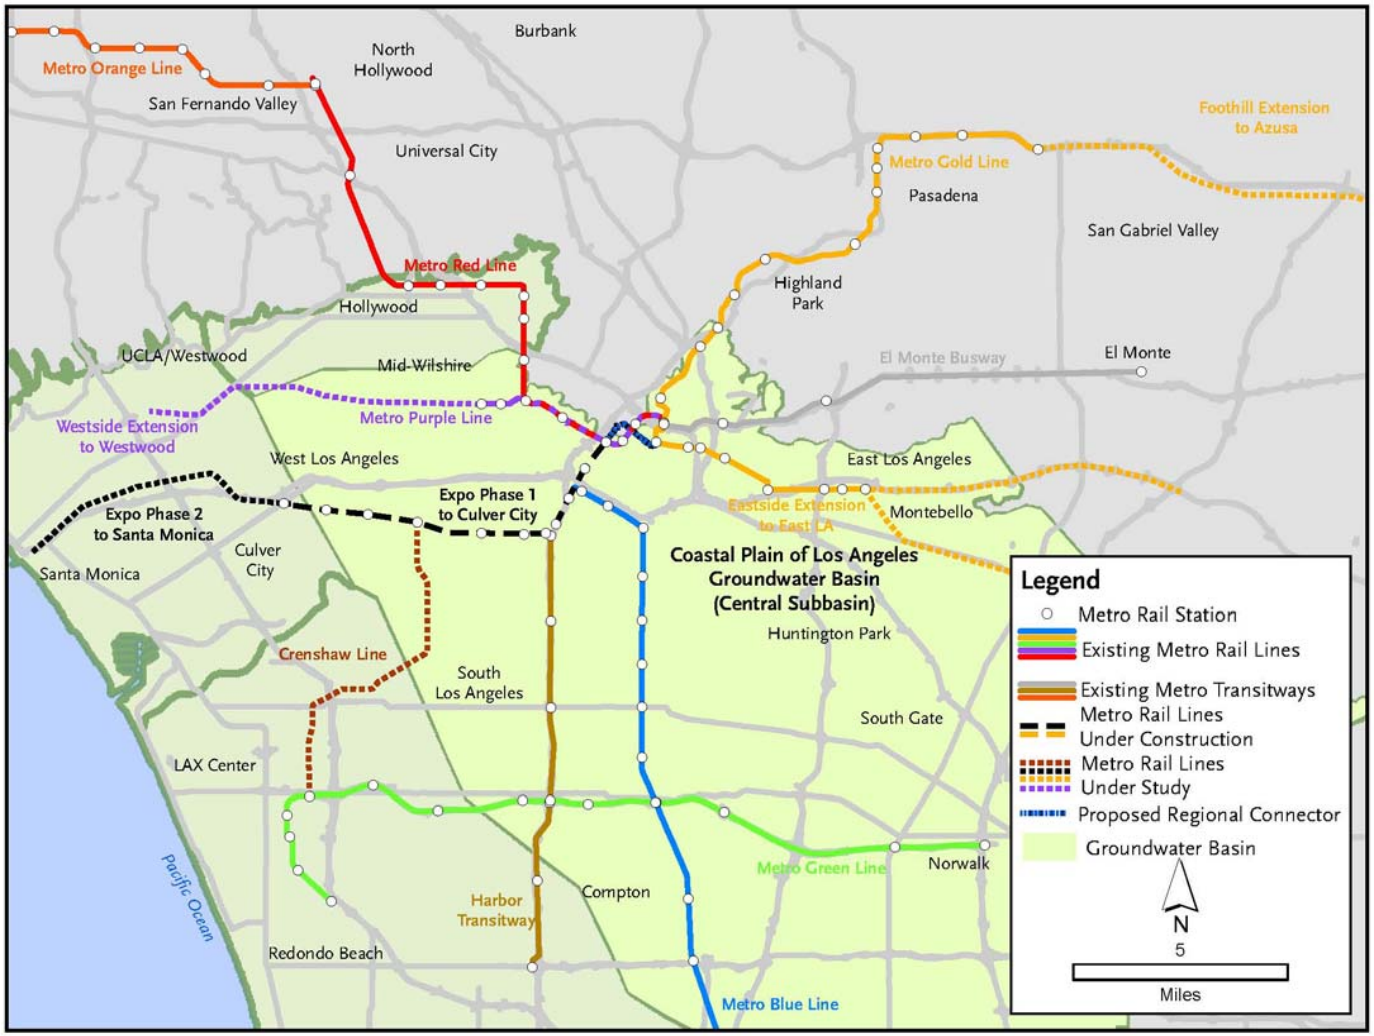

Figure 4-4. Groundwater Basin Boundaries Relative to the Project Area

local interconnecting tributary drains. The City's system is designed to convey storm flows from a ten-year storm event, while the County system is designed for a 50 year storm event.

4.5 Flooding

Historical flooding in the Los Angeles River basin has caused extensive property damage and loss of lives. Major storms include January 1914, 1934, 1943, and 1956, February 1978 and 1980, and March 1938 and 1983. As described above, the basin the project area is located in is considered the middle reach of the Los Angeles River. The channel capacity of the middle reach can safely convey the 100-year flow within the channel banks. In comparison, the upper reach of the river (located immediately upstream of the project area) is not certified to adequately handle the 100-year flood. However, as identified on current FEMA floodplain mapping, the 100-year flow in the river is fully contained in the river channel (see Figure 4-5).

The project area is outside of the 100-year and 500-year flood zones and thus would not be susceptible to these storm events as defined by FEMA (100-year and 500-year storms are defined as having a one percent and 0.2 percent chance, respectively, of occurring in any given year). The closest 100-year floodplain area is along the Los Angeles River between Broadway and Mission Road approximately 0.5 to 0.7 miles from the project area (City of Los Angeles 1996). The 100-year flood zone is used as the benchmark in administering the National Flood Insurance Program (NFIP), a voluntary program managed by FEMA through which communities enforce floodplain management ordinances in return for federally backed flood insurance (City of Los Angeles Planning Department 1995).

Flooding impacts are generated when development is placed in floodplain areas. Figure 4-5 shows the location of the proposed Regional Connector alignments located in flood zone X, where there is no flood hazard. Since the project area is not in a floodplain, potential floodplain impacts do not apply to the analysis of the alternatives.

4.6 Inundation

Inundation is defined as flooding related to earthquake-induced failure of up-gradient dams, flood control facilities, or other water retaining structures. Multiple flood control facilities are located in the San Fernando Valley portion of the Los Angeles River watershed. Failure of these flood control mechanisms would potentially cause inundation in the vicinity of the proposed alternatives. A limited portion of the eastern section of the proposed build alternatives is at the edge of a potential inundation area (near the intersection of Alameda Street with both Temple and 1st Streets) (City of Los Angeles 1996). However, the majority of the length of the build alternatives is not located in an area mapped to have the potential to be susceptible to this type of flooding.

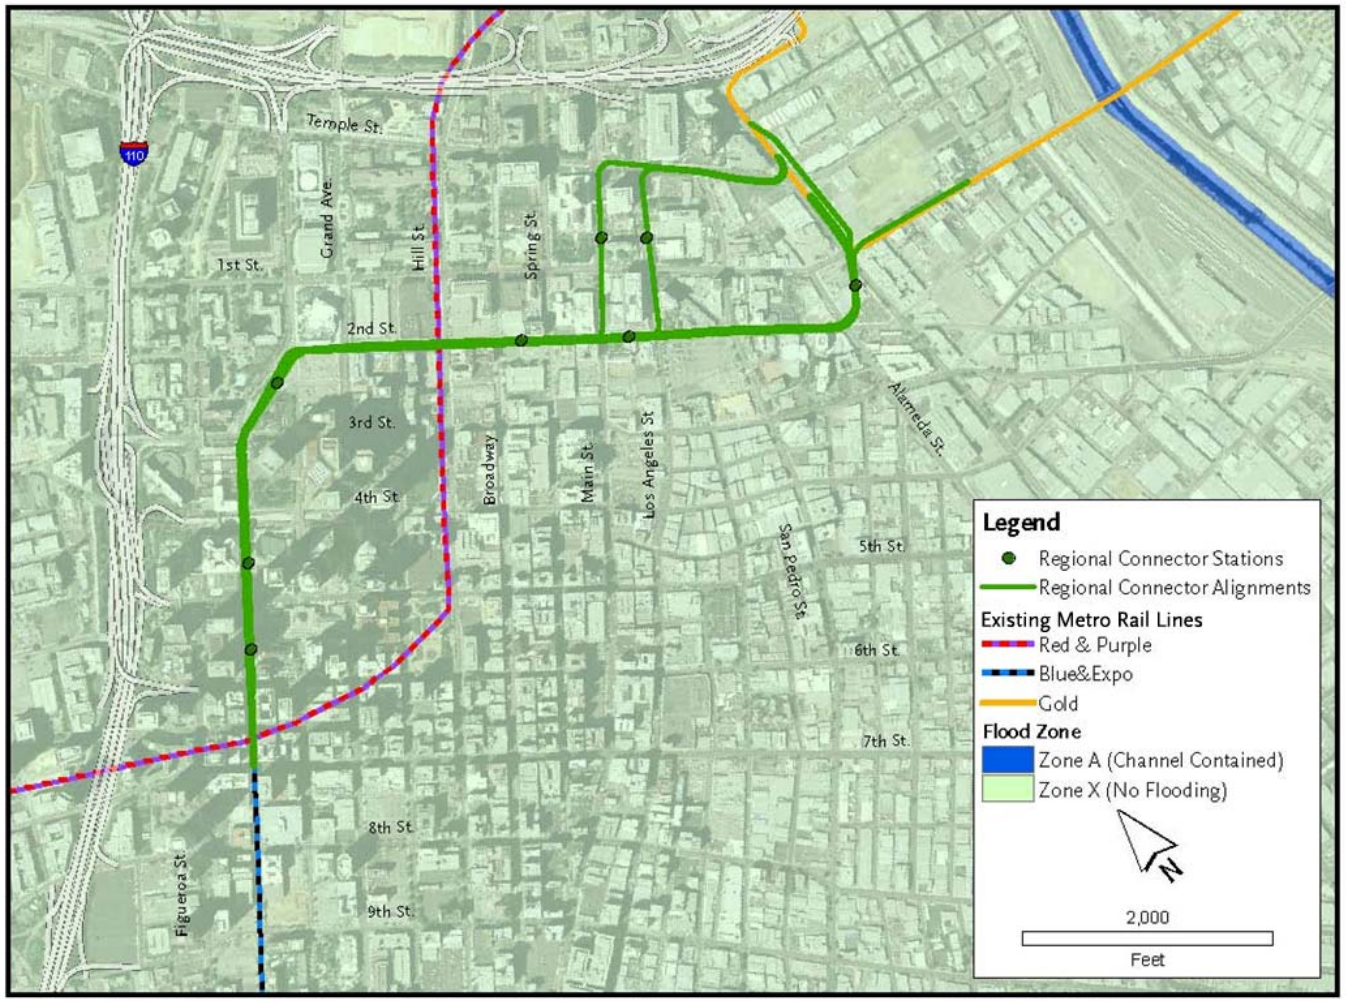

Figure 4-5.The 100-year Flood Zone Near the Proposed Project

Earthquake activity can also cause large waves to form in enclosed bodies of water. Known as seiches, these waves have the potential to cause inundation. Along the same lines, tsunamis are tidal waves generated in large bodies of water by fault displacement or major ground movement. The proposed project alignments are located over a mile from the nearest enclosed water bodies and more than 10 miles from the ocean. Therefore, the alternatives are not located within areas potentially impacted by seiches or tsunamis. The Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum also addresses potential impacts from seiche and tsunami-related flooding.

4.7 Water Quality

4.7.1 Surface Water

Daily urban runoff from the project area has negative impacts to surface water quality. Runoff washes residues from the land, including deposits from vehicles, pet waste, pesticides, and street litter into the storm drain system. The Basin Plan for the Los Angeles River watershed lists the following beneficial uses for the river (LARWQCB 1995):

- Groundwater Recharge: Uses of water for natural or artificial recharge of groundwater for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
- Water Contact Recreation (REC-1 and REC-2): Uses of water for recreational activities involving both body contact with water (REC-1) and no body contact with water (REC-2). These uses include, but are not limited to, swimming, wading, and boating.
- Warm Freshwater Habitat: Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.

Water bodies not meeting the beneficial uses of state water quality standards are placed on the 303(d) List of Water Quality Limited Segments and states are required to develop TMDLs for the pollutants causing the impairment.

The Los Angeles River in the project area is listed on the LARWQCB's 2008 CWA Section 303(d) list of impaired water bodies. Total Maximum Daily Loads (TMDLs) have been developed for trash, metals, and nitrogen compounds. In addition to the impact trash has on aesthetics, its presence inhibits plant growth and it can be ingested by or entangle wildlife (City of Los Angeles and USACE 2007).

.

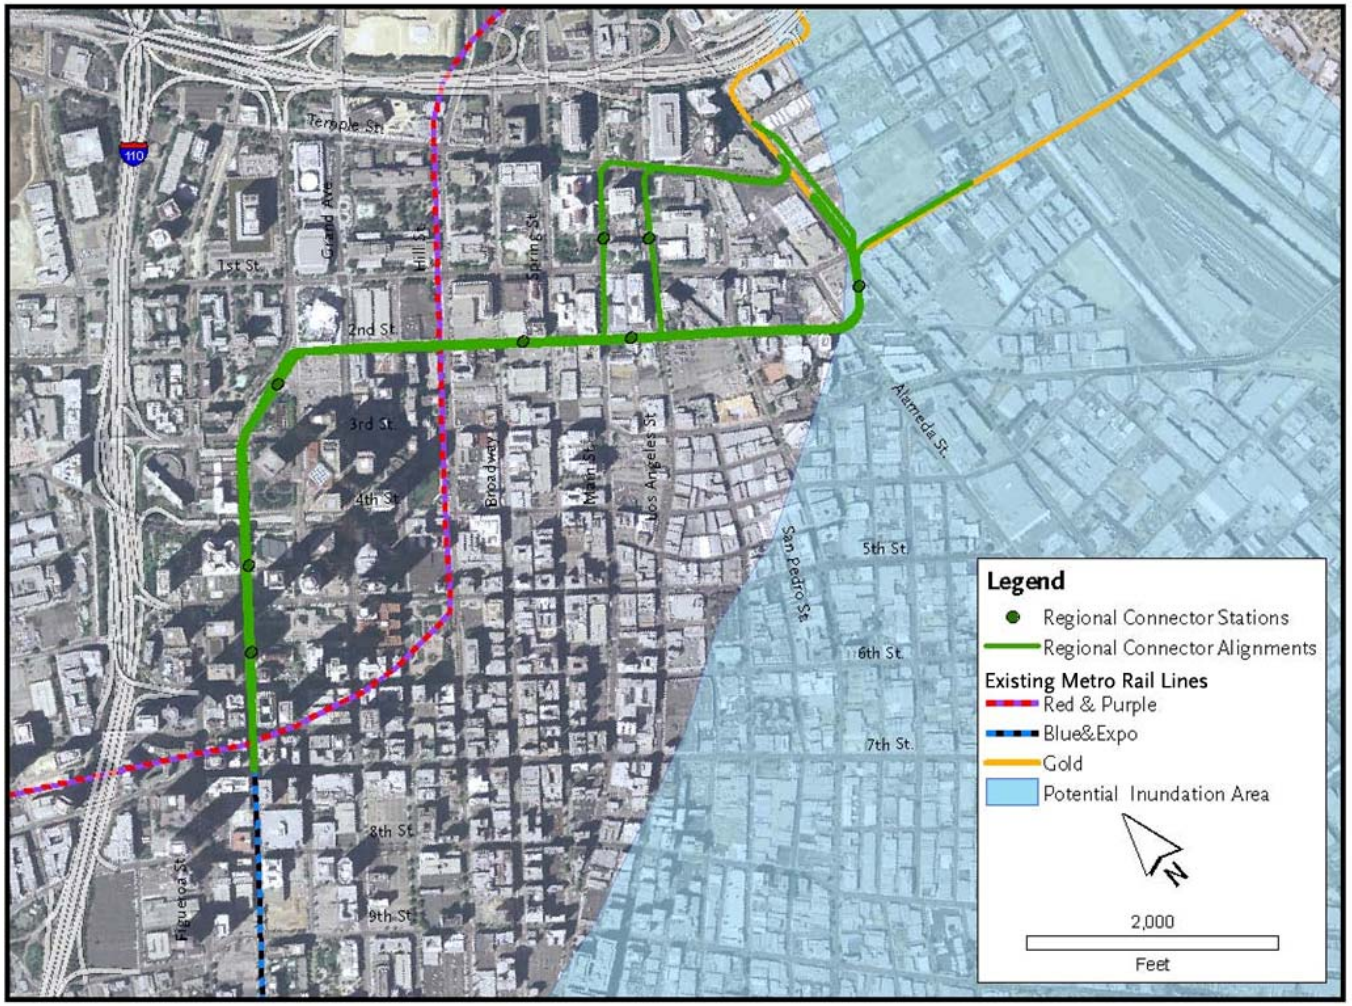

Figure 4-6. Potential Inundation Areas Relative to the Project Area

Table 4-2 summarizes the pollutants causing impairment in the reach of the Los Angeles River through the project area, the TMDL requirement status, and the associated TMDL completion and approval dates.

Table 4-2. 303(d) List of Pollutants Requiring TMDLs, Los Angeles River Reach 3, Downtown Los Angeles

Pollutant	TMDL Requirement Status	Date USEPA Approved TMDL
Ammonia	B[1]	3/18/2004
Copper	B	12/22/2005
Lead	B	12/22/2005
Nutrients (Algae)	B	3/18/2004
Trash	B	7/24/2008

Source: LARWQCB 2008
Notes: [1] B = Pollutant being addressed by USEPA approved TMDL.

Water quality monitoring along the urbanized section of the Los Angeles River is conducted by the Los Angeles County Department of Public Works (LACDPW) and reported in their annual Stormwater Monitoring Reports. As described in the 2007-2008 report, the County monitors water quality in the river at the existing stream gage station located in the City of Long Beach (LACDPW 2008).

Findings from the County's most recent water quality report describe that the total runoff volume and pollutant loading at the Los Angeles River monitoring station was usually higher than at other monitoring stations in the county (LACDPW 2008). However, this is likely due to the fact that the Los Angeles River has approximately two to twenty-five times the surface area of other watersheds, thus creating more potential for surface runoff pollution.

4.7.2 Groundwater

Due to the long history of commercial and industrial activity in the project area, groundwater contaminants include sulfate, total dissolved solids, iron, chloride, and other types of industrial wastes (City of Los Angeles Planning Department 1995). Wells are sampled by the LACDPW on an annual basis for major minerals, total dissolved solids, electrical conductivity, pH, phosphate, iron, manganese, fluoride, and boron (City of Los Angeles Planning Department 1995). In addition, the Water Replenishment District (WRD) of Southern California and the U.S. Geological Survey (USGS) conduct regional groundwater quality

monitoring in the Central Sub-basin. The WRD's monitoring for Water Year 2006-2007 found that groundwater in the main producing aquifers of the basin is of good quality; however volatile organic compounds (VOCs) (primarily perchloroethylene (PCE) and trichloroethylene (TCE)) are present in the Central Basin and have impacted many production wells (WRD 2008). The VOCs are at low concentrations and are below enforceable regulatory levels.

The Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum describes specific local causes and sources of groundwater contamination within 0.25 mile of the proposed alignments as well as some that are located directly along the alignments for the build alternatives.

Table 4-3 summarizes water quality in public supply wells in the Coastal Plain of Los Angeles Central Sub-basin as monitored by the WRD of Southern California.

Table 4-3. Constituents of Concern in the Central Basin

Constituent	Units	Range Detected in Sampling
Total Dissolved Solids	mg/L	170 to 2,770 Average: 500
Volatile Organic Compounds (TCE and PCE[1])	µg/L	Not detected to 32 for TCE Not detected to 8.3 for PCE
Perchlorate	µg/L	Less than 6
Nitrate	mg/L	Not detected to 12
Iron and manganese	mg/L	Not detected to 8.4 for iron Not detected to 1.3 for manganese
Chromium	µg/L	Not Available

Source: WRD 2008
Notes: TCE = trichloroethylene; PCE = perchloroethylene

5.0 IMPACTS

The proposed project is located in downtown Los Angeles, which is an urban environment, served by existing drainage infrastructure and comprised predominantly of impervious surfaces. This section addresses potential impacts to ground and surface water resources, drainage, flooding, and public safety issues that could stem from construction and operation of the proposed alternatives.

5.1 No Build Alternative

Under the No Build Alternative, there would be no transportation improvements beyond those listed in Metro's Long Range Transportation Plan (LRTP). By the projection year 2035, it is expected that the Metro Expo Line to Santa Monica, the Metro Gold Line to Azusa, the Metro Gold Line to I-605, the Metro Purple Line to Westwood, and the Metro Crenshaw Line would be operational. While it is anticipated that bus service in the project area would predominantly remain the same, there may be some service adjustments in order to provide connections to the Metro Expo Line and Metro Gold Line service areas. The No Build Alternative would not involve any new construction of rail lines or other transportation improvements within the Regional Connector corridor.

5.1.1 Construction

Since there would be no new construction under the No Build Alternative, no impacts would be expected in relation to erosion, increased runoff, or construction dewatering and disposal of contaminated groundwater.

There would be no construction of new tracks or stations under the No Build Alternative, and therefore, there would not be any new structures placed in the 100-year flood hazard area. The proposed bus improvements under the No Build Alternative would not affect flood flows. Therefore, the No Build Alternative would result in no impact associated with flooding hazards.

5.1.2 Operation

The existing project area is urbanized and is mostly covered by impervious surfaces. The No Build Alternative would not change these conditions and would not impact groundwater resources or recharge. While there would be some service adjustments under the No Build Alternative, these would result in negligible increases in the buildup of typical runoff contaminants that collect on streets (i.e., oil, grease, and metals). There would be no increase in pollutant loadings that would percolate to groundwater. Overall, the No Build Alternative would not increase groundwater supply withdrawals, would not alter groundwater recharge, would not affect groundwater quality, and would not increase flood flows. Operation of the No Build Alternative would result in no direct impacts to water quality or

hydrology. However, there would be less potential for the transit system to replace automobile trips and associated potential reduction in roadway pollutants.

5.1.3 Cumulative

There would be no cumulative impacts from the No Build Alternative.

5.2 Transportation System Management (TSM) Alternative

Similar to the No Build Alternative, this alternative is focused on enhancements to and/or restructuring of the existing transit service in the project area. In addition to the provisions in Metro's LRTP, two new shuttle bus routes would operate to link the 7th Street/Metro Center Station to Union Station. The TSM Alternative would involve no construction of additional tracks or stations outside of the projects already approved in the LRTP. The creation of peak hour bus-only lanes would not require any new construction since this would potentially be accomplished by restricting parking on streets that do not already have dedicated all-day bus lanes.

5.2.1 Construction

There may be some rebuilding of existing drainage structures at some bus shelter locations where reconstruction of the bus shelter and bus landing might be required. This is particularly likely to occur where a new concrete landing the length of the bus would be constructed. The minor physical modifications associated with the TSM Alternative would result in no impact to the existing drainage infrastructure or the direction of drainage through the project area.

There would be no construction-related erosion or stormwater runoff and there would be no need to dispose of contaminated groundwater potentially encountered during dewatering activities. The TSM Alternative would result in no impacts to water quality, hydrology, and/or drainage.

5.2.2 Operations

Proposed transportation improvements under the TSM Alternative would be accomplished through minor physical modifications such as upgraded bus stops and new shuttle bus routes. Therefore, operation of the TSM Alternative would result in negligible increases in the buildup of typical runoff contaminants that collect on streets (i.e., oil, grease, and metals). There would be no increase in pollutant loadings that would percolate to groundwater. The TSM Alternative would not increase groundwater supply withdrawals, would not alter groundwater recharge or contribute to groundwater contamination, would not significantly change the local storm sewer drainage pattern, and would not increase flood flows. Operation of the TSM Alternative would result in no impact to water quality or hydrology.

The proposed express shuttle bus lines and new bus stops would not affect flood flows; therefore, the TSM Alternative would result in no impact associated with flooding hazards.

5.2.3 Cumulative

Since there would be no direct or indirect impacts to water resources and hydrology, there would be no cumulative impacts under the TSM Alternative.

5.3 At-Grade Emphasis LRT Alternative

This alternative includes both underground and at-grade configurations with approximately 46 percent of the route located underground. Under the At-Grade Emphasis LRT Alternative, there would be a direct connection from the existing underground 7th Street/Metro Center Station to the Metro Gold Line at Temple Street. This alternative would involve the construction of at least three new stations.

5.3.1 Construction

5.3.1.1 Groundwater Impacts

The existing project area consists predominantly of impervious surfaces. Therefore, the project area does not currently allow for direct percolation within the Central Los Angeles Basin and there would be no direct or indirect impacts on groundwater levels for water supplies used for consumption by municipal, industrial and irrigation purposes.

While approximately half of the At-Grade Emphasis LRT Alternative would be constructed above ground and would not require as much excavation and tunneling as the underground alternatives (analyzed below), there would still be a potential need for dewatering if groundwater is encountered during construction activities. Stations and tunneling would occur between 50 and 80 feet below ground. As described in Section 4.3, recent borings showed groundwater depths of 15 to 35 feet below ground along Flower Street in the vicinity of the proposed At-Grade Emphasis LRT Alternative alignment. Due to the presence of relatively shallow groundwater, it is likely that groundwater would be encountered during tunneling and excavation activities.

Additionally, as described in Section 4.7.2, groundwater in the Central Basin as well as locally in the vicinity of the proposed alignment is contaminated with pollutants common to urban industrial and commercial activities; therefore, groundwater encountered during construction could be contaminated. Given the likelihood of encountering contaminated groundwater, compliance with federal, state, and local laws and regulations (as described in the Geotechnical/Subsurface/ Seismic/ Hazardous Materials Technical Memorandum) would be required during construction activities. A dewatering permit from the LARWQCB would be necessary and any contaminated groundwater would be properly treated prior to being discharged. Uncontaminated groundwater that is collected during construction dewatering

can be treated and pumped back into the groundwater table, pumped to the sewer or storm drain system, or used onsite for dust control purposes. Additional data gathering and site specific groundwater investigation may be necessary to further determine the extent and location of groundwater contaminants as well as potential impacts (CDM 2009).

Excavation activities also have the potential to create a preferential pathway for the spreading of contaminated groundwater in the groundwater basin. This impact could be mitigated by the use of impermeable concrete grouting materials which would reduce contaminant migration. Further mitigation measures to protect against potential environmental and social impacts from encountering contaminated groundwater are also described in the Geotechnical/Subsurface/ Seismic/ Hazardous Materials Technical Memorandum. Potential impacts on groundwater quality would be less than significant with mitigation.

In general, construction-related tunnel excavation dewatering impacts have the potential to result in over-withdrawal of groundwater resources. However, as previously described, groundwater encountered along the project alignment is perched (e.g., separated from the aquifers of the San Fernando Formation); therefore, potential dewatering would not impact groundwater levels in the aquifers used for municipal and industrial water uses.

5.3.1.2 Drainage Impacts

Under the At-Grade Emphasis LRT Alternative, there is a potential for conflicts with the existing drainage system along 2nd Street between Grand Avenue and Olive Street where the alignment would be constructed through the 2nd Street Tunnel. Along the intersection of 2nd Street and Grand Avenue, it is anticipated that there would be minimal potential conflicts with the current location of the drainage system. The existing storm drain system would also potentially conflict with the proposed construction of the proposed station at Flower/4th/5th Streets. Overall however, construction of the At-Grade Emphasis LRT Alternative would be expected to result in minimal impacts and need for relocation of the current drainage system. In the case where construction activities would result in the need to relocate certain drainage infrastructure, temporary lines would be installed during the construction period. Construction of the At-Grade Emphasis LRT Alternative would have no significant impact on the overall drainage pattern in the project area.

5.3.1.3 Flooding Impacts

The proposed alignment is outside of the 100-year flood hazard area; therefore, construction and operation of the At-Grade Emphasis LRT Alternative would not alter any existing flood zones. No fill would be placed in and no encroachment would be made to an existing floodplain. As described in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum, the majority of the At-Grade Emphasis LRT Alternative alignment is not located in an Inundation Hazard Area. There is also no potential for seiches and tsunamis as there are no lakes or reservoirs in the vicinity and the ocean is over 10 miles from

the proposed alignment. The alternative is located in an urbanized area comprised mainly of impervious surfaces and has an existing extensive drainage infrastructure. Construction of the At-Grade Emphasis LRT Alternative would not increase the risk of flooding.

There would be no significant impacts from construction on the natural and beneficial floodplain values in the vicinity of the proposed project. In addition, the at-grade alignment would be consistent with local and regional land use and transportation planning and, therefore, would not result in incompatible floodplain development. Overall, implementation of the At-Grade Emphasis LRT Alternative would not result in flooding impacts.

5.3.1.4 Water Quality Impacts

Water quality impacts could potentially result from construction of the At-Grade Emphasis LRT Alternative. Construction activities have the potential to increase erosion and sedimentation around proposed construction and staging areas. Grading activities associated with construction could potentially result in a temporary increase in the amount of suspended solids running off construction sites. In the case of a storm event, construction site runoff could result in sheet erosion of exposed soil. If not adequately controlled, contaminated water runoff from these areas has the potential to degrade surface water quality. While the introduction of new impervious surfaces resulting from the construction of the At-Grade Emphasis LRT Alternative has the potential to increase the concentration and accumulation of pollutants associated with transit projects (e.g. oil and grease), the project area is already highly urbanized. Proposed construction would take place on already impervious land and therefore would not significantly increase the amount or peak flow of runoff entering the storm drain system.

In order to reduce any potential impacts related to stormwater runoff, a Notice of Intent (NOI) and a SWPPP would be prepared in order to comply with the SWRCB's NPDES Construction General Permit. Implementation of the SWPPP would ensure that the applicable provisions of Sections 301 and 402 of the CWA and Chapter 6 Article 4.4, Stormwater and Urban Runoff Pollution Control from the Los Angeles Municipal Code, would be met and pollutant discharges would be properly controlled. Additionally, a SUSMP would be prepared and implemented in accordance with the Los Angeles Municipal Code, to ensure that stormwater runoff is managed for water quality concerns through implementation of appropriate BMPs. Prior to issuance of any grading or building permits, the County and/or Stormwater Division of the Bureau of Sanitation must approve the SUSMP. Applicable BMPs include;

- Oil/water separators;
- Catch basin inserts;
- Storm drain inserts;

- Media filtration; and/or
- Catch basin screens.

Construction Stormwater Management Controls: These controls would function to minimize the contact of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, solvents) with stormwater. The SWPPP would specify properly designed, centralized storage areas that would keep these materials out of the rain. Spill cleanup materials (e.g., rags, absorbent materials, and secondary containment) would be kept at the work site when handling materials. It is important that site supervisors and workers have knowledge of the SWPPP. Therefore, site supervisors would conduct regular meetings to discuss pollution prevention. The frequency of such meetings and the personnel required to attend would be specified in the SWPPP.

The SWPPP would also specify a monitoring program to be implemented by the construction site supervisor, and would include both dry and wet weather inspections. City personnel would also conduct regular inspections to ensure compliance with the SWPPP.

Erosion and Sediment Control: BMPs designed to reduce erosion of exposed soil may include, but are not limited to: soil stabilization controls, water for dust control, perimeter silt fences, placement of straw wattles, and sediment basins. The potential for erosion is generally increased in the case that grading is performed during the rainy season, as disturbed soil can be exposed to rainfall and storm runoff. If grading activities must take place during the rainy season, the BMPs selected would focus on erosion control and keeping sediment in place. End-of-pipe sediment control measures (e.g., basins and traps) would be used as secondary measures. Entry and egress from construction sites would be carefully controlled to minimize off-site tracking of sediment. Additional sources of information regarding BMPs include the California Stormwater Municipal and Construction Activity BMP Handbooks.

The effect on water quality would be minor since the project area is already highly urbanized. Additionally, the amount of impervious surfaces and any potential added runoff would be small compared to the region as a whole. In order to ensure that surface water runoff would not have significant impacts on water quality, human health, or safety, appropriate measures would be taken to control runoff. Some examples of these include establishing an erosion control plan, ensuring the proper storage and handling of hazardous materials, and the periodic monitoring of the water quality of runoff leaving the site.

5.3.1.5 Groundwater Quality Impacts

Due to the predominance of impervious surfaces throughout the project area, there is minimal percolation to the underlying groundwater basins. Therefore, any potential increases in contaminated surface water runoff would have no significant impact on groundwater quality.

Tunneling during construction could potentially create a preferential pathway for any contaminated groundwater that is potentially encountered. This could cause the contamination to spread at higher rates than would normally occur without disruption by construction activity. This has the potential to result in an impact that would be managed to a less than significant level with the potential mitigation techniques described in Section 6.0.

5.3.2 Operation

5.3.2.1 Groundwater Impacts

Upon implementation of the At-Grade Emphasis LRT Alternative, conditions in the project area would be comparable to existing conditions, that is, the project area would continue to be developed largely with impervious surfaces. Although unlikely during the operation phase of the At-Grade Emphasis LRT Alternative, groundwater dewatering and subsequent discharge may occur. The tunnel and underground stations would be constructed to preclude gas leakage or groundwater intrusion into the tunnel using a technique similar to that used for the Metro Gold Line tunnels in Boyle Heights. This technique consists of installing a pre-cast concrete lining with rubber gaskets between the tunnel segments to prevent water and gas leakage into the tunnel. This method will avoid the leakage of water into the tunnels and stations. During operation, in the unlikely event that any water accumulates in the tunnel portions of the alignment, it would be pumped out by sump pumps and treated in accordance with applicable discharge permits before being discharged into the drainage system. Therefore, potential impacts to groundwater would be less than significant.

5.3.2.2 Water Quality Impacts

Operation of the At-Grade Emphasis LRT Alternative would likely decrease Vehicle Miles Traveled (VMT) of personal automobiles through the project area. An overall reduction in VMT could decrease the primary pollutants associated with all types of transportation operations such as heavy metals, solvents, and petroleum hydrocarbons. This would be a beneficial impact to surface water quality in the project area.

Indirect water quality impacts would stem from operation, over time, of the At-Grade Emphasis LRT Alternative. Indirect impacts potentially resulting from long-term operation of the At-Grade Emphasis LRT Alternative would be similar to direct impacts, but would occur later in time. Potential indirect impacts could be related to groundwater leaking into the tunnels and potential impacts to surface and groundwater quality. Indirect water quality impacts stemming from operation of the At-Grade Emphasis LRT Alternative would be less than significant.

Overall, water quality impacts associated with operation of the At-Grade Emphasis LRT Alternative would be less than significant or slightly beneficial.

5.3.3 Cumulative

Development of the At-Grade Emphasis LRT Alternative in combination with related renovation, new construction, and transportation projects identified in the vicinity of the proposed project could result in cumulative impacts to water quality. However, each of the concurrent projects would be subject to applicable water quality regulations and, thus, would be required to prepare a SWPPP for construction activities and to incorporate BMPs to control pollutant discharges. In addition, all the related projects would be required to operate in compliance with Chapter 13.29, Stormwater and Urban Runoff Pollution Prevention Control and SUSMP of the Los Angeles Municipal Code and to submit and implement a SUSMP. The SUSMP would contain design features and appropriate BMPs to reduce post-construction pollutants in stormwater discharges.

As described under existing conditions (Section 4), the project area within the Los Angeles River Watershed is covered by urban uses. The existing drainage system in the watershed consists of engineered storm channels and, therefore, would be expected to change little due to potential cumulative increases in stormwater runoff. It is not expected that any of the cumulative projects would result in a substantial change to the amount of impervious land cover in the project area, or a substantial alteration of the drainage systems. Since the amount of runoff generated in the project area would not be expected to significantly increase due to development of surrounding projects, substantial increases in erosion, siltation, flooding, or exceedance of the stormwater drainage system would not be expected.

Overall, construction and operation of the At-Grade Emphasis LRT Alternative would not contribute to significant cumulative water quality, hydrology, and/or drainage impacts.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would be underground except for a single at-grade crossing at the intersection of 1st and Alameda Streets. Newly constructed light rail right of way would consist of a combination of underground double tracks running beneath Flower and 2nd Streets and at-grade double tracks at the northeast corner of the project area. Additionally, three new stations are proposed under this alternative.

5.4.1 Construction

5.4.1.1 Groundwater Impacts

The components for construction of the Underground Emphasis LRT Alternative are generally the same in relation to their potential impacts on groundwater as those described for the At-Grade Emphasis LRT Alternative. Given the existing impervious nature of the project area, there is minimal infiltration to groundwater under existing conditions. Implementation of the Underground Emphasis LRT Alternative would not significantly impact groundwater recharge.

Additionally, potential dewatering activities would not be expected to impact the quantity of groundwater used for consumption by municipal, industrial, or irrigation purposes.

As with the At-Grade Emphasis LRT Alternative, trenching and tunneling activities could lead to exposure of contaminated groundwater and the need to dewater and dispose of contaminated groundwater. The Geotechnical/Subsurface/Seismic/ Hazardous Materials Technical Memorandum analyzes potential impacts from encountering contaminated groundwater as well as mitigation measures that would be employed in order to ensure proper handling of contaminated materials. Compliance with federal, state, and local laws and regulations (as described in the Geotechnical/Subsurface/ Seismic/ Hazardous Materials Technical Memorandum) would be required during construction activities. A dewatering permit from the LARWQCB would be necessary and any contaminated groundwater would be properly treated prior to being discharged. Uncontaminated groundwater that is collected during construction dewatering can be treated and pumped back into the groundwater table, pumped to the sewer or storm drain system, or used onsite for dust control purposes.

Excavation activities also have the potential to create a preferential pathway for the spreading of contaminated groundwater in the groundwater basin. This impact could be mitigated by the use of impermeable concrete grouting materials which would reduce contaminant migration. Further mitigation measures to protect against potential environmental and social impacts from encountering contaminated groundwater are also described in the Geotechnical/Subsurface/ Seismic/ Hazardous Materials Technical Memorandum. Potential impacts on groundwater quality would be less than significant with mitigation.

In general, construction-related tunnel excavation dewatering impacts have the potential to result in over-withdrawal of groundwater resources. However, as previously described, groundwater encountered along the project alignment is perched (e.g., separated from the aquifers of the San Fernando Formation); therefore, potential dewatering would not impact groundwater levels in the aquifers used for municipal and industrial water uses.

5.4.1.2 Drainage Impacts

As described in the analysis of storm drain impacts under the At-Grade Emphasis LRT Alternative, there could be conflicts with the existing storm drain infrastructure along the proposed alignment. Similar impacts would be expected under the Underground Emphasis LRT Alternative. The main conflicts could occur along the pipe backbone along Flower and 2nd Streets. However, design measures would be implemented in order to address potential conflicts and there would be no significant impact to the capacity of the existing system or the overall direction of storm flows through the drainage infrastructure in the project area.

5.4.1.3 Flooding Impacts

Construction of the Underground Emphasis LRT Alternative would not occur in the 100- or 500-year floodplain areas as delineated by FEMA. Additionally, construction of this alternative would not impact any flood control structures in the Los Angeles River watershed. As described above in Section 4.6, the proposed alternatives are not located in an Inundation Hazard Area, or in an area with potential to be flooded by a seiche or tsunami. Overall, the proposed project area is urbanized and covered by impervious surfaces. Construction of the Underground Emphasis LRT Alternative would not increase the risk of flooding. Flooding and floodplain impacts would be less than significant.

5.4.1.4 Water Quality Impacts

Construction-related impacts from the Underground Emphasis LRT Alternative would be similar to those described for the At-Grade Emphasis LRT Alternative; the main difference would be the amount and intensity of construction activity that would take place. Construction-related activities including grading and excavation have the potential to result in water quality impacts due to increased erosion and sedimentation. Runoff during construction would be routed to the existing underground storm drain systems and/or lined channels, mitigating offsite erosion. In addition, applicable municipal NPDES permits and waste discharge requirements would be complied with in order to minimize potential impacts to water quality.

As described above in Section 5.3, the At-Grade Emphasis LRT Alternative, in order to comply with the Los Angeles Municipal NPDES permit and the SUSMP, a Stormwater Pollution Prevention Plan (SWPPP) including BMPs would be prepared which would reduce potential adverse effects to surface water quality from sedimentation during construction. The SWPPP would include specific measures to ensure that runoff from construction sites do not further impair the water quality of the Los Angeles River. These measures would be the same as those described in Section 5.3.

5.4.2 Operation

5.4.2.1 Groundwater Impacts

The tunnel and underground stations would be constructed to preclude gas leakage or groundwater intrusion into the tunnel using a technique similar to that used for the Metro Gold Line tunnels in Boyle Heights. This technique consists of installing a pre-cast concrete lining with rubber gaskets between the tunnel segments to prevent water and gas leakage into the tunnel and stations. In the unlikely event that groundwater accumulates in tunnels during operation, the water would be pumped out and treated to meet municipal standards before being discharged to the city's sewer system. Impacts to groundwater under the Underground Emphasis LRT Alternative would be less than significant.

5.4.2.2 Water Quality Impacts

Similar to the At-Grade Emphasis LRT Alternative, it is anticipated that the amount of impervious surfaces in the project area would remain equivalent to existing conditions. Therefore, operation of the Underground Emphasis LRT Alternative would not contribute to a substantial increase in stormwater runoff or degradation of existing water quality.

Implementation of the Underground Emphasis LRT Alternative would be expected to result in more daily transit trips than the No Build, TSM or At-Grade Emphasis LRT Alternatives, thereby reducing annual VMT of automobiles through the project area. Therefore, there would be less buildup of pollutant loads associated with automobile use such as oil, grease, and metals. Overall, water quality impacts associated with operation of the Underground Emphasis LRT Alternative would be less than significant or slightly beneficial.

5.4.3 Cumulative

Neither the proposed project nor any of the projects considered for cumulative impacts would be developed in active recharge areas; therefore, cumulative impacts to groundwater quality and quantity would be less than significant.

Increases in pollutant loading resulting from construction of the Underground Emphasis LRT Alternative, combined with potential impacts from the construction activity of renovation and new development projects in the vicinity of the project area could result in cumulative increases in the amount of polluted stormwater runoff as well as cumulative impacts to water quality. Related projects that do not require the construction of new facilities would not have a direct physical effect on water resources in the project area. Proposed transportation projects in the area that would be expected to reduce traffic congestion or reduce VMT would be beneficial to water quality in the region since reductions in air emissions and accident-related roadway surface pollutants would reduce the level of water-borne pollutants that are able to migrate to surface and groundwater. Projects requiring the construction of new or expanded facilities would potentially have the greatest impact on water quality. Increases in surface parking areas and clearing and grading activities could increase surface water pollutants such as those related to increased automobile traffic and operation as well as construction-related erosion and sedimentation.

As described in Section 5.3.3, existing programs, procedures, and permits administered by the LARWQCB would be required and adhered to for the Regional Connector project as well as any of the other related projects. Therefore, potential cumulative construction and operation-related impacts associated with water quality would be less than significant. Potential cumulative impacts to pollutant loads and resulting water quality would be expected to be less under the Underground Emphasis LRT Alternative than under the No Build Alternative since the operation of light-rail vehicles would not be expected to cause or

contribute to pollutants commonly associated with non-light rail transportation such as oil, grease, and metals.

To the extent that the proposed project and projects considered for cumulative impacts would be built within already urbanized areas, there would be minimal increases in impervious surfaces and cumulative impacts to water quality would be less than significant. Additionally, potential impacts would be minimized by the same measures as described under Section 5.3.3 (described in further detail in Section 6.0).

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would be identical to the Underground Emphasis LRT Alternative with the Broadway Station Option described above in Section 5.4 for all areas west of 2nd Street and Central Avenue. East of Central Avenue, this alternative includes an underground station just southwest of the intersection of 1st and Alameda Streets. In addition to this station, this alternative includes a new underground three-way junction. One set of tracks extend north from the junction and would continue underground under Temple Street and surface in the LADWP yard. The other set of tracks leaving the three-way junction would rise to street level to the east within East 1st Street in order to accommodate a new portal and connect to the existing Metro Gold Line tracks.

5.5.1 Construction

Potential impacts from construction to groundwater resources, floodplains, and water quality would be the same as those described for the Underground Emphasis LRT Alternative (Sections 5.4.1 and 5.4.2).

Potential impacts to stormwater drainage facilities could result from construction of this alternative. However, as described above in Section 5.4.1.2, design measures would address these potential conflicts. Overall, with appropriate mitigation there would be no significant impact to the capacity of the existing system or the overall direction of storm flows through the drainage infrastructure in the project area.

Construction of the underground station at 2nd Street and Central Avenue and new portions of track connecting to the underground three-way junction near the intersection of 1st and Alameda Streets at the connection point with the Metro Gold Line would be located in the potential inundation area (Figure 4-6). Construction would not affect flood control structures in the vicinity of the project area. Given the fact that this area near Alameda Street is currently fully urbanized and highly impervious, construction-related inundation impacts would be less than significant. Additionally, construction would comply with the City of Los Angeles' policies and regulations related to inundation hazards.

5.5.2 Operation

Potential impacts from operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same as those described above in Section 5.4.2.

5.5.3 Cumulative

Potential cumulative impacts would be the same as those described in Section 5.4.3.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

Similar to the Fully Underground LRT Alternative - Little Tokyo Variation 1, Little Tokyo Variation 2 would be identical to the Underground Emphasis LRT Alternative with the Broadway Station Option for all areas west of 2nd Street and Central Avenue. This alternative also includes a new underground station near 2nd Street and Central Avenue; however, under this alternative, the new station would have two underground levels, each with a single-track platform. This alternative would have a similar underground junction as that described for the Little Tokyo Variation 1; the main difference would be that the junction would have two underground levels.

5.6.1 Construction

Potential construction impacts would be the same as those described in Section 5.5.1.

In addition to construction of the proposed two-level underground 2nd Street/Central Avenue station, the Fully Underground LRT Alternative - Little Tokyo Variation 2 includes construction of a two-level underground junction to the northeast of the intersection of 1st and Alameda Streets. Potential construction-related impacts to inundation and stormwater drainage facilities would be the same as those described for the Little Tokyo Variation 1 (Section 5.5.1).

5.6.2 Operation

Potential impacts from operation would be the same as those described in Section 5.4.3.

5.6.3 Cumulative

Given that potential construction and operation impacts would be the same as those described in the analysis for the Underground Emphasis LRT Alternative (Section 5.4), potential cumulative impacts would also be the same.

6.0 POTENTIAL MITIGATION MEASURES

In the case that contaminated groundwater is encountered and it is determined that there is potential for the contamination to spread, this would be mitigated during the design and engineering process. For example, it could be specified that impermeable concrete-based grouting materials be used to fill the gap between the tunnel and the surrounding earth. The permeability of grouting materials is lower than surrounding soil types and this would reduce the possibility that the tunnel could serve as a preferential pathway for contaminant migration. Additional BMPs that would address potential impacts from encountering contaminated groundwater and groundwater dewatering activities are proposed in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum.

Additional potential construction mitigation measures could include:

- Establish an erosion control plan prior to the initiation of construction activities. The erosion control plan would include:
    - Use of natural drainage, detention ponds, sediment ponds, or infiltration pits to allow runoff to collect and reduce or prevent erosion;
    - Use of barriers to direct and slow the rate of runoff and to filter out large-sized sediments;
    - Use of down-drains or chutes to carry runoff from the top of a slope to the bottom; and,
    - Control the use of water for irrigation and dust control so as to avoid off-site runoff.

Potentially significant impacts to water quality stemming from both construction and operation of the Regional Connector project could be mitigated with the following measures as appropriate;

- Project design could include properly designed and maintained biological oil and grease removal systems in new storm drain systems to treat water before it leaves project sites;
- Proper storage of hazardous materials to prevent contact with precipitation and runoff;
- Development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials;

- Placement of equipment to be repaired or maintained in covered areas on a pad of absorbent material to contain leaks, spills, or small discharges;
- Periodic and consistent removal of landscape and construction debris;
- The removal of any significant chemical residue on the project sites through appropriate methods;
- The use of non-toxic alternatives for any necessary applications of herbicides or fertilizers;
- Installation of detention basins to remove suspended solids by settlement; and/or,
- Periodic monitoring of the water quality of runoff before discharge from the site and into the storm drainage system.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

There would be no adverse impacts from the No Build Alternative with respect to surface or groundwater resources, the stormwater drainage system, water quality, or flooding and safety issues.

7.1.2 CEQA Determinations

The No Build Alternative would have no impact on surface or groundwater resources, the stormwater drainage system, water quality, or flooding and safety issues.

7.2 Transportation System Management (TSM) Alternative

7.2.1 NEPA Findings

There would be no adverse impacts from the TSM Alternative with respect to surface or groundwater resources, the stormwater drainage system, water quality, or flooding and safety issues.

7.2.2 CEQA Determinations

The TSM Alternative would not be expected to result in significant impacts to existing conditions in relation to surface water and groundwater resources, drainage, inundation and flooding, or water quality. Additionally, this alternative would not be expected to result in significant impacts related to erosion, increased runoff, or construction dewatering and disposal of contaminated groundwater.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

There is the potential for adverse impacts with respect to polluted stormwater runoff affecting water quality during construction of the At-Grade Emphasis LRT Alternative. There is also a possibility of encountering contaminated groundwater during excavation activities. Compliance with applicable regulations as well as implementation of mitigation measures would reduce these potential impacts to a less than significant level.

7.3.2 CEQA Determinations

The At-Grade Emphasis LRT Alternative could result in impacts associated with polluted stormwater runoff and degradation of surface and groundwater quality. Compliance with federal, state, and local laws would reduce many of these potential impacts to a less than significant level. In addition, implementation of specific mitigation measures would reduce

specific issues (such as runoff contamination from hazardous construction materials) to a less than significant level.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

There is the potential for adverse impacts with respect to polluted stormwater runoff affecting water quality during construction of the Underground Emphasis LRT Alternative. There is also a possibility of encountering contaminated groundwater during excavation activities. Compliance with applicable regulations as well as implementation of mitigation measures would reduce these potential impacts to a less than significant level.

7.4.2 CEQA Determinations

As with the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative could result in potential impacts associated with polluted stormwater runoff and degradation of surface and groundwater quality. Compliance with federal, state, and local laws would reduce many of these potential impacts to a less than significant level. In some instances, implementation of specific mitigation measures would be necessary to reduce potential impacts to a less than significant level.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1NEPA Findings

NEPA findings for this alternative would be the same as those for the Underground Emphasis Alternative (Section 7.4.1).

7.5.2 CEQA Determinations

Similar to the CEQA determinations described in Sections 7.3.2 and 7.4.2, the Fully Underground LRT Alternative – Little Tokyo Variation 1 could result in impacts to surface water and groundwater quality. Compliance with federal, state, and local laws and regulations, as well as the implementation of specific mitigation measures and BMPs would reduce potential impacts to a less than significant level.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

NEPA findings would be the same as those described for the Fully Underground LRT Alternative – Little Tokyo Variation 1.

7.6.2 CEQA Determinations

CEQA determinations would be the same as those described above in Section 7.5.2.

1.0 SUMMARY

Provision of new rail services is anticipated to result in decreased highway vehicle miles traveled (VMT) and a corresponding decrease in the consumption of fossil fuels throughout the project area. While construction of the proposed alternatives would require energy expenditures, projected horizon year (2035) decreases in VMT and corresponding energy savings outweigh the one-time energy costs required for construction.

The following section describes existing energy supplies as well as existing and forecasted demand for energy resources in the project area. Estimated energy requirements for each of the proposed alternatives were compared to baseline conditions (year 2009) to analyze impacts under the California Environmental Quality Act (CEQA) and to horizon year conditions (year 2035) to analyze impacts under the National Environmental Policy Act (NEPA). Potential energy impacts for each alternative were broken down into construction energy use and operational energy use.

For operational energy impacts, the analysis looked at changes in regional VMT, added bus routes, added light rail lines, and added light rail stations. In order to compare impacts for CEQA and NEPA analysis, energy use is expressed in British Thermal Units (BTUs) and equivalent barrels of oil. Since other units of energy can all be converted into equivalent BTU units (Table 3-1) the BTU is used as the basis for comparing energy consumption associated with different resources.

Construction and operational energy usage was compared to CEQA and NEPA significance thresholds in Section 3.1 to determine the significance of potential impacts for each of the proposed alternatives. Predicted energy usage for each alternative is greater than energy usage in 2009 because of a forecasted increase in regional VMT. Increased VMT, and a corresponding increase in energy use, would result predominantly from projected regional population growth and other factors unrelated to the proposed project. Reasons for this increase are further described in the *Climate Change Impacts Technical Memorandum* written for this project.

Compared to the No Build Alternative, operational energy use under the TSM and build alternatives would decrease. Thus, the project would have a beneficial impact on energy resources and fossil fuel consumption in the project area. As described previously, each of the build alternatives would result in a one-time, non-recoverable expenditure of energy during the construction phase.

Energy needed for construction would be supplied by the Los Angeles Department of Water and Power (LADWP) and would not result in the need for new off-site energy supply facilities. Operation of the Transit System Management Alternative and the build alternatives would reduce automobile VMT throughout the project area by more than 100 million vehicle miles

annually. Additionally, operational energy use under the build alternatives would result in a decrease in total annual BTUs in the region of 0.054 to 0.063 percent compared to the No Build Alternative.

2.0 INTRODUCTION

This section characterizes energy resources, usage associated with the proposed Regional Connector Project alternatives, and the net energy demand associated with changes to the regional transportation network under each of the proposed alternatives. Energy resources and the consumption of energy are integral considerations for this project. Construction activities would consume differing amounts of energy, and it is necessary to analyze the impacts these energy needs could have on the current generation capacity of the Los Angeles Department of Water and Power (LADWP) as well as petroleum resources. The operation of each alternative would consume energy in two main ways:

- Operational energy needs of new Metro stations, light rail trains, and buses; and
- Changes in regional automobile VMT and corresponding changes in regional fuel use

Overall energy demand in Los Angeles County for transportation and non-transportation uses will continue to increase as the County's population grows. Congestion on freeways in the County and region, combined with long commuting distances of the region's workforce, results in proportionally higher transportation-related energy use compared to the rest of the state (Los Angeles County 2008).

The following sections describe existing conditions for energy use at the regional and local level. Section 5 analyzes potential energy impacts for both the construction and operation stages of the project alternatives. The increment between a proposed future alternative (2035) and existing conditions (2009) was determined to evaluate project significance under CEQA, whereas the increment between a proposed future alternative (2035) and the No Build Alternative (2035) was used to evaluate project significance under NEPA.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

3.1.1 Federal

The Energy Policy and Conservation Act of 1975 calls for energy conservation, when feasible. The Alternative Fuels Act of 1988 amends a portion of the Energy Policy and Conservation Act to encourage the use of alternative fuels including electricity. The Safe, Accountable, Flexible, and Efficient Transportation Act: A Legacy for Users (SAFETEA-LU), passed in 2005, focuses on reducing traffic congestion, increasing intermodal connectivity, and protecting the environment. SAFETEA-LU gives state and local transportation decision makers more flexibility for solving transportation problems in their communities (Federal Highway Administration 2005).

3.1.2 State

3.1.2.1 California Energy Commission

The California Energy Commission is responsible for, among other things, forecasting future energy needs for the state. Senate Bill 1389 (Chapter 568, Statutes of 2002) requires the commission to prepare a biennial integrated energy policy report assessing major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors. The report also provides policy recommendations to conserve resources, protect the environment, and ensure reliable, secure, and diverse energy supplies (California Energy Commission 2009). The most recent report was issued in December 2009.

3.1.2.2 Executive Order S-3-05

Executive Order S-3-05 was enacted in June 2005. The order sets specific greenhouse gas emission reduction targets for the state and gives the Transportation and Housing Agency responsibility to help meet the targets. The executive order sets 2050 greenhouse gas reduction targets at 80 percent below 1990 levels (California Energy Commission 2009). The order envisions reduced VMT and increased vehicle fuel efficiency as major factors in achieving greenhouse gas reductions.

3.1.2.3 Southern California Association of Governments (SCAG)

The SCAG is required by state and federal mandates to prepare a regional transportation plan (RTP) every 3 years. The 2008 RTP provides a long-range vision for regional transportation goals and policies and predicts transportation challenges and the region's future transportation strategy.

The SCAG region is the second-most populated metropolitan area in the United States. Population estimates from 2007 were approximately 19 million for the region with an expected increase to 24 million by 2035. Growth in population is expected to result in greater demands

on the region's transportation system (SCAG 2008). The proposed project is located in the South Coast Air Basin (SCoAB), a sub-region of the South Coast Air Quality Management District (SCAQMD).

The SCAG 2008 report describes energy production and consumption throughout the SCoAB and provides VMT by county. VMT data indicates the extent of vehicle usage throughout the region and is a valuable factor in calculating the amount of energy consumed by transportation.

The RTP establishes the following goals relevant to the proposed project:

- Preserve and ensure a sustainable transportation system
- Protect the environment, improve air quality, and promote energy efficiency

These goals are implemented through the five policies established by SCAG in the RTP. Policies include balancing safety, maintenance, and efficiency of the existing transportation system with the need for system expansion (SCAG 2008).

3.1.3 Regional

3.1.3.1 Air Quality Management Districts

As described in the Air Quality Technical Memorandum, the SCAQMD has the primary responsibility for developing the plans and regulations that will improve air quality in the SCoAB. The SCAQMD has set daily and quarterly emission thresholds for construction and operational sources. In addition, the SCAQMD is responsible for contributing to the development of State Implementation Plans (SIPs) in compliance with federal and state Clean Air Act regulations to reduce unhealthy levels of air pollutants. The SCoAB contributes to the SIPs by indicating how air quality standards will be met through the development of air quality management plans. Among other strategies, these plans promote reductions in VMT through the development of transportation alternatives (Los Angeles County 2008).

3.1.3.2 Metro Energy and Sustainability Policy

Metro adopted an Energy and Sustainability Policy in June 2007 to aid in controlling energy consumption and encouraging energy efficiency, conservation, and sustainability. Metro's long-term objectives include:

- Reducing the use of fossil fuels through the use of ambient and renewable energy sources
- Using fuels and electricity as efficiently as possible
- Reducing the amount of carbon dioxide emissions caused by Metro's consumption

3.1.3.3 Los Angeles County General Plan

The Mineral and Energy Resources Section of the County's General Plan addresses the use and management of valuable energy and mineral resources in Los Angeles County. (Los Angeles County 2008). The County recognizes that there is a high demand for energy resources and projected growth in the region will continue to strain these supplies. The General Plan seeks to promote efficient and sustainable use of energy resources and combat the stress placed on finite energy resources by patterns of low-density, automobile-dependent communities.

The County's policies promote the development of rail and bus transportation alternatives. Policy C/OS 9.1, *Expand the Production and Use of Alternative Energy Resources*, would relate specifically to construction of the proposed alternatives since there would be the potential to decrease petroleum use and increase electricity-powered rail lines.

The Mobility Element of the General Plan includes policy guidance and strategies to reach the County's long-term transportation goals. Specific policies include the following:

- Policy M1.1: Expand the availability of transportation options throughout the County.
- Policy M1.2: Encourage a range of transportation services at both the regional and local levels, especially for transit dependent populations.
- Policy M1.7: Maintain, upgrade, and create new transit facilities.
- Policy M2.2: Expand transportation options throughout the County that reduce automobile dependence.
- Policy M2.3: Reduce Vehicle Miles Traveled (VMT) and vehicle trips through the use of alternative modes of transportation.

SCAG reported a 6 percent (44 million boardings) increase in transit use in the region from July 2005 to July 2006. Such increases align with the County's General Plan goals and have potentially significant implications for countywide energy savings. Policies in the Mobility Element of the General Plan are consistent with and supportive of policy directives of the SCAG, Metro, and other agencies charged with transportation planning in Los Angeles County.

3.1.3.4 City of Los Angeles General Plan

The purpose of the City's Transportation Element (City of Los Angeles 1999) is to guide the future development of a citywide transportation system. Primary emphasis is placed on maximized efficiency and reducing vehicle trips.

The following policy in the Transportation Element relates to the proposed alternatives:

- Policy 2.2: Promote the development of transportation facilities and services that encourage transit ridership such as enhanced transit services and improved transit safety

3.2 Standards of Significance

3.2.1 NEPA Guidance

The Council on Environmental Quality (CEQ) dictates requirements for reporting environmental consequences under NEPA. While there are no specific NEPA criteria for analyzing impacts to energy resources, 40 CFR § 1502.16(e) directs that EISs include a discussion of the "energy requirements and conservation potential of various alternatives," "natural or depletable resource requirements and conservation potential of various alternatives," and potential mitigation measures.

3.2.2 CEQA Guidance

The following significance criteria are based on Appendix G of the state CEQA Guidelines (CERES 2005) and the *City of Los Angeles CEQA Thresholds Guide* (2006). The proposed project alternatives would result in a significant impact to energy resources if they would:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state;
- Require new (off-site) energy supply facilities and distribution infrastructure, or capacity enhancing alterations to existing facilities;
- Conflict with adopted energy conservation plans;
- Use non-renewable resources in a wasteful and inefficient manner; or
- Result in a need for new systems or substantial alterations to power or natural gas.

It is possible to determine whether the alternatives would have a significant effect on energy supplies by comparing the energy demands of the alternatives to current and anticipated energy supplies.

Appendix F, Energy Conservation, of the state CEQA Guidelines describes the specific requirements for EIRs to include a discussion of potential energy impacts for proposed projects. CEQA energy conservation goals include decreasing overall per capita energy consumption and decreasing reliance on natural gas and oil. Particular emphasis is given to

reducing inefficient, wasteful and unnecessary consumption of energy, and alternatives should be compared based on these criteria.

In addition to the above significance thresholds, the City of Los Angeles CEQA Guide (2006) describes appropriate considerations for cumulative impact analysis to energy resources. These guidelines state that cumulative projects relying on the same energy distribution infrastructure as the proposed project should be analyzed for their cumulative impact on energy supply and distribution. In addition, it should be determined whether new energy supply and distribution infrastructure would be required as a result of the cumulative effect of all relevant projects.

3.3 Evaluation Methodology

Analysis of potential energy resource impacts included consideration of the following elements:

- Construction-related energy
- Energy operating costs
- Direct energy consumption (measured in British thermal units (BTU) per vehicle mile for cars, trucks, buses, and light rail operating in the project area)
- Net project operating energy savings or costs

The area of potential impact for energy resources is defined by the LADWP's service area for short-term construction and station operation energy demands. Changes in regional VMT were assessed using data generated in the Transportation/Traffic technical report; therefore, the area of potential impact used to compare changes in VMT and corresponding energy use between alternatives aligns with that used in the Transportation technical report.

Detailed explanations of how each of the above was determined are given in the following section.

3.3.1 Construction and Operations Energy Analysis

3.3.1.1 Construction

Energy consumption during construction was determined by analyzing the energy requirements of construction equipment and construction processes. Energy requirements would differ for the construction phase of at-grade alternatives versus underground alternatives. The use of earthmoving equipment for excavating tunnels would be the primary source of additional energy consumption during construction of underground alternatives.

Construction-related impacts were estimated by applying a highway construction energy factor to the total estimated construction cost of the Regional Connector project. The California Department of Transportation (CALTRANS) derived energy consumption for different light rail transit facilities in *Energy and Transportation Systems,* and these factors are still widely used in the industry today (CALTRANS 1983).

Consumption factors are reported in BTUs per dollar of construction spending. Given the date of this data source, the energy consumption factors were adjusted to account for the change in construction costs. The California Construction Cost Index was used to adjust the factors to 2009 dollars.

The following energy consumption factors were used to estimate the energy consumed during project construction:

- Track elements: 6,012 BTU/2009$
- Site work and special conditions: 6,012 BTU/2009$
- Systems (including signaling and power supply and distribution): 9,240 BTU/2009$
- Stations, stops, terminals: 6,012 BTU/2009$
- Maintenance facilities: 7,394 BTU/2009$

Only direct construction costs related to this project were used to calculate energy consumption during construction. Professional engineering and right-of-way costs were not considered in the analysis.

3.3.1.2 Operations

Operational energy requirements would differ between at-grade and underground alternatives due to the need for escalators, elevators, and heating, cooling, and ventilation systems in underground stations. Each alternative would require the installation of an overhead catenary system (OCS) above the track-way to supply electricity to the trains.

Analysis of the operational energy impact of proposed stations for the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1 and Little Tokyo Variation 2 was determined following the same methodology used in the Climate Change Technical Memorandum, following Chester and Horvath's electricity usage factors used for the San Francisco Municipal Railway (Muni) in San Francisco (Chester and Horvath 2008).

3.3.2 VMT and Fuel Consumption Energy Analysis

The project area in downtown Los Angeles has a relatively low population density compared to its employment base. This disparity results in heavy commuter traffic in the morning and afternoon peak hours. The project area has the highest levels of mass transit ridership in the four-county region (Los Angeles, Orange, Riverside, and San Bernardino), and the transit system alleviates traffic congestion on freeways and arterial streets in the vicinity of downtown Los Angeles. Potential energy impacts related to VMT and vehicle fuel consumption are described and analyzed for a four-county region since the Regional Connector is intended to affect commuters and ridership from surrounding counties.

Energy needs for the proposed alternatives are measured in BTUs and equivalent barrels of oil. A BTU is defined as the quantity of heat required to raise the temperature of water one degree Fahrenheit at sea level. Table 3-1 compares various types of energy and their equivalent BTU units.

Table 3-1. Energy Comparisons

Energy Type	Energy Unit	Equivalent BTU Units
Electrical	Kilowatt-Hour (kWh)	3,412
Natural Gas	Cubic Foot	1,034
Crude Oil	Barrel (42 Gallons)	5,800,000
Gasoline	Gallon	125,000

Source: California Energy Commission 2007.

The United States Department of Energy's (DOE) *Transportation Data Book* was used to identify BTUs for each vehicle type in the project area and determine energy consumption factors for different modes of transportation. Table 3-2 summarizes these energy consumption factors. For transit buses, the DOE provides only one level of energy intensity regardless of fuel type (e.g., compressed natural gas or diesel). Light rail transit mode energy intensity accounts for electric use. Change in VMT was calculated based on the BTU per vehicle-mile rate shown in Table 3-2. Passenger miles for each alternative were obtained from the transportation model.

Table 3-2. Energy Consumption Factors	
Mode	**Factor (BTU/Vehicle Mile)**
Cars/Light Trucks[1]	6,213
Buses[2]	6,255
Light Rail[2]	77,327

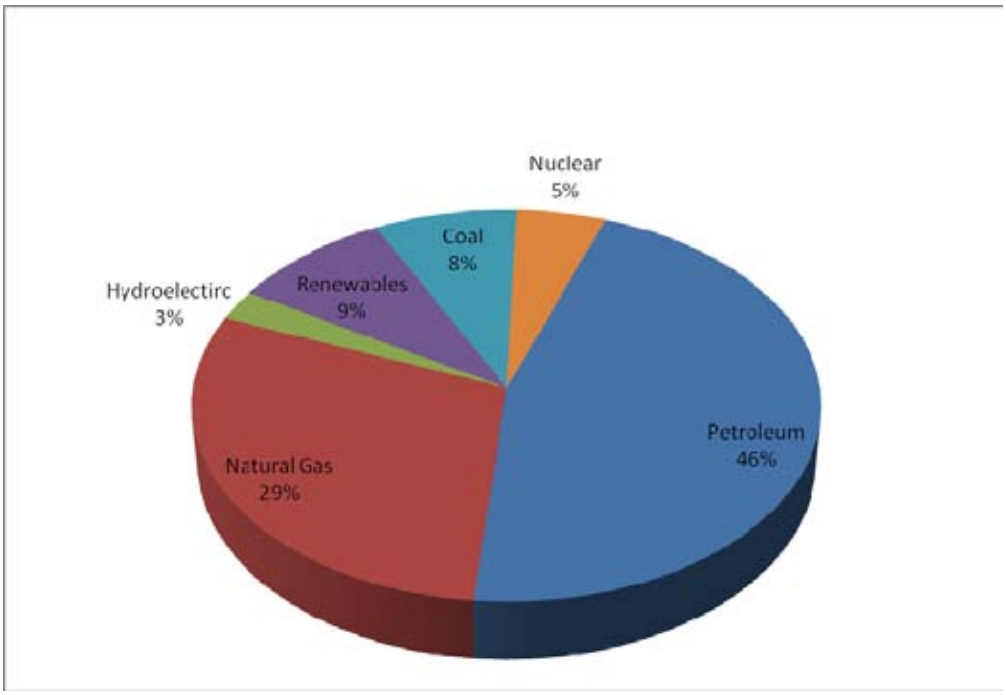
Sources: [1] RY2007 Database: http://www.ntdprogram.gov/ntdprogram/data.htm; [2] DOE 2008;

4.0 AFFECTED ENVIRONMENT

4. 1 California's Energy

Existing conditions of the state's energy and electricity supply and demand were developed from the two most recent California Energy Commission (CEC) Integrated Energy Policy Reports (2007 and 2009).

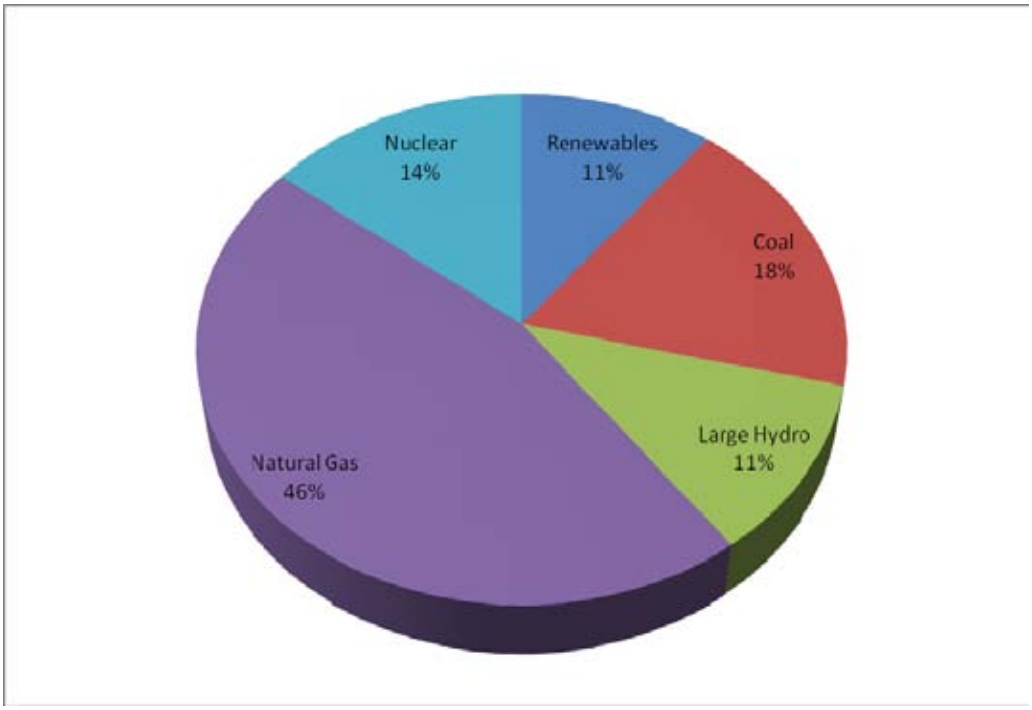
Currently, the state's energy infrastructure is over-burdened. Population growth is expected to increase demand for energy throughout the state (CEC 2009). Figure 4-1 depicts the makeup of California's energy sources in 2006.



Source: California Energy Commission 2007a.

Figure 4-1. California's Energy Sources - 2006

Electricity and transportation are the major energy use sectors analyzed by the CEC. Federal and state policies and regulations are gradually transforming electricity generation to cleaner sources and away from reliance on petroleum sources (CEC 2007a). Figure 4-2 depicts the state's electricity generation supply mix in 2008 (CEC 2009).



Source: CEC 2009.

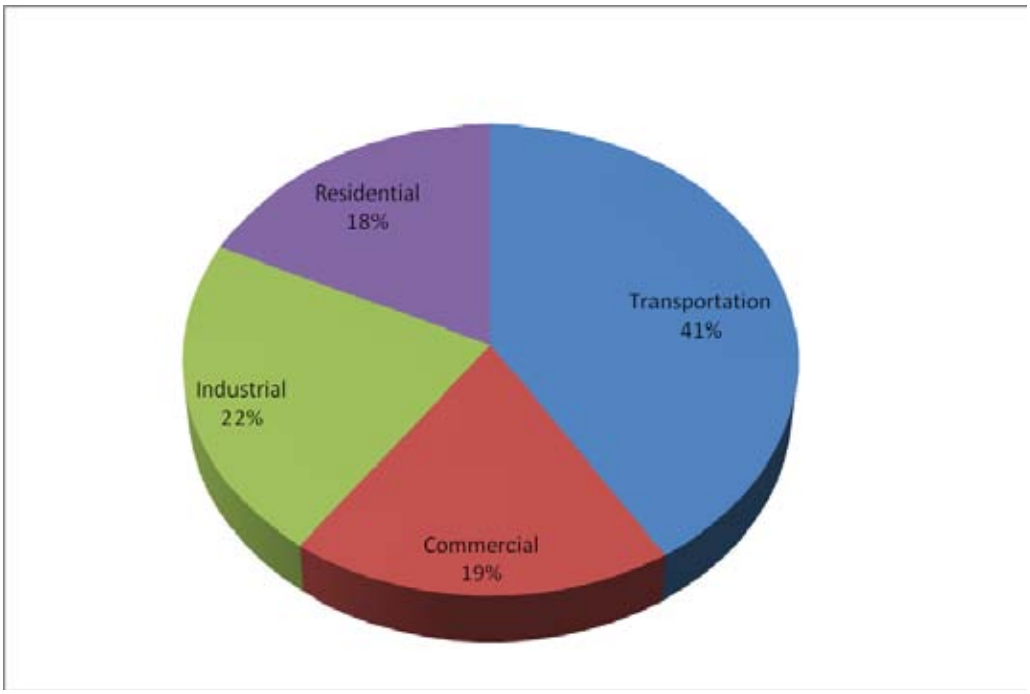
Figure 4-2. California's Electricity Generation Mix – 2008

4.2.2 Energy and the Transportation Sector

As shown in Figure 4-3, the transportation sector in California consumes a relatively large amount of energy. There has been a dramatic increase in the number of vehicles operated and the number of vehicle miles traveled in the state since the early 1970s. The California Energy Commission reports that Californians consumed approximately 20 billion gallons of gasoline and diesel fuel due to transportation in 2007. This amount represents an increase of nearly 50 percent over the last 20 years.

Registered vehicles operating in the state produce about 40 percent of the state's greenhouse gas emissions (CEC 2007b). Current projected growth rates from the Department of Finance and Moody's Economy.com indicate that population and real personal income will continue to increase between 2009 and 2030. Based on these projections, travel demand in California would likely increase during the same period (CEC 2009).

In 2006, the state's nearly 26 million vehicles consumed almost 16 billion gallons of gasoline and 4 billion gallons of diesel. California is the third largest consumer of gasoline in the world, behind the rest of United States and China (CEC 2007a). Figure 4-3 shows how over 40 percent of all energy consumed in the state is used for transportation.



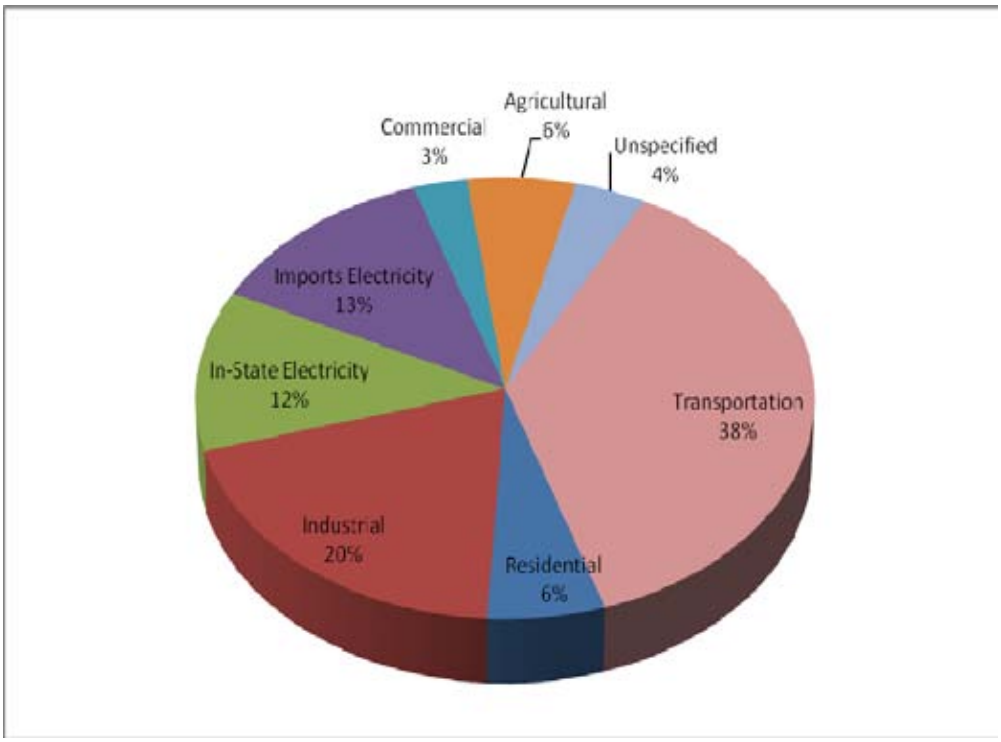
Source: California Energy Commission 2007a.

Figure 4-3. California Energy Use by Sector – 2006

The CEC's 2009 *Integrated Energy Policy Report* presents gasoline and diesel demand forecasts for both a low petroleum price case (high demand) scenario and a high petroleum price case (low demand) scenario. The high-demand scenario projects peak gasoline demand to be 16.4 billion gallons in 2014 and 14.32 billion gallons in 2030 (4 percent below 2008 levels). The low-demand scenario projects a peak demand of 15.69 billion gallons in 2014 and 13.57 billion gallons in 2030 (a decrease of 9 percent below 2008 levels).

The low demand scenario projects that total diesel demand will increase to 5.14 billion gallons, an increase in 49.8 percent between 2008 and 2030. Under the high-demand scenario, diesel demand would increase 57.4 percent to 5.4 billion gallons.

Transportation in Los Angeles County continues to be dominated by single-occupancy automobiles. In 2005, 74.7 percent of all people in the Southern California region drove alone to work (Los Angeles County 2008). High percentages of single-occupancy vehicles result in higher VMT throughout the state. In turn, high VMT translate into high energy use and increased air quality pollutants in the SCAG region. The CEC's *Integrated Energy Policy Report* concludes that the transportation sector is the largest polluter of greenhouse gases in the state (CEC 2007a). Figure 4-4 shows the role the transportation sector plays in greenhouse gas emissions.



Source: California Air Resources Board 2007, as cited in CEC 2007a.

Figure 4-4. Sources of Greenhouse Gas Emissions – 2004

The most recent available data for Metro bus and light rail energy consumption in the project region are from 2007. In that year, light rail and buses consumed approximately 900 billion BTUs, the equivalent of approximately 160,000 barrels of oil. The most recent data for annual automobile energy consumption in the region comes from the transportation model. Automobiles in the region consumed approximately 700,000 billion BTUs in 2009, the equivalent of over 118 million barrels of oil. Table 4-1 summarizes baseline (2009) annual energy usage in the region.

Metro Fuel Consumption

Metro's 2009 *Baseline Sustainability Report* describes that Metro ridership outpaced population growth by 14 percent between 1997 and 2008. While ridership grew by approximately 23 percent, the County's population grew by only nine percent (LACMTA 2009a). The report notes the role that increasing ridership can play in reducing regional VMT.

Table 4-1. Regional Annual Transportation Energy Usage, Existing Conditions [a]				
Vehicle Class	**Consumption Factors1. 2 (BTU/mi)**	**Miles Travelled (Annual)**	**Total BTU Consumption (Billions)**	**Total Barrels of Oil**
Light Rail[2]	77,327	3,925,583	304	52,400
Bus[2]	6,255	101,930,386	638	110,000
Automobiles[3]	6,213	111,037,526,000	689,876	118,944,100
Annual Total	N/A	111,143,381,969	690,818	119,106,600

Source: [1] DOE, 2008;
[2] RY2007 (Database: http://www.ntdprogram.gov/ntdprogram/data.htm);
[3] CDM, 2009.
Notes: [a] Existing conditions are reported from data sources dated 2007 and 2009. The 2007 data are the most recent available data from the National Transportation Data Program for Metro-reported light rail and bus miles travelled annually.

Metro uses two types of fuel to power its bus fleet, compressed natural gas (CNG) and diesel. With a total fleet of 2,635 buses, Metro currently operates 129 diesel-powered buses, 2,506 CNG buses. In addition, 173 buses are leased to independent contractors who provide service on Metro routes (LACMTA 2009a). Contract-operated buses currently run on a mix CNG, propane, and other fuels; however, Metro is moving towards transitioning all buses to run on CNG. Petroleum fuels are currently purchased through a variety of commercial sources. CNG is purchased through the Southern California Gas Company. Since 2002, Metro's fuel use has increased 3 percent annually, but it continues to work to reduce the use of diesel and gasoline in favor of cheaper and cleaner CNG.

As of June 2009, Metro operates six fixed guideways (rail and transitways) that run on electricity and CNG (LACMTA 2009a). Metro's electricity use is split between powering the rail system and transit facilities (LACMTA 2009b). For both rail and facility electricity requirements, Metro buys power from LADWP, Southern California Edison (SCE), and Pasadena Water and Power (LACMTA 2009b).

Electricity usage for both facilities and rail operations increased between 2005 and 2008. In 2008, Metro rail consumed 175 million kWh of electricity (approximately 597 billion BTUs) and Metro facilities consumed 69 million kWh (approximately 235 thousand BTUs) (LACMTA 2009b). In addition, Metro is currently electrifying all of the CNG facilities at the various divisions. Metro's *2009 Baseline Sustainability Report* presents goals and recommendations

for tracking and improving performance measures. Metro would purchase additional electricity from its current providers to operate the proposed project.

4.2.3 Los Angeles Department of Water and Power

The LADWP provides electricity to the project area. The LADWP's *2007 Integrated Resource Plan* and the CEC staff revised forecast, *California Energy Demand 2008-2018*, were used to determine current total electricity generation and consumption in the LADWP planning area (California Energy Commission 2007c; LADWP 2007. The most recent data used came from 2006, and current production and consumption were projected for 2009.

Total electricity generation in 2006 was 29 billion kilowatt hours (KWh) (LADWP 2007). Total electricty consumption was 25.6 billion KWh (87,300 billion BTUs). The 2007 LADWP *Integrated Resource Plan* forecasts loads from 2007 to 2027. The base case load forecast for 2009 is 49.6 billion KWh (169,000 billion BTUs). The CEC's demand forecast report predicts total consumption in the LADWP service area for 2009 equal to 26.1 billion KWh (89,100 billion BTUs).

5.0 IMPACTS

Located in downtown Los Angeles, the proposed project would be served by the LADWP. As discussed in Section 4.0, the transportation sector consumes much of the energy produced in California and is one of the largest contributors of greenhouse gases. However, public transit contributes to VMT reduction resulting in overall reductions in greenhouse gas emissions. The following sections address potential impacts to energy resources and energy usage from the proposed project alternatives.

Table 5-1 summarizes annual changes in energy consumption for each of the action alternatives compared to the No Build Alternative. Calculations were based on data from the transportation model that projected changes in daily VMT throughout the region. Table 5-2 summarizes total operational energy demands under all of the proposed alternatives. Table 5-2 compares BTUs and barrels of oil under each alternative as well as the percent change in BTUs between each build alternative and the No Build Alternative.

Table 5-1. Estimated Regional Highway VMT and Energy Consumption Comparisons

Scenario	Annual Change in Automobile VMT	Annual Change in Energy Consumption (BTU in billions)	Annual Change in Barrels of Oil
TSM Alternative vs. No Build Alternative	(100,083,000)	(622)	(107,200)
At-Grade Emphasis LRT Alternative vs. No Build Alternative	(110,157,000)	(684)	(118,000)
Underground Emphasis LRT Alternative vs. No Build Alternative	(113,989,500)	(708)	(122,100)
Fully Underground LRT Alternative – Little Tokyo Variation 1 vs. No Build Alternative	(117,384,000)	(729)	(125,700)
Fully Underground LRT Alternative – Little Tokyo Variation 2 vs. No Build Alternative	(117,384,000)	(729)	(125,700)

Note: Parentheses indicate a reduction compared to the No Build Alternative.

Table 5-2. Estimated Annual Operational Energy Consumption for Each Alternative

Stations – --	4.5	800			

Notes: [1] – Calculation of VMT describes changes in highway VMT within the project area projected by the transportation model for the 2035 horizon year under each alternative. Added bus VMT are included in the TSM Alternative and added light rail VMT are included in the four LRT build alternatives. Operations of buses and light rail outside of the proposed alternatives are assumed to remain unchanged.
[2] – Operational BTUs include the energy required to operate additional stations under the LRT build alternatives.
[3] – This percentage represents percent change in operational BTUs and does not include construction.

Potential energy impacts from construction and operation of the alternatives, as well as the significance of these impacts, are described in further detail in the following sections.

5.1 No Build Alternative

Under the No Build Alternative, no transportation improvements would be made beyond those listed in Metro's Long Range Transportation Plan (LRTP). By the projection year 2035 it is expected that the Metro Expo Line to Santa Monica, the Metro Gold Line to Azusa, the Metro Gold Line to the San Gabriel Valley, the Metro Purple Line to Westwood, and the Metro Crenshaw Line would be operational. While it is anticipated that bus service in the project area would predominantly remain the same, there may be some service adjustments in order to provide connections to the Metro Expo and Gold Lines service areas. The No Build Alternative would not involve new construction of rail lines or other transportation improvements.

5.1.1 Construction

The No Build Alternative would not include any construction of new light rail lines in the project area. The No Build Alternative would not result in construction-related impacts to energy use or resources in the project area or region.

5.1.2 Operations

Under the No Build Alternative, no energy consumption would be associated with the operation of new light rail lines or stations. Increased energy consumption that would occur under the No Build Alternative represents predicted increases in VMT unrelated to the proposed project. Annual highway VMT in the region would increase from 111,037,526,000 (2009) to 184,190,899,000 (2035). Correspondingly, energy consumption throughout the region would increase by approximately 500,000 billion BTUs (Table 5-2). Since the No Build Alternative assumes that the Regional Connector Transit Corridor project would not be built, this increase in BTUs is a result of projected growth in traffic that is expected to occur in the region without the project. There would be no direct impact to energy resources as a result of this alternative.

5.1.3 Cumulative

There would be no construction-related impacts under the No Build Alternative. Consequently, this alternative would not result in energy-related impacts when considered cumulatively with renovation, new construction, and transportation projects in the region.

Development of the Regional Connector Transit Corridor would not occur under the No Build Alternative. As a result, there would be no project-level changes in energy consumption associated with the No Build Alternative. Increases in energy consumption would result from regional traffic growth and projects already approved under Metro's LRTP. Therefore, the No

Build Alternative would not contribute to cumulative impacts with respect to energy resources.

5.2 Transportation System Management (TSM) Alternative

The TSM Alternative focuses on enhancements to and restructuring of the existing transit service in the project area. In addition to provisions in Metro's LRTP, two new shuttle bus routes would link the 7th Street/Metro Center Station to Union Station. The TSM Alternative would not involve construction of additional tracks or stations outside of projects already approved in the LRTP. Creation of peak hour bus-only lanes would not require new construction. Rather, the lanes could be created by restricting parking on streets that do not already have dedicated all-day bus lanes.

5.2.1 Construction

The TSM Alternative would have no construction impact on energy resources or energy use in the project area or region because there would be no construction outside of that previously approved in Metro's LRTP.

5.2.2 Operations

To determine operational energy use of the TSM Alternative, the analysis evaluated energy use of the potential new bus lines and regional traffic.

5.2.2.1 Light Rail Operations

LRT facilities are not proposed under the TSM Alternative. Light rail operations energy use is assumed to remain unchanged from the No Build Alternative and is not estimated in this section.

5.2.2.2 Regional Traffic

Compared to the No Build Alternative, operation of the TSM Alternative would reduce highway VMT in the project area by over 100 million vehicle miles per year. Correspondingly, automobile energy consumption would decrease by over 620 billion BTUs (over 107,000 barrels of oil) (Table 5-1). These potential impacts would be beneficial to energy and vehicle fuel resources in the project area.

5.2.2.3 Bus Operation

Under the TSM Alternative, two additional bus lines would travel a total of approximately 994,000 vehicle miles annually. The new buses would consume energy totaling 6 billion BTUs annually (approximately 1,000 barrels of oil).

5.2.2.4 Total Operational Energy Consumption

Total operational energy use under the TSM Alternative would equal approximately 1,143,757 billion BTUs. This figure is compared to current total energy usage of 689,876 (2009) to determine significance under CEQA. Total energy use is compared to the No Build Alternative (2035) to determine significance under NEPA.

Total operational energy under the TSM Alternative is greater than existing (2009) consumption. However, this increase is largely due to an increase in VMT in the region unrelated to the project. Compared to year 2035 under the No Build Alternative, VMT in the region would decrease by over 100 million, and energy consumption would decline by 622 billion BTUs. Given the reduction in BTUs associated with reduction in highway VMT, total net savings from operations of the TSM Alternative would be greater than 600 billion BTUs annually. Therefore, operations of the TSM Alternative would result in potential beneficial impacts.

5.2.3 Cumulative

There would be no construction-related impacts under the TSM Alternative. Considered cumulatively with relevant identified renovation, new construction, and transportation projects, this alternative would not have significant adverse energy impacts. Operation of two added bus routes under the TSM Alternative would result in a less than significant impact to energy use and energy resources.

Projects considered for cumulative impact would comply with federal, state, and local regulations to conserve and reduce energy usage. Additionally, the TSM Alternative would result in a reduction in automobile VMT and BTUs compared to No Build Alternative. This would result in a potential beneficial impact.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative includes both underground and at-grade configurations. Depending on the final configuration, approximately 38 to 46 percent of the route would run underground. A direct connection would link the 7th Street/Metro Center Station to the Metro Gold Line at Temple and Alameda Streets. This Alternative would involve the construction of three new stations (two underground and a one-way couplet at street level).

5.3.1 Construction

To determine construction-related energy consumption, the analysis used capital cost data per the methodology described in Section 3.3. Construction energy impacts are summarized in Table 5-3.

Table 5-3. Estimated Energy Consumption from Construction – At-Grade Emphasis LRT Alternative			
Project Component	**Base Year Dollars (thousands)**	**Energy Consumption Factor (BTU/2009$)**	**Total BTU Consumption (billions)**
Track Elements	105,506	6,012	634
Stations, Stops, Terminals	230,850	6,012	1,388
Maintenance Facilities	8,625	7,394	63
Site work	165,378	6,012	994
Systems	40,950	9,240	378
Total	**551,308**	**N/A**	**3,457**

Construction of the At-Grade Emphasis LRT Alternative would result in a temporary energy demand of 3,457 billion BTUs. This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative, potential construction-related impacts would be less-than-significant.

5.3.2 Operations

Operational energy use for the At-Grade Emphasis LRT Alternative includes the energy use of new light rail vehicles, new stations and regional traffic.

5.3.2.1 Light Rail and Station Operations

Annual operations of light rail under this alternative would consume approximately 30 billion BTUs (approximately 5,000 barrels of oil) (Table 5-2). Stations would consume 3.1 billion BTUs annually.

5.3.2.2 Regional Traffic

Operation of the At-Grade Emphasis LRT Alternative would result in an annual decrease of highway VMT within the region by over 110 million vehicle miles when compared to the No

Build Alternative. This decrease would result in annual reductions of 684 billion BTUs (118,000 barrels of oil). Reduction in vehicle energy consumption would result in a beneficial potential impact to energy resources in the region.

5.3.2.3 Bus Operations

Since additional bus routes are not part of this alternative, changes in energy use related to bus operations would not occur.

5.3.2.4 Total Operational Energy Consumption

Total annual BTU consumption associated with the At-Grade Emphasis LRT alternative would be approximately 1,143,731 billion BTUs. This figure is compared to current total energy usage (2009) to determine significance under CEQA. Total energy use is compared to the No Build Alternative (2035) to determine significance under NEPA.

Total operational energy consumption under the At-Grade Emphasis LRT Alternative would be greater than baseline 2009 levels. However, this increase would be largely due to an increase in VMT in the region unrelated to the project. This alternative would reduce VMT and result in an annual 684 billion BTU decrease (118,000 barrels of oil) in energy consumption compared to the No Build Alternative. Total annual net savings from operations under this alternative would be greater than 600 billion BTUs (113,000 barrels of oil). Since this alternative would result in reduced energy consumption (compared to the 2035 No Build Alternative), the potential impact to energy resources in the region would be beneficial.

5.3.3 Cumulative

Construction of the At-Grade Emphasis LRT Alternative would result in less-than-significant impacts to energy resources. The proposed project, as well as renovation, new construction, and transportation projects in the vicinity of the proposed project, would comply with federal, state, and local regulations to conserve and reduce energy usage. Construction would require energy from both transportation fuels and LADWP's electricity supply.

The LADWP is working to develop new renewable energy and energy efficient resources. This project alternative, and other potential projects in the area, would comply with applicable energy efficiency guidance set by the LADWP. Potential cumulative impacts related to construction would be less-than-significant.

LADWP predicts increases in electricity demand over the next decade. LADWP has increased its ability to serve the area by adding new facilities and increasing and diversifying its energy supplies. Given that operation of the At-Grade Emphasis LRT Alternative would result in a beneficial energy impact, potential cumulative impacts related to operation would be less-than-significant.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would run underground except for a single, at-grade crossing at the intersection of 1st and Alameda Streets. Newly constructed light rail right of way would consist of at-grade double tracks near 1st and Alameda Streets and underground double tracks running beneath Flower and 2nd Streets. Additionally, three new underground stations are proposed under this alternative.

5.4.1 Construction

The analysis used capital cost data per the methodology described in Section 3 to determine construction-related energy consumption. Construction energy impacts are summarized in Table 5-4.

Table 5-4. Estimated Energy Consumption from Construction – Underground Emphasis LRT Alternative

Project Component	Base Year Dollars (thousands)	Energy Consumption Factor (BTU/2009$)	Total BTU Consumption (billions)
Track Elements	161,921	6,012	973
Stations, Stops, Terminals	388,140	6,012	2,333
Maintenance Facilities	8,625	7,394	63
Site work	201,937	6,012	1,214
Systems	40,285	9,240	372
Total	**800,908**	**N/A**	**4,957**

Construction of the Underground Emphasis LRT Alternative would consume a one-time amount of approximately 5,000 billion BTUs. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. The one-time energy use required to construct this alternative would be offset by the project's long-term, beneficial operational impacts. Given the long-term, beneficial decreases in energy use, potential construction-related impacts would be less than significant.

5.4.2 Operations

Operational energy use for the Underground Emphasis LRT Alternative includes the energy use of new light rail vehicles, new stations, and regional traffic.

5.4.2.1 Light Rail Operations

Annual operations of the light rail under this alternative would consume approximately 30 billion BTUs (approximately 5,000 barrels of oil). Stations would consume 3.4 billion BTUs annually (Table 5-2).

5.4.2.2 Regional Traffic

Operation of the Underground Emphasis LRT Alternative would result in an annual decrease of approximately 114 million vehicle miles when compared to the No Build Alternative (Table 5-1). This decrease would result in annual reductions of 700 billion BTUs (122,000 equivalent barrels of oil). Reduction in vehicle energy consumption would result in a potential beneficial impact to energy resources in the region.

5.4.2.3 Bus Operations

Since bus operations are not part of this alternative, changes in energy usage would not occur.

5.4.2.4 Total Operational Energy Consumption

Annual operation of this alternative would require approximately 1,143,698 billion BTUs (Table 5-2). This figure is compared to current total energy usage (2009) to determine significance under CEQA. Total energy use is compared to the No Build Alternative (2035) to determine significance under NEPA.

Total operational energy consumption related to this alternative is greater than baseline 2009 conditions. This increase would result from increases in regional VMT unrelated to the project. This alternative would reduce VMT and result in an annual 700 billion BTU decrease (equivalent to approximately 122,000 barrels of oil) in energy consumption compared to the No Build Alternative. Total annual net savings from operations under this alternative would be greater than 650 billion BTUs (equivalent to 115,000 barrels of oil). Since this alternative would result in reduced energy consumption (compared to the 2035 No Build Alternative), the potential impact to energy resources in the region would be beneficial.

5.4.3 Cumulative

Construction of the Underground Emphasis LRT Alternative would result in less than significant impacts to energy resources. The proposed project, as well as renovation, new construction, and transportation projects in the vicinity of the proposed project would comply

with federal, state, and local regulations to conserve and reduce energy usage. Construction would require energy from both transportation fuels and LADWP's electricity supply.

The LADWP is working to develop new renewable energy and energy efficient resources. This project alternative, and other potential projects in the area, would comply with applicable energy efficiency guidance set by the LADWP. Potential cumulative impacts related to construction would be less than significant.

LADWP predicts increases in electricity demand over the next decade and has increased its ability to serve the area by adding new facilities and increasing and diversifying its energy supplies. Given that operation of the Underground Emphasis LRT Alternative would result in a beneficial energy impact, potential cumulative impacts related to operation would be less than significant.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would be identical to the Underground Emphasis LRT Alternative 2nd Street station – Broadway Option for all areas west of 2nd Street and Central Avenue. East of Central Avenue, this alternative would include an underground station just southwest of the intersection of 1st and Alameda Streets. In addition to this station, this alternative would include a new, underground, three-way junction.

From the junction, one set of tracks would continue north, travel under Temple Street, and surface in the LADWP maintenance yard just east of and adjacent to Alameda Street. The other set of tracks would rise to street level to the east within 1st Street in order to accommodate a new portal and connect to the existing Metro Gold line tracks. This alternative would include construction of four new underground stations.

5.5.1 Construction

To determine construction-related energy consumption, the analysis used capital cost data per the methodology described in Section 3.1. Construction energy impacts are summarized in Table 5-5.

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a temporary energy demand of approximately 6,000 billion BTUs. This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative; potential construction-related impacts would be less than significant.

Table 5-5. Estimated Energy Consumption from Construction – Fully Underground LRT Alternative – Little Tokyo Variation 1			
Project Component	**Base Year Dollars (thousands)**	**Energy Consumption Factor (BTU/2009$)**	**Total BTU Consumption (billions)**
Track Elements	229,148	6,012	1,377
Stations, Stops, Terminals	457,640	6,012	2,759
Maintenance Facilities	8,825	7,394	65
Site work	188,060	6,012	1,130
Systems	49,124	9,240	453
Total	**932,797**	**N/A**	**5,886**

5.5.2 Operations

Operational energy use for the Fully Underground Alternative – Little Tokyo Variation 1 includes the energy use of new light rail vehicles, new stations, and regional traffic.

5.5.2.1 Light Rail Operations

Annual operations of light rail under this alternative would consume approximately 28 billion BTUs (approximately 4,800 barrels of oil) (Table 5-2). Stations would consume 4.5 billion BTUs annually.

5.5.2.2 Regional Traffic

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in an annual decrease of 117 million vehicle miles when compared to the No Build Alternative. This decrease would result in annual reductions of 730 billion BTUs (125,000 barrels of oil). Reduction in vehicle energy consumption would result in a beneficial potential impact to energy resources in the region.

5.5.2.3 Bus Operations

Since bus operations are not part of this alternative, changes in energy usage would not occur.

5.5.2.4 Total Operational Energy Consumption

Total annual BTU consumption associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be approximately 1,143,659 billion BTUs (Table 5-2). This figure is compared to current total energy usage (2009) to determine significance under CEQA. Total energy use is compared to the No Build Alternative (2035) to determine significance under NEPA.

Total operational energy consumption under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be greater than baseline 2009 levels. However, this increase would be largely due to an increase in VMT in the region unrelated to the project. This alternative would reduce VMT and result in an annual 730 billion BTU decrease (equivalent to 125, 000 barrels of oil) in energy consumption compared to the No Build Alternative. Total annual net savings from operations under this alternative would be greater than 700 billion BTUs (120,000 barrels of oil). Since this alternative would result in reduced energy consumption (compared to the 2035 No Build Alternative), the potential impact to energy resources in the region would be beneficial.

5.5.3 Cumulative

Cumulative impacts would be similar to those described for the Underground Emphasis LRT Alternative; thus, potential cumulative impacts from construction and operations of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less than significant.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would be identical to the Underground Emphasis LRT Alternative 2nd Street station – Broadway Option for all areas west of 2nd Street and Central Avenue. This alternative would include a new underground station on the block bounded by 2nd, 1st, and Alameda Streets, Central Avenue. This proposed station would have two underground levels, each with a single-track platform.

This alternative would create an underground junction similar to that described for the Fully Underground LRT Alternative - Little Tokyo Variation 1. Under this alternative, however, the junction would have two underground levels. In addition, 1st Street would contain two portals instead of one as described for the Fully Underground LRT Alternative - Little Tokyo Variation 1. This alternative would also require construction of four new underground stations.

5.6.1 Construction

The analysis used capital cost data per the methodology to determine construction-related energy consumption. Construction energy impacts are summarized in Table 5-6.

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a temporary energy demand of approximately 6,300 billion BTUs. This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative; potential construction-related impacts would not be significant.

Table 5-6. Estimated Energy Consumption from Construction – Fully Underground LRT Alternative – Little Tokyo Variation 2

Project Component	Base Year Dollars (thousands)	Energy Consumption Factor (BTU/2009$)	Total BTU Consumption (billions)
Track Elements	230,895	6,012	1,388
Stations, Stops, Terminals	538,830	6,012	3,239
Maintenance Facilities	8,625	7,394	64
Site work	192,128	6,012	1,155
Systems	48,154	9,240	445
Total	**1,018,632**	**N/A**	**6,291**

5.6.2 Operations

Operational energy use for Fully Underground Alternative – Little Tokyo Variation 2 includes the energy use of new light rail vehicles, new stations, and regional traffic.

5.6.2.1 Light Rail Operations

Annual operations of light rail under this alternative would consume approximately 28 billion BTUs (approximately 4,800 barrels of oil) (Table 5-2). Stations would consume 4.5 billion BTUs annually.

5.6.2.2 Regional Traffic

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in an annual decrease of 117 million vehicle miles when compared to the No Build Alternative. This decrease would result in annual reductions of 730 billion BTUs (125,000 barrels of oil).

Reduction in vehicle energy consumption would result in a beneficial potential impact to energy resources in the region.

5.6.2.3 Bus Operations

Since bus operations are not part of this alternative, changes in energy usage would not occur.

5.6.2.4 Total Operational Energy Consumption

Total operational energy consumption under this alternative would mirror that of the Fully Underground LRT Alternative – Little Tokyo Variation 1, described in Section 5.5.2.4. Since this alternative would result in reduced energy consumption (compared to the 2035 No Build Alternative), the potential impact to energy resources in the region would be beneficial.

5.6.3 Cumulative

Cumulative impacts from construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be the same as those described for the Fully Underground LRT Alternative – Little Tokyo Variation 1. Thus, potential cumulative impacts from construction and operation of this alternative would be less than significant.

6.0 POTENTIAL MITIGATION MEASURES

No mitigation measures would be required because potential impacts to energy resources under the TSM and build alternatives would be beneficial.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

There would be no adverse impacts from the No Build Alternative with respect to energy resources in the region.

7.1.2 CEQA Determinations

The No Build Alternative would have no impact on energy resource availability or energy use in the region.

7.2 Transportation System Management (TSM) Alternative

7.2.1 NEPA Findings

There would be no adverse impacts from the TSM Alternative with respect to energy resources.

7.2.2 CEQA Determinations

The TSM Alternative would not result in significant impacts to the availability of energy resources in the region. The TSM Alternative would not require new offsite energy supplies or conflict with regional energy conservation plans. Additionally, the TSM Alternative would not result in an inefficient or wasteful use of resources or the need for new systems for power or natural gas. Thus, potential impacts to energy resources would be less than significant.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

Construction of the At-Grade Emphasis LRT Alternative would result in a one-time, non-recoverable energy use in the project area. However, operations would result in net energy resource savings of approximately 600 billion BTUs (113,000 equivalent barrels of oil) in the region. Given long-term, beneficial decreases in energy use under this alternative, construction-related impacts would be less than significant. The At-Grade Emphasis LRT Alternative would result in a long-term, beneficial impact to energy resources in the region when compared to the No Build Alternative.

7.3.2 CEQA Determinations

Total operational energy consumption under the At-Grade Emphasis LRT Alternative would be greater than that of existing conditions. However, this increase results from increased regional traffic unrelated to this alternative. Operation of this alternative would result in a net decrease in energy consumption. Thus, this alternative would have a beneficial potential

impact to energy resources and would offset the one-time, non-recoverable energy use associated with construction. Construction and operation of the At-Grade Emphasis Alternative would not exceed CEQA significance thresholds.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Construction impacts from the Underground Emphasis LRT Alternative would result in a one-time, non-recoverable energy use in the project area. However, operation of the Underground Emphasis LRT Alternative would result in a decrease in energy consumption in the project area. Given the long-term beneficial decreases in energy use under this alternative, potential construction-related impacts would be less than significant. The Underground Emphasis LRT Alternative would result in a long-term beneficial impact to energy resources in the region when compared to the No Build Alternative.

7.4.2 CEQA Determinations

Total operational energy consumption under the Underground Emphasis LRT Alternative would be greater than that of existing conditions. However, this increase results from increased regional traffic unrelated to this alternative. Operation of this alternative would result in a net decrease in energy consumption. Thus, this alternative would have a beneficial potential impact to energy resources and would offset the one-time, non-recoverable energy use associated with construction. Construction and operation of the Underground Emphasis LRT Alternative would not exceed CEQA significance thresholds.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

Construction impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a one-time, non-recoverable energy use in the project area. However, operation of this alternative would result in a decrease in energy consumption in the project area. Given the long-term beneficial decreases in energy use under this alternative, potential construction-related impacts would be less than significant. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a long-term beneficial impact to energy resources in the region when compared to the No Build Alternative.

7.5.2 CEQA Determinations

Total operational energy consumption under the Fully Underground Emphasis LRT Alternative – Little Tokyo Variation 1 would be greater than that of existing conditions. However, this increase results from increased regional traffic unrelated to this alternative. Operation of this alternative would result in a net decrease in energy consumption. Thus, this alternative would have a beneficial potential impact to energy resources and would offset the one-time, non-

recoverable energy use associated with construction. Construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not exceed CEQA significance thresholds.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

NEPA findings mirror those described for the Fully Underground LRT Alternative – Little Tokyo Variation 1. Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would reduce energy consumption in the project area, and would have a beneficial impact to energy resources.

7.6.2 CEQA Determinations

Construction and operational impacts associated with this alternative would mirror those described for the Fully Underground LRT Alternative – Little Tokyo Variation 1. Construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not exceed CEQA significance thresholds. Long-term potential impacts from operation of this alternative would be beneficial to regional energy resources.

Draft Environmental Impact Statement/
Draft Environmental Impact Report

APPENDIX X

CULTURAL RESOURCES - BUILT ENVIRONMENT (UPDATED)

State Clearinghouse Number: 2009031043

California State Office of Historic Preservation Coordination

The Cultural Resources – Built Environment Technical Memorandum for the Regional Connector Transit Corridor project contained in this appendix was submitted to the California State Office of Historic Preservation. The State Historic Preservation Officer (SHPO) reviewed the technical memorandum including the determinations of eligibility for all potentially eligible properties within the Area of Potential Effect (APE). On June 1, 2010, the SHPO concurred with the determinations of eligibility and with the findings of effect from project alternatives. That concurrence letter is included in the following pages.

OFFICE OF HISTORIC PRESERVATION
DEPARTMENT OF PARKS AND RECREATION
P.O. BOX 942896
SACRAMENTO, CA 94296-0001

Re: Determinations of Eligibility and Finding of Effect for the Regional Connector Transit Corridor Project, Los Angeles, Los Angeles County, CA

Dear Ms. Saltarelli:

Thank you for your letter of 19 April 2010 continuing consultation on behalf of the Federal Transit Authority (FTA) for the above referenced undertaking in order to comply with Section 106 of the National Historic Preservation Act of 1966 and its implementing regulation at 36 CFR Part 800. You are requesting that I review the determinations of eligibility and assessment of effects for the Regional Connector Transit Corridor Project.

After reviewing the enclosed cultural resources report, I am able to concur with FTA's determinations of eligibility. 289 properties were identified in the APE for the project. Of those 289, 118 were of sufficient age to be considered for inclusion in the National Register of Historic Places (NRHP). Fifteen properties were previously listed in the NRHP and 33 were determined eligible by FTA. FTA has determined the following properties are eligible for inclusion in the NRHP:

1. Barker Brothers, 818 West 7th Street
2. Fine Arts Building, Global Marine House, 811 West 7th Street
3. 811 Wilshire Building, Tishman 615 Building, Wilflower Building, 811 Wilshire Boulevard
4. The California Club, 528 South Flower Street
5. 2nd Street Tunnel, Bridge# 53C 1318
6. Los Angeles Civic Center Historic District
7. Los Angeles Department of Water and Power Building, John Ferraro Office Building, 111 North Hope Street
8. Ahmanson Theater, 135 North Grand Avenue
9. Mark Taper Forum, 135 North Grand Avenue
10. Dorothy Chandler Pavilion, 135 North Grand Avenue
11. Los Angeles County Hall of Administration, Kenneth Hahn Hall of Administration, 500 West Temple Street, 222 North Grand Avenue
12. El Paseo de los Pobladores de Los Angeles, 224 North Grand Avenue
13. Los Angeles County Courthouse, Stanley Mosk Los Angeles County Courthouse, 111 North Hill Street
14. County of Los Angeles Central Heating and Refrigeration Plant, 301 North Broadway
15. Los Angeles County Hall of Records, 320 West Temple Street
16. Court of Historic American Flags, 224 North Hill Street, 100 block Hill Street
17. Los Angeles County Law Library, Mildred L. Lillie Building, 301 West 1st Street
18. Hall of Justice, Los Angeles County Jail, 211 West Temple Street

19. Clara Shortridge Foltz Criminal Justice Center, 210 West Temple Street
20. Los Angeles City Hall, 200 North Spring Street
21. City Health Building, City Hall South, 111 East 1st Street
22. Federal Building, North Los Angeles Field Office, 300 North Los Angeles Street
23. The Police Facilities Building, Parker Center, Motor Transportation Division, 150 North Los Angeles Street and 151 North Judge John Aiso Street
24. Mark Kuwata Real Estate, 301 East 1st Street, 104-106 North San Pedro Street, 104-106 Judge John Aiso Street
25. Koyasan Buddhist Temple, Koyasan Church, Koyasan Temple, 342 East 1st Street
26. John A. Roebling's Sons Co., Robert Arranaga & Company, Incorporated, 216 South Alameda Street,
27. Los Angeles Times Building, 202 West 1st Street
28. The Mirror Building (Site of Butterfield Stage Station), Los Angeles Times-Mirror Annex, Times Building South, Mirror-News Building, 145 South Spring Street
29. Cathedral of Saint Vibiana, 214 South Main Street
30. Cathedral of Saint Vibiana, Rectory, 114 East 2nd Street
31. J.R. Newberry Company Building, 900 East 1st Street
32. 1st Street Viaduct, 1st Street between Vignes Street and Mission Road
33. Walt Disney Concert Hall, 111 South Grand Avenue

I concur with the NRHP determinations but will not comment on those properties identified solely for CRHR determination. The remaining resources in the APE are not eligible for inclusion in the NRHP.

Only one historic property, the 2nd Street Tunnel will be adversely affected by the project. I concur with the FTA's determination of adverse effect. Once FTA has submitted a draft MOA for the consultation I can comment on the mitigation measures for the undertaking.

Thank your for considering historic properties in your planning process. If you have any questions, please contact Amanda Blosser of my staff at (916) 654-7372 or e-mail at ablosser@parks.ca.gov.

Sincerely,

Susan K Stratton for

Milford Wayne Donaldson, FAIA
State Historic Preservation Officer

1.0 SUMMARY

1.1 Purpose and Scope

SWCA Environmental Consultants (SWCA) conducted a cultural resources inventory of the built environment that may be affected by the proposed Regional Connector Transit Corridor project (the project). Cardno ENTRIX, Inc. reviewed and revised the Inventory and prepared this Technical Memorandum. Cardno ENTRIX prepared revisions to the Technical Memorandum to address refinements to the Locally Preferred Alternative (LPA).

The Metro Board of Directors has designated the Fully Underground LRT Alternative as the LPA. Based on input received during the Draft EIS/EIR review period, refinements to the LPA were made to reduce impacts. Revisions (excluding minor edits for consistency and correction of minor typographical errors) are indicated by a vertical line in the margin. No changes to the NEPA impact findings or CEQA impact determinations were identified as a result of refinements to the LPA, responses to comments, or other developments since publication of the Draft EIS/EIR.

The project is approximately 1.9 miles in length and is located in the City of Los Angeles, in Los Angeles County, California. The purpose of this project is to improve the region's public transit service and mobility within the corridor by connecting the light rail service of the Metro Gold Line to Claremont and the Eastside with the Metro Blue Line to Long Beach and the Metro Expo Line to Santa Monica. This link would serve communities across the region, allowing greater accessibility while serving expected population and employment growth in downtown Los Angeles.

This Technical Memorandum was prepared to comply with federal and state cultural resource compliance regulations and guidelines. The National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA) of 1966 regulations require the identification of historic properties and evaluation of project-related effects on those properties. Section 106 of the NHPA defines "historic properties" as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places" (National Register) (36 CFR Section 800.16 (l) (1).

The California Environmental Quality Act (CEQA) and CEQA Guidelines also require lead agencies to evaluate proposed projects for the potential to cause significant impacts on "historical resources." This Technical Memorandum was completed under provisions of CEQA (Section 15064.5) and CEQA Guidelines (Title 14, California Code of Regulations or CCR, Chapter 3, Article 5) for determining "significance of impacts to archeological and historical resources."

1.2 Architectural Field Survey Findings

Cardno ENTRIX concluded that there are a total of 55 architectural historical properties that are listed in or eligible for listing in the National and/or California Registers within a 0.25 mile radius of the area of potential effect (APE). The State Historic Preservation Officer (SHPO) confirmed the definition of the APE in a letter dated February 10, 2010.

SWCA architectural historians conducted reconnaissance-level built environment surveys of the 1.8-mile-long APE in April 2009. In December 2009 a new alternative was added to the proposed project, requiring subsequent field surveys, bringing the total project length to approximately 1.9 miles. Each parcel in the direct and indirect APE containing improvements completed in or before 1968 was digitally photographed and researched, using data from the Los Angeles County Office of the Assessor and other sources. All properties in the APE were field-checked to verify whether or not their construction may have occurred more than 50 years prior to the anticipated project opening date.

In April and May 2009 and again in December 2009, SWCA conducted intensive-level surveys of properties containing improvements completed in or before 1968 within the APE that required evaluation or re-evaluation for historical significance. SWCA reviewed those properties in the field, photographed, and performed subsequent building permit and other research on properties that appeared to retain sufficient integrity to warrant evaluation for National Register and/or California Register eligibility.

The architectural field survey identified a total of 289 properties in the Project APE. ENTRIX concluded that of the 289 historical resources, 118 buildings, structures or objects were found to have been constructed 50 years or more before the assumed project construction date of 2018. California Department of Parks and Recreation (DPR) series 523 forms were prepared for each property containing improvements completed in or before 1968 that were not previously listed in or determined eligible for the National and California Registers. The DPR series 523 forms are used to evaluate eligibility for listing on the National and/or California Registers. Of the 118 resources evaluated within the APE, 49 were found to be eligible for both the National and California Registers; six were found to be only eligible for the California Register; while 63 of the resources were found to be ineligible for either list.

In June 2010 the SHPO reviewed the draft Technical Memorandum and Inventory. SHPO concurred on the initial determinations of eligibility and effects for NRHP eligible properties. SHPO did not comment on California Register eligible properties or effects.

The draft Technical Memorandum was included with the draft Environmental Impact Statement (DEIS) that was released for public comment on September 3, 2010. Two variations of the Fully Underground LRT Alternative (Little Tokyo Variation 1 and Little Tokyo Variation 2) are analyzed in this report. Little Tokyo Variation 2 was subsequently dropped

from consideration, and Little Tokyo Variation 1 became the sole alignment for the Fully Underground LRT Alternative. Both variations are described in this report, and the LPA (as refined) is described separately.

On October 28th, 2010, Metro's Board of Directors approved staff's recommendation to select the Fully Underground Alternative described in the publicly reviewed Draft EIS/EIR for the Regional Connector Transit Corridor as the Locally Preferred Alternative (LPA). The LPA would provide a direct connection from 7th Street/Metro Center Station to the Metro Gold Line at 1st and Alameda Streets. The Metro Gold, Blue and Expo light rail lines would be connected allowing trains to operate between Azusa and Long Beach, and from Culver City and the Eastside. In the action for approval, the Board also directed staff to remove the property located on the southeast corner of 2nd and Spring Streets from the list of potential acquisitions as well as eliminated the station at 5th and Flower Station due to its close proximity to the existing 7th St. Metro Center station and to reduce cost. The approved LPA thus includes three new stations instead of the original four described in the Draft EIS/EIR and northern entrances to the existing 7th St. Metro Center station are to be studied.

On January 4th, 2011, the Federal Transit Administration (FTA) authorized Metro to initiate Preliminary Engineering as part of FTA New Starts funding program. In its authorization, FTA requested that Metro among other items pursue the identification of appropriate mitigations and realize potential cost savings. Consistent with FTA's authorization, refinements to the Locally Preferred Alternative have been identified and are to be analyzed as part of the development of the Final EIS/EIR. The refined Locally Preferred Alternative is described in Section 2.4 Project Description.

This document was updated to describe the effects on historic properties and impacts on historical resources from the project refinements.

1.3 Project Effect/Impact Conclusions

Under NEPA for the No Build Alternative and the Transportation System Management (TSM) Alternative, project construction and operations would not result in any adverse construction or implementation-related effects on historic properties in the Project APE. Under CEQA, construction and operation of the No Build and TSM Alternatives would not result in any direct or indirect significant impacts on historical resources, and would not be expected to result in cumulative effects to historical resources under CEQA. The TSM and No Build alternatives would not result in any Section 4(f) effects.

Under NEPA, for the At-Grade Emphasis Light Rail Transit (LRT) Alternative, project construction and operations would result in an adverse effect to the NRHP/CRHR eligible 2nd Street Tunnel. Under CEQA, the project would result in one direct significant impact and 14 indirect significant impacts to historical resources. Implementation of mitigation measures

would reduce the adverse impacts to a less than significant level. Under Section 4(f), this alternative would require the partial acquisition and use of five NRHP eligible properties.

Under NEPA, for the Underground Emphasis LRT Alternative, the project is not expected to result in any direct or indirect adverse effects to historic properties. Under CEQA, project construction would result in one significant impact and 14 indirect impacts to historical resources. Implementation of mitigation measures would reduce impacts to a less than significant level. Under section 4(f), the Underground Emphasis LRT Alternative would require the acquisition of a subsurface easement situated on one NRHP-eligible property.

Under NEPA, for the Fully Underground LRT Alternative - Little Tokyo Variation 1 and the Fully Underground LRT Alternative – Little Tokyo Variation 2, the project is not expected to result in any direct or indirect adverse effects to historic properties. Under CEQA, there would be one direct significant impact and 14 indirect significant impacts to historical resources. With implementation of mitigation measures, these impacts would be reduced to a less than significant level. Under Section 4(f), the project would require the acquisition of a subsurface easement situated on one NRHP-eligible property, but there would be no adverse effects as a result of the easement.

Under NEPA, for the LPA, the project is not expected to result in any direct or indirect adverse effects to historic properties. Under CEQA, there would be one direct significant impact and 14 indirect significant impacts to historical resources. With implementation of mitigation measures, these impacts would be reduced to a less than significant level. Under Section 4(f), the project would require the acquisition of a subsurface easement situated on one NRHP-eligible property, but there would be no adverse effects as a result of the easement.

1.4 Summary of Findings

There are 55 resources listed in, determined eligible for listing in, or eligible for listing in the National Register and the California Register of Historical Resources (California Register) in the project APE. The Federal Transit Administration (FTA), in coordination with the Los Angeles County Metropolitan Transportation Authority (Metro) with concurrence from the SHPO, established the APE that limits the scope of study to those parcels expected to be affected by the proposed project alternatives. Of the 55 resources, 49 are historic properties that are either listed in, determined eligible for listing in, or recommended as eligible for listing in the National Register, while six are only historical resources listed in, determined eligible for listing in, or recommended as eligible for listing in the California Register (See Table 4-6 and Figure 4-4 in Section 4).

1.5 Potential Impacts

Under the No Build Alternative, there would be no cumulative or potential impacts to historical resources other than impacts resulting from continued escalated automobile traffic

due to the lack of additional mass transit options. Under the TSM Alternative, the project would result in no potential impacts on historical resources. Under the At-Grade Emphasis LRT Alternative, Underground Emphasis LRT Alternative, Fully Underground LRT Alternative Little Tokyo Variations 1 and 2, and the LPA, any potential direct or indirect impacts to historical resources would be reduced to a less than significant level through the implementation of mitigation measures. Project operations are not expected to cause any potential impacts.

1.6 Mitigation Recommendations

For Section 4(f) under the No Build and TSM Alternatives, there would be no mitigation measures to consider as there would be a lack of potential effects to historic properties or impacts to historical resources. Under the At-Grade Emphasis LRT Alternative, Underground Emphasis LRT Alternative, Fully Underground LRT Alternative Little Tokyo Variations 1 and 2, and the LPA, the implementation of mitigation measures MM-BE-1 through MM-BE-5 for CEQA would reduce any potential direct or indirect impacts to historical resources to a less than significant level. For NEPA, the implementation of MM-BE-1 and MM-BE-5 would be required to mitigate potential adverse effects to historic properties. The other alternatives would not require mitigation as there would be no adverse effects to historic properties. For Section 4(f), the implementation of mitigation measures MM-BE-2, MM-BE-3, and, when applicable, MM-BE-4, would greatly reduce the likelihood of a constructive use determination.

1.7 Disposition of Data

This report will be filed with the FTA, Metro, the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton, SWCA, and Entrix. All field notes and records related to the project will remain on file at the South Pasadena office of SWCA.

2.0 INTRODUCTION

NEPA guidelines include compliance with related federal laws that require identification of historic properties and consideration of project-related effects on those properties. This Technical Memorandum was prepared to comply with Section 106 of NHPA, as amended, and with regulations contained in 36 Code of Federal Regulations (CFR) Part 800. These regulations require federal agencies to consider the effects of proposed projects and undertakings on historic properties as part of the environmental assessment process and allow the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on those undertakings. Effects under Section 106 of the NHPA are defined in the "Criteria of Adverse Effect" (36 CFR Section 800.5(1).

Properties that are identified as historical resources within the identified project APE were evaluated for eligibility for listing in the National Register according to criteria set forth in 36 CFR Part 60.4. The age criterion for inclusion in the National Register is 50 years and older, except in cases of exceptional significance (Criteria Consideration G).

This Technical Memorandum was also prepared to comply with requirements of CEQA and the CEQA Guidelines (CERES 2009) as they apply to cultural resources. Under CEQA, it is necessary for a lead agency to evaluate proposed projects for the potential to cause significant impacts on "historical resources." A historical resource is defined as "a resource listed in, or determined eligible for listing in, the California Register of Historical Resources" in California Public Resources Code (PRC) Section 21084.1. A proposed project that may affect historical resources is submitted to the California State Historic Preservation Officer (SHPO) for review and comment prior to project approval by the lead agency and before any project-related clearance, demolition, or construction activities are commenced.

If a proposed project could be expected to cause substantial adverse change to a historical resource, environmental clearance for the project would require evaluating alternatives and/or implementing mitigation measures to reduce or avoid potential impacts. If a project is expected to result in an impact on historical resources, CEQA Guidelines require analysis of a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most the basic objectives of the project and avoid or substantially lessen any significant potential impacts on the historical resource.

Properties were also considered for California Register of Historical Resources (California Register) eligibility; although there is no established age threshold for the California Register, the same 50-year cutoff was used for this project. Under PRC Section 5024.1, the California Register was established to serve as an authoritative guide to the state's significant historical and archaeological resources.

If a proposed project and its related potential impacts would adversely affect the values of an archaeological or built environment site that is either listed in or determined eligible for inclusion in the National or California Register, such potential effects and/or impacts would be considered adverse.

2.1 Report Format

This report meets the Secretary of the Interior's Standards and Guidelines and follows contemporary professional standards for the preparation of historical resources reports.

2.2 Project Personnel

SWCA conducted the cultural resources inventory of the built environment for this project. The results of the inventory were included in a draft Technical Memorandum that was prepared by SWCA Senior Architectural Historian Francesca Smith, who meets the Secretary of the Interior's Professional Qualifications Standards in history and architectural history. SWCA architectural historians Jim Steely, Shannon Carmack, Kathy Corbett, Samantha Murray, and Sonnier Francisco provided technical input.

Cardno Entrix reviewed and revised the draft Technical Memorandum and prepared the submittal of the final Technical Memorandum. The Entrix project staff included Kimberly Demuth as Project Manager and Reviewer, Kirk Ranzetta as Senior Architectural Historian, David Harvey as Senior Project Historian and Reviewer, Jennifer Flathman as Project Architectural Historian, Don Craig as Project Historian, and Joe Rubin as Project Coordinator and Reviewer.

2.3 Project Description

The proposed project would extend approximately 1.9 miles through downtown Los Angeles (Figure 2-1) and provide enhanced Metro service throughout four distinct travel corridors that span over 50 miles across Los Angeles County. The proposed new dual-tracks would provide a direct link between the Metro Gold, Blue, and Expo Lines by bridging the gap in the regional light rail network between 7th Street/Metro Center Station at 7th and Flower Streets and the Little Tokyo/Arts District area near 1st and Alameda Streets. This would allow trains to travel directly from the Eastside to Santa Monica and from Long Beach to Claremont. The project also includes construction of new stations in downtown that would allow all passengers on the Metro Gold, Blue, and Expo Lines to reach multiple destinations in the central business district without transferring.

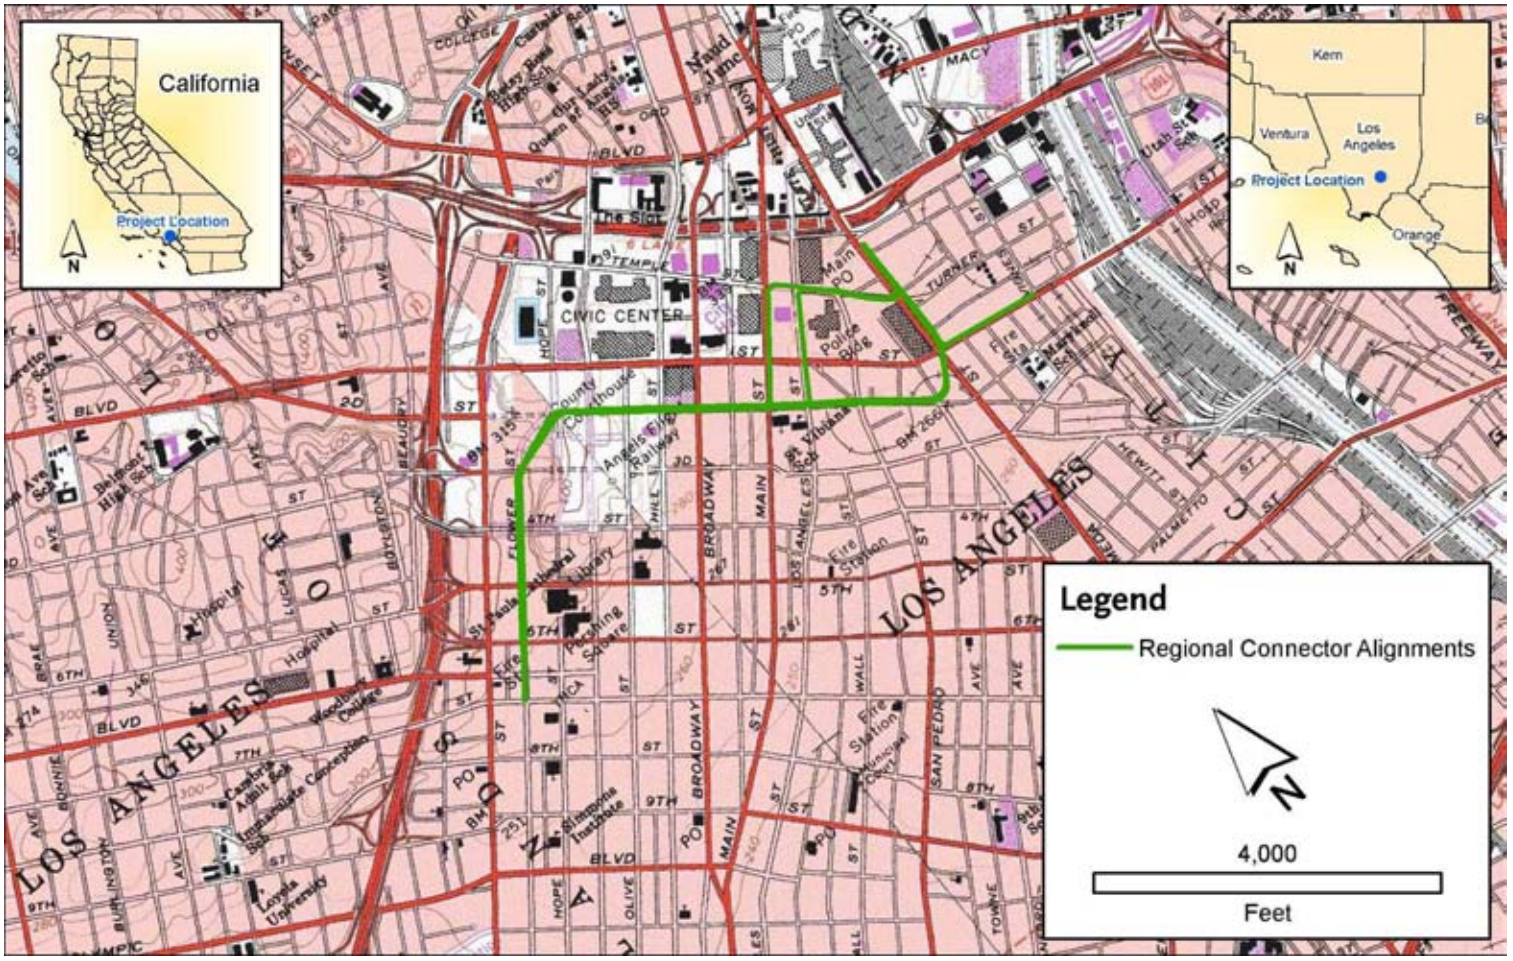

Figure 2-1. Project Location

The following alternatives are evaluated in this Technical Memorandum:

- No Build Alternative
- Transportation System Management (TSM) Alternative
- At-Grade Emphasis Light Rail Transit (LRT) Alternative
- Underground Emphasis LRT Alternative
- Fully Underground LRT Alternative- Little Tokyo Variation 1
- Fully Underground LRT Alternative- Little Tokyo Variation 2
- Locally Preferred Alternative (LPA)

2.3.1 No Build Alternative

Transit service under the No Build Alternative would be focused on preservation of existing services and projects. The No Build Alternative would not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP).

By the projection year of 2035, the Metro Expo Line and the Metro Gold Line to the San Gabriel Valley would be open, and a number of bus routes may be reorganized and expanded to provide connections with these new rail lines. All bus and rail lines would operate using a fleet of vehicles similar to those currently in service or identified for purchase in the LRTP. The transit network within the project area should otherwise be largely the same as it is now.

2.3.2 Transportation System Management (TSM) Alternative

The TSM Alternative includes all of the provisions of the No Build Alternative, plus two new express shuttle bus lines linking the 7th Street/Metro Center and Union Stations. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. Rail service would remain the same as described for the No Build Alternative.

The two routes are described below and illustrated on Figure 2-2.

- Upper Grand Route – From the 7th Street/Metro Center Station, buses would proceed east on 7th Street, north on Olive Street, west on 5th Street, north on Grand Avenue, east on Temple Street, and then north on Los Angeles Street to Union Station. As a variation, buses could use Alameda Street between Temple Street and Union Station

to allow a stop at Temple and Alameda Streets, near the Little Tokyo/Arts District Station. The alignment is assumed to follow the same route as part of the existing Los Angeles Department of Transportation (LADOT) DASH Route B service, proceeding from the 7th Street/Metro Center Station to Union Station using Grand Avenue, Temple Street, and Los Angeles Street. Shuttle buses would run less than eight minutes apart and provide coverage of the Bunker Hill and Civic Center areas.

- Lower Grand Route – This route would use the existing northbound bus-only lanes on Figueroa Street and mixed flow lanes on 2nd and 3rd Streets, which are lightly used by other bus lines. From the 7th Street/Metro Center Station, buses would proceed north on Figueroa Street, west on 2nd Street, and north on Alameda Street to Union Station. To return to 7th Street/Metro Center Station, buses would travel south on Alameda Street, west on 3rd Street, and south on Flower Street. The alignment passes by both the Little Tokyo/Arts District Station and Union Station, and would provide good coverage of Little Tokyo and the southern edge of the Civic Center.

2.3.2.1 Operating Characteristics

The shuttle routes would be operated by Metro, and could use vehicles ranging from 30-foot shuttle buses to standard 40-foot buses. Buses would run every few minutes during peak periods, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes. Similar to the Metro Rapid Bus lines, a transit priority system that allows longer green lights to oncoming transit vehicles would be used where possible to increase bus speed and efficiency.

2.3.3 At-Grade Emphasis LRT Alternative

2.3.3.1 Overview

The At-Grade Emphasis LRT Alternative would provide a direct connection from the existing underground 7th Street/Metro Center Station to the Metro Gold Line at Temple and Alameda Streets. Three new stations would be added, one would be a split station with single-direction platforms one block apart. This alignment includes a combination of underground and at-grade segments, with 46 percent of the route underground. New stations would serve the Civic Center, Grand Avenue, and the Financial District. Conversion of 2nd Street to a pedestrian-friendly transit mall is assumed.

To implement this alternative, the number of traffic lanes and on-street parking spaces on 2nd Street would be reduced. As a result, traffic is likely to divert to adjacent parallel streets such as 1st and 3rd Streets, but the roadway capacity along these streets would remain unchanged, as with the No Build Alternative. Traffic congestion along these streets would likely increase. Figure 2-3 illustrates the At-Grade Emphasis LRT Alternative.

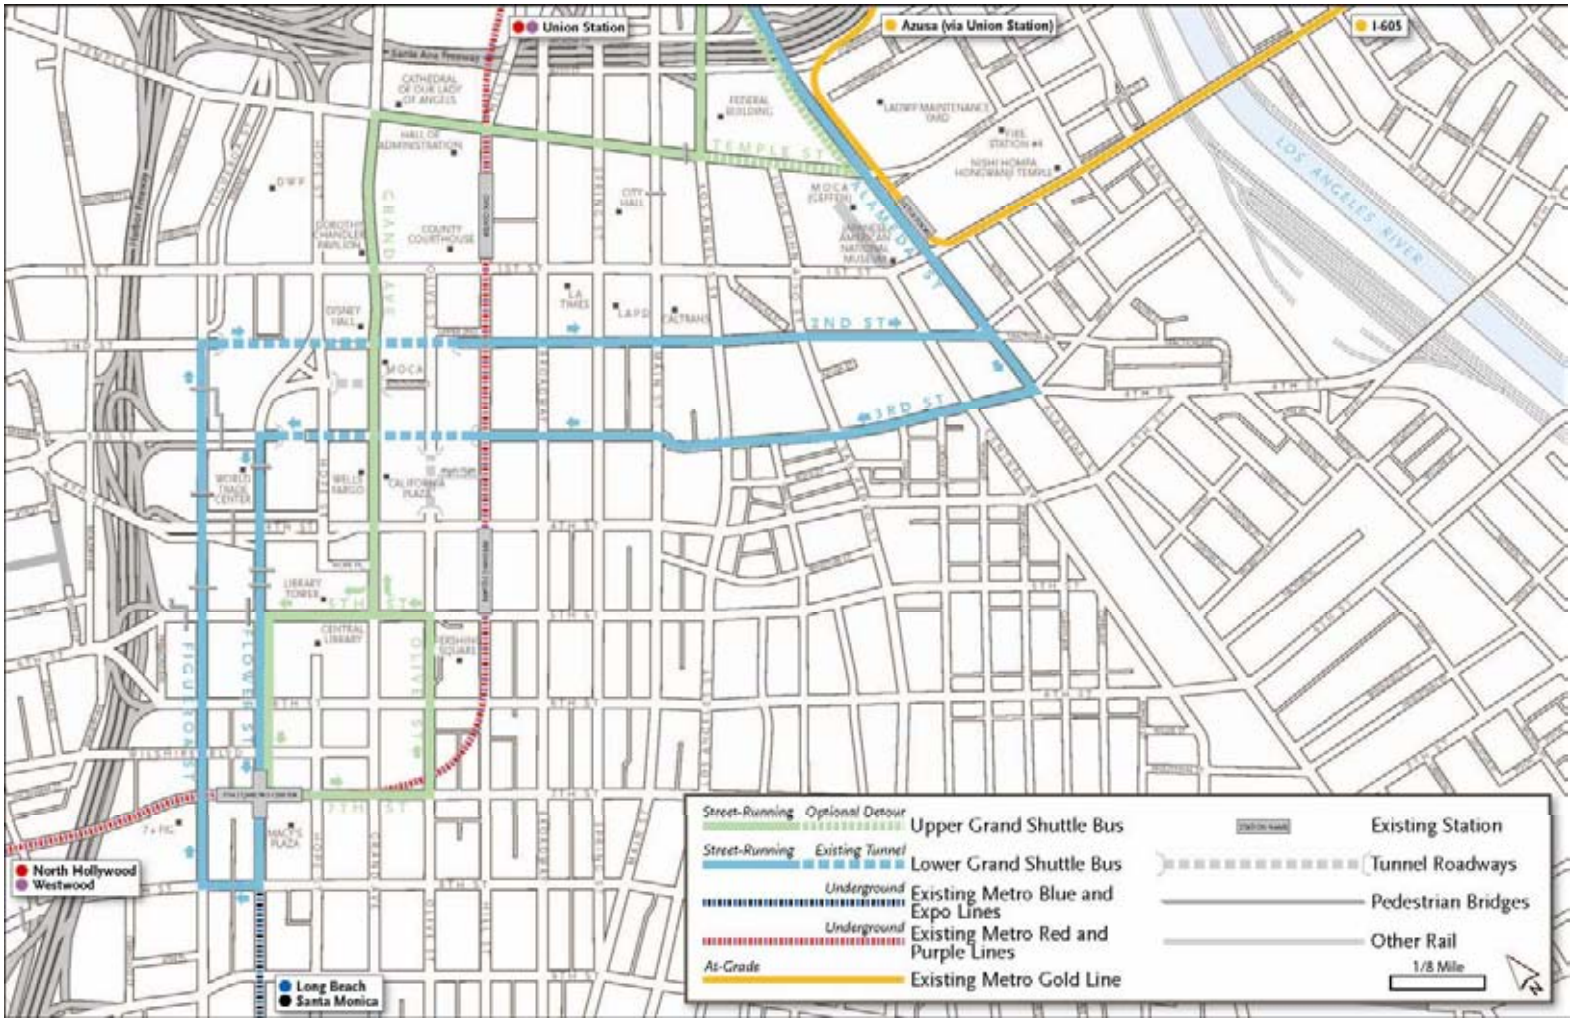

Figure 2-2. Transportation System Management (TSM) Alternative

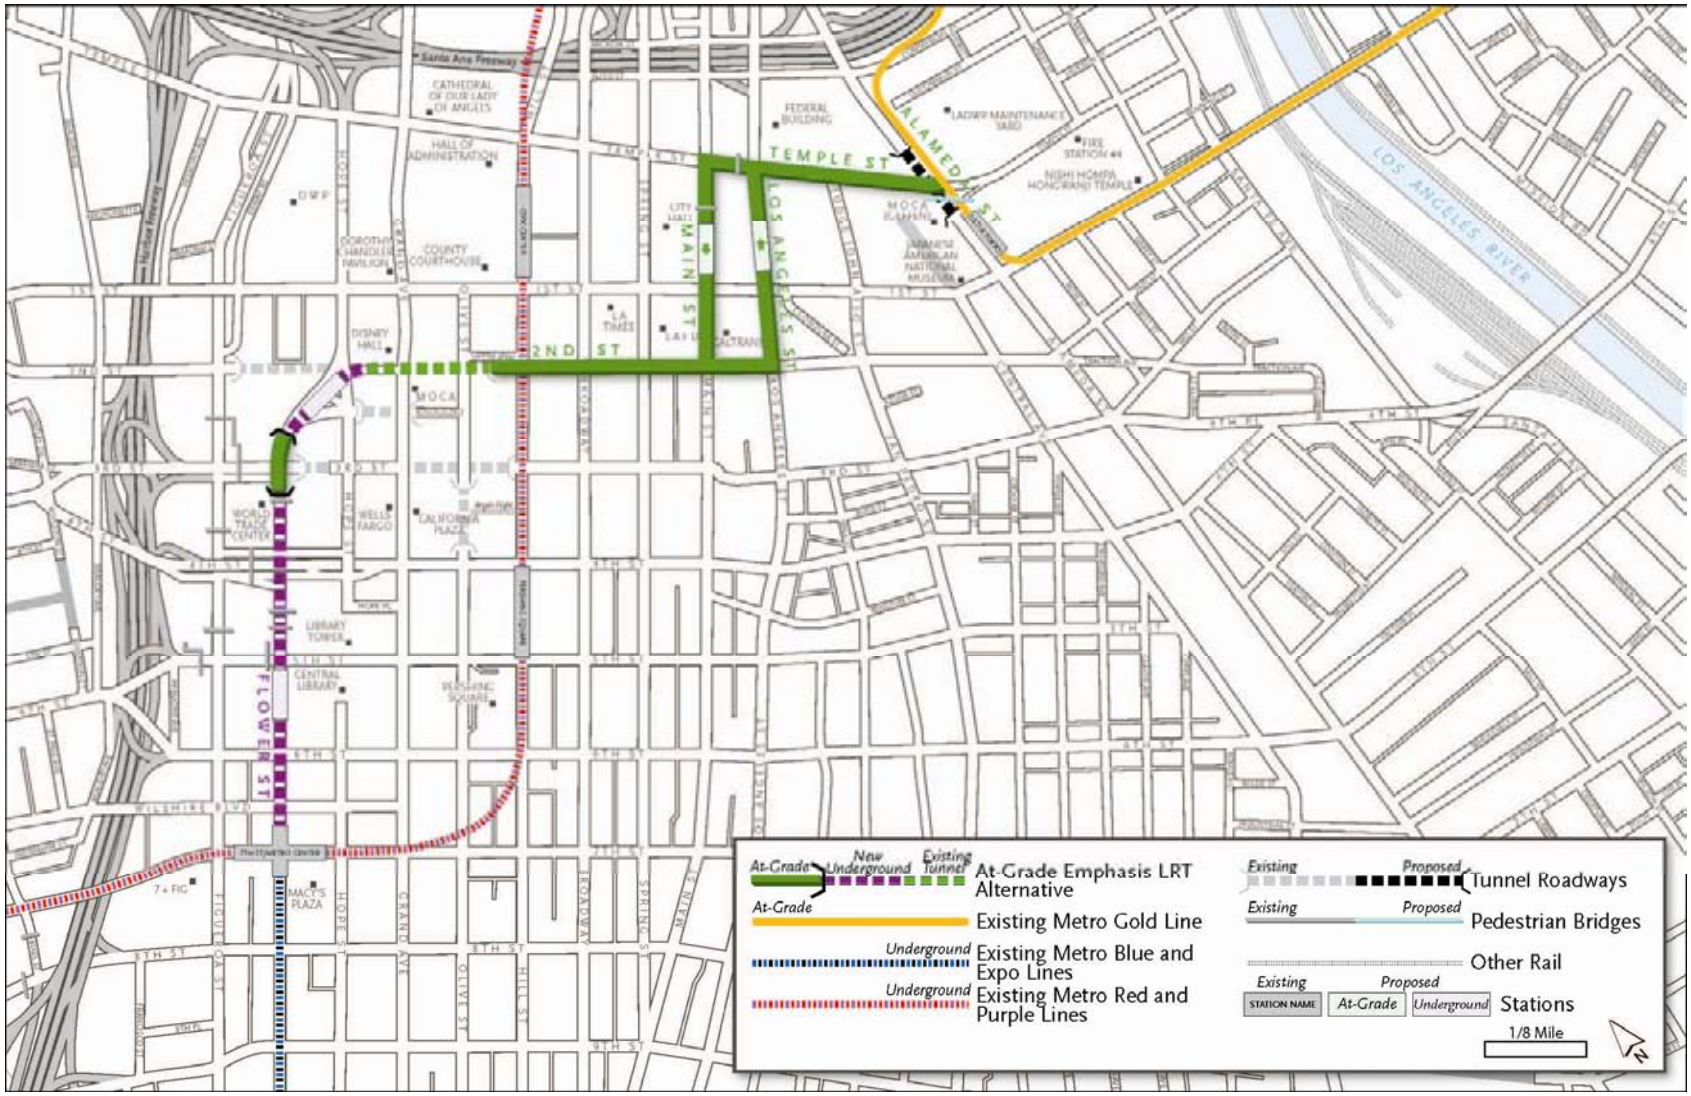

Figure 2-3. At-Grade Emphasis Light Rail Transit (LRT) Alternative

2.3.3.2 Route Configuration

From the existing platform at the 7th Street/Metro Center Station, the tracks would extend north underneath Flower Street to a new underground station just south of 5th Street. The tracks would then continue north, surface just south of 3rd Street, cross 3rd Street at-grade, and veer northeast through a portal in the hillside to an underground station at 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The tracks would continue northeast, "punch" through the wall of the existing 2nd Street Tunnel, and then travel east in the 2nd Street Tunnel toward Hill Street.

This alignment would reduce the 2nd Street Tunnel from four lanes to one (potentially two lanes, pending further detailed engineering). Trains would proceed east on 2nd Street to Main Street. Second (2nd) Street would be transit-dedicated, with its current two travel lanes and two parking lanes reduced to a single travel lane primarily for access to parking lots and loading zones. This type of configuration would extend from Hill Street to Los Angeles Street.

At Main Street, the alignment would split into two single-track alignments. One track (for northbound trains) would continue east to Los Angeles Street and then north to Temple Street. The other track (for southbound trains) would travel north on Main Street and then west on Temple Street. The at-grade station just north of 1st Street would be a split couplet with one-way stops at Main/1st Street and Los Angeles/1st Street.

At Temple and Los Angeles Streets, the two tracks would rejoin and proceed west on Temple Street to Alameda Street, where the tracks would join the Metro Gold Line to East Los Angeles in a three-way junction. Before reaching Alameda Street, the tracks would shift to the south side of Temple Street to provide an adequate turning radius for trains turning north onto the Metro Gold Line's existing ramp leading to the bridge over the US 101 freeway to Union Station. The ramp would need to be reconfigured to a steeper slope to facilitate turning movements in the three-way junction area. The intersection of Temple and Alameda Streets would also have a vehicular underpass for through-traffic on Alameda Street and a proposed pedestrian bridge to reduce potential conflicts between pedestrians, trains, and automobiles. The pedestrian bridge could potentially have endpoints located on each of the intersection's four corners.

At-grade crossovers could be located on 2nd Street between Hill Street and Broadway, and on 2nd Street between Broadway and Spring Street. Crossovers are mechanical track installations along the double-track alignment that allow trains traveling in either direction on either track to move to the other track and continue traveling in the same direction without stopping. Trains may also pass through a crossover without switching tracks. A wider right-of-way may be required in the vicinity of at-grade crossovers, thus potentially increasing the amount of roadway space needed for LRT facilities.

In summary, the At-Grade Emphasis LRT Alternative would connect the Metro Blue and Expo Line tracks at the 7th Street/Metro Center Station to the Metro Gold Line tracks at a new junction north of the Little Tokyo/Arts District Station. This would be accomplished using new light rail right-of-way and new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated into two routes.

This memorandum also analyzes maximum potential effects for each station. Therefore, the actual effects may be smaller in magnitude than the potential impacts discussed in this analysis. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.3.3 Operating Characteristics

Two consolidated routes:

- East-West Route – Trains on the Metro Expo Line tracks from Santa Monica would use existing tracks to the 7th Street/Metro Center Station and then continue along the new Regional Connector tracks to the new three-way junction at Temple and Alameda Streets. The service would then continue east along the Metro Gold Line tracks to East Los Angeles.

- North-South Route – Trains on the Metro Blue Line tracks would travel from the 7th Street/Metro Center Station north along the new Regional Connector tracks to the new three-way junction at Temple and Alameda Streets. The service would then continue north along the existing Metro Gold Line tracks to Pasadena and the future Metro Gold Line extension to Azusa.

Vehicle and Pedestrian Circulation

For the at-grade segments of the At-Grade Emphasis LRT Alternative, the two LRT tracks would typically occupy a 26-foot-wide surface right-of-way bordered by mountable curbs. It is expected that this width would increase to 39 feet at center-platform station locations.

Vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections, with the signal phasing modified to provide adequate green time for the LRT vehicles to safely cross. For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted.

Access to existing parking structures, parking lots, loading docks, and commercial frontage would be affected by the at-grade LRT facilities. Left-turn parking access and egress is presently allowed at many downtown sites. However, the at-grade LRT facilities would prohibit uncontrolled mid-block left turns, thus modifying existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT Alternative alignment would travel at-grade along 2nd Street. It is assumed that this street would be dedicated as a transit-only roadway between the tunnel and Los Angeles Street. This segment of 2nd Street may be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties. As a result of this proposed change in street circulation, through traffic currently using 2nd Street would be diverted to parallel roadways such as 1st and 3rd Streets. East of Los Angeles Street 2nd Street would maintain its current physical features and operating characteristics.

The one-way transit couplet near City Hall along Main and Los Angeles Streets between 2nd and Temple Streets would consist of a single LRT track along each roadway. Both Main and Los Angeles Streets are wide enough to accommodate a single track and maintain acceptable vehicular operations. The curb-to-curb width of Temple Street, between Main and Alameda Streets, is 62 to 71 feet, which would leave one lane of traffic in each direction with potentially mountable curbs for use by emergency vehicles. Traffic operations along this segment of Temple Street would be affected by the lane reduction.

To minimize potential conflicts between rail, vehicular, and pedestrian traffic and minimize delays at the intersection of Temple and Alameda Streets, a vehicular underpass and a proposed pedestrian overpass would be proposed along Alameda Street to route the through traffic beneath the rail tracks and Temple Street traffic. Temple Street and the rail tracks would remain at-grade and the existing at-grade segment of Alameda Street would be lowered to pass under Temple Street.

Through traffic traveling north and south on Alameda Street would operate unimpeded without being stopped or delayed at the intersection. Through traffic traveling east and west on Temple Street would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation. In addition, a one-lane southbound at-grade frontage road would be provided along Alameda Street to maintain access to businesses and properties on the west side of the street.

2.3.4 Underground Emphasis LRT Alternative

2.3.4.1 Overview

The Underground Emphasis LRT Alternative would provide a direct connection from 7th Street/Metro Center Station to the Gold Line tracks at the Little Tokyo/Arts District Station, and would include three new station locations. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street Tunnel and 2nd Street to a new portal on the parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue.

It is expected that a portion of this property would need to be acquired to construct the portal and stage construction of the tunnels beneath 2nd Street. The tracks would then connect to the Gold Line tracks across Alameda Street.

The Underground Emphasis LRT Alternative would be located entirely underground except for a single at-grade crossing at the intersection of 1st and Alameda Streets in the same type of three-way junction proposed for the At-Grade Emphasis LRT Alternative. Figure 2-4 illustrates this alternative.

2.3.4.2 Route Configuration

The Underground Emphasis LRT Alternative alignment would extend north from the existing platform at the 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue.

The tracks would then head east underneath 2nd Street to the next proposed station. There are two options for a station on 2nd Street. The Broadway station option would place an underground station on 2nd Street between Broadway and Spring Street, and the Los Angeles Street station option would include an underground station between Main and Los Angeles Streets.

The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast and surface in the lot bounded by 1st, Alameda, and 2nd Streets, and Central Avenue. The tracks would then enter an at-grade three-way junction in the intersection of 1st and Alameda Streets.

A new underpass would carry car and truck traffic along Alameda Street beneath 1st Street and the rail junction, and a proposed overhead pedestrian bridge structure would reduce most potential conflicts between pedestrians and trains. The pedestrian overpass could potentially have endpoints at each of the four corners of the intersection.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station on 2nd Street (whether it is between Broadway and Spring Street or between Main and Los Angeles Streets). Crossovers may not be needed at all of these locations and may ultimately be placed in locations that are not adjacent to stations. Underground crossover locations require cut-and-cover construction; tunnel-boring machines cannot be used to construct underground crossovers.

In summary, the Underground Emphasis LRT Alternative would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line from a new junction just south of the Little Tokyo/Arts District Station at 1st and Alameda Streets. This would be accomplished using new light-rail right-of-way and new stations, enabling the consolidation of the Metro Gold, Blue, and Expo Line services into two routes.

This Memorandum analyzes maximum potential impacts for each station. Ultimate potential impacts may therefore be less in magnitude than the potential impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.4.3 Operating Characteristics

Two consolidated routes:

- East-West Route – Trains on the Metro Expo Line tracks from Santa Monica would run on tracks to the 7th Street/Metro Center Station and then continue north along the new Regional Connector tracks to the new three-way junction at the intersection of 1st and Alameda Streets. Trains would then turn east on 1st Street, bypassing the Little Tokyo/Arts District Station, and continue along the Metro Gold Line tracks to East Los Angeles.

- North-South Route – From the 7th Street/Metro Center Station, trains from Long Beach would continue north along the new Regional Connector tracks to the new three-way junction at 1st and Alameda Streets. The trains would then turn north on 1st Street and stop at the existing Little Tokyo/Arts District Station before continuing along the Metro Gold Line route to Pasadena and Azusa.

Vehicle and Pedestrian Circulation

The Underground Emphasis LRT Alternative alignment would not permanently affect surface traffic or pedestrian circulation except at the intersection of 1st and Alameda Streets, where the LRT alignment would operate in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns.

The future roadway levels of service for this alternative would be similar to the No Build Alternative except at the intersection of 1st and Alameda Streets, where a vehicular underpass and pedestrian overpass are proposed to separate the heavy traffic volumes along Alameda Street from rail traffic to minimize delays. The proposed underpass would result in uninterrupted flow along Alameda Street in the north and south directions between 2nd and Temple Streets. Through traffic traveling east and west on 1st Street would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation.

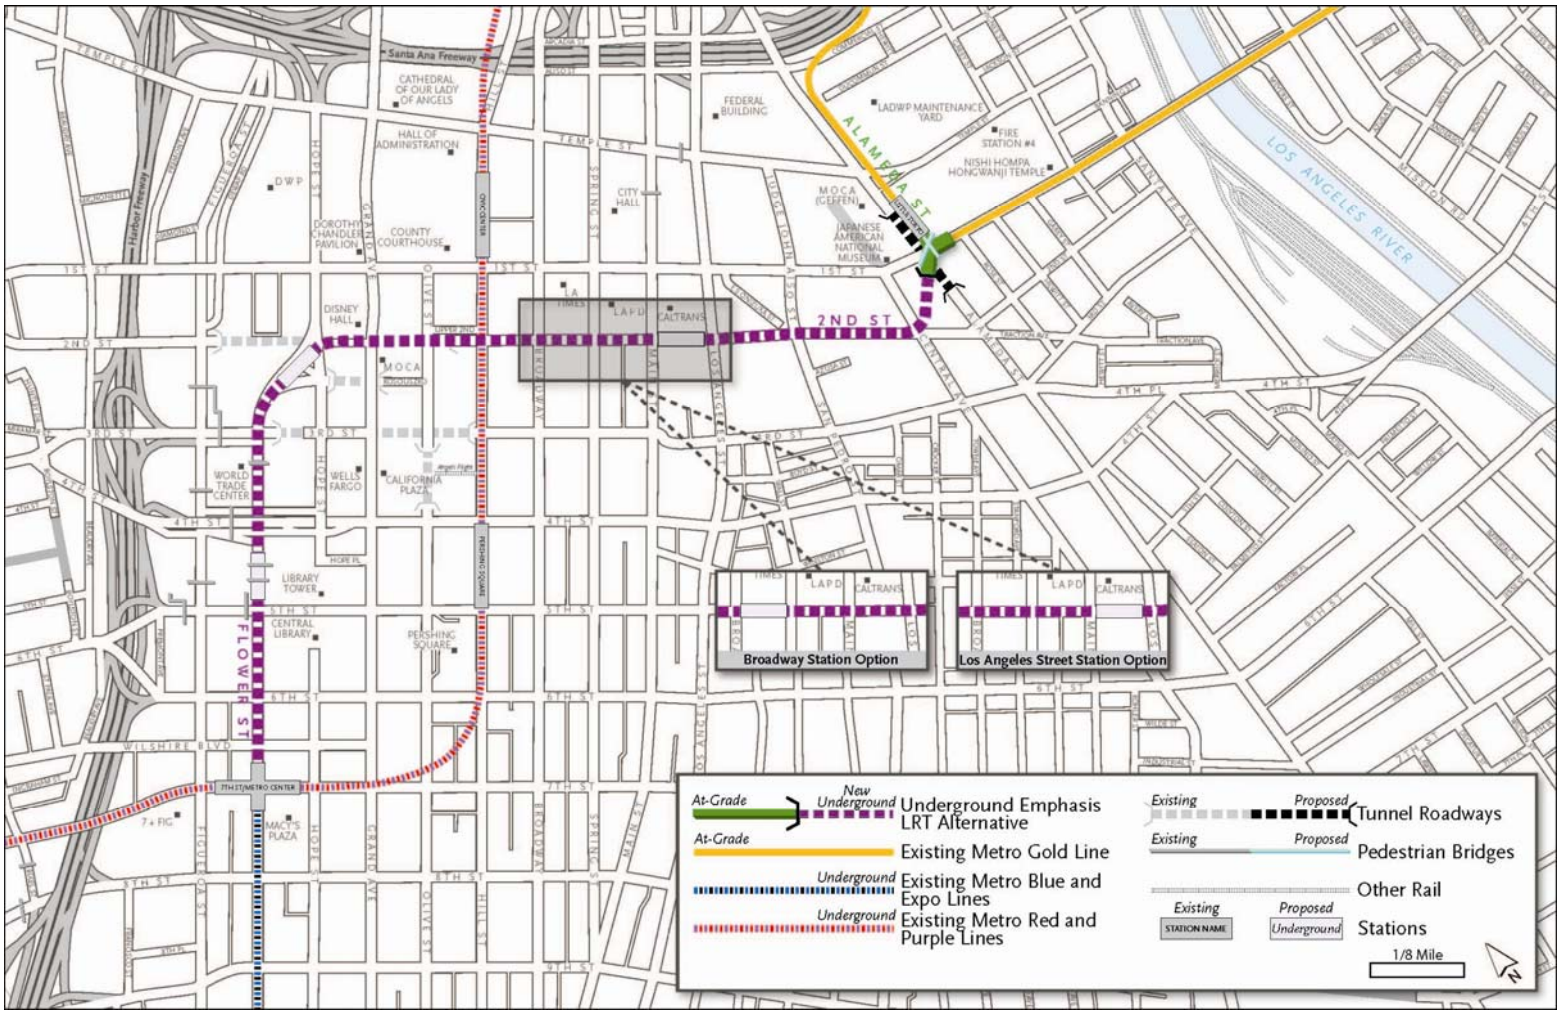

Figure 2-4. Underground Emphasis LRT Alternative

To maintain access to adjacent businesses and properties, at-grade frontage roads would be provided along both sides of Alameda Street south of the intersection and on the southbound side of the street north of the intersection. A full northbound frontage road crossing 1st Street is not feasible because of the location of the tracks and the Little Tokyo/Arts District Station on the east side of Alameda Street.

2.3.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

2.3.5.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street Tunnel and 2nd Street to Central Avenue.

At 2nd and Central, the tracks would continue underground heading northeast under 1st and Alameda Streets. A three-way junction would be constructed underground beneath the 1st and Alameda intersection. To the north and east of the junction, trains would rise to the surface through two new portals to connect to the Metro Gold Line heading north to Azusa and east to the San Gabriel Valley. One portal would be located northeast of the Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the City of Los Angeles Department of Water and Power (LADWP) Maintenance Yard and connect to the existing LRT Bridge over the US-101 freeway, allowing a connection to the Metro Gold Line to Azusa. The portal would be connected to the 1st and Alameda junction by a new tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (the parcel on the northeast corner of 1st and Alameda Streets), running immediately east of the Little Tokyo/Arts District Station and tracks.

The second portal would be located within 1st Street between Alameda and Vignes Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. To accommodate the portal, 1st Street would be widened to the north. Street widening would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street to join the existing 1st Street LRT tracks about one and half blocks west of the 1st Street Bridge.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT bridge, and complete the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 1 would be located entirely underground from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Figure 2-5 illustrates this alternative.

2.3.5.2 Route Configuration

The Fully Underground LRT Alternative- Little Tokyo Variation 1 alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The bridge could begin at street level near the station entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

The tracks would then head east underneath 2nd Street to the next proposed station at Broadway. The 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street. The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new underground station, which would potentially be located within the property currently occupied by Office Depot and other small commercial uses.

The tracks would continue from the station under the 1st and Alameda intersection into a new underground three-way junction. One set of tracks would separate from this junction, continuing underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station. These tracks would travel under Temple Street before surfacing in the LADWP yard and rising to connect to the existing Metro Gold Line LRT bridge over the US-101 Freeway. This would allow trains to continue along the Metro Gold Line to Pasadena, which would eventually extend to Azusa per Metro's Long Range Transportation Plan. Traffic lanes on Alameda Street would be reconfigured temporarily during construction.

The other set of tracks leaving the three-way junction would rise to the east within 1st Street to accommodate a new portal as well as existing Metro Gold line tracks. To accommodate the portal, the north portion of 1st Street would be widened. Street widening would be initiated at Alameda and continue east, tapering down significantly as the alignment crosses Hewitt Street to join the existing 1st Street LRT tracks, about one and half blocks west of the 1st Street Bridge. This would allow trains to continue along the Metro Gold Line to East Los Angeles, which should eventually extend to I-605 per Metro's Long Range Transportation Plan.

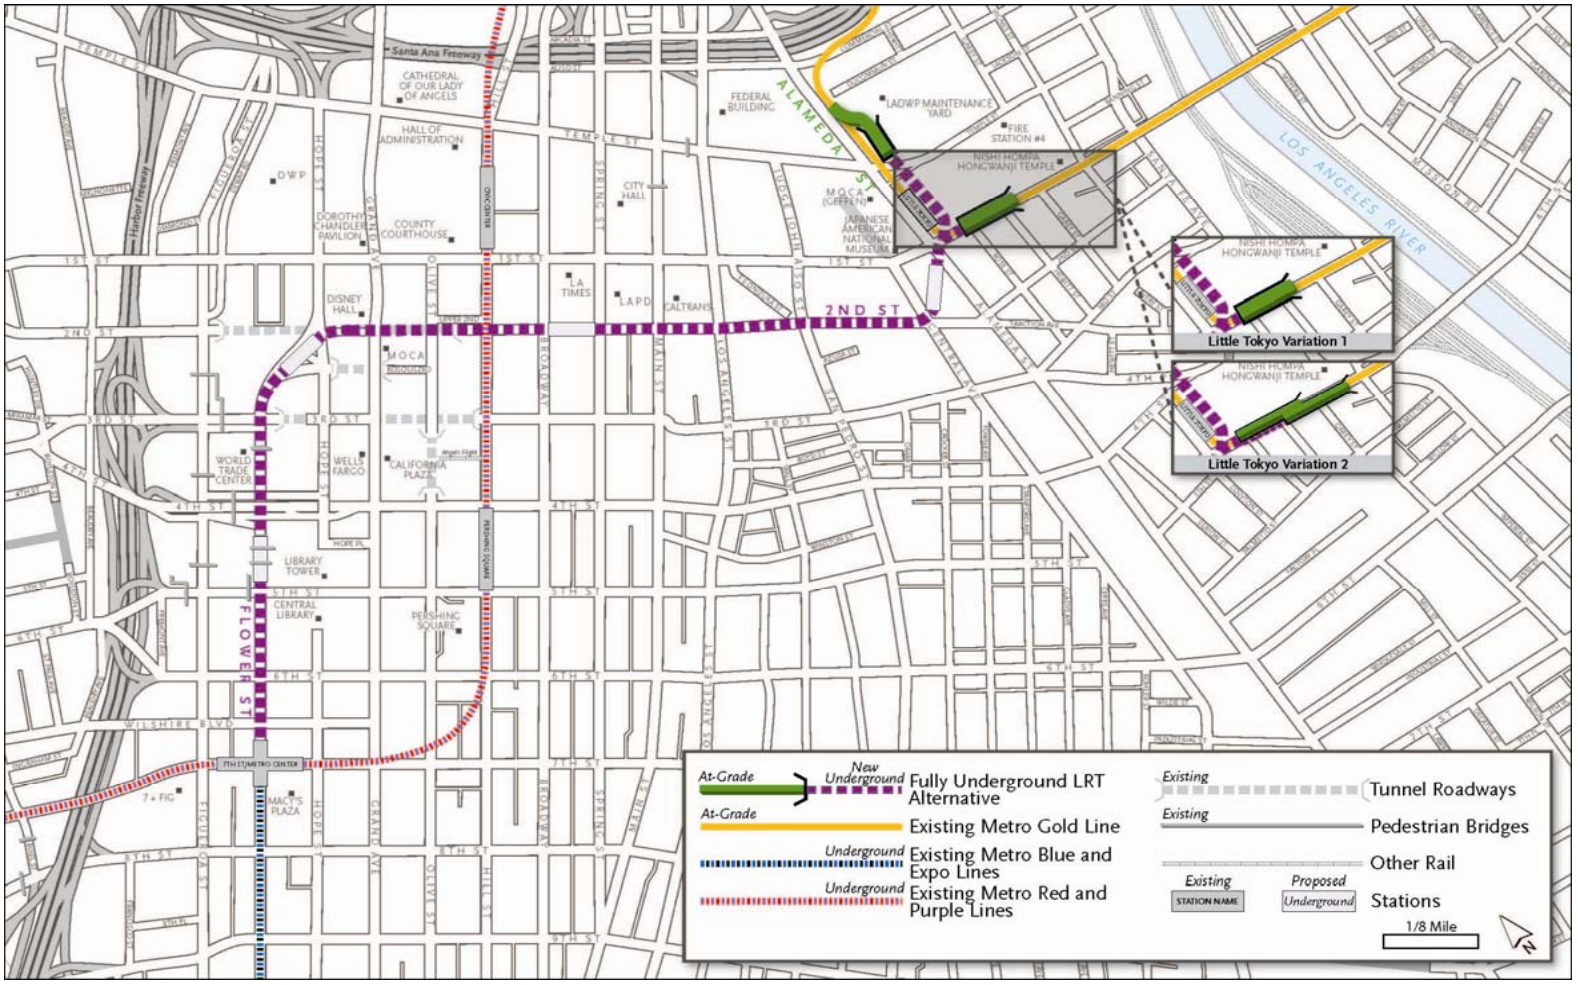

Figure 2-5. Fully Underground Emphasis LRT Alternative Alignment and Configuration, Little Tokyo Variations 1 and 2

The signalized intersection of 1st and Hewitt Streets would be removed. North-south traffic along Hewitt Street would no longer be able to cross 1st Street. All left turns at 1st and Hewitt would be prohibited. Right turns to and from Hewitt Street would continue to be permitted. Automobile access to the proposed Nikkei Center parcel would continue to be available from Temple and 1st Streets. However, access at any driveways into the parcel along 1st Street would be restricted to right turns only.

The existing Metro Gold Line and the Little Tokyo/Arts District Station surface tracks and station would be maintained for continued service during construction, with only intermittent disruptions related to construction activities. Once construction is complete, operation of the current Metro Gold Line between Pasadena and East Los Angeles would terminate. Metro would initiate operations on two routes: between Azusa and Long Beach, and between East Los Angeles and Santa Monica.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station at 2nd Street and Broadway. Crossovers may not be needed at both of these locations, and may ultimately be placed in locations that are not adjacent to stations.

Underground crossover locations require cut-and-cover construction; tunnel boring machines cannot be used to construct underground crossovers. More information on these construction methods is provided in the Description of Construction.

In summary, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line from a new junction under 1st and Alameda Streets. This would be accomplished using new light rail right-of-way and four new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated.

This technical memorandum analyzes maximum potential impacts for each station. Ultimate potential impacts may therefore be smaller in magnitude than the potential impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.5.3 Operating Characteristics

Two consolidated routes:

The Regional Connector would consolidate the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes:

- East-West Route - Metro Expo Line trains from Santa Monica would continue north from the existing 7th Street/Metro Center Station along new Regional Connector tracks

to a new three-way junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to the new portal on 1st Street, and continue along the Metro Gold Line tracks toward I-605.

- North-South Route - After stopping at 7th Street/Metro Center Station, trains from Long Beach would continue north along the new Regional Connector tracks to the new three-way junction beneath 1st and Alameda Streets. Trains would then travel to the new portal on the LADWP site, and continue along the existing Metro Gold Line alignment to Azusa.

The east-west and north-south routes would each operate with 5 minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector corridor.

Vehicle and Pedestrian Circulation

The Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment would not permanently affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street Bridge, where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area.

Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns except where a newly installed traffic signal at 1st and Hewitt Streets would be removed. Through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possible.

Permanent roadway and lane reconfigurations around the proposed 2nd/Hope Street and Flower/5th/4th Street stations would also be needed. At the proposed 2nd/Hope Street station, a short connector roadway would be removed, but all existing traffic movements would still be possible via the remaining connector roadways. At the proposed Flower/5th/4th Street station, one traffic lane would need to be removed from Flower Street to accommodate station entrances along the sidewalk.

2.3.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

2.3.6.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would be the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1 from the 7th Street/Metro Center Station to 2nd Street and Central Avenue.

A new two-level underground junction would be constructed beneath the 1st and Alameda Streets intersection. Trains traveling north toward Azusa and east toward I-605 would use the lower level of the junction, and trains travelling south toward Long Beach and west toward Santa Monica would use the upper level. To the north and east of the junction, trains would rise to the surface through new portals to connect to the Metro Gold Line heading north to Azusa and east towards I-605.

One portal containing the northbound and southbound tracks would be located northeast of the Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the LADWP Maintenance Yard and connect to the existing LRT bridge over the US-101 freeway, allowing a connection to the Metro Gold Line tracks.

This portal would be connected to the 1st and Alameda junction by a new cut-and-cover tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (the parcel on the northeast corner of 1st and Alameda Streets), and would run immediately east of the existing Little Tokyo/Arts District station and tracks. The new tunnel would feed southbound trains from the portal into the upper level of the junction, and carry northbound trains away from the lower level of the junction toward the portal.

Two portals, each containing one track, would rise to the east within the widened median of 1st Street to allow a connection to the Metro Gold Line towards I-605. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

The northern portion of 1st Street would be widened to accommodate the westbound portal. The widening would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street. There, the new tracks would feed into the existing 1st Street LRT tracks, about a block west of the 1st Street Bridge. Also, 1st Street would be widened to the south between Hewitt and Vignes Streets to accommodate the eastbound track portal. The widening would taper down as it approaches Vignes Street. No modification to the 1st Street Bridge would be necessary.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT Bridge, and complete the tunnels beneath 2nd Street and the Nikkei Center property.

The Fully Underground Alternative – Little Tokyo Variation 2 would be located entirely underground from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Figure 2-5 illustrates this alternative.

2.3.6.2 Route Configuration

The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The bridge could begin at street level near the station entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

From 2nd and Hope Streets, the tracks would head east underneath 2nd Street to the next proposed station at Broadway. The 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street.

The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new underground station that would potentially be located within the property currently occupied by Office Depot and other small commercial uses.

As the tunnels turn northeast from 2nd Street, the northbound tunnel would descend and the southbound tunnel would rise so that the southbound tunnel would be stacked on top of the northbound tunnel. The new underground station near 2nd Street and Central Avenue would have two underground levels, each with a single-track platform. The northbound track with trains headed north and east would be on the lower level, and the southbound track with trains headed south and west would be on the upper level.

The tracks would continue from the station under the 1st and Alameda intersection into a new two-level underground junction. Separating from the junction, one track from the lower level (northbound) and one track from the upper level (southbound) would continue underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station.

These tracks would travel under Temple Street before surfacing in the LADWP yard and rising to connect to the existing Metro Gold Line LRT Bridge over the US-101 Freeway. This would allow trains to continue along the Metro Gold Line to Pasadena, which should extend to Azusa per Metro's Long Range Transportation Plan. Traffic lanes on Alameda Street would be reconfigured temporarily during construction.

A second track (westbound) leaving the upper level of the junction would rise to the east within 1st Street between Alameda and Hewitt Streets and link to the existing Metro Gold Line

track. Another track (eastbound) leaving the lower level of the junction would rise to the east within 1st Street between Hewitt and Vignes Streets, adjacent to the westbound track, and link to the existing Metro Gold Line track.

To accommodate the portal and temporary tracks to maintain Metro Gold Line service during construction, 1st Street would be widened to the north and south. Widening would be initiated at Alameda and continue east, tapering down significantly as the alignment crosses Hewitt Street and again at Vignes Street, where tracks would join the existing 1st Street LRT tracks, just west of the 1st Street Bridge. This would allow trains to continue along the Metro Gold Line to East Los Angeles, which would eventually extend toward I-605 per Metro's Long Range Transportation Plan.

The signalized intersection of 1st and Hewitt Streets would be removed. North-south traffic along Hewitt Street would no longer be able to cross 1st Street. All left turns at 1st and Hewitt would be prohibited. Right turns to and from Hewitt Street would continue to be permitted.

Automobile access to the proposed Nikkei Center parcel would continue to be available from Temple and 1st Streets. However, access at any driveways into the parcel along 1st Street would be restricted to right turns only. The existing Metro Gold Line and Little Tokyo/Arts District Station and surface tracks would be maintained for continued service during construction, with intermittent disruptions related to construction activities.

One lane of 1st Street would need to be temporarily closed during construction between Alameda and Vignes Streets to maintain these surface tracks. The surface tracks would not remain in place beyond construction. Once construction is complete, operation of the current Metro Gold Line between Pasadena and East Los Angeles would terminate. Metro would initiate operations on two routes: between Azusa and Long Beach, and between East Los Angeles and Santa Monica.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station at 2nd Street and Broadway. Crossovers may not be needed at both of these locations and may ultimately be placed in locations that are not adjacent to stations. Underground crossover locations require cut-and-cover construction; tunnel boring machines cannot be used to construct underground crossovers. More information on these construction methods is provided in the Description of Construction.

In summary, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line tracks. The link would be provided by a new two-level junction under 1st and Alameda Streets using new light rail right-of-way and new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated.

This technical memorandum analyzes maximum potential impacts for each station. Ultimate potential impacts may therefore be smaller in magnitude than the potential impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.6.3 Operating Characteristics

Two consolidated routes:

- The Regional Connector would consolidate the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes: East-West Route - Metro trains from Santa Monica would run on existing tracks from the 7th Street/Metro Center Station north along the new Regional Connector tracks to a new two-level junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to the new portals on 1st Street, and continue along the Metro Gold Line tracks towards I-605.

- North-South Route - After stopping at 7th Street/Metro Center Station, trains from Long Beach would continue north along the new Regional Connector tracks to the new two-level junction beneath 1st and Alameda Streets. The trains would then travel to the new portal on the LADWP site, and continue along the Metro Gold Line tracks to Azusa.

The east-west and north-south routes would each operate with 5-minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector.

Vehicle and Pedestrian Circulation

The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment would not permanently affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street Bridge, where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area.

Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns except where a newly installed traffic signal at 1st and Hewitt Streets would be removed. Through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possible.

Permanent roadway and lane reconfigurations around the proposed 2nd/Hope Street and Flower/5th/4th Street stations would also be needed. At the proposed 2nd/Hope Street station, a short connector roadway would be removed, but all existing traffic movements would still be

possible via the remaining connector roadways. At the proposed Flower/5th/4th Street station, one traffic lane would need to be removed from Flower Street to accommodate station entrances along the sidewalk.

2.3.7 Locally Preferred Alternative

On October 28th, 2010, the Metro Board of Directors concurred with staff's recommendation to designate the Fully Underground LRT Alternative as the LPA. The LPA is essentially the same configuration as the Fully Underground LRT Alternative – Little Tokyo Variation 1, except that this alternative does not include the Flower/5th/4th Street station. It travels under the Japanese Village Plaza in Little Tokyo instead of continuing underneath 2nd Street to Central Avenue, and it then connects to the Metro Gold Line within 1st Street and north of Temple Street.

The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. Tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to just west of Central Avenue. At 2nd Street and the pedestrian signal to the JVP, the tracks would continue underground heading northeast under the JVP and 1st and Alameda Streets.

An underground junction would be constructed beneath the intersection of 1st Street and Alameda Street. Unlike the Underground Emphasis LRT Alternative, two portals would be needed to facilitate the connection between the underground Regional Connector and the at-grade Metro Gold Line branches to Pasadena/Claremont and the Eastside. The new portals would be located to the north and east of the junction, where trains would rise to the surface to connect to the Metro Gold Line heading north to Claremont and east to the Eastside.

One portal would be located north of Temple Street, northeast of the existing at-grade Little Tokyo/Arts District Station and Metro Gold Line tracks. This portal would rise to the north within the maintenance yard of the City of Los Angeles Department of Water and Power (LADWP) and connect to the existing LRT bridge over US 101, allowing a connection to the Metro Gold Line to Claremont. Tracks would run from the junction under 1st and Alameda Streets through a new tunnel crossing beneath Temple Street and the Mangrove property (the parcel on the northeast corner of 1st and Alameda Streets) to the new portal. This new tunnel would run immediately east of the existing Little Tokyo/Arts District Station and Metro Gold Line tracks.

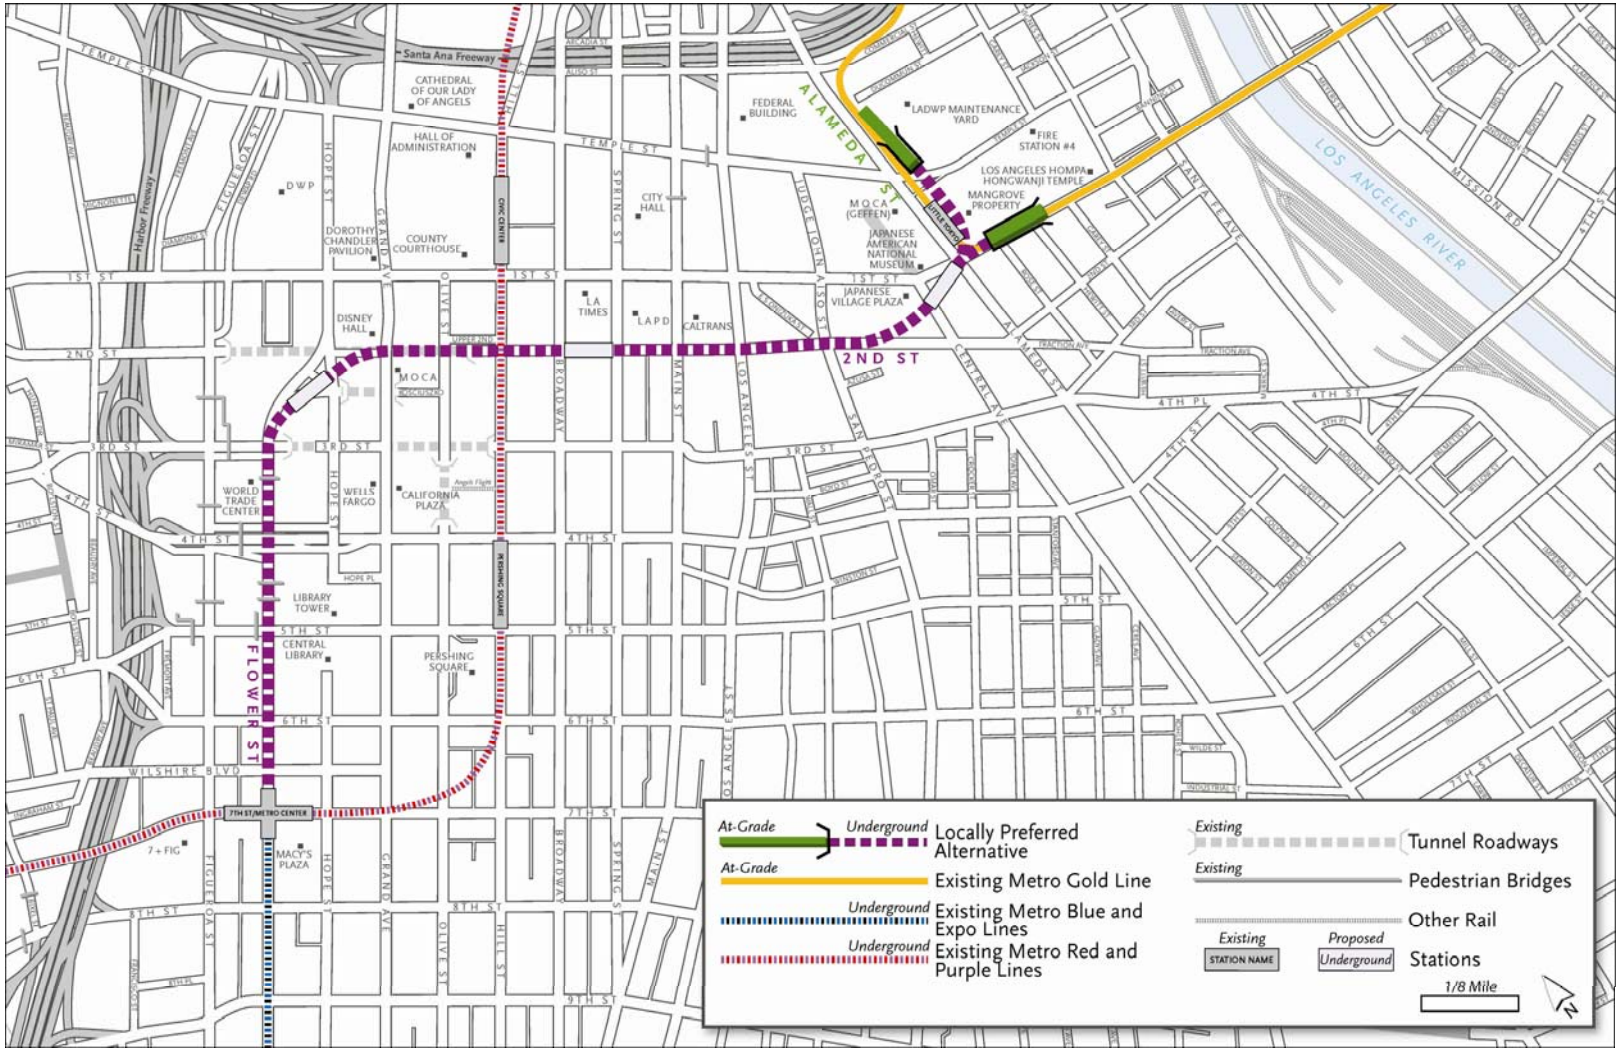

Figure 2-6 –Locally Preferred Alternative

The second portal would be located within 1st Street between Alameda and Garey Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. 1st Street would be widened to the north to accommodate this second portal and maintain the existing number of through lanes. The widening would start at Alameda Street and continue east, significantly tapering down as it crosses Hewitt Street, returning to the existing condition prior to the Los Angeles Hompa Hongwanji Buddhist Temple, to join the existing 1st Street LRT tracks, just west of the 1st Street Bridge.

Property northeast of 1st and Alameda Streets, the Mangrove property, would need to be acquired for insertion of the TBM, to stage construction of both portals, to connect to the Metro Gold Line LRT bridge, and to construct the tunnels beneath Temple Street and the Mangrove property. During construction, tracks would be installed in this area at-grade to allow service to proceed on the Metro Gold Line while construction activities occur within the project area.

2.3.7.1 Route and Configuration

The LPA alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station and would run underneath Flower Street. An enhanced pedestrian walkway would be provided along Flower Street from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets, which would improve the pedestrian connection between the Financial District and the 7th Street/Metro Center Station. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets. A new underground station would be located just southwest of the intersection of 2nd and Hope Streets.

At 2nd and Hope Streets, a pedestrian connection to Upper Grand Avenue would be provided. A pedestrian plaza above General Thaddeus Kosciuszko Way connecting to Upper Grand Avenue is planned as part of the Broad Collection museum. Metro would construct an elevator from the station entrance to the plaza if one is not already provided, If the plaza is not built, Metro would construct a pedestrian bridge from the elevator to Upper Grand Avenue. Tracks would then head east underneath 2nd Street to the next proposed underground station between Broadway and Spring Street (2nd Street/Broadway station).

The tracks would continue east underneath 2nd Street to just west of Central Avenue at approximately the pedestrian signal to the JVP, where the alignment would then veer northeast under privately held property and Central Avenue to a newly proposed Little Tokyo/Arts District underground station (1st/Central Avenue station). The proposed underground station would be partially located within Central Avenue and the northern half of the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street. The Señor Fish, Weiland Brewery, the former Café Cuba (The Spice Table), and associated parking would

need to be acquired for construction of this station. However, the remaining businesses on that block would remain, including the Office Depot and associated parking.

The tracks would leave the station and cross under the intersection of 1st Street and Alameda Street into a new underground rail junction. Separating from the junction, one set of tracks would continue underground beneath the Mangrove property (located on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station.

The tracks would then travel under Temple Street before surfacing through a portal in the southwest corner of the LADWP maintenance yard and rise to connect to the existing Metro Gold Line LRT bridge over US 101. This would allow trains to continue along the Metro Gold Line to Pasadena, which would be extended to Claremont. Traffic lanes on Alameda Street would be temporarily reconfigured during construction.

The other set of tracks leaving the underground junction would rise to the east within 1st Street to accommodate a new portal and the existing Metro Gold Line tracks. 1st Street would be widened on its northern side to accommodate the portal. The widening would initiate at Alameda Street and continue east, significantly tapering down as the alignment crosses Hewitt Street, returning to the existing condition prior to the Los Angeles Hompa Hongwanji Buddhist Temple, to join the existing 1st Street LRT tracks, just west of the 1st Street Bridge. This would allow trains to continue along the Metro Gold Line to East Los Angeles, which would be eventually extended to I-605 per Metro's LRTP. The signals would be removed at the intersection of 1st and Hewitt Streets. North-south traffic along Hewitt Street would no longer be able to cross 1st Street. All left turns would be prohibited at the intersection of 1st and Hewitt Streets. Right turns would continue to be permitted to and from Hewitt Street. Automobile access to the Mangrove property would continue to be available from Temple and 1st Streets. However, automobile access to the parcel along 1st Street would be restricted to right turns only.

The existing Metro Gold Line Eastside Extension and the Little Tokyo/Arts District Station surface tracks and station would be maintained for continued service during construction with intermittent disruptions related to construction activities. Once construction is complete, operation of the current Metro Gold Line between Pasadena and the Eastside and the existing, at-grade Little Tokyo/Arts District Station would terminate. In its place, Metro would initiate operations on two routes:

- Between Claremont and Long Beach
- Between the Eastside and Santa Monica

Crossovers could be located just east of the proposed station at 2nd and Broadway Streets, underground beneath 1st Street just east of the intersection of 1st and Alameda Streets, and

underground beneath the Mangrove property, north of the rail junction. In addition, a pocket track, which could also serve as a crossover, would be located beneath Flower Street between 5th and 6th Streets. The crossovers and pocket track may not be needed at these locations and may ultimately be placed in other locations. Tunnel boring machines cannot be used for construction of crossovers since underground crossover locations require cut and cover construction. More information on these construction methods is provided in the Description of Construction, Appendix K.

In summary, the LPA would link the Metro Blue Line and Metro Expo Line at the 7th Street/Metro Center Station to the Metro Gold Line at a new junction under 1st and Alameda Streets using new light rail rights-of-way and new stations. This would enable the Metro Gold Line, Metro Blue Line, and Metro Expo Line services to be consolidated. Key features of the LPA are described below.

Proposed LRT alignments that would be constructed as part of the LPA are:

Underground double track beneath Flower Street from the existing platform at the 7th Street/Metro Center Station to 3rd Street

- Underground double track curving northeast from the intersection of 3rd and Flower Streets toward 2nd and Hope Streets
- Underground double track beneath the 2nd Street tunnel and 2nd Street from Hope Street to just west of Central Avenue, at approximately the pedestrian signal to the JVP, then northeast to 1st and Alameda Streets
- Underground rail junction beneath the intersection of 1st and Alameda Streets
- Underground double track from the rail junction to the portal located within a widened 1st Street between Alameda and Garey Streets, prior to the Los Angeles Hompa Hongwanji Buddhist Temple; then at-grade double track connecting to the existing Metro Gold Line Eastside Extension tracks toward I-605
- Underground double track from the rail junction running north beneath the Mangrove property and Temple Street, just east of the existing Little Tokyo/Arts District Station, to the new portal in the LADWP maintenance yard site; then at-grade double track rising from the portal on a new ramp structure to connect to the existing Metro Gold Line bridge over the US 101

Proposed stations that would be constructed as part of the LPA are:

- Underground station just southwest of the intersection of 2nd and Hope Streets (2nd/Hope Street station)
- Underground station on 2nd Street between Broadway and Spring Streets (2nd/Broadway station)
- Underground station just southeast of the intersection at 1st Street and Central Avenue (1st/Central Avenue station). This station may include a small building at ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans. This shallow station may potentially be built without a roof or mezzanine, leaving the below-grade platform level exposed

The proposed crossovers and pocket track could be located at the following preliminary locations:

- Pocket track, which could also serve as a crossover, underground along Flower Street between 5th and 6th Streets , which would allow for a possible future station at this location constructed as a separate project
- Crossover underground just east of 2nd/Broadway station
- Crossover underground beneath 1st Street just east of the intersection of 1st and Alameda Streets
- Crossover underground beneath the Mangrove property, north of the rail junction

Proposed TPSS facilities would be placed at the following locations:

- Along Flower Street between 5th and 4th Streets
- Underground in the 2nd/Broadway station

2.4.7.2 Operating Characteristics

The LPA consolidates the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes:

East-West Route (Santa Monica to the Eastside via the Metro Expo Line, Regional Connector, and Metro Gold Line Eastside Extension tracks): Metro Expo Line trains from Santa Monica would travel on existing Flower Street tracks north of the junction at Washington and Flower Streets. After stopping at the existing 7th Street/Metro Center Station, the trains would continue north along the new Regional Connector tracks to a new junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to a new portal on 1st Street, and continue along the Metro Gold Line Eastside Extension tracks to the Eastside in

the vicinity of I-605.North-South Route (Claremont to Long Beach via the Metro Gold Line, Regional Connector, and Metro Blue Line tracks): After stopping at 7th Street/Metro Center Station, Metro Blue Line trains from Long Beach would continue north along the new Regional Connector tracks to a new junction beneath 1st and Alameda Streets. Trains would then travel to a new portal on the LADWP maintenance yard site, and continue along the Pasadena Metro Gold Line and the Foothill Extension to Claremont.

The east-west and north-south routes would each operate with five minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector.

Vehicle and Pedestrian Circulation

The Regional Connector alignment would not affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street bridge, where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area. Through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possibleVehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns with the exception of the removal of a newly installed traffic signal at 1st and Hewitt Streets and potentially reduce lane of traffic and parking lane between Wilshire and 5th Streets.

Compared to other alternatives, the LPA alignment would require relatively small changes to surface traffic and pedestrian circulation patterns. There would be some changes on 1st Street between Alameda Street and the 1st Street Bridge where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area. Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns with the exception of the removal of a newly installed traffic signal at 1st and Hewitt Streets. Through traffic movements would no longer be permitted along Hewitt Street at 1st Street, and left turns would no longer be possible to or from Hewitt Street.

An enhanced pedestrian walkway would be created along Flower Street from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets, which would improve the pedestrian connection between the Financial District and the 7th Street/Metro Center Station. Pedestrian enhancements would include an enhanced pedestrian walkway with landscaping, wayfinding signage, art features, and amenities aimed at improving pedestrian experience and safety.

Permanent roadway and lane reconfigurations would also be needed around the proposed 2nd/Hope Street station and the proposed pedestrian walkway enhancement along Flower

Street. At the 2nd/Hope Street station, a short connector roadway would be removed, but all existing traffic movements would still be possible via the remaining connector roadways. One traffic lane would need to be removed from Flower Street between 4th and 6th Streets to accommodate the enhanced pedestrian walkway from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework and Standards of Significance

This section discusses the applicable federal, state, and local regulations that 1) define historic properties and historical resources and 2) provide thresholds for determining effects to historic properties under NHPA and impacts to historical resources under CEQA.

3.1.1 Federal

A number of federal laws address the protection of historic properties. Analysis of expected effects to built environment resources are primarily addressed through NEPA, the National Historic Preservation Act (NHPA), and Section 4(f) of The Department of Transportation Act of 1966.

3.1.1.1 National Environmental Policy Act (NEPA)

The intent of NEPA is to protect the natural and built environment, including historic properties, from adverse effects resulting from federal actions. Before a federal agency may proceed with a proposed action, an environmental evaluation must be made to determine whether the action may have a significant effect on the environment. Effects on historic properties are usually assessed in coordination with the process established under Section 106 of the NHPA.

NEPA requires that agencies evaluate the degree to which an action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for the National Register of Historic Places. Properties that are listed in or eligible for listing in the National Register are defined as "historic properties" (See 36 CFR 800.16(l)). NEPA requires federal agencies to evaluate the significance of potential project-related effects, including both direct and indirect effects upon historic properties.

3.1.1.2 National Historic Preservation Act (NHPA)

Any project, activity, or program that is permitted, licensed, approved, or funded in whole or in part by a federal agency must comply with Section 106 of the NHPA. Federal agencies are required to take into account the effect of their actions on historic properties listed in or eligible for the National Register. Under 36 CFR Part 800.8, federal agencies are specifically encouraged to coordinate compliance with Section 106 and the NEPA process.

The NRHP, created under the NHPA, is the federal list of historic, archaeological, and cultural resources worthy of preservation. Resources listed in the NRHP include districts, sites, buildings, structures, and objects that are significant in American history, prehistory, architecture, archaeology, engineering, and culture. The NRHP is maintained and expanded by the National Park Service on behalf of the Secretary of the Interior. The California Office of Historic Preservation (in Sacramento) administers the statewide NRHP program under the

direction of the SHPO. To guide the selection of properties included in the NRHP, the National Park Service has developed the NRHP Criteria for Evaluation. The criteria are standards by which every property that is nominated to the NRHP is judged. Significance in American history, architecture, archaeology, and culture is possible in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, material, workmanship, feeling and association, and meet one of the following Criteria (36 CFR 60.4):

- Criterion A: A property is associated with events that have made a significant contribution to the broad patterns of our history; or
- Criterion B: A property is associated with the lives of a person or persons significant in our past; or
- Criterion C: A property embodies the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction; or
- Criterion D: A property has yielded, or may be likely to yield, information important in prehistory or history.

Buildings less than 50 years old do not meet the NRHP criteria unless they are of exceptional importance under Criteria Consideration G, as described in the NPS's Bulletin No. 22, "How to Evaluate and Nominate Potential National Register Properties That Have Achieved Significance Within the Last 50 Years." Other NRHP criteria considerations are used for religious properties, moved properties, birthplaces or graves, cemeteries, reconstructed properties, and commemorative properties.

Effects on historic properties under Section 106 of the NHPA are defined in the assessment of adverse effects in 36 CFR Part 800.5(a) (1). These standards of significance are used in the evaluation of potential project effects and are described further in Section 3.2.

Section 110(f) of the NHPA of 1966, as codified in 36 CFR 800.10, requires federal agencies to undertake planning and actions to minimize harm to designated National Historic Landmark (NHL) properties. If a proposed project is found to have the potential for an adverse effect on a NHL, the Secretary of the Interior (typically represented by a representative of the National Park Service) is invited to participate under Section 110(f) of the NHPA. For this project, the Little Tokyo Historic District NHL is situated within the APE and would not be adversely affected. Consultation with the National Park Service will be conducted.

3.1.1.3 U.S. Department of Transportation Act (USDOT), Section 4(f)

Section 4(f) (23 CFR Part 774) of the U.S Department of Transportation (USDOT) Act of 1966, as amended (49 USC 1653[f]), defines impacts of DOT agency projects to be the "use" of certain types of resources, including "historic sites."

DOT agencies, including FTA, cannot approve the use of land from publicly owned parks, recreational areas, wildlife and waterfowl refuges, or public and private historical sites that are listed in or eligible for listing in the National Register unless the following conditions apply:

- There is no feasible and prudent alternative to the use of land; and
- The action includes all possible planning to minimize harm to the property resulting from use (FHWA 2009).

Under Section 4(f), a historic site is significant if it is a historic property (i.e. a property listed in or eligible for the NRHP). Historic properties are considered 4(f) resources that are subject to the provisions of 23 CFR Part 774.

3.1.2 State

The protection of historical resources in California is addressed through the regulatory compliance of the CEQA. The identification and designation of resources in California follow guidelines set in the California Register of Historical Resources, California Historical Landmarks, and California Points of Historical Interest.

3.1.2.1 California Environmental Quality Act (CEQA)

CEQA includes regulatory compliance in relation to historical resources. The CEQA guidelines define a significant historical resource as "a resource listed in or eligible for listing in the California Register of Historical Resources" (CRHR) (Public Resources Code Section 5024.1; 14 CCR 4852). The term historical resource is defined as any site that:

- Is listed in, or determined to be eligible by the State Historical Resources Commission for listing in the CRHR, or is determined to be significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, or cultural annals of California; and
- Meets any of the following criteria, denominated 1 through 4:

    1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
    2. Is associated with the lives of persons important in California's past;

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition, a resource included in a local register of historical resources, as defined by Section 5020.1(k) of the PRC or identified as significant in a historical resource survey meeting the requirements of Section 5024.1(g) of the PRC is presumed to be historically or culturally significant.

3.1.2.2 California Register of Historical Resources (California Register)

Under California PRC Section 5024.1, the CRHR was established to serve as an authoritative guide to the State's significant historic and archaeological resources. A resource is considered historically significant if it meets the criteria for listing in the CRHR (PRC Section 5024.1, Title 14 CCR Section 4852). For a property to be considered eligible for listing in the CRHR, it must be found significant under at least one of four criteria by the State Historical Resources Commission. The four criteria include a finding that the resource:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Has yielded, or may be likely to yield, information important in prehistory or history.

In addition to possessing one of the above-listed characteristics, to be eligible for listing in the CRHR, resources must retain "substantial" integrity to their period of significance. The seven aspects or qualities of integrity are the same as those applied to NRHP-eligible properties: location, design, setting, materials, workmanship, feeling, and association.

The CRHR also includes properties which:

- Have been determined eligible for listing in, or are listed in the National Register;
- Are registered State Historical Landmark Number 770 and all consecutively numbered landmarks above Number 770 (see Section 3.1.2.3);

- Are points of historical interest that have been reviewed and recommended to the State Historical Resources Commission for listing (see Section 3.1.2.4);
- Are city- and county-designated landmarks or districts (see Section 3.1.3., historic districts) are a concentration of historic buildings, structures, objects, or sites within precise boundaries that share a common historical, cultural or architectural background. Individual resources within a historic district may lack individual significance but be considered a contributor to the significance of the historic district (PRC Section 5024.1 (d) (1-3)).
- Are identified as significant in a historic resource survey if it meets the following criteria:

    1. The survey has been or will be included in the State Historical Resources Inventory;
    2. The survey and the survey documentation were prepared in accordance with Office of Historic Preservation (OHP) procedures and requirements;
    3. The resource is evaluated and determined by the office to have a significance rating of category "1–5" on California Department of Parks and Recreation (DPR) series 523 form; and
    4. If the survey is five or more years old, at the time of its nomination for inclusion in the California Register the survey is updated to identify historical resources which have become eligible or ineligible due to changed circumstances or further documentation and those which have been demolished or altered in a manner that substantially diminishes the significance of the resource (PRC Section 5024.1(g)).

3.1.2.3 California Historical Landmarks

California Historical Landmarks (CHLs) are sites, buildings, features, or events that are of statewide significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value.

Designated CHLs are numbered sequentially as they are listed by the State Historical Resources Commission. CHLs numbered 770 and higher are automatically listed in the CRHR. According to PRC Section 5031(a), to be eligible for California Historical Landmark designation, a property must be of "statewide historical importance" and must demonstrate its statewide significance by meeting one of the following three requirements:

- The property is the first, last, only, or most significant historical property of its type in the region. The regions are Southern California, Central California, and Northern California.

- The property is associated with an individual or group having a profound influence on the history of California. The primary emphasis should be the place or places of achievement of an individual. Birthplace, death place, or place of interment shall not be a consideration unless something of historical importance is connected with his or her birth or death.

- The property is a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or it is one of the more notable works, or the best surviving work in a region of a pioneer architect, designer, or master builder.

3.1.2.4 California Points of Historical Interest

California Points of Historical Interest include "sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value." Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission are also listed in the California Register. To be designated, a property must meet at least one of the following criteria:

- The first, last, only, or most significant of its type within the local geographic region (City or County).

- Associated with an individual or group having a profound influence on the history of the local area.

- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer or master builder.

3.1.3 Local

The City of Los Angeles designates local landmarks (Historic-Cultural Monuments) and historic districts, through Ordinance Number 175891, Section 12.20.3, of the Los Angeles Municipal Code.

NEPA and CEQA guide lead agencies to incorporate local designations in the review and evaluation of project effects. Therefore, designated Historic-Cultural Monuments and Historic Preservation Overlay Zones are also considered in the affected environment and included in identified properties. Since Los Angeles is a Certified Local Government, locally designated properties have "presumptive significance" under CEQA. If project alternatives

are expected to affect locally designated historic properties, mitigation measures are recommended, as for CEQA, to avoid, minimize, and mitigate those effects. No Historic Preservation Overlay Zones are located in the APE for this project.

3.1.3.1 City of Los Angeles Designation

Local landmarks in Los Angeles are designated as "Historic-Cultural Monuments." To be eligible for separate designation, properties must meet the criteria described in City of Los Angeles Administrative Code Section 22.130. Historic Cultural Monuments would include any site (including significant trees or other plant life located thereon), building, or structure which:

- Is of particular historic or cultural significance to the City of Los Angeles, such as historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified; or
- Is identified with historic personages or important events in the main currents of national, State or local history; or
- Embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period style or method of construction; or
- A notable work of a master builder, designer, or architect whose individual genius influenced his age.

Properties are usually submitted to City of Los Angeles Office of Historic Resources staff for review, and if considered are presented to the Cultural Heritage Commission. If approved, the Cultural Heritage Commission makes a recommendation to a preliminary committee for its review and later to the City Council for designation.

3.2 Standards of Significance

3.2.1 Federal (NHPA) Criteria of Adverse Effect – Section 106

Effects on historic properties under Section 106 of the NHPA are defined in the assessment of adverse effects in 36 CFR Part 800.5(a) (1):

> An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the National Register. Adverse effects may include

reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

If a project's effects do not diminish the integrity of a historic property, then a "no adverse effect" finding is appropriate (36 CFR 800.5(b)). An "adverse effect" finding is appropriate when any of the following project effects occur:

- Physical destruction of or damage to all or part of the property;
- Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic Properties (36 CFR Part 68) and applicable guidelines;
- Removal of the property from its historic location;
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance (36 CFR Part 800.5(a) (2)).

If an adverse effect is expected to occur as a result of a proposed project, the lead agency shall consult further to resolve the adverse effect, pursuant to 36 CFR Part 800.5(2) and develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on historic properties (36 CFR Part 800.6).

3.2.2 CEQA Standards of Significance for Potential Impacts

As noted in Section 3.1.2.1, under CEQA, proposed public projects must be evaluated for their probability to cause significant effects on "historical resources." Historical resources are defined as "a resource listed in, or determined eligible for listing in, the California Register of Historical Resources" in PRC Section 21084.1. CEQA equates a "substantial adverse change" in the significance of a historic property with a significant effect on the environment (PRC Section 21084. 1). Thresholds of substantial adverse change are established in PRC Section

5020.1, and include demolition, destruction, relocation, or "alteration activities that would impair the significance of the historic resource."

Material impairment occurs when a project results in demolishment, or materially alters in an adverse manner, the physical characteristics that convey a property's historic significance, or that are the reason for that property's inclusion in an official register of historic resources (PRC Section 15064. 5[b] (2)).

If a proposed project or alternative under consideration is expected to cause substantial adverse change to a historical resource, an evaluation of alternatives for the project or implementation of mitigation measures to reduce or avoid impacts is required. If the project is expected to result in an effect on historical resources, CEQA guidelines require an analysis of a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project and avoid, or substantially lessen, any significant effects on the historical resource.

3.2.3 Noise and Vibration

Noise generated by construction equipment can cause adverse effects to historic properties and significant impacts to historical resources when exposure exceeds the "severe level" as established by FTA (Hanson 2006). Noise that reaches a severe level which cannot be reduced through mitigation or other measures may cause a reduction in use or access to historic properties or historical resources, and thus cause an adverse effect to historic properties or a significant impact to historical resources. For properties or resources where the sense of quiet represents a characteristic of its historical significance, increases in noise may also cause adverse effects and/or significant impacts.

Ground borne vibration (GBV) generated by construction equipment can also cause adverse effects to historic properties and significant impacts to historical resources that are in close proximity construction activities. Construction-related vibration can cause damage ranging from minor cosmetic damage to interior plaster or woodwork damage to major structural damage. Thus, GBV can harm the characteristics that make historic properties eligible for the NRHP and historical resources eligible for the CRHR.

GBV is established by measuring the vibratory potential of construction equipment, the distance between the equipment and a sensitive receptor (i.e. historical resource or historic property), and the structural category of the historic property and/or historical resource. When assessing the potential for building damage, GBV is usually expressed in terms of the peak particle velocity (PPV) in units of inches per second. FTA vibration damage criteria for various structural categories are listed in Table 3-1.

Depending on the types of construction equipment and the category of buildings, potential "minimum safe distances" for GBV for this project have been calculated in Table 3-2. The

approximations in Table 3-2 are based on "typical" equipment and construction activities as well as the general classification of structures.

Table 3-1. FTA Construction Vibration Damage Criteria

Building Category and Description	PPV (in/sec)
I. Reinforced-concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: U.S. Federal Transit Administration's Transit Noise and Vibration Impact Assessment Manual, May 2006. FTA-VA-90-1003-06. Table 12-3.

Table 3-2. Calculated "Minimum Safe Distances" from Construction Equipment to Reduce Potential for GBV Damage (ft)

Equipment		Building Categories and (FTA Guideline Damage Thresholds)			
		Cat I (0.5 PPV) Inch/sec	Cat II (0.3 PPV) Inch/sec	Cat III (0.2 PPV) Inch/sec	Cat IV (0.12 PPV) Inch/sec
Pile Driver (Impact)	Upper Range	53	74	97	136
	Typical	30	42	55	77
Pile Driver (Sonic)	Upper Range	33	46	60	84
	Typical	13	18	23	32
Large Vibratory Roller		15	20	26	37
Hoe Ram		8	12	15	21
Large Bulldozer		8	12	15	21
Caisson drilling		8	12	15	21

3.3 Area of Potential Effects

The project-specific Area of Potential Effects (APE) (See Figures 3-1 through 3-9) was established through consultation between the lead federal agency, FTA, the lead CEQA agency, Metro, SHPO, and other consulting parties, in accordance with 36 CFR 800. Consistent with 36 CFR 800.16(d), the APE is defined as:

> The geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking.

The project APE was delineated to ensure identification of historic properties and historical resources that may be directly or indirectly affected by the project and that are listed in or eligible for inclusion in the NRHP and/or CRHR. The APE was established using methodology consistent with those of previous Metro projects. The 1.9-mile-long APE consists of 246 Los Angeles County Office of the Assessor parcels, some of which are subdivided into multi-property entities.

The SHPO concurred with the project APE on September 9, 2009. Subsequent to the September 2009 APE concurrence, two new alternatives were developed by MTA. As a result, the APE was revised and resubmitted to SHPO for review of the new areas on December 24, 2009. The SHPO concurred with the revised APE on February 10, 2010. Although the Fully Underground Alternative has been altered slightly due to project refinements the APE has not changed.

Correspondence between FTA and SHPO for this project is included in Appendix E.

3.4 Evaluation Methodology

3.4.1 Records Search

A California Historical Resources Information System (CHRIS) records search was conducted at the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton for the area within the APE. The SCCIC houses cultural resources records for Los Angeles County and the primary purpose of the CHRIS records search was to identify any previously recorded cultural resources known to exist within or adjacent to the project corridor. The records review included a review of listings for the National Register of Historic Places California Register of Historical Resources, State Historical Landmarks, and California Points of Historical Interest. In addition, complete listings for designated local landmarks were also reviewed.

3.4.2 Built Environment Survey Methods

SWCA architectural historians conducted reconnaissance-level built environment surveys of the 1.8-mile-long APE in April 2009. In December 2009 to two new alternatives were added to the proposed project, requiring subsequent field surveys, bringing the total project length to approximately 1.9 miles. Each parcel in the direct and indirect APE containing improvements completed in or before 1968 was digitally photographed and researched, using data from the Los Angeles County Office of the Assessor and other sources. Since construction year records are not entirely reliable, all properties in the APE were field-checked to verify whether or not their construction may have occurred more than 50 years from the anticipated project construction date of 2018.

SWCA assumed that the historic status of properties listed in or determined eligible for the National and/or California Registers was unchanged, unless improvements were no longer extant or major alterations had recently been made as noted. One building that was determined eligible for listing in the National Register was field-checked and the determination, which is believed to have been made in error, was corrected in this document as a finding. DPR series 523 forms were prepared for properties that have been demolished since they were listed or eligibility determinations were made for National and/or California Registers.

In April and May 2009 and again in December 2009, SWCA conducted intensive-level surveys of properties containing improvements completed in or before 1968 in the APE that required evaluation or re-evaluation for historical significance. SWCA reviewed those properties in the field, photographed, and performed subsequent building permit and other research on properties that retained sufficient integrity to warrant evaluation for National Register and/or California Register eligibility. Those properties were studied to identify the architects, builders, owners, and tenants, as well as events that may have taken place, in order to make recommendations regarding their historic significance.

3.4.3 Consultation/Coordination

In addition to consultation with the SHPO (see Appendix E), Metro has coordinated with other interested parties regarding cultural resources as described in Section 3.4.3.1, Section 3.4.3.2, and the Cultural Resources – Archaeology Technical Memorandum. This early coordination is intended to assist in the identification of potential cultural resources and historic properties in support of the effects evaluation.

Figure 3-8. Area of Potential Effects Map, Sheet 8

Figure 3-9. Area of Potential Effects Map, Sheet 9

3.4.3.1 Native American Coordination

In compliance with Section 106 of the NHPA, FTA initiated the consultation process with Native American tribes with interests in the project area as consulting parties, pursuant 36 CFR Part 800.

Under the guidance of FTA, SWCA contacted the California Native American Heritage Commission (NAHC) by a letter dated February 10, 2009, requesting review of the Sacred Lands File and a list of appropriate Native American contacts for the project. The NAHC search of the Sacred Lands File indicated the presence of Native American cultural resources in the project area. The NAHC also provided a list of five Native American contacts.

SWCA sent letters via U.S. mail to the five Native American contacts on April 16, 2009, requesting information regarding potential cultural resources that may be located within the project APE. These letters included location maps and a description of the proposed project and its related APE. A follow-up contact with each group was made via telephone on May 11, 2009, and subsequent follow-ups via telephone and/or email were made as necessary. Not all of the contacts responded.

Details of SWCA's contacts with the tribes are provided in the Regional Connector Transit Corridor Cultural Resources – Archaeology Technical Memorandum.

3.4.3.2 Local Historical Group/Local Government Coordination

Metro's representative, SWCA, sent letters via U.S. mail to nine local government, local historic preservation advocacy, and history advocacy groups to request information regarding historic resources that may be located within the project APE. The letters were mailed on April 16, 2009, and described the proposed project and its related APE, and included location maps (Appendix C). SWCA followed up with each group via telephone and/or email between April 23 and May 14, 2009, and made subsequent follow-up efforts, as necessary. The Fully Underground LRT Alternative (Little Tokyo Variation 1 and 2) were added to the project in December 2009. These alternatives are in or immediately adjacent to the original study area; therefore, additional consultation was not undertaken.

Five groups did not provide responses. One asserted that it was too early in the project to discuss. One agency and one local historic preservation advocacy group reserved the right to consult regarding effects in the future. Subsequently, meetings were held with each of these groups and one meeting was jointly held with both groups. One group commented on general environmental issues, and another group provided additional research on the history of Little Tokyo and the Atomic Café. Results of the coordination are described in detail in Table 3-3. Coordination regarding identification, effects, and mitigation are ongoing as part of this project's Section 106 compliance efforts.

On March 16, 2011 METRO, FTA, Cardno ENTRIX and other project staff met with the Los Angeles Conservancy and the City of Los Angeles to discuss project refinements and proposed mitigation for the project.

City of Los Angeles Office of Historic Resources, Department of City Planning 200 N. Spring Street, Room 620 Los Angeles, CA 90012 Contact: Ken Bernstein, Director	4/16/09, via U.S. Priority Mail	4/27/09, telephone call from Mr. Bernstein	• 4/23/09, telephone message by Francesca Smith (FS), SWCA • 4/27/09, Mr. Bernstein returned the call to FS3/7/11 An invitation was sent by email to invite the City to participate in a meeting to discuss project refinements	Mr. Bernstein stated on 4/27/09: "No comments, really." He asserted that when Survey LA is "up and running" they will be able to provide more information. He recommended that SWCA contact the Los Angeles Conservancy, which recently teamed with the Downtown Los Angeles Council to create a street map that identified historic resources. Map was obtained for reference. He also said that once effects were identified, their agency would likely want to consult on the project. In a brief telephone call and subsequent e-mail message sent on 8/4/09, Mr. Bernstein said that his office was "starting to hear concerns from the downtown community about potential historic resources impacts, including impacts on historic Little Tokyo. He requested "a briefing/consultation meeting for Office of Historic Resources staff. We would be happy to include other interested parties in the historic preservation community, including the Los Angeles Conservancy," suggesting potential meeting dates. A joint meeting was held with Los Angeles Conservancy staff on 9/2/09. The project was presented, identification efforts were described, and very general ideas about effects and mitigation were discussed. Consultation is expected to be ongoing. A joint meeting was held with Los Angeles Conservancy

4.0 AFFECTED ENVIRONMENT

4.1 Historic Overview

The project is located within the City of Los Angeles in Los Angeles County, California. Generally, the APE extends in a northeasterly direction from south of the intersection of Flower and 7th streets to the Gold Line at Alameda Street between 2nd and Temple streets in downtown Los Angeles. The project crosses several community areas in downtown Los Angeles, including the Civic Center and Little Tokyo communities. This area is highly urbanized with development ranging from commercial, public, and institutional uses to high density residential. The following historic context statement was prepared to present an overview of development of the overall community and project area and provides the framework used to evaluate historic significance of properties within the project APE.

4.1.1 Spanish Period (1769–1822)

Los Angeles was established in 1781 as a Spanish pueblo near the Los Angeles River. The Spanish governor of California, Felipe de Neve, led a procession of soldiers, laypeople, and priests from nearby Mission San Gabriel Arcángel and founded the pueblo near the Porciúncula, now Los Angeles River. The objective of the settlement was to supplement the agricultural goods produced at the Mission San Gabriel. The mission and Los Angeles were designed according to the Laws of the Indies, the town planning guidelines codified by the Spanish in the mid-sixteenth century for colonial towns (Fogelson 1993). Due to seasonal river flooding, the settlement was relocated three times before its final location was established. All three iterations of the pueblo had similar plans: houses and buildings faced a central square, oriented to the cardinal points. The pueblo lands were divided and distributed among the 44 original settlers, or pobladores, each of whom received two suertes, or fields, of irrigable land, two fields of dry land, and a house lot, facing the central square (Ríos-Bustamante and Castillo 1986). The third site chosen by the Spanish for the new pueblo was located in what is now known as the Plaza, to the north of the project APE. Selected in 1825, the final pueblo site was originally named El Pueblo de la Reina de Los Angeles (Ríos-Bustamante and Castillo 1986).

4.1.2 Mexican Period (1822–1848)

Mexico gained independence from Spain in 1821; the subsequent secularization of the mission system and distribution of its holdings dramatically shifted the character of land ownership in Los Angeles and much of California. Mission secularization in 1833 marked the beginning of highly profitable private trade in cattle hide and tallow exports, which eventually resulted in larger, commercially driven farms. During Mexican rule of California, between 1821 and 1848, land owned by the Spanish crown and clergy was distributed in more than 800 land grants, passing mostly to Mexican settlers born in California, or Californios. This shift marked the beginning of the rancho system that would "dominate California life for nearly half

a century..." (Poole 2002) but the rural character of the pueblo of Los Angeles and its surroundings remained (Fogleson 1993).

Many ranchers maintained second homes near the pueblo area, which was managed by the ayuntamiento or common council. The ayuntamiento was responsible for an informal system of zanjas or irrigation ditches that conveyed water for both agricultural and domestic use. By the 1830s, the population of the settlement had grown from the original 44 to approximately 1,000 persons, making Los Angeles the most populous of the original three pueblos, as well as the center of economic and political life, in Alta (or upper) California (Fogleson 1993).

4.1.3 American Period (1848–Present)

With the signing of the Treaty of Guadalupe Hidalgo in 1848, the U.S.-Mexican War formally ended. California was annexed to the United States and subsequently gained statehood in 1850. That same year, the City of Los Angeles was incorporated. During the city's transition from a Mexican pueblo to an American town, public authority rather than private enterprise became the influence behind development.

In 1849, the first survey of Los Angeles was made when Lieutenant Edward O. C. Ord produced the city's first map. Ord made his plat according to the same grid plan (albeit using the pueblo's original orientation to the cardinal points) that had become the standard for American cities by this time (O'Flaherty 1978). The survey had a northeast-southwest street alignment, which was influenced by natural landforms, colonial irrigation patterns, and the concept that no side of the street be entirely in shade or shadow during the most important business hours. The city's oldest areas, just east of Main Street, still exhibit the characteristics of the imperfect platting that dates from before 1848. The 33-degree "skewed" grid orientation of downtown Los Angeles characterizes the north-south streets east of Hoover Avenue and west of Indiana Street.

With the 1849 Gold Rush, and growing influx of European-Americans to Southern California, the population of Los Angeles expanded substantially. During the American period, from 1850 to 1860, the population grew nearly 300 percent from approximately 1,600 to 4,300 persons (Hill 1929). Many of the new residents were farmers who came to Southern California to take advantage the abundance of inexpensive land and water. As settlement continued to expand outward of the central city, the core of Los Angeles, its Plaza area, continued to serve as the center of social and religious life in the town. Harris Newmark came from West Prussia (now Germany) to settle in Los Angeles in 1853. He learned Spanish before mastering English and subsequently published his recollections of early Los Angeles. Newmark described the Plaza area as the "nucleus" of town, around which were "clustered the homes of many of those who were uppermost in the social scale" (Newmark and Newmark 1970).

The three major railroads, Southern Pacific Railroad, Atchison Topeka & Santa Fe Railway, and Union Pacific Railroad, came to Los Angeles in 1876, 1872 and 1905, respectively. Their presence, coupled with an agricultural boom, helped to fuel the community's then-unparalleled growth. As one of the first cities to significantly benefit from the presence of railroads, the citrus industry expanded enormously after the advent of the refrigerated freight car. Artificially cooled freight cars allowed produce to be shipped to other markets that previously only had access to such goods during colder months.

Once the railroads came to Los Angeles, development of the city was tremendously influenced by transit and transportation patterns, which expanded as the community matured. Growth of the community and enhancements in transportation modes each influenced the other more compellingly than in more established cities, where principal transit corridors had already been identified before rail transit became a factor.

Its strategic location on the Pacific Ocean made Los Angeles a regional business center during the early American Period, but was still viewed as a small town with rough edges. In *Inventing the Dream*, the pronounced effect of railroads on the region was summarized:

> [t]he railroads settled Southern California: first the Southern Pacific, blasting its way through the San Fernando Mountains in 1876 to link Los Angeles with San Francisco and the east, and then, in 1885, the Atchison Topeka and Santa Fe Railway arriving overland through the deserts and gorges of the southwest (Starr 1985).

The consequences of rail traffic were further illustrated in the community's sudden progress:

> [i]n the...1870s... [Los Angeles] became an American city. Adobe gave way to brick and wood, candles and kerosene to gas. The streets were paved and tracks laid for horse-drawn streetcars. Police and fire departments were organized on a permanent basis and a lending library was established. A city hall was built, together with a train station a county hospital, an opera house, and a [large] theater... (Starr 1985).

4.1.4 City of Los Angeles

Between 1880 and 1900, Los Angeles grew from a town of 11,000 to a bustling city of 100,000 residents, prompting the development and expansion of city roads, buildings, and services. A dramatic real estate rush in Los Angeles between roughly 1886 and 1888, coupled with price wars between the three transcontinental railways serving the region, led to further increases; the population peaked in 1888 at 80,000. In the downtown area, development was particularly dense as government and commercial buildings were constructed throughout the area that now comprises the Civic Center (Roseman et al. 2004).

The plaza and community matured as daily newspapers, public and private schools and universities, and a racetrack were established. Expansion of railroads, as well as the growth of

port facilities, contributed substantially to the celebrated economic boom that occurred in the region in the 1880s (Caughey and Caughey 1977; Dumke 1944). Although the real estate boom exponentially affected surrounding areas, Los Angeles, as the commercial center, also reaped substantial benefits from the unprecedented growth. That growth was spurred by efforts of community boosters, who assisted in propelling the small town into a major city. Los Angeles was the subject of "the longest, loudest, [and] most persistent promotional campaign" to promote an American city between the 1870s and the Depression (Zimmerman 2008). Due to their obvious role in moving goods and transporting the populace, local, regional, and national railroad companies helped shape the development and growth of present-day Los Angeles as well as the surrounding region.

The first Sanborn Fire Insurance Company maps prepared for Los Angles portrayed north-south streets in 1888. The west-to-east sequence was: Pearl Street (currently Figueroa Street), Flower Street, Hope Street, Bunker Hill Avenue (not applicable to current street name), Grand Avenue, Olive Avenue, Hill Street, Fort Street (now Broadway), Spring Street, Main Street, Los Angeles Street, San Pedro Street (currently Judge John Aiso Street north of 1st Street), and Vine Street (currently Central Avenue). Figure 4-1 shows an excerpted image of 1888 Sanborn Fire Insurance map with proposed project alternatives overlaid to show how the essential arrangement of streets has not substantially changed since that time. By 1888, the rise in real estate values had finally deflated; causing the population to slide down to 50,900. The subsequent economic depression lasted through the mid-1890s (O'Flaherty 1978).

4.1.4.1 The Metropolis Develops

By the turn of the twentieth century, downtown Los Angeles was growing quickly in size and stature. Although affected by the real estate downturn of the late 1880s, industrial and commercial activity remained high throughout downtown, as well as in the rest of the city. The 1890 discovery of oil prompted the development of new technologies and sparked a wave of manufacturing activities, including furniture, sportswear, and homes. By 1900, the city's first central business district emerged, centered around 2nd and Spring Streets, consisting of some 20 city blocks (Longstreth 1998; Fogelson 1993).

As the city grew, the need for interurban transportation significantly increased. A number of small, short rail lines were established throughout the city to provide residents with local transportation. Many of these rail lines operated for brief periods of time, lasting only a few years before being bought out by larger firms or forced out of business by competing lines. One of the unique smaller lines that managed to succeed was Angel's Flight, established in 1901 by Colonel J. W. Eddy to serve the residents of Bunker Hill in the northwest area of present-day downtown. The steep climb up 3rd Street between Hill and Olive Streets proved difficult for the affluent residents. The short funicular rail line only traveled a block or two, but the route was up a steep grade and it proved invaluable to residents. Angel's Flight closed in 1969 and was dismantled. It was briefly reopened one-half block south of its original location

at 3rd and Hill streets and is currently situated mid-block between 3rd and 4th streets, just south of the project APE.

Henry Huntington was a nephew of Collis P. Huntington, one the notorious "big four" who built the Central Pacific Railroad, the western portion of the first transcontinental railroad in the United States. The younger Huntington completed his first streetcar line, the Pacific Electric Railway Company (PE), in 1902. The line connected Los Angeles to Long Beach. In part because of the PE interurban rail lines, Broadway evolved as a main retail thoroughfare. Many of the PE's routes terminated at 4th Street and Broadway. Public use of the PE peaked in 1924, and it made that intersection and corridor valuable commercial property. Broadway was developed with commercial uses, specifically retail and theater buildings. Beginning in the early 1910s and extending to the 1940s it was the center of retail commerce in the growing city of Los Angeles.

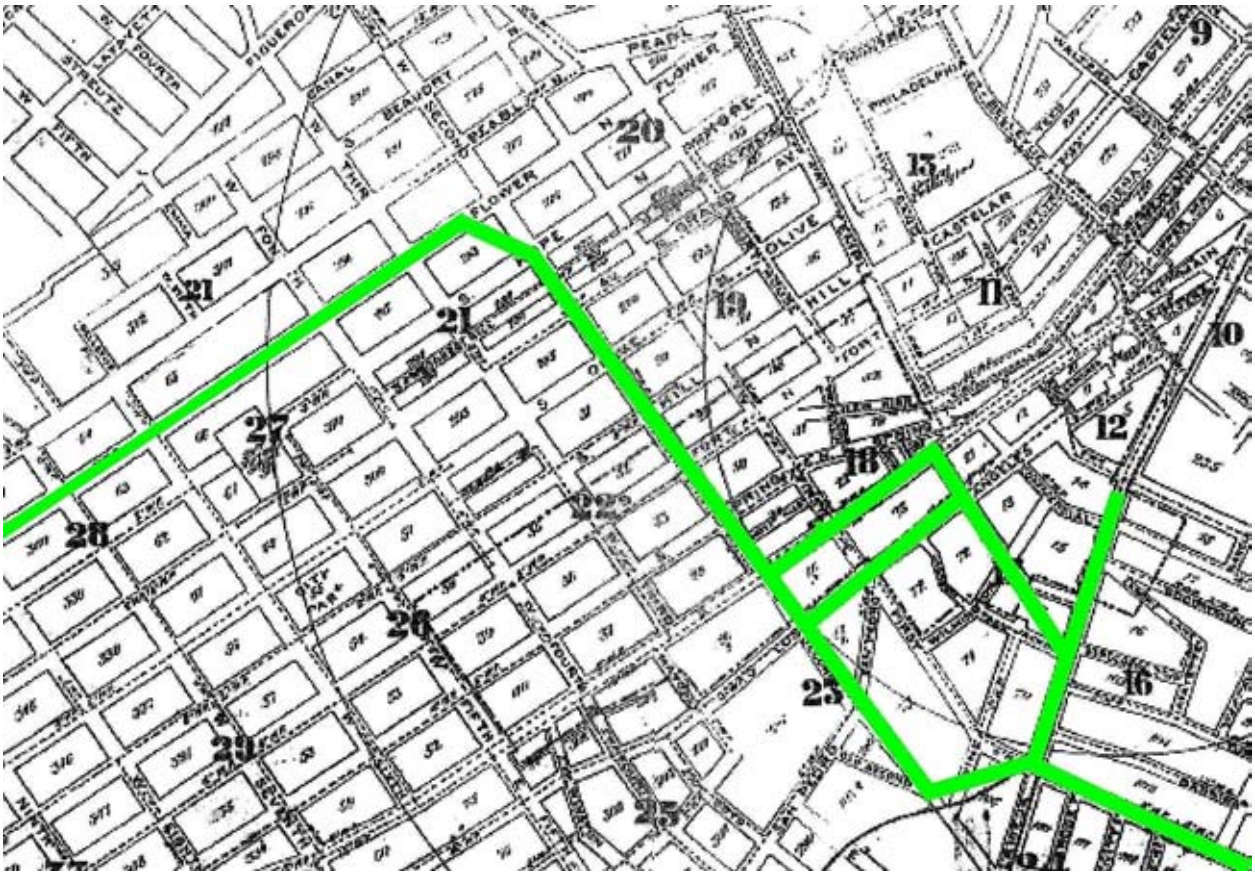

Figure 4-1. Excerpted Sanborn Fire Insurance Company maps of Los Angeles, California dated 1888.

Notes: Index sheets combined and annotated, graphically depicting all proposed project alternatives in green. Note that the arrangement of streets is essentially the same in 2010 as they were in 1888.

Along with early city growth the first demand for organized urban planning was made. Until planning and zoning rules were implemented, single-family homes (some belonging to city fathers) were dwarfed by tall, commercial buildings. City officials and residents became vigilant regarding fast-paced changes occurring in downtown, which were largely fueled by private commercial development. When the 12-story Braly (now Continental) Building (400 South Spring Street; John D. Parkinson) was completed in 1902, the city adopted its first of two height limit ordinances, establishing what became the uniform height of 150 feet or less for all buildings.

By the 1910s, city planners were calling for more parks, fewer saloons, and improved streets. To implement these goals, planners turned to the "City Beautiful" trend for direction. The City Beautiful movement was a progressive concept that had great influence on American civic design and planning from the late 1800s to the early twentieth century (Bluestone 1988). Espousing precepts that monumental formal design, beautification, and grandeur would improve cities, it was expected that those noble efforts would counteract the increasing moral and physical decay of poverty. Originally associated with the cities of Chicago, Detroit, and Washington, D.C., this influential planning style did not promote beauty for the sake of aesthetics, but was intended to be a subtle social control device for creating moral and civic virtue in urban populations. Advocates of the movement believed that such beautification could thus provide a harmonious social order that would improve the lives of the inner-city poor. The City Beautiful movement resulted, in part, in gracious long vistas in civic plazas; usually light-colored, formal buildings and other structures; the inclusion of diagonal streets rather than simple grids; and gracious public gardens and parks.

In an unintended move that foretold the city's future as a major metropolis, the City of Los Angeles Municipal Arts Commission engaged "city architect" Charles Mulford Robinson to bring the City Beautiful concept to the community. The City Beautiful principal was adopted in 1908, the same year that Los Angeles adopted a zoning code. Its realization in Los Angeles was complicated and ultimately compromised by the demise of the PE and the concurrent rise in use of the private automobile. It did, however, provide the first dialogue for development of a civic center, a plan that would not finally be realized until after World War II (Starr 1990).

The Los Angeles River Bridges are an ensemble of 12 City Beautiful-inspired bridges, built near downtown between 1911 and 1933. It is the largest and most architecturally significant grouping of concrete bridges in the state according to some experts (Mikesell 1986). Each of the 12 is a reinforced concrete structure, built in concrete strengthened by interior reinforcing steel bars. The steel was notably included in the concrete curing process.

Reinforced concrete technology began in Europe in the 1840s and continues to evolve and improve. California engineers are credited with introducing reinforced concrete use to the rest of the nation, in part because of the ready availability of raw concrete ingredients such as

sand. The state became a proving ground for reinforced concrete, and the Los Angeles River Bridges are considered by many to be the finest examples of its use.

The 1st Street Viaduct (property 9R-7) was completed in 1929 as the eighth of the 12 bridges. The first was North Buena Vista Viaduct/North Broadway Bridge in 1911, and the final bridge in the series was 6th Street Viaduct/Whittier Boulevard Viaduct in 1933. The resulting remarkable series of concrete bridges and viaducts cross the river with surprising grace. Each of the bridges (nine of the 12 are technically viaducts) adapted the unique qualities of reinforced concrete and used state of the art engineering and design concepts.

By the 1920s, the economic core of downtown had expanded to 50 square blocks. The Central Business District, the center of which was once the Plaza, had "migrated southwesterly since the boom the 1880s, so that Broadway and 7th [were] its main shopping arteries" during most of the twentieth century (Lantis et al. 1973). This economic expansion prompted a period of unprecedented growth in Los Angeles, both in population and in physical development. Strides in manufacturing, oil development, tourism, land development, and the film industry prompted a period of rapid construction and invigorated downtown, which became home to about three-quarters of the city's commercial and professional activity (Fogleson 1993). As described in *Material Dreams: Southern California Through the 1920s*, "the financing of Los Angeles's exfoliating real-estate, construction, oil, port, manufacturing, entertainment and aviation industries remained largely in local hands, and so Los Angeles emerged as a banking center as well" (Starr 1990). So many of these financial institutions were located along Spring Street, the street was known as the "Wall Street of the West."

Retail expansion was focused along Broadway and Hill Street, crowded with department stores that sold everything from shoes to pianos. Barker Brothers Furniture Store (Property 2-1, 818 West 7th Street, Curlett & Beelman), completed in 1925 in the Classical Revival style, was a striking example of a multi-story retail complex constructed during the period. At the time, it was one of the largest furniture stores in the United States; its facilities were separated into interior spaces that reflected the organization and spaces found in the average household (Hatheway 1978).

In addition to commercial expansion that occurred in the 1920s, many of the civic improvements drafted earlier in the century finally came to fruition, including the early beginnings of a civic center district. At the center of this achievement was Los Angeles City Hall (Property 6-2, 200 North Spring Street, Austin, Parkinson & Parkinson and Martin), which was completed in 1926 on the former site of the Temple Block. When it was built, City Hall was the tallest building downtown; at 454 feet, it was substantially taller than the allowable 150-foot building height limitation in place at the time. The Los Angeles Central Library (Property 3-2, 630 West 5th Street, Bertram Goodhue with Carlton Winslow), completed in 1926 was another ambitious 1920s civic building project that announced Los Angeles as a

major city. The "light of learning" theme was a remarkable architectural collaboration at the time and remains one of the largest library systems in the nation.

By 1924, downtown was thriving; a reported 1.2 million people (a figure greater than the city's total population) traveled each day to the area, which by that time had expanded to encompass Temple Avenue, Los Angeles Street, Pico Boulevard, and Figueroa Street. Although downtown retained an intricate network of rail lines and trolley cars that connected the big city to outlying communities, the automobile had begun to guide development throughout Los Angeles. Inter-urban streetcar use began to wane as the automobile gained relevance. Adding to the difficulty were the thousands of at-grade streetcar-automobile intersections, which greatly impeded streetcar service. By 1921, some of the urban railways offered bus service. The Roosevelt Building (Property 2-7, 727 West 7th Street, Curlett & Beelman), completed in 1925, was one of the many downtown buildings that incorporated automobile parking into its design, offering subterranean space for 350 vehicles, when comparable competitors offered only 120 spaces (Longstreth 1998).

Improvements to roads were also necessary to accommodate the influx of automobiles. The 2nd Street Tunnel (APE Map # 4-3), completed in 1924, was the fourth in a sequence of significant tunnels to be built by the City of Los Angeles to ease traffic congestion in the early twentieth century (Los Angeles Times 1924). The first was Broadway Tunnel (opened 1901, demolished 1969), followed by the 3rd Street Tunnel (1907, significantly altered 1967), and the Hill Street Tunnel (1909, demolished 1948). The sleek, tile-lined 2nd Street Tunnel is noteworthy for its construction methods and as a masonry arch structure, supported by eight rings of brick in the upper section of the arch.

Figueroa Street was one of a handful of great boulevards of Los Angeles that were expanded in the 1920s. An early alignment of Figueroa Street was part of the famed US Route 66, and is currently a component of the Pasadena Freeway (Interstate 110). The notable Figueroa Street Tunnels, near present-day Chinatown, were once a part of Figueroa Street as well. Figueroa Street is credited with being one of the longest avenues in the United States, with a length of more than 30 miles, stretching between Eagle Rock to the Los Angeles Harbor.

Downtown continued to thrive throughout the 1920s. The commercial and civic core of the city continued to shift farther south, toward a new center at 7th and Hill Streets (Fogleson, 1993). Throughout the twentieth century, businesses and retail services crept south, with major businesses eventually abandoning the Broadway and Spring Street areas for 7th Street, and later Figueroa and Flower Streets (Starr 1997).

Along the eastern end of downtown, the Japanese-American community of Little Tokyo was also thriving. The first Japanese American resident had arrived in Los Angeles in 1886 and started a restaurant on East 1st Street. By the end of the nineteenth century, Japantown (as it was then known) was home to more than 2,000 Japanese Americans, and a prosperous

community had been established. Many of those residents had moved to the area to lay track for the Pacific Electric interurban streetcar system. By 1935, Los Angeles was home to 13,000 people of Japanese ancestry, most of whom resided close to or within Little Tokyo (Starr 2002; Hayden 1996).

Figure 4-2. Figueroa Street Tunnels, view north, circa 1940s.

Source: Longshaw Post Card Company. Private collection, used with permission.

Downtown's building frenzy continued until 1929, when the stock market crash brought both large and small investment to a halt. As real estate and automobile values plummeted, shops and apartments stood vacant. In downtown Los Angeles, few buildings were added to the downtown skyline during the 1930s. As described in *City Center to Regional Mall, Architecture, the Automobile and Retailing in Los Angeles, 1920-1950*:

> Between the early 1930s and early 1950s little new construction of consequence occurred in the [business] district. The depression did not, of course destroy downtown Los Angeles; it only accelerated tendencies set in motion during the previous decade when the city center seemed indomitable. Many property owners 'held on' and many put new capital into their buildings (Longstreth 1998).

The decade of the 1930s eventually included additional growth in Los Angeles, although much of it was outside of downtown. The San Fernando Valley expanded as an agricultural,

commercial, and residential center. The Los Angeles Memorial Coliseum (John and Donald Parkinson), actually completed in 1924, was built for the 10th Olympiad in 1932. Griffith Park Planetarium (John C. Austin and Frederick Ashley) was completed in 1934. The Union Passenger Terminal (John and Donald Parkinson) was built on the north end of downtown in 1939. Along with residential development, retail areas expanded from downtown to include Wilshire, Sunset, and Santa Monica Boulevards, each of which drew away more and more of what had been downtown's loyal patronage. Notable downtown projects ranged from the Los Angeles Times Building (Property 8-2, 101 South Spring Street, Gordon B. Kaufmann), built in 1935, to the United States District Courthouse Building (Property 6-1, 312 North Spring Street), completed in 1940, and the concept and design for a new, unified Civic Center began to take shape.

4.1.4.2 World War II and Post-war Los Angeles

In the immediate aftermath of the attack on Pearl Harbor, downtown Los Angeles became involved in the war effort, as did the rest of the nation. Within Little Tokyo, the bombing sparked the beginning of significant change for business owners and residents. During World War II, Executive Order 9066 gave the Army authority to relocate more than 110,000 Japanese Americans on the west coast to internment camps in isolated and barren areas. As suggested in *Embattled Dreams: California in War and Peace*, "the Japanese-Americans of California suffered the trauma and indignity of an incarceration that represented the most massive violation of the constitutional rights of any single ethnic group in this nation after the ending of slavery" (Starr 2002). The spirit of what was the largest Nihonmachi (Japantown) in the United States was suddenly extinguished, as its Japanese-American residents were forced into internment camps. This action eradicated Japanese settlements and culture until after the end of the war and caused interned families to start their lives over - personally, emotionally, and financially - after release from incarceration.

During the war, African Americans, who had come to Los Angeles in large numbers to work in the defense industry, moved into Little Tokyo. Like other Japanese communities in California, after blacks moved in, the area became a thriving "Bronzeville" until the 1950s (Waugh et al. 1988). Part of the explanation for the widespread and local African-American population changeover was that Little Tokyo was not subject to deed restrictions.

Downtown failed to return to its 1920s economic peak in the aftermath of the Second World War. Nearly 13 million veterans returned to the United States, ready to buy homes and settle into suburban life. While many returned to or decided to settle in or near Los Angeles, patterns changed, and these residents moved away from the city center, residing in the growing, outlying residential suburbs. Home ownership in the nation was propelled to unprecedented numbers, in part due to low-interest loans and long-term mortgages provided by the G.I. Bill (Servicemen's Readjustment Act of 1944, Public Law 78-346, 58 Statute 284m). Through the late 1950s, the effect of the automobile was reflected in the built environment, as

the economic potential from commercial establishments along heavily traveled highways and thoroughfares prompted roadside development.

During the post-WWII period, many downtown areas suffered economic downturns, including that of Los Angeles. Suburbs became increasingly desirable as residential and commercial hubs, and as a result downtown Los Angeles lost some of its caché as a business center and retail destination. The 1940 opening of Arroyo Seco Parkway (now Interstate-110), constructed to ease downtown commuting, instead sent the populace away, leaving the downtown area empty compared to its pre-war level of activity. The growth of the suburbs pushed population away from the city center, and many downtown buildings deteriorated as a result. Once grand movie places were no longer crowded, department store flagship stores were no longer fashionable destinations, and ornate office buildings were not the sought-after real estate they had once been.

Figure 4-3. Postcard depicting view of freeway and Civic Center, c. 1953.

Source: Private collection, used with permission.
Notes: View southwest toward Civic Center, looking across Hollywood Freeway (U.S. 134). Back of postcard reads "The Hollywood Freeway is one of a vast network of major highways engineered and designed to provide unobstructed driving to and from the metropolitan area of Los Angeles."

In an effort to combat the urban slump, the California Community Redevelopment Law was passed in 1945, followed by Title 1 of the Federal Housing Acts of 1946 and 1949. These laws

were designed to legally and financially assist cities to address problems of decay and neglect within their communities. In response to this new legislation, the Community Redevelopment Agency of the City of Los Angeles (CRA) was established in 1948, in part to cure economic "blight" by funding and overseeing redevelopment. As its first major project, the CRA sought to improve the Bunker Hill area, which had been one of the more exclusive residential neighborhoods at the turn of the twentieth century but had deteriorated and fallen out of fashion. Despite many proposals, plans to redevelop Bunker Hill were rejected, and ultimately not begun until the 1960s, when large hotels and Victorian-era homes were bulldozed and the landforms were rearranged. Slowly, over the past 50 years, a community of high-rises has been constructed in their place (Kawaratani 2008).

When the Harbor Freeway (Interstate-110) was completed in 1952, it was hopefully called "downtown's new Main Street" by noted local architect A. C. Martin, Jr. (Los Angeles Times 1967). Construction of the freeway and the repeal of the building height ordinance in 1954 created a significant new concentration of high- and midrise buildings, eventually concentrated on Figueroa and 7th Streets.

The downtown civic center began to take shape in the post-war era. As discussed in *California: A Land of Contrast*:

> Business blocks of the late nineteenth century have been replaced by the Civic Center, whose buildings, most of contemporary design, are flanked by multi-acre parking lots. The Civic Center has encroached westward upon Bunker Hill, once occupied by the city's wealthier residents and now experiencing impressive [redevelopment] (Lantis, et al. 1973).

The resulting Civic Center plan, adopted in 1947, has an east-west axis and is roughly bounded on the north by Aliso Street, on the south by 2nd Street, Grand Avenue to the west, and Alameda Street on the east side.

A new police facilities building was constructed on two city blocks formerly occupied by shops and residences in Little Tokyo. The new police building (Property 6-6, 150 North Los Angeles Street, constructed in 1955) was expected to "revolutionize the design of law enforcement buildings" and was designed by Welton Becket and Associates and J. E. Stanton. The new building consolidated activities that were previously scattered throughout the city and provided a modern anchor for the eastern terminus of the expanded civic center (Los Angeles Police Department, no date).

Additional contributions to the Civic Center included the Courthouse in 1958 (Property 5-7); the County Hall of Records in 1962 (Property 5-9, 320 West Temple Street, Richard Neutra and Robert Alexander); the City Department of Water and Power building in 1965 (Property 5-1, 111 North Hope Street, Albert C. Martin & Associates); the Federal Office Building in 1966

(Property 6-5, 300 North Spring Street, Welton Becket); and the Music Center (Properties 5-2, 3, 4) 135 North Grand Avenue, Welton Becket), containing the Dorothy Chandler Pavilion (Property 5-4, completed in 1964), the Mark Taper Forum, and the Ahmanson Theatre (Properties 5-3 and 5-2, both constructed in 1967).

Within Little Tokyo, redevelopment efforts began as early as the 1960s when local Japanese-American businessmen initiated a $50 million rejuvenation plan that sought to control urban renewal and protect the unique community atmosphere. A number of office and retail buildings as well as banks and hotels were developed under this effort (Hebert 1965). Redevelopment efforts within Little Tokyo continued into the 1970s and 1980s under the management of the CRA, which implemented an aggressive improvement plan that unwittingly destroyed most of the old vestiges of the community. Little Tokyo was dramatically shifting from a quaint enclave of low- and midrise buildings into a mixed-use area of large-scale commercial high-rises, hotels, and shopping centers, including Weller Court (123 Weller Court, constructed in1982) and Japanese Village Plaza (350 East 1st Street, constructed in 1978).

Efforts to combat redevelopment in 1986 succeeded with listing the Little Tokyo Historic District in the National Register of Historic Places (Properties 7-7 through 7-19). In 1995, the District received the higher distinction of being designated a National Historic Landmark (NHL) district. In 1990, artist Sheila de Bretteville was commissioned by the City of Los Angeles' CRA to design a public art exhibit to showcase the history of the Little Tokyo Historic District. Working in collaboration with Japanese-American artists and assistants, the Little Tokyo 1st Street public art initiative took four years to create and the final design was approved by community members and local agencies. Completed by 1996 the decorative terrazzo with concrete sidewalk designs depict images of Japanese-American culture, personal testimonials (transcribed in English and Japanese), and historic names and tenants for each building in the district. The resulting Omoide no Shotokyo (Remembering Old Little Tokyo) installation includes an oversized replica of the camera used by photographer Toyo Miyatake to capture images documenting the Manzanar Internment Camp (Hayden 1996).

One of the most recent hallmarks of the Civic Center, the Walt Disney Concert Hall (Property 4-4), was completed in 2003. It was built in stages, funded through a public-private partnership, to serve as the new home for the Los Angeles Philharmonic Orchestra. It was completed at a reported cost of nearly $300 million, after 16 years of funding and construction challenges. Designed by Frank O. Gehry, in collaboration with Japanese acoustician Yasuhisa Toyota, it was applauded for its state-of-the-art acoustics.

The development of downtown Los Angeles continued throughout the twentieth century and beyond, surviving peaks and valleys in the real estate market. Recent trends have included conversion of historically significant, vacant office and residential hotel buildings to residential apartment and condominium uses. This movement has brought an entirely new

residential population to downtown and has encouraged the development and reintroduction of additional services and improvements. Although the inevitable problems that gentrification brings have been part of the revitalization of downtown, it has nonetheless invigorated what was recently a collective nine to five streetscape. New services include the completion of the Red, Blue, and Gold line transit systems in the 1990s, and redevelopment of the Convention Center area. The addition of Staples and Nokia Centers with these other factors has all worked toward returning downtown to a more animated character, with a less commuter-focused economy.

4.2 California Historic Resources Information Literature Search (CHRIS)

SWCA conducted a cultural resources records search for the Regional Connector Transit Corridor project at the California Historical Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC) on February 10, 2009 in Fullerton, CA (Appendix B). Subsequent requests for information were made in March, April, and May 2009 and in January 2010. The records search included a review of the available documents and site records within a 0.25-mile radius of the project area. In addition to official maps and records, the following sources of information were consulted as part of the records search:

- National Register of Historic Places – Listed Properties (2006, updated to present)
- California Register of Historical Resources (2006, and review of minutes from State Historic Resources Commission meetings thereafter)
- California Inventory of Historical Resources (1976)
- California State Historical Landmarks (1996 and updates)
- California Points of Historical Interest (1992 and updates)
- Office of Historic Preservation Historic Property Directory and Determinations of Eligibility (2008)
- Survey of Surveys: A Summary of California's Historical and Architectural Resource Surveys (1986)
- Five Views: An Ethnic Sites Survey for California (1988)

The records search focused on obtaining information on private and public lands located within a 0.25-mile search radius of the project alignment.

4.2.1 Previous Studies in 0.25-mile Radius of APE

Downtown Los Angeles has been the subject of a large number of cultural resources studies in the last three decades. The SCCIC records search identified 143 prior cultural resources studies within a 0.25-mile radius of the direct APE. Twenty-three of the studies are located within the direct APE and 12 studies are adjacent to the direct APE (Table 4-1).

4.2.2 Previously Recorded Built Environment Resources within 0.25 miles Radius of Project APE

The SCCIC records search revealed 47 previously recorded built environment resources in the APE (Table 4-2). The majority of these resources were built in the early years of the twentieth century. Of these 47 resources, 33 were listed in, determined eligible for listing in, or found eligible for listing in the National Register. An additional three were listed in, determined eligible for listing in, or found eligible for listing in the California Registers. One of the resources is a designated California Historical Landmark. The remaining 10 properties were found not eligible for National or California Register-listing. Of the 47 previously recorded properties in Table 4-2, six resources were found in this survey to be no longer extant and one evaluation was found to have likely been made in error. Therefore, there are a total of 29 previously recorded properties that are listed in or eligible for listing in the National and/or California Registers.

Table 4-2 lists previously identified properties, including those listed in, determined eligible for listing in, or found eligible for listing in the National or California registers, otherwise recognized by the state or locally designated.

Note: for California Historical Resource Status Codes, see Appendix F.

4.2.3 Recently Evaluated Built Environment Resources within a 0.25 Mile Radius of Project APE

Table 4-3 lists the 18 properties in the APE that were recently evaluated for the National and California Register eligibility as part of the Grand Avenue Project DEIR Technical Report (PCR Services Corporation 2006). Of these 18 properties, 13 were found eligible for listing in the National or California Registers. This survey, which identified the Los Angeles Civic Center Historic District, was not included in records on file at the SCCIC, and no California Department of Parks and Recreation (DPR) 523 forms were on file for the properties. Many of the buildings in the survey were found to "appear eligible for the National Register as an individual property through survey evaluation." The Civic Center complex was found to "appear eligible for the California Register as a contributor to a California Register-eligible district through survey evaluation." No evidence was found to demonstrate SHPO concurrence with the findings.

Los Angeles City Hall was recently determined eligible for listing in the National Register through the Section 106 process and is therefore listed in the California Register. City Hall was also found to be a contributor to the California Register-eligible Civic Center district.

4.2.4 Structures within the APE

The following 24 structures, including bridges, pedestrian overcrossings (POCs) and pedestrian undercrossings (PUCs), are in or cross the boundaries of the project APE (Table 4-4). One bridge within the APE was constructed prior to 1968; the 1st Street Viaduct (1929) was previously determined eligible for listing in the National Register. The remaining twenty-three structures within the APE were constructed after 1968 or were not found to be exceptionally significant, under Criteria Consideration G.

4.3 Built Environment Survey

The built environment survey methods were described in Section 3.4.2.

4.3.1 Survey Results

The proposed APE includes a total of 289 properties. Appendix A lists all of the properties within the APE that were surveyed for this project. Of those, there were 118 buildings, structures, or objects that were constructed more than 50 years before the assumed project construction date of 2018. Of the 118 properties, 29 were previously listed in or determined eligible for the National and/or California Registers (Table 4-2). DPR forms were not prepared for those properties unless current conditions necessitated updating, because of changes in improvements or if improvements were no longer extant. The remaining properties in the APE that were built in or prior to 1968 and have not been listed in or determined eligible for the National and California Registers required evaluation for historical significance. Those properties are discussed in Section 4.3.2.

4.3.2 Significance Evaluations

A total of 118 resources, including buildings, structures, and objects were either previously identified or investigated for this project. California DPR series 523 forms were prepared for each property containing improvements completed in or before 1968 that were not previously listed in or determined eligible for the National and California Registers to evaluate their National and California Register eligibility. The results of those evaluations, in support of this section, are included in Appendix D.

Table 4-5 shows the 85 properties that contain improvements completed in or prior to 1968, according to Los Angeles County tax assessor records and/or building permits, and that were re-evaluated or evaluated for historic significance. The DPR 523 forms for these properties are included in Appendix D. Also included in Table 4-5 are properties that fall within the APE but do not have specific APNs. One building, Walt Disney Concert Hall, was completed in 2003, but meets Criteria Consideration G for properties that have achieved significance in less than 50 years and has therefore been included in the table. The Los Angeles Civic Center District was found eligible for listing in the National and California Registers for this project. Properties that are located within the district and that were built after 1968 were also evaluated for historical significance and therefore included in the table. Table 4-5 depicts resources that were evaluated or re-evaluated for National and California Register eligibility.

** Note: California Historical Resource Status Codes, see Appendix F.*

Of the total 118 resources that were investigated for this project, 49 were found to be listed in or eligible for listing in the National and California Register. Six were found eligible for listing only in the California Register, and 63 resources were found to be ineligible for either listing. Figure 4-4 shows eligible historic properties and historical resources within the APE. Table 4-6 outlines all of the resources (previously recorded and evaluated for this project) that are listed in or eligible for listing in the National and/or California Registers.

5.0 IMPACTS

The impacts analysis examined likely effects of the proposed project to historic properties under NHPA and impacts to historical resources under CEQA. This analysis incorporates the findings of other applicable technical studies, including displacement, right-of-way, noise and vibration studies, sound walls, retaining walls, geotechnical studies, and station designs. Tables 5-1 through 5-8 list the potential project effects to historic properties and impacts to historical resources by alternative. A discussion of the potential effects to historic properties and impacts to historical resources under the No Build Alternative and the TSM Alternatives are included in the text.

As noted previously in Section 3.0 of this technical memorandum, if a project affects a "historic property" within the APE, the lead federal agency must assess whether the effect is adverse in order to comply with Section 106 of the NHPA. This is accomplished in consultation with the SHPO by applying the "criteria of adverse effect" as stated in 36 CFR 800.5(a)(1).

If a project's effects do not diminish the integrity of a historic property, then a "no adverse effect" finding is appropriate (36 CFR 800.5(b)). Adverse effects are defined in Section 3.2.

If an adverse effect is expected to occur as a result of a proposed project, the lead agency shall consult further to resolve the adverse effect, pursuant to 36 CFR Part 800.5(2) and develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on historic properties (36 CFR Part 800.6).

Section 110(f) of the NHPA of 1966, as codified in 36 CFR 800.10, requires federal agencies to undertake planning and actions to minimize harm to designated National Historic Landmark (NHL) properties. If a proposed project is found to have the potential for an adverse effect on a NHL, the Secretary of the Interior (typically represented by a representative of the National Park Service) is invited to participate under Section 110(f) of the NHPA. For this project, the Little Tokyo Historic District NHL is situated within the APE and would not be adversely affected by any of the alternatives. If project planning necessitates changes, and potential adverse effects to the NHL arise, consultation with the National Park Service will be conducted.

As noted in Section 3.0, CEQA also requires that proposed public projects be evaluated for their probability to cause significant effects on "historical resources." CEQA equates a "substantial adverse change" in the significance of a historic property with a significant effect on the environment (PRC Section 21084.1). Thresholds of substantial adverse change are established in PRC Section 5020.1, and include demolition, destruction, relocation, or "alteration activities that would impair the significance of the historic resource."

5.1 No Build Alternative

5.1.1 Construction Impacts

The No Build Alternative would not result in short-term or long-term construction related effects to historic properties or impacts to historical resources. This alternative does not include capital improvements, and thus would not result in construction or implementation-related effects to historic properties under NEPA or impacts on historical resources under CEQA within the project APE.

5.1.2 Operational Impacts

The No Build Alternative would not result in operational short- or long-term effects to historic properties or impacts to historical resources. This alternative would not result in the introduction of any new improvements that would be expected to cause effects on historic properties under NEPA or have impacts under CEQA on historical resources in the project APE.

5.1.3 Cumulative Impacts

The No Build Alternative would not result in cumulative effects to historic properties or impacts to historical resources, other than the current effects on resources though continued high and escalated levels of vehicular traffic, unabated by additional mass transit options. Therefore, the No Build Alternative would not contribute to a cumulative effect to historic properties or impacts to historical resources.

5.2 Transportation System Management (TSM) Alternative

Under the TSM Alternative, the transit infrastructure investment (two new bus routes and associated structures) would use the existing street and sidewalk networks and would not require the displacement or relocation of properties, residents, or employees.

Improvements under this alternative would entail minor physical modifications, such as the installation of bus stops along existing city streets and rebuilding some curbs, sidewalks, and street surfaces to accommodate increased bus weights and traffic frequency.

No detailed engineering plans for the TSM alternative have been prepared to date.

5.2.1 Construction Impacts

5.2.1.1 Addition of Bus Stops

Under the TSM Alternative, an unspecified number of buses would be added throughout the APE. Installation of up to six new bus stops within the APE would entail minor alterations to the sidewalks, curbs, and other features in the public right of way.

Section 106 Effects Analysis for Historic Properties

An effect, but no adverse effect, to historic properties would result from the addition of bus stops because the current streetscapes were historically busy transportation corridors. The new proposed features would not alter the characteristics of historic properties located in the APE in a manner that would diminish the integrity of any historic materials.

CEQA Impact Analysis for Historical Resources

The addition of a limited number of bus stops in the APE would not constitute a substantial adverse change that would impair the significance of historical resources. The resources' features would remain to convey their significance. The project, therefore, would have a less than significant impact upon historical resources.

5.2.1.2 One-Way Express Bus Traffic

The construction and implementation of the TSM Alternative may result in the rebuilding of curbs, sidewalks, and street surfaces to accommodate increased bus weights and traffic frequency.

Section 106 Effects Analysis for Historic Properties

The improvements to facilitate bus traffic would result in an effect, but no adverse effect, to historic properties because the current streetscapes were historically busy transportation corridors. The changes would not alter a characteristic of a historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential changes to sidewalks and street surfaces to accommodate bus traffic would not constitute a substantial adverse change that would impair the significance of historical resources. The majority of the resource's features would remain to convey their significance. The TSM Alternative, therefore, would have a less than significant impact upon historical resources.

5.2.1.3 Noise and Vibration

According to the Noise and Vibration Technical Memorandum, the TSM Alternative may include minor construction, i.e. install new bus stop benches and signage. These activities would take less than a day to erect, require no heavy equipment, and would not exceed ambient levels of noise in the APE. Noise generated by this alternative is not expected to cause an adverse effect to historic properties or a significant impact to historical resources.

For the TSM Alternative, no major construction activities that use the larger equipment in Table 3-2 are planned, therefore no adverse effects or significant impacts under CEQA from ground borne vibration (GBV) are anticipated.

Section 106 Effects Analysis for Historic Properties

Selecting construction techniques that use specified equipment within safe distances from sensitive buildings would diminish the potential for ground borne vibration and noise. Large equipment would not adversely affect historic properties. Potential noise would also not rise above existing conditions. Any changes that could occur as a result of GBV or noise generated by this alternative would not alter a characteristic of a historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential changes generated by GBV and noise for this alternative would not constitute a substantial adverse change that would impair the significance of historical resources. The resources' features would remain to convey their significance. The project, therefore, would have a less than significant impact upon historical resources.

5.2.2 Operational Impacts

5.2.2.1 Noise and Vibration

Under the TSM Alternative, potential sources of future noise and vibration levels would not increase over the existing sources of noise and vibration. Buses currently use the routes associated with this alternative. Therefore, the operation of additional buses along the proposed route would not result in a noticeable increase in vibration or noise levels over those currently generated by existing buses. Additional bus use may reduce cumulative noise by decreasing personal vehicle use.

Section 106 Effects Analysis for Historic Properties

Noise and vibration caused by the operation of buses would not adversely affect historic properties in the APE. Potential changes would not alter the characteristics of a historic property in a manner that would diminish the integrity of the location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Potential noise and vibration generated from bus service in the APE would not constitute a substantial adverse change that would impair the significance of any historical resources. Character defining features would remain to convey the significance of the historical resources. The TSM Alternative, therefore, would have a less than significant impact upon historical resources.

5.2.3 Cumulative and Indirect Impacts

There are no expected indirect impacts under the TSM Alternative.

Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic brought about by increased density as new buildings are constructed. Taken collectively, the reasonably foreseeable projects in the project area do not appear to have additional effects upon historic properties or impacts upon historical resources that would be affected by the TSM Alternative.

5.2.4 Potential Effects to Section 4(f) Resources

Section 4(f) applies to the Regional Connector Transit Corridor project because several of the project alternatives potentially affect 4(f) properties. The TSM Alternative, however, would not affect, displace, alter, or use any 4(f) properties to implement construction and/or project operation.

5.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

The At-Grade Emphasis LRT Alternative would install double-track light-rail guideways in the existing street system, rebuild street surfaces and underground utilities, rebuild curbs and sidewalks, and install stations, all within the APE. Underground segments of the alternative would use parts of the existing 2nd Street Tunnel (APE Map # 4-3) and would require new cut and cover tunneling under Flower Street between 7th and 4th Streets north of the 7th Street/Metro Center Station.

5.3.1 Construction Impacts

Construction activities were analyzed using the Criteria of Adverse Effect for their potential to impact properties. The following discussion describes the types of effects that may occur in the APE due to construction activities for the At-Grade Emphasis LRT Alternative. Short-term effects from construction typically result from dirt, changes in the visual environment, or alteration to access. Other types of construction effects may be related to specific construction activities or locations. Operational effects are discussed in Section 5.3.2. Table 5-1 indicates the resources that may experience construction-related effects due to their location within the APE.

5.3.1.1 Temporary Dirt/Unintended Damage

Properties in the APE may experience effects from construction including dirt and unintended damaged. Metro would employ best management practices (BMPs) to ensure that these effects are short-term.

Section 106 Effects Analysis for Historic Properties

Dirt and other damage from construction would result in effects, but not adverse effects, to historic properties in the APE because the effects would be short-term. The effects would not

directly alter a characteristic of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Potential dirt and other unintended damage during construction would not constitute a substantial adverse change that would impair the significance of the historical resources. The impacts would be short-term and the majority of the resources' features would remain to convey their significance. This alternative, therefore, would have a less than significant impact upon historical resources.

5.3.1.2 Traffic Congestion/Parking/Access

Changes in access to properties and resources within the APE may result from road closures, use of equipment, and other construction activities. Metro would employ BMPs to minimize these changes and keep the public and property owners informed of potential issues.

Section 106 Effects Analysis for Historic Properties

Potential effects, but no adverse effects, would result from changes in access during construction. The effects would be short-term and would not alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Changes in access resulting from congestion and loss of parking during construction would not constitute a substantial adverse change that would impair the significance of the historical resources. The impacts would be short-term and the majority of the resources' features would remain to convey their significance. The At-Grade Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.3.1.3 Visual

Visual changes may result from the storage and operation of equipment, cuts in the road, and signage used during construction. Metro would employ best management practices (BMPs) to minimize these changes and they would be short term.

Section 106 Effects Analysis for Historic Properties

Visual changes during construction would result in an effect, but not an adverse effect, to historic properties because the effects would be short-term. The changes would not directly alter a characteristic of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Visual changes during construction would not constitute a substantial adverse change that would impair the significance of historical resources. The impacts would be short-term and the resources' character-defining features would remain to convey their significance. The At-Grade Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.3.1.4 Demolition, Partial Takes or Alteration of a Property:

As part of the At-Grade Emphasis LRT Alternative a portion of several properties may be acquired (partial takes). Portions of properties occupied by the Los Angeles Police Facilities Building (APE Map #6-6), Motor Transport Division Building (APE Map #6-7), and City Health Building (City Hall South) (APE Map #6-4), three contributing resources to the Los Angeles Civic Center Historic District, would be acquired to accommodate new stations (Metro 2010). A temporary construction staging easement would also be acquired. A portion of the CRHR eligible "Tinkertoy" Parking Structure (APE Map #6-8), would be acquired to accommodate the turning radius as the rail line joins the existing Gold Line Extension tracks. Drive way access would also be potentially limited. The Tinkertoy Parking Structure is not eligible for the NRHP.

Section 106 Effects Analysis for Historic Properties

There are no adverse effects to historic properties under this alternative from partial property acquisitions. Since only a portion of the properties would be acquired and converted to new uses, the change would not affect the physical buildings, the historic district that they are a part of, or the characteristics that make them eligible for the NRHP, and thus would not diminish their integrity of location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Partial property acquisitions would not constitute a substantial adverse change that would impair the significance of historical resources in the APE. The characteristics that make the historical resources eligible for the CRHR and NRHP would remain to convey their significance. This alternative, therefore, would not have a significant impact upon historical resources.

5.3.1.5 Above-Ground Station Construction

One potential at-grade station is proposed for the At-Grade Emphasis LRT Alternative. The proposed station would be a one-way couplet located on Main and Los Angeles Streets in the NRHP and CRHR Eligible Civic Center Historic District (APE Map #51-1 through 5-13, 6-1 though 7-7, 6-12) and immediately beside three NRHP and CRHR eligible properties; the Los Angeles Police Facilities Building (APE Map #6-6), Motor Transport Division Building (APE

Map #6-7) and City Health Building (City Hall South) (APE Map #6-4). Based upon the preliminary designs, the platforms would be simple poured concrete platforms with modest coverings (IBI Group 2009) similar to what are already used in the nearby Little Tokyo/ Arts District Station.

Section 106 Effects Analysis for Historic Properties

The construction of the proposed at-grade station would result in an effect, but not an adverse effect, to historic properties under this alternative. The proposed changes would not alter the setting of any historic properties in a manner that would diminish either the integrity of the individual properties that are contributors to the historic district or the historic district itself.

CEQA Impact Analysis for Historical Resources

Construction of the proposed station would not constitute a substantial adverse change that would impair the significance of either the Civic Center Historic District or the individual resources that contribute to the district. The historical resources' character-defining features would remain to convey the significance of the Historic District and the individual contributors. This alternative, therefore, would have a less than significant impact upon historical resources.

5.3.1.6 Flower Street Station Entry Construction

As part of the At-Grade Emphasis LRT Alternative, pedestrian entrances would be constructed to provide access to the underground station on Flower Street. Although not finalized, the initial designs show that escalators would rise from the underground station. A glass canopy, supported by a steel frame, would shelter the opening. The entrances would be located on the east side of Flower Street in areas that provide views of the NRHP and CRHR listed Central Public Library (APE Map #3-2). One entrance would also be located in front of NRHP eligible California Club (APE Map #3-1). A glass enclosed elevator would also be constructed on the southeast side of Flower Street in front of the Maguire Gardens. This elevator would be adjacent to Maguire Gardens, on the west side of the Central Library (IBI Station Planning Report 2009).

Section 106 Effects Analysis for Historic Properties

No adverse effects to historic properties would occur as the result of proposed improvements for the Flower Street Station. Although the improvements are a change to the setting of the California Club and the Central Public Library; the scale, massing, size, and materials of the new facilities would not alter characteristics of any of the historic properties in a manner that would diminish the integrity of the location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential entrances and elevators associated with Flower Street Station would not constitute a substantial adverse change that would impair the significance of historical resources (Central Public Library, see APE Map #3-2; and California Club, see APE Map #3-1). The character-defining features of these resources would remain to convey their significance. This alternative, therefore, would have a less than significant impact upon historical resources.

5.3.1.7 Catenary pole and Wire Installation

Catenary poles and wires would be installed in the portion of the APE where the trains run at-grade. Catenary poles provide support for the wires that would be suspended overhead. The final spacing, method of installation, and design for the poles and wires has not been established.

Section 106 Effects Analysis for Historic Properties

No adverse effects to historic properties would result from the installation of the catenary poles and wires because the project area streetscapes are historically dynamic and have changed dramatically over time. Changes to the streetscape resulting from the addition of catenary poles and wires as proposed under this alternative are within the range of past changes, and therefore, would not alter historic properties in a manner that would diminish the integrity of any property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential changes to install catenary poles and wires under this alternative would not constitute a substantial adverse change that would impair the significance of historical resources. The resources' features would remain to convey their significance. The project, therefore, would have a less than significant impact upon historical resources.

5.3.1.8 Tunnels

Under this alternative the NRHP eligible 2nd Street Tunnel (APE Map #4-3) would be altered. The walls of the tunnel would be partially demolished along its southwest interior wall to construct a new entrance and exit for the new tunnel in which the light rail would run. New elements that would be added to the tunnel include double tracks, catenary wires, and a sidewalk.

The cut and cover trench would also require demolition of a portion of the CRHR eligible Belmont Tunnel (APE Map #3-4). The Belmont Tunnel is not eligible for the NRHP.

Section 106 Effects Analysis for Historic Properties

In applying the criteria of adverse effect for historic properties (36 CFR 800.5(a)(1)) potentially affected by the construction near 2nd Street, an adverse effect would occur due to the demolition of a portion of the NRHP eligible 2nd Street Tunnel and the subsequent change in use. The changes would directly alter a characteristic of the historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Documentation of the property in accordance with mitigation measure MM-BE-1 would resolve the potential adverse effect.

CEQA Impact Analysis for Historical Resources

Potential changes to the 2nd Street Tunnel would constitute a substantial adverse change that would impair the significance of the historical resource. However, the majority of the resource's features would remain to convey its significance. Additionally, implementation of MM-BE-1 would reduce the impact to a less than significant level. The implementation of MM-BE-1 would reduce any impact to the CRHR-eligible Belmont Tunnel to a less than significant level.

5.3.1.9 Traction Power Substations

Construction of traction power substations (TPSS) adjacent to the right-of-way along at-grade segments is proposed. The substations deliver electricity to overhead catenary systems. The designs have not been identified but the substations can fit in rooms or standalone buildings of 5,000 square feet or less. The only at-grade location currently identified as a proposed site for a TPSS is on the southwest corner of Spring and 2nd Streets. There are no historical resources or historic properties at this location.

Section 106 Effects Analysis for Historic Properties

The proposed location for the TPSS would not be located on or near any historic properties and therefore, there would be no adverse effects to historic properties. If any additional locations are identified, the criteria of adverse effect would be applied to any historic properties that might be affected (36 CFR 800.5(a)(1)). However, because of the small scale of the TPPS, their construction is an effect, but not an adverse effect, that would alter a characteristic of historic properties in a manner that would diminish the integrity of a property' s location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The proposed TPSS location would not be on or near any historical resources and therefore there would be no impact under CEQA. If additional stations are proposed, a CEQA analysis would be conducted. However, due to the small scale of the feature, it is likely that the construction of a TPSS would not constitute a substantial adverse change that would impair the significance of any historical resources. The majority of the resources' features would

remain to convey their significance. The project, therefore, would have a less than significant impact upon historical resources.

5.3.1.10 Differential Settlement

According to the *Description of Construction*, some of the buildings situated near cut and cover excavation would be susceptible to differential settlement. Differential settlement is defined as "unequal settling of material; gradual downward movement of foundations due to compression of soil which can lead to damage if settlement is uneven" (Allaby 1999). Differential settlement occurs when a building or feature's shape is twisted, or is raised and lowered in different places, sometimes imperceptibly. Differential settlement can cause foundations to settle and crack, floors to buckle and go out of level, walls to shift out of plumb and plane, and roofs to twist and deform. The resulting changes in structural systems and cladding or finish materials, including wood and masonry, floor tiles, wood flooring, concrete floors, plaster, marble, and other decorative wall and ceiling treatments, and adobe, stucco, and wood-framed walls can be cracks, fractures, and other noticeable (as well as long term, not immediately visible) deformations and damage. Since historically significant buildings often have archaic construction and finish attachment systems, including unreinforced masonry, those building types are usually more susceptible to the effects of ground-borne vibration than more recently constructed buildings.

According to the *Description of Construction*, at least seven NRHP and/or CRHR eligible properties could be potentially affected by cut and cover construction associated with the At-Grade Emphasis LRT Alternative. These buildings include the Superior Oil Company Building(APE Map #2-13), California Club (APE Map #3-1), 2nd Street Tunnel (APE Map #4-3), Walt Disney Concert Hall (APE Map #4-4), the former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los Angeles Times Building (APE Map #8-2), and St. Vibiana's Cathedral (APE Map #8-12).

Section 106 Effects Analysis for Historic Properties

The implementation of design measures would protect and stabilize the ground near historic properties as noted in MM-BE-2, MM-BE-3, and MM-BE-5. These measures would avoid adverse effects to all properties. If properly implemented, short term construction activities would not directly alter a characteristic of the historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential for differential settlement could constitute a substantial adverse change that would impair the significance of the Superior Oil Company Building(APE Map #2-13), California Club (APE Map #3-1), 2nd Street Tunnel (APE Map #4-3), Walt Disney Concert Hall (APE Map #4-4), the former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los

Angeles Times Building (APE Map #8-2), and St. Vibiana's Cathedral (APE Map #8-12). The implementation of MM-BE-2, MM-BE-3, and MM-BE-5 would reduce the potential impacts to these historical resources to a less than significant level.

5.3.1.11 Noise and Vibration

Noise generated by construction equipment can cause adverse effects to historic properties and significant impacts to historical resources when exposure exceeds the "severe level" established by FTA. Noise that reaches a severe level, which cannot be reduced through mitigation or other measures, may cause a reduction in use or access to historic properties or historical resources. This may result in an adverse effect to historic properties or a significant impact to historical resources. For properties or resources where a sense of quiet represents a characteristic of its historical significance, increases in noise may also cause adverse effects and/or significant impacts.

According to the Noise and Vibration Technical Memorandum, construction activities with the most potential for noise impacts under the At-Grade Emphasis LRT Alternative, include the cut and cover tunnel along Flower Street, the proposed cut and cover stations at Flower/6th/5th and 2nd/Hope Street, and the Temple and Alameda junction, which includes lowering Alameda Street. To ensure noise impacts are minimized during construction, all construction activities would conform to the provisions in Section 41.40(a) of the City of Los Angeles Code. Furthermore, best management practices (BMPs) would be employed to reduce any potential noise effects to historic properties and result in a no adverse effect finding and reduce potential impacts to historical resources to a less than significant level.

GBV generated by construction equipment can also cause adverse effects on historic properties and significant impacts to historical resources that are in close proximity to construction activities. Construction-related vibration can cause damage ranging from minor cosmetic damage to interior plaster or woodwork damage to major structural damage. Thus GBV can harm the characteristics that make historic properties eligible for the NRHP and historical resources eligible for the CRHR.

For the At-Grade Emphasis LRT Alternative, pre-augering of soldier piles at the cut and cover sections would eliminate the need for impact pile driving. This would leave "Large Bulldozer" and "Drill Rigs" as the main construction vibration sources (Table 3-2). If these large pieces of equipment are not used within the 21 feet of a historic property or historical resource, it is reasonably foreseeable that no adverse effects or significant impacts to historic properties and historical resources from GBV could occur. Buildings near potential construction activities include Barker Brothers (APE Map #2-1), Roosevelt Building (APE Map #2-7), General Petroleum-Mobil Oil Building (APE Map #2-12), Superior Oil Building (APE Map #2-13), California Club (APE Map #3-1), Los Angeles Central Library (APE Map #3-2), 2nd Street Tunnel (APE Map #4-3), Mirror Building (APE Map #8-3), Higgins Building(APE Map #8-11,

CRHR-eligible only), Cathedral of Saint Vibiana (APE Map #8-12), Cathedral of Saint Vibiana Rectory (APE Map #8-13).

Section 106 Effects Analysis for Historic Properties

No adverse effects would occur if measures MM-BE-2 and MM-BE-3 are implemented. If these measures are properly implemented, potential effects of the At-Grade Emphasis LRT Alternative would not diminish the integrity of the historic properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Under the At-Grade Emphasis LRT Alternative, construction-induced vibration could potentially cause a substantial adverse change that would impair the significance of any or all of the historical resources noted in this section. The implementation of MM-BE-2, MM-BE-3, and MM-BE-5 would reduce potential impacts to a less than significant level.

5.3.2 Operational Impacts

The At-Grade Emphasis LRT Alternative would add transit options that would be consistent with the historic use of streetcars within the APE. Additionally, the LRT could benefit historic properties and historical resources in the APE by increasing pedestrian access and use of the area.

Activities associated with the operation of the At-Grade Emphasis LRT Alternative may also cause impacts to properties within the APE. The potential effects are described below and summarized in Table 5-2.

5.3.2.1. Traffic Congestion/Parking/Access:

Operation of the At-Grade Emphasis LRT Alternative may result in loss of parking and changes to vehicular patterns that result in increased congestion.

Section 106 Effects Analysis for Historic Properties

Changes in access, parking, and traffic patterns would result in effects, but no adverse effects, to historic properties. The changes would not alter a characteristic of historic properties in the APE in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Potential changes to traffic patterns and access would not constitute a substantial adverse change that would impair the significance of historical resources. The majority of the resources' features would remain to convey their significance. This alternative, therefore, would have a less than significant impact upon historical resources.

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.3.2.2 Visual:

Operation of the At-Grade Emphasis LRT Alternative above ground along 2nd, Main, Los Angeles, and Temple Streets would be a minimal change to the visual setting of properties in this area of the APE.

Section 106 Effects Analysis for Historic Properties

There would be an effect, but no adverse effect, to historic properties in areas in the APE where the new LRT would be visible. No adverse effect would occur because the changes would not directly alter characteristics of historic properties in the APE in a manner that would diminish the integrity of the property' s location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Potential changes to historical resources within the APE where the LRT would be visible would not constitute a substantial adverse change that would impair the significance of historical resources. The project, therefore, would have a less than significant impact upon historical resources.

5.3.2.3 Noise and Vibration

Noise from LRT operations would be generated from the interaction of wheels on track, motive power, signaling and warning systems, platform announcements, and operation of TPSS. The interaction of steel wheels on rails generates three different types of noise depending on the type of track work. These include: (1) noise generated from wheel squeal on tightly curved track, (2) noise generated on special trackway sections, such as at crossovers or turnouts, and (3) noise generated by rolling of the wheel over continuous rail. According to the Noise and Vibration Technical Memorandum, only one moderate noise effect/impact is anticipated from LRT operation to a CRHR-eligible property. Only the first floor of the Higgins Building (APE Map #8-11) would be subjected to a moderate noise effect/impact, but since the Higgins Building is not eligible for the NRHP, no historic properties would be affected. Wheel skirts would be included on LRT vehicles to reduce the wayside noise levels, but this design implementation would not reduce noise levels on the first floor of the Higgins Building to below moderate levels. Since the noise levels on the first floor of the Higgins Building would not be considered severe, the noise from LRT operation would not be considered a significant impact to a historical resource under CEQA.

Vibration impacts from transit operations would be generated by motions/actions at the wheel/rail interface. While vibration from a passing train would have a relatively small potential to move through the geologic strata, it could result in building vibration from energy transferred through the earth to the building's foundation. The principal concern with rail transit vibration is annoyance to building occupants; it is extremely unlikely that GBV from transit operations would cause any effect on or damage of any kind to buildings. For the At-

Grade Emphasis LRT Alternative no adverse effects or significant impacts to historic properties or historical resources would be expected.

Section 106 Effects Analysis for Historic Properties

Noise and vibration caused by project operation would be an effect, but not an adverse effect, to historic properties within the APE. Project operations would not alter characteristics of historic properties in the APE in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Potential noise and vibration impacts caused by operation of the At-Grade Emphasis LRT Alternative to the CRHR-eligible Higgins Building would not constitute a substantial adverse change that would impair the significance of the historical resource. The resource's features would remain to convey its significance. This alternative, therefore, would have a less than significant impact upon historical resources.

5.3.3 Cumulative and Indirect Impacts

There are no expected indirect impacts under the At-Grade Emphasis LRT Alternative on historic resources.

Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic brought about by increased density as new buildings are constructed. Taken collectively, reasonably foreseeable projects within the project area do not appear to have additional effects upon historic properties or impacts upon historical resources that would be affected by the At-Grade Emphasis LRT Alternative.

5.3.4 Potential Effects to Section 4(f) Resources

The At-Grade Emphasis LRT Alternative would require the acquisition and/or use of property associated with five NRHP-eligible properties: Civic Center Historic District, Los Angeles Police Motor Transport Building (APE Map #6-7), City of Los Angeles Parker Center Police Department Building (APE Map #6-6), City Hall South (APE Map #6-4) as well as the 2nd Street Tunnel (APE Map #4-3).

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

Los Angeles Police Motor Transport Building

The At-Grade Emphasis LRT Alternative would require the acquisition in-fee of a 16-foot strip of property that would be used for the construction of the proposed Los Angeles/1st Street station (northbound). An additional easement would be acquired for construction staging and would be situated to the east of the 16-foot strip. Neither the fee property nor the easement would touch or adversely affect the historic integrity of the Motor Transport Building as a more modern building currently buffers the Motor Transport Building from Los Angeles Street. Contingent upon consultation with the California SHPO and the Advisory Council on Historic Preservation (if the ACHP participates in consultation) and their respective concurrence, a *de minimus* impact finding would be consistent with FTA's *Guidance for Determining De Minimus Impacts to Section 4(f) Resources*.

City of Los Angeles Parker Center Police Department Building

The At-Grade Emphasis LRT Alternative would require the acquisition in-fee of a 16-foot strip of property that would be used for the construction of the proposed Los Angeles/1st Street station (northbound). An additional easement would be acquired for construction staging and would be situated to the east of the 16-foot strip. Both the fee property and construction staging easement are located on the east side of Los Angeles Street and neither would touch or adversely affect the historical integrity of the Parker Center. Contingent upon consultation with the California SHPO and their respective concurrence, a *de minimus* impact finding would be consistent with FTA's *Guidance for Determining De Minimus Impacts to Section 4(f) Resources*.

City Hall South

The At-Grade Emphasis LRT Alternative would require the acquisition of an 18-foot strip of property that would be used for the construction of the proposed Main/1st Street station (southbound). A construction staging easement would also be acquired along Main Street, as well as on the west side of Los Angeles Street. None of these acquisitions would touch or adversely affect the historical integrity of the City Hall South building. Contingent upon consultation with the California SHPO and the Advisory Council on Historic Preservation (if the ACHP participates in consultation) and their respective concurrence, a *de minimus* impact finding would be consistent with FTA's *Guidance for Determining De Minimus Impacts to Section 4(f) Resources*.

2nd Street Tunnel

The At-Grade Emphasis LRT Alternative would require the piercing and use of the 2nd Street Tunnel to accommodate the proposed LRT corridor. The "punch through" required by this alternative would adversely affect the characteristics that make the 2nd Street Tunnel eligible for the NRHP. This would constitute a direct use, as the tunnel would be permanently incorporated into the proposed project. This use could only occur if 1) there is no prudent and feasible alternative to using the resource; and 2) the project includes all possible planning

to minimize harm to the tunnel from the use. Additional analysis of project alternatives and consultation with the California SHPO would be required.

Civic Center Historic District

The At-Grade Emphasis LRT Alternative would require the fee acquisition of two strips of streetside property for the two parts of the split station as well as several construction staging easements on properties that are associated with three contributors to the NRHP/CRHR eligible Civic Center Historic District (as discussed above); the City Hall South Building, the City of Los Angeles Parker Center Police Department Building, and the Los Angeles Motor Transport Building. These acquisitions would not affect the historical integrity of these individual contributors and would also not affect the overall historical integrity and ability of the historic district as a whole to convey its significance. The property acquisitions, therefore, would have no adverse effect upon the Civic Center Historic District. Contingent upon consultation with the California SHPO and the Advisory Council on Historic Preservation (if the ACHP participates in consultation) and their respective concurrence, a *de minimus* impact finding would be consistent with FTA's *Guidance for Determining De Minimus Impacts to Section 4(f) Resources*.

5.4 Underground Emphasis LRT Alternative

5.4.1 Construction Impacts

Construction activities were analyzed using the Criteria of Adverse Effect (discussed in Section 3.2.1) for their potential to impact historic properties. Potential effects that may occur in the APE due to construction activities for the Underground Emphasis Alternative are discussed in this section. Short-term effects from construction typically result from dirt, changes in the visual environment, or alteration to access. Other types of construction effects may be related to specific construction activities or locations. Operational effects are discussed in Section 5.4.2. Table 5-3 indicates the resources that may experience construction effects due to their location within the APE.

5.4.1.1 Temporary Dirt/Unintended Damage:

Properties in the APE would be affected by construction activities including dirt and unintended damaged. Metro would employ BMPs to ensure that these effects are short-term.

Section 106 Effects Analysis for Historic Properties

Dirt and other damage from construction would affect, but not adversely affect, historic properties in the APE because the potential effects would be short-term. The potential effects would not directly alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Dirt and other unintended damage during construction would not constitute a substantial adverse change that would impair the significance of historical resources. The impacts would be short-term and the majority of the resources' features would remain to convey their significance. The Underground Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.4.1.2 Traffic Congestion/Parking/Access:

Changes in access to properties and resources within the APE may result from road closures, use of equipment, and other construction activities. Metro would employ BMPs to minimize these changes and keep the public and property owners informed of potential issues.

Section 106 Effects Analysis for Historic Properties

Potential effects, but no adverse effects, would result from changes in access during construction. The effects would be short-term and would not alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Changes in access resulting from congestion and loss of parking during construction would not constitute a substantial adverse change that would impair the significance of historical resources. Potential impacts would be short-term and the majority of the resources' features would remain to convey their significance. The Underground Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.4.1.3 Visual:

Visual changes may result from the storage and operation of equipment, cuts in the road, and signage used during construction. Metro would employ BMPs to minimize these changes and they should be short term.

Section 106 Effects Analysis for Historic Properties

Visual changes during construction would affect, but not adversely affect, historic properties because the effects would be short-term. The changes would not directly alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Visual changes during construction would not constitute a substantial adverse change that would impair the significance of historical resources. The impacts would be short-term and the resources' character-defining features would remain to convey their significance. The

Underground Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.4.1.4 Demolition, Partial Takes, or Alteration of a Property:

To construct the Underground-Emphasis LRT Alternative, one parcel that contains a historical resource would be acquired. The S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports (APE Map #7-30) is a CRHR-eligible (not NRHP eligible) commercial building built in 1913. The entire parcel is anticipated to be acquired to serve as the underground egress/ingress portal.

A subsurface easement would be acquired for the Higgins Building (APE Map #8-11). The easement would extend approximately five feet beyond the property line for the CRHR-eligible Higgins Building (not NRHP eligible). No project-related construction would affect the Higgins Building.

The Underground Emphasis LRT Alternative would also require the acquisition of a subsurface easement beneath the NRHP Eligible Cathedral of St. Vibiana Rectory (APE Map #8-13). The subsurface easement would extend approximately five feet beyond the north (2nd Street side) property line of the building. The easement acquisition is a requirement of the project to provide a buffer between subsurface project facilities and at-grade structures.

Section 106 Effects Analysis for Historic Properties

The subsurface easement for the area beneath the Cathedral of St. Vibiana Rectory would affect, but not adversely affect, the historic property. No project facilities would use any portion of the Rectory building or adversely affect the characteristics that make it eligible for the NRHP.

CEQA Impact Analysis for Historical Resources

The subsurface easement acquisitions that would extend five feet beyond the north (2nd Street side) property lines of the Higgins Building and the Cathedral of St. Vibiana Rectory would not constitute a substantial adverse change that would impair the significance of the historical resources, as no other project-related construction or use would directly affect the buildings. Due to the proximity of proposed project facilities to the buildings, indirect effects such as differential settlement and project related vibration have the potential to affect the structures (see Differential Settlement, Section 5.4.1.8, and Noise and Vibration, Section 5.4.1.7).

The property acquisition and subsequent demolition of the S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports building would constitute a substantial adverse change that would impair the significance of the historical resource. However, implementation of MM-BE-1 and MM-BE-5 would reduce impacts to a less than significant level.

5.4.1.5 Station Construction

For the Underground Emphasis LRT Alternative, a new station would be constructed beneath Flower Street between 5th and 4th Streets. This would require demolition of a portion of the CRHR eligible Belmont Tunnel (APE Map #3-4). The Belmont Tunnel is not eligible for the NRHP. Another new station would be constructed on 2nd street. This alternative evaluates two possible locations for the proposed 2nd Street station: a location near Broadway or a location near Los Angeles Street. The Broadway Option would have entrances facing the NRHP eligible Los Angeles Mirror Building (APE Map #8-2). The Los Angeles Street Option has proposed entrances opposite and next to the NRHP eligible St Vibiana Rectory (APE Map #8-13). Although the design of proposed stations is not finalized, conceptual renderings indicate simple glass canopies supported on steel frames would be likely. The design and materials would be clearly differentiated from the PWA Moderne Style of the Mirror Building and the Classical Revival Style of the Rectory Building. The massing and scale would be modest in comparison with nearby historic properties.

Section 106 Effects Analysis for Historic Properties

Construction of proposed stations would affect, but not adversely affect, the Los Angeles Mirror Building or the St. Vibiana Rectory. No adverse effects would occur to these historic properties because the changes would not diminish the integrity of the location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Construction of proposed stations would not constitute a substantial adverse change that would impair the significance of the historical resources. The change in setting created by the station would not diminish the integrity of the properties' significant historic features. The Underground Emphasis LRT Alternative would therefore have a less than significant impact upon historical resources. Implementation of MM-BE-1 would reduce any impact to the CRHR-eligible Belmont Tunnel to a less than significant level.

5.4.1.6 Portal

The proposed train portal at the intersection of Alameda and 1st Street would be within the viewshed of two historic properties, the Little Tokyo National Historic Landmark Historic District and the NRHP eligible John A. Roebling Sons Co. Building (APE Map #7-35). However, the portal area is not encompassed within the boundary of a historic property, historical resource, or a contributing element to the significance of either property. An asphalt paved parking lot currently occupies the majority of the parcel.

Section 106 Effects Analysis for Historic Properties

No adverse effect would occur to the Little Tokyo National Historic Landmark District or the John A. Roebling Sons Co Building from the construction of the portal. Potential effects

would not alter the setting of historic properties in a manner that would diminish the integrity of the historic district.

CEQA Impact Analysis for Historical Resources

Construction of the portal would not constitute a substantial adverse change that would impair the significance of historical resources. The change in setting created by the portal would not diminish the integrity of the resources' significant historic features. The Underground Emphasis LRT Alternative, therefore, would have a less than significant impact upon historical resources.

5.4.1.7 Noise and Vibration

According to the Noise and Vibration Technical Memorandum, construction activities with the most potential for noise impacts include the cut and cover tunnel under Flower Street, proposed underground cut and cover stations at Flower/6th/5th Streets and 2nd/Hope Street, and the junction at Temple and Alameda Streets, which includes lowering Alameda Street. To ensure potential noise impacts are minimized during construction, all construction activities would conform to the provisions in Section 41.40(a) of the City of Los Angeles Code. Furthermore, BMPs would be employed to reduce any potential noise effects to historic properties to result in a "no adverse effect" finding and/or minimize potential impacts to historical resources to a less than significant level.

Noise levels for the tunnel boring machine (TBM) were not evaluated as a part of the Noise and Vibration Technical Memorandum because the TBM "is underground and produces little to no noise that reaches the surface land uses." Operations at the portal/launch site for the TBM, where bored material is hauled out, treated, and removed, also would not impact historic properties and historical resources as noise levels from these activities would not exceed ambient noise levels.

For the Underground Emphasis LRT Alternative, pre-augering of soldier piles at cut and cover sections would eliminate the need for impact pile driving. This would leave "Large Bulldozer" and "Drill Rigs" as the main sources of construction vibration. If these large pieces of equipment are not used within 21 feet of a historic property or historical resource, there would be no adverse effects and significant impacts to historic properties and historical resources from GBV would not occur. Properties that are close to the project work zone and which may be affected by construction-related vibration include Barker Brothers (APE Map #2-1), Roosevelt Building (APE Map #2-7), General Petroleum-Mobil Oil Building (APE Map #2-12), Superior Oil Building (APE Map #2-13), California Club (APE Map #3-1), Los Angeles Central Library (APE Map #3-2), 2nd Street Tunnel (APE Map #4-3), Mirror Building (APE Map #8-3), Higgins Building(APE Map #8-11), Cathedral of Saint Vibiana (APE Map #8-12), and Cathedral of Saint Vibiana Rectory (APE Map #8-13).

The TBM would not cause vibratory effects or impacts to historic properties or historical resources because the TBM performs a slow moving drilling process that generates very little vibration to the surrounding areas. Studies have measured TBM vibration to be in the range of 0.0024 to 0.0394 inches per second PPV at a distance at 33 feet. The proposed TBM tunnels on 2nd Street would vary in depth due to the existing topography, as well as vertical curves in the alignment. The tunnel would range from about 140 feet below the surface (distance from street level to the top of the tunnel) to about 40 feet below the surface. The vibratory potential of the TBM is minimal and would be well below the FTA threshold for Category IV buildings (buildings extremely susceptible to vibration damage) of 0.12 inches per second PPV.

Section 106 Effects Analysis for Historic Properties

There would be an effect, but no adverse effect, to the Barker Brothers, Roosevelt, General Petroleum Mobil Oil Building, Superior Oil Building, California Club, Los Angeles Central Library, 2nd Street Tunnel, Mirror Building, Cathedral of Saint Vibiana, and the Cathedral of Saint Vibiana Rectory from noise and vibration-induced damage from construction, if measures MM-BE-2 and MM-BE-3 are implemented. If these measures are properly implemented, construction of this alternative would not diminish the integrity of the historic properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential for construction-related vibration could cause a substantial adverse change that would impair the Barker Brothers, Roosevelt, General Petroleum Mobil Oil Building, Superior Oil Building, California Club, Los Angeles Central Library 2nd Street Tunnel, Mirror Building, Cathedral of Saint Vibiana, the Cathedral of Saint Vibiana Rectory, or the Higgins Building. The implementation of MM-BE-2, MM-BE-3, and MM-BE-5 would reduce the potential impacts to a less than significant level.

5.4.1.8 Differential Settlement

According to the Description of Construction, at least eight NRHP and/or CRHR eligible properties could be potentially affected by tunneling (TBM operation) and cut and cover construction. They include the Standard Hotel (APE Map #2-13), California Club (APE Map #3-1), Walt Disney Concert Hall (APE Map #4-4), 2nd Street Tunnel (APE Map #4-3), former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los Angeles Times Building (APE Map #8-2), Higgins Building (APE Map #8-11), and St. Vibiana's Cathedral (APE Map #8-12). Implementation of mitigation measures MM-BE-2, MM-BE-3, and MM-BE-4 (when applicable) would avoid potential adverse effects to historic properties and reduce potential impacts to historical resources to a less than significant level.

Section 106 Effects Analysis for Historic Properties

Implementation of measures to protect and stabilize the ground near the Standard Hotel (APE Map #2-13), California Club (APE Map #3-1), 2nd Street Tunnel (APE Map #4-3), Walt Disney Concert Hall (APE Map #4-4), former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los Angeles Times Building (APE Map #8-2), and St. Vibiana's Cathedral (APE Map #8-12) noted in MM-BE-2, MM-BE-3, and MM-BE-5, would avoid adverse effects to all properties under this alternative. If properly implemented, differential settlement would not directly alter characteristics of historic properties in a manner that would diminish the integrity of each property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential for differential settlement could constitute a substantial adverse change that would impair the significance of any or all of the historical resources noted in this section. Implementation of MM-BE-2, MM-BE-3, and MM-BE-5 would reduce potential impacts to a less than significant level.

5.4.2 Operational Impacts

The additional transit options proposed under the Underground Emphasis LRT Alternative would be consistent with the historic use of streetcars within the APE. Additionally, the LRT could benefit historic properties and historical resources in the APE by increasing pedestrian use of the area.

Potential visual changes, traffic, and congestion from operation of the LRT under this alternative would have similar effects to historic properties under NEPA and impacts to historical resources under CEQA as those discussed for the At-Grade Emphasis LRT Alternative. Table 5-4 lists potential effects from operation of the Underground Emphasis LRT Alternative.

Table 5-3. Potential Underground Emphasis LRT Alternative Construction Effects

[a] *Right of Way Required is a sub-surface easement*
Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.4.2.1 Noise and Vibration

The Underground Emphasis LRT Alternative has the same potential sources of noise impacts during operations as the At-Grade Emphasis LRT Alternative. According to the Noise and Vibration Technical Memorandum, no noise, adverse effects, or significant impacts to historic properties or historical resources would be expected. Most of this alternative would be situated underground, and thus project operations would not exceed FTA Noise Impact Criteria. Operation of the Underground Emphasis LRT Alternative would result in a moderate noise impact at only one location, a proposed switch on Alameda near 1st Street. Moderate noise impacts do not exceed the FTA Noise Impact Criteria.

For the Underground Emphasis LRT Alternative, potential vibration impacts from transit operations would be generated by two of the same potential sources as the At-Grade Emphasis LRT Alternative: motions/actions at the wheel/rail interface and areas of special track work. While vibration from a passing train and areas of special track work have a relatively small potential to move through the geologic strata, it can result in building vibration from energy transferred through the earth to a building's foundation. The principal concern with rail transit vibration is annoyance to building occupants; it is extremely unlikely that GBV from transit operations would have any effect on or cause any damage to buildings. For the Underground Emphasis LRT Alternative, no adverse effects or significant impacts to historic properties or historical resources related to vibration would be expected.

Table 5-4 lists the potential operational effects and impacts for this alternative by resource.

5.4.3 Cumulative and Indirect Impacts

There would be no indirect impacts from the Underground Emphasis LRT Alternative.

Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic generated by increased density as new buildings are constructed. Taken collectively, reasonably foreseeable projects in the project area do not appear to have additional effects upon historic properties or impacts upon historical resources that would be affected by the Underground Emphasis LRT Alternative.

Table 5-4. Potential Underground Emphasis LRT Alternative Operation Effects

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.4.4 Potential Effects to Section 4(f) Resources

The Underground Emphasis LRT Alternative would require the acquisition of a subsurface easement beneath the Cathedral of St. Vibiana Rectory (APE Map #8-13). The subsurface easement would extend approximately five feet beyond the north (2nd Street side) property line of the building. The easement acquisition is a requirement of the project to provide a buffer between subsurface project facilities and at-grade structures. No project facilities would use any portion of the Rectory building or adversely affect the characteristics that make it eligible for the NRHP. Contingent upon consultation with the California SHPO and the Advisory Council on Historic Preservation (if the ACHP participates in consultation) and their respective concurrence, a *de minimus* impact finding would be consistent with FTA's *Guidance for Determining De Minimus Impacts to Section 4(f) Resources*.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

5.5.1 Construction Impacts

The following discussion describes potential effects in the APE due to construction activities for the Fully Underground LRT Alternative – Little Tokyo Variation 1. Table 5-5 lists the effects/impacts for each NRHP property/CRHR resource.

5.5.1.1 Temporary Dirt/Unintended Damage

Potential effects and impacts from dirt and unintended damage to historic properties and historical resources from the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those previously described for the Underground Emphasis LRT Alternative.

5.5.1.2 Traffic Congestion/Parking/Access

Potential effects and impacts from changes in access, parking, and traffic patterns to historic properties and historical resources from the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those described for the Underground Emphasis LRT Alternative

5.5.1.3 Visual

Potential visual effects and impacts to historic properties and historical resources from the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those described for the Underground Emphasis LRT Alternative.

5.5.1.4 Demolition, Partial Takes or Alteration of a Property

Potential impacts to historical resources under this alternative from demolition or property acquisitions would be identical to those described for the Underground Emphasis LRT Alternative.

5.5.1.5 Station Construction

For the Fully Underground LRT Alternative - Little Tokyo Variation 1 a station would be constructed beneath Flower Street between 5th and 4th Streets. This would require demolition of a portion of the CRHR eligible Belmont Tunnel (APE Map #3-4). The Belmont Tunnel is not eligible for the NRHP. Another station would be constructed at the intersection of 2nd Street and Broadway. The effects of these construction activities on the NRHP eligible LA Mirror Building would be similar to those described for the Underground Emphasis LRT Alternative.

A proposed station would be constructed under Flower Street between 5th and 4th Streets. Although still conceptual and preliminary, the potential designs for station entrances would be modest glass canopies supported on steel frames. Largely transparent, the new entrances would not significantly alter views to the Los Angeles Central Library or the California Club.

Another proposed station would be constructed underground southwest of the intersection of 2nd and Hope Streets. The National Register eligible Walt Disney Concert Hall (APE Map #4-4) is located on the hill above the proposed station. The preliminary conceptual designs would be compatible with the contemporary forms, materials, and massing of this historical resource. The station is also near the NRHP eligible 2nd Street Tunnel (APE Map #4-3).

A fourth station would be constructed at 2nd Street and Central Avenue. This underground station may also include a small building at ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans. If the entrances are similar to those proposed for the other stations, the changes would not result in a significant effect to the NRHP eligible John A. Roebling's Sons Co. Building (APE Map #7-35). While the station would also be near the CRHR eligible S. Kamada Restaurant, Atomic Café, Señor Fish, Coast Imports (APE Map #7-30), this building would be removed as a result of the open cut method of construction in this portion of the alignment.

Section 106 Effects Analysis for Historic Properties

Construction of proposed stations would create effects to the Los Angeles Central Library, Walt Disney Concert Hall, California Club, and the John A. Roebling Sons Co Buildings. However, the effects on these historic properties would not be considered adverse because the potential changes would not diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Construction of proposed stations would not constitute a substantial adverse change that would impair the significance of the Los Angeles Central Library, California Club, John A. Roebling Sons Co building, or the 2nd Street Tunnel, or the Disney Concert Hall. Implementation of MM-BE-1 would reduce any potential impact to the CRHR-eligible Belmont

Tunnel to a less than significant level. Potential changes in setting created by stations would not diminish the integrity of the resources' significant historic features. The Fully Underground LRT Alternative – Little Tokyo Variation 1, therefore, would have a less than significant impact upon historical resources.

The property acquisition and subsequent demolition of the S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports building would constitute a substantial adverse change that would impair the significance of the historical resource. However, implementation of MM-BE-1 and MM-BE-5 would reduce impacts to a less than significant level.

5.5.1.6 Portals

For this alternative two portals would be constructed. One portal would be located northeast of the Little Tokyo/Arts District Station and tracks. There are no historical resources or historic properties in the vicinity of this portal.

The second portal would be located within 1st Street between Alameda and Vignes Streets. The NRHP eligible J.R. Newberry Company Building (APE Map #9-6R) is located just east of the intersection of 1st Street and Vignes Street but would not be affected by this alternative.

Section 106 Effects Analysis for Historic Properties

The NRHP eligible J.R. Newberry Company Building (APE Map #9-6R) would be affected by the construction of a portal. No adverse effect would occur because the changes would not directly alter the setting of the historic property in a manner that would diminish the integrity of the historic property.

CEQA Impact Analysis for Historical Resources

Construction of a portal would not constitute a substantial adverse change that would impair the significance of the J.R. Newberry Company Building (APE Map #9-6R). The change in setting created by the portal would not diminish the integrity of the property's significant historic features. This alternative, therefore, would have a less than significant impact upon historical resources.

5.5.1.7 Noise and Vibration

Potential effects and impacts to historic properties and historical resources caused by noise and vibration would be the same as those discussed for the Underground Emphasis LRT Alternative. Implementation of mitigation measures MM-BE-2 and MM-BE-3 would avoid adverse effects to historic properties and reduce potential impacts to historical resources to a less than significant level.

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.5.1.8 Differential Settlement

Potential effects and impacts to historic properties and historical resources caused by differential settlement would be the same as those discussed in the Underground Emphasis LRT Alternative. Implementation of mitigation measures MM-BE-2, MM-BE-3, and MM-BE-4 (when applicable), would avoid adverse effects to historic properties and lower impacts to historical resources to a less than significant level.

5.5.2 Operational Impacts

Potential operational effects and impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same to historic properties and historical resources as those discussed for the Underground Emphasis LRT Alternative, except that a proposed switch, located at 1st and Alameda for the Underground Emphasis LRT Alternative, would instead be located at the intersection of 1st and Vignes Streets. Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would result in a moderate noise impact at this location. This switch is located near the NRHP eligible J.R. Newberry Company Building (APE Map #9R-6) and the 1st Street Viaduct (APE Map #9R-7). Moderate noise effects/impacts do not exceed the FTA Noise Impact Criteria, therefore no adverse effects to historic properties and no significant impacts to historical resources are anticipated from project operations. Table 5-6 lists potential effects and impacts by resource.

5.5.3 Cumulative and Indirect Impacts

There are no anticipated indirect impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1.

Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic generated by an increase in density as new buildings are constructed. Taken collectively, the reasonably foreseeable projects in the project area do not appear to have additional effects upon historic properties or impacts upon historical resources that are affected by the Fully Underground LRT Alternative - Little Tokyo Variation 1.

5.5.4 Potential Effects to Section 4(f) Resources

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map # 8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

Table 5-6. Potential Fully Underground LRT Alternative – Little Tokyo Variation 1 Operation Effects							
APE Map No.	Name	NRHP Eligibility	CRHR Eligibility	CEQA Evaluation	No Historic Properties Affected	Effect-Not Adverse	Adverse Effect

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets.

5.6.1 Construction Impacts

The following sections describe potential effects that may occur to historic properties in the APE due to construction activities for the Fully Underground LRT Alternative – Little Tokyo Variation 2. Table 5-7 lists the construction effects/impacts for each NRHP property/ CRHR resource.

5.6.1.1 Temporary Dirt/Unintended Damage

Potential effects and impacts from dirt and unintended damage to historic properties and historical resources from the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those previously described for the Underground Emphasis LRT Alternative.

5.6.1.2 Traffic Congestion/Parking/Access

Potential effects and impacts from changes in access, parking, and traffic patterns to historic properties and historical resources from the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those described for the Underground Emphasis LRT Alternative.

5.6.1.3 Visual

Potential visual effects and impacts to historic properties and historical resources from construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those described for the Underground Emphasis LRT Alternative.

5.6.1.4 Portals

As part of the Fully Underground LRT Alternative – Little Tokyo Variation 2 new portals would be constructed to connect the proposed tracks to the Metro Gold Line tracks heading north to Azusa and east towards I-605. One portal containing the northbound and southbound tracks would be located northeast of the Little Tokyo/Arts District Station and tracks. There are no historical resources or historic properties within the APE that would be impacted by this new portal.

Two additional portals, each containing one track, would rise to the east within the widened median of 1st Street to allow a connection to the Metro Gold Line tracks towards I-605. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track

between Hewitt and Vignes Streets. The NRHP eligible J.R. Newberry Company Building (APE Map #9R-6) is located at the east side of the intersection of 1st Avenue and Vignes Street.

Section 106 Effects Analysis for Historic Properties

There would be an effect, but no adverse effect, to the J.R. Newberry Company Building (APE Map #9R-6). No adverse effect would occur to this historic property because potential changes would not directly alter the setting in a manner that would diminish its integrity.

CEQA Impact Analysis for Historical Resources

Construction of the portals would not constitute a substantial adverse change that would impair the significance of the J.R. Newberry Company Building. The change in setting created by the portals would not diminish the integrity of the resource's significant historic features. This alternative, therefore, would have a less than significant impact upon historical resources.

5.6.1.5 Station Construction

Potential effects/impacts from construction of proposed stations would be similar to those described for Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.6.1.6 Demolition, Partial Takes or Alteration of a Property

Potential impacts to historical resources from this alternative due to demolition or property acquisitions would be identical to those described for the Underground Emphasis LRT Alternative.

5.6.1.7 Noise and Vibration

Potential effects and impacts to historic properties and historical resources caused by noise and vibration would be the same as those discussed for the Underground Emphasis LRT Alternative and the Fully Underground Emphasis LRT Alternative - Little Tokyo Variation 1. Implementation of mitigation measures MM-BE-2 and MM-BE-3 would avoid adverse effects to historic properties and reduce potential impacts to historical resources to a less than significant level.

5.6.1.8 Differential Settlement

Potential effects and impacts to historic properties and historical resources caused by differential settlement would be the same as those discussed for the Underground Emphasis LRT Alternative and the Fully Underground Emphasis LRT Alternative - Little Tokyo Variation 1. Implementation of mitigation measures MM-BE-2, MM-BE-3, and when applicable MM-BE-4, would avoid adverse effects to historic properties and reduce potential impacts to historical resources to a less than significant level. Table 5-7 lists the potential effects and impacts for construction for the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Table 5-7. Potential Fully Underground LRT Alternative – Little Tokyo Variation 2 Construction Effects

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.6.2 Operational Impacts

Potential operational impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be largely the same on historic properties and historical resources as those described for the Underground Emphasis LRT Alternative, except that a proposed switch, located at 1st and Alameda for the Underground Emphasis LRT Alternative, would instead be located at the intersection of 1st and Vignes Streets. Operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would result in a moderate noise impact at this location. This switch is located near the NRHP eligible J.R. Newberry Company Building (APE Map #9R-6) and the 1st Street Viaduct (APE Map #9R-7). Moderate noise effects/impacts do not exceed the FTA Noise Impact Criteria, therefore no adverse effects to historic properties and no significant impacts to historical resources are anticipated from project operations. Table 5-8 lists the potential effects and impacts for operation for the Fully Underground LRT Alternative - Little Tokyo Variation 2.

5.6.3 Cumulative and Indirect Impacts

There would be no expected indirect impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic generated by increased density created as new buildings are constructed. Taken collectively, the reasonable foreseeable projects do not appear to have additional effects upon historic properties or impacts upon historical resources that would be affected by the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4 Potential Effects to Section 4(f) Resources

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map #8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

Table 5-8. Potential Fully Underground LRT Alternative – Little Tokyo Variation 2 Operation Effects

APE Map No.	Name	NRHP Eligibility	CRHR Eligibility	CEQA Evaluation	No Historic Properties Affected	Effect-Not Adverse	Adverse Effect

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.7 Locally Preferred Alternative (LPA)

5.7.1 Construction Impacts

Construction activities were analyzed using the Criteria of Adverse Effect (discussed in Section 3.2.1) for their potential to impact historic properties. The following discussion describes potential effects in the APE due to construction activities for the LPA. Table 5-9 lists the effects/impacts for each NRHP property/CRHR resource.

Short-term effects from construction typically result from dirt, changes in the visual environment, or alteration to access. Other types of construction effects may be related to specific construction activities or locations. Operational effects are discussed in Section 5.7.2.

5.7.1.1 Temporary Dirt/Unintended Damage

Properties in the APE would be affected by construction activities including dirt and unintended damaged. Metro would employ BMPs to ensure that these effects are short-term.

Section 106 Effects Analysis for Historic Properties

Dirt and other damage from construction would affect, but not adversely affect, historic properties in the APE because the potential effects would be short-term. The potential effects would not directly alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Dirt and other unintended damage during construction would not constitute a substantial adverse change that would impair the significance of historical resources. The impacts would be short-term and the majority of the resources' features would remain to convey their significance. The LPA, therefore, would have a less than significant impact upon historical resources.

5.7.1.2 Traffic Congestion/Parking/Access

Changes in access to properties and resources within the APE may result from road closures, use of equipment, and other construction activities. Metro would employ BMPs to minimize these changes and keep the public and property owners informed of potential issues.

Section 106 Effects Analysis for Historic Properties

Potential effects, but no adverse effects, would result from changes in access during construction. The effects would be short-term and would not alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Changes in access resulting from congestion and loss of parking during construction would not constitute a substantial adverse change that would impair the significance of historical resources. Potential impacts would be short-term and the majority of the resources' features would remain to convey their significance. The LPA therefore, would have a less than significant impact upon historical resources.

5.7.1.3 Visual

Visual changes may result from the storage and operation of equipment, cuts in the road, and signage used during construction. Metro would employ BMPs to minimize these changes and they should be short term.

Section 106 Effects Analysis for Historic Properties

Visual changes during construction would affect, but not adversely affect, historic properties because the effects would be short-term. The changes would not directly alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Visual changes during construction would not constitute a substantial adverse change that would impair the significance of historical resources. The impacts would be short-term and the resources' character-defining features would remain to convey their significance. The LPA. therefore, would have a less than significant impact upon historical resources.

5.7.1.4 Demolition, Partial Takes or Alteration of a Property

To construct the LPA, one parcel that contains a historical resource would be acquired. The S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports (APE Map #7-30) is a CRHR-eligible (not NRHP eligible) commercial building built in 1913. The entire parcel is anticipated to be acquired for station construction.

A subsurface easement would be acquired for the Higgins Building (APE Map #8-11). The easement would extend approximately five feet beyond the property line for the CRHR-eligible Higgins Building (not NRHP eligible). No project-related construction would affect the Higgins Building.

The LPA., would also require the acquisition of a subsurface easement beneath the NRHP Eligible Cathedral of St. Vibiana Rectory (APE Map #8-13). The subsurface easement would extend approximately five feet beyond the north (2nd Street side) property line of the building. The easement acquisition is a requirement of the project to provide a buffer between subsurface project facilities and at-grade structures.

Section 106 Effects Analysis for Historic Properties

The subsurface easement for the area beneath the Cathedral of St. Vibiana Rectory would affect, but not adversely affect, the historic property. No project facilities would use any portion of the Rectory building or adversely affect the characteristics that make it eligible for the NRHP.

CEQA Impact Analysis for Historical Resources

The subsurface easement acquisitions that would extend five feet beyond the north (2nd Street side) property lines of the Higgins Building and the Cathedral of St. Vibiana Rectory would not constitute a substantial adverse change that would impair the significance of the historical resources, as no other project-related construction or use would directly affect the buildings. Due to the proximity of proposed project facilities to the buildings, indirect effects such as differential settlement and project related vibration have the potential to affect the structures (see Differential Settlement, Section 5.5.1.8, and Noise and Vibration, Section 5.5.1.7).

The property acquisition and subsequent demolition of the S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports building would constitute a substantial adverse change that would impair the significance of the historical resource. However, implementation of MM-BE-1 and MM-BE-5 would reduce impacts to a less than significant level.

5.7.1.5 Station Construction

For the LPA. a station is proposed to be constructed underground southwest of the intersection of 2nd and Hope Streets. The National Register eligible Walt Disney Concert Hall (APE Map #4-4) is located on the hill above the proposed station. The preliminary conceptual designs would be compatible with the contemporary forms, materials, and massing of this historical resource. However, noise and vibration from the construction of the station of the LRT would affect the use of the historic property as a concert hall and recording facility. The station is also near the NRHP eligible 2nd Street Tunnel (APE Map #4-3). This would require demolition of a portion of the CRHR eligible Belmont Tunnel (APE Map #3-4). The Belmont Tunnel is not eligible for the NRHP.

There will also be a station on 2nd Street between Broadway and Spring Street. Entrances will be located in the property currently used as a surface parking lot on the south side of 1st Street between Broadway and Spring Streets. A portion of the property located on the northwest corner of 2nd and Broadway will be used for access and other ancillary facilities. The construction of the station and other facilities are in the vicinity of the Los Angeles Mirror Building (APE #8-3).

A new underground station would be constructed to serve the Little Tokyo/ Arts District. The station is located under Central Avenue, Alameda Street and privately held properties on the south side of 1st Street behind Central Avenue. This station may include a small building at

ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans. This shallow station may potentially be built without a roof or mezzanine, leaving the below-grade platform level exposed. The property currently contains the California Register Eligible S. Kamada Restaurant, Atomic Café, Señor Fish, Coast Imports (APE Map #7-30), this building would be removed as part of construction for the LPA.

Section 106 Effects Analysis for Historic Properties

Construction of proposed stations would create effects to the Walt Disney Concert Hall (APE Map #4-4), and Los Angeles Mirror Building (APE Map #8-3). However, the effects on these historic properties would not be considered adverse because the potential changes would not diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

Construction of proposed stations would not constitute a substantial adverse change that would impair the significance of the Walt Disney Concert Hall or Los Angeles Mirror Building (APE Map #8-3). I. Implementation of MM-BE-1 would reduce any potential impact to the CRHR-eligible Belmont Tunnel to a less than significant level. Potential changes in setting created by stations would not diminish the integrity of the resources' significant historic features. The Locally Preferred Alternative, therefore, would have a less than significant impact upon these historical resources.

The property acquisition and subsequent demolition of the S. Kamada Restaurant, Atomic Café, Senor Fish, and Coast Imports building would constitute a substantial adverse change that would impair the significance of the historical resource. However, implementation of MM-BE-1, MM-BE-5 , MM-BE6, and MM-BE7 would reduce impacts to a less than significant level.

5.7.1.6 Portals

For this alternative two portals would be constructed. One would be located north of Temple Street, northeast of the existing at-grade Little Tokyo/Arts District Station and Metro Gold Line Tracks. There are no historic properties or historical resources within the vicinity of the portal.

The second portal would be located within 1st Street between Alameda and Gatey Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line Tracks toward 1-605. 1st Street would be widened to the north to accommodate this second portal and maintain the existing number of through lanes. This portal would be within the viewshed of two historic properties, the Little Tokyo National Historic Landmark Historic District and the NRHP eligible John A. Roebling Sons Co. Building (APE MAP #7-35). However, the portal is not encompassed within the boundary of a historic property, historical resource, or a contributing element to the significance of either property.

Section 106 Effects Analysis for Historic Properties

No adverse effect would occur to the Little Tokyo National Historic Landmark District or the John A. Roebling Sons Co Building from the construction of the portal. Potential effects would not alter the setting of historic properties in a manner that would diminish the integrity of the historic district.

CEQA Impact Analysis for Historical Resources

Construction of the portal would not constitute a substantial adverse change that would impair the significance of historical resources. The change in setting created by the portal would not diminish the integrity of the resources' significant historic features. The LPA. therefore, would have a less than significant impact upon historical resources.

5.7.1.7 Noise and Vibration

According to the Noise and Vibration Technical Memorandum, construction activities with the most potential for noise impacts include the cut and cover tunnel under Flower Street, proposed underground cut and cover stations at Flower/6th/5th Streets and 2nd/Hope Street, and the junction at Temple and Alameda Streets, which includes lowering Alameda Street. To ensure potential noise impacts are minimized during construction, all construction activities would conform to the provisions in Section 41.40(a) of the City of Los Angeles Code. Furthermore, BMPs would be employed to reduce any potential noise effects to historic properties to result in a "no adverse effect" finding and/or minimize potential impacts to historical resources to a less than significant level.

Noise levels for the tunnel boring machine (TBM) were not evaluated as a part of the Noise and Vibration Technical Memorandum because the TBM "is underground and produces little to no noise that reaches the surface land uses." Operations at the portal/launch site for the TBM, where bored material is hauled out, treated, and removed, also would not impact historic properties and historical resources as noise levels from these activities would not exceed ambient noise levels.

For the LPA. pre-augering of soldier piles at cut and cover sections would eliminate the need for impact pile driving. This would leave "Large Bulldozer" and "Drill Rigs" as the main sources of construction vibration. If these large pieces of equipment are not used within 21 feet of a historic property or historical resource, there would be no adverse effects and significant impacts to historic properties and historical resources from GBV would not occur. Properties that are close to the project work zone and which may be affected by construction-related vibration include Barker Brothers (APE Map #2-1), Roosevelt Building (APE Map #2-7), General Petroleum-Mobil Oil Building (APE Map #2-12), Superior Oil Building (APE Map #2-13), California Club (APE Map #3-1), Los Angeles Central Library (APE Map #3-2), 2nd Street Tunnel (APE Map #4-3), Mirror Building (APE Map #8-3), Higgins Building(APE Map

#8-11), Cathedral of Saint Vibiana (APE Map #8-12), and Cathedral of Saint Vibiana Rectory (APE Map #8-13).

The TBM would not cause vibratory effects or impacts to historic properties or historical resources because the TBM performs a slow moving drilling process that generates very little vibration to the surrounding areas. Studies have measured TBM vibration to be in the range of 0.0024 to 0.0394 inches per second PPV at a distance at 33 feet. The proposed TBM tunnels on 2nd Street would vary in depth due to the existing topography, as well as vertical curves in the alignment. The tunnel would range from about 140 feet below the surface (distance from street level to the top of the tunnel) to about 40 feet below the surface. The vibratory potential of the TBM is minimal and would be well below the FTA threshold for Category IV buildings (buildings extremely susceptible to vibration damage) of 0.12 inches per second PPV.

Section 106 Effects Analysis for Historic Properties

There would be an effect, but no adverse effect, to the Barker Brothers, Roosevelt, General Petroleum Mobil Oil Building, Superior Oil Building, California Club, Los Angeles Central Library, 2nd Street Tunnel, Walt Disney Concert Hall, Mirror Building, Cathedral of Saint Vibiana, and the Cathedral of Saint Vibiana Rectory, from noise and vibration-induced damage from construction, if measures MM-BE-2, MM-BE-3,MMBE-5, and MMBE-8 are implemented. If these measures are properly implemented, construction of this alternative would not diminish the integrity of the historic properties' location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential for construction-related vibration could cause a substantial adverse change that would impair the Barker Brothers, Roosevelt, General Petroleum Mobil Oil Building, Superior Oil Building, California Club, Los Angeles Central Library 2nd Street Tunnel, Mirror Building, Cathedral of Saint Vibiana, the Cathedral of Saint Vibiana Rectory, or the Higgins Building. The implementation of MM-BE-2, MM-BE-3, and MM-BE-8 would reduce the potential impacts to a less than significant level.

5.7.1.8 Differential Settlement

According to the Description of Construction, some of the buildings situated near cut and cover excavation would be susceptible to differential settlement. Differential settlement is defined as "unequal settling of material; gradual downward movement of foundations due to compression of soil which can lead to damage if settlement is uneven" (Allaby 1999). Differential settlement occurs when a building or feature's shape is twisted, or is raised and lowered in different places, sometimes imperceptibly. Differential settlement can cause foundations to settle and crack, floors to buckle and go out of level, walls to shift out of plumb and plane, and roofs to twist and deform. The resulting changes in structural systems and

cladding or finish materials, including wood and masonry, floor tiles, wood flooring, concrete floors, plaster, marble, and other decorative wall and ceiling treatments, and adobe, stucco, and wood-framed walls can be cracks, fractures, and other noticeable (as well as long term, not immediately visible) deformations and damage. Since historically significant buildings often have archaic construction and finish attachment systems, including unreinforced masonry, those building types are usually more susceptible to the effects of ground-borne vibration than more recently constructed buildings.

According to the Description of Construction, at least eight NRHP and/or CRHR eligible properties could be potentially affected by tunneling (TBM operation) and cut and cover construction. They include the Superior Oil Building/Standard Hotel (APE Map #2-13), California Club (APE Map #3-1), Walt Disney Concert Hall (APE Map #4-4), 2nd Street Tunnel (APE Map #4-3), former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los Angeles Times Building (APE Map #8-2), Higgins Building (APE Map #8-11), and St. Vibiana's Cathedral (APE Map #8-12). Implementation of mitigation measures MM-BE-2, MM-BE-3, and MM-BE-4 (when applicable) would avoid potential adverse effects to historic properties and reduce potential impacts to historical resources to a less than significant level.

Section 106 Effects Analysis for Historic Properties

Implementation of measures to protect and stabilize the ground near the Standard Hotel (APE Map #2-13), California Club (APE Map #3-1), 2nd Street Tunnel (APE Map #4-3), Walt Disney Concert Hall (APE Map #4-4), former Nishi Hongwanji Buddhist Temple (APE Map #7-19), Los Angeles Times Building (APE Map #8-2), and St. Vibiana's Cathedral (APE Map #8-12) noted in MM-BE-2, MM-BE-3, and MM-BE-5, would avoid adverse effects to all properties under this alternative. If these measures are properly implemented, differential settlement would not directly alter characteristics of historic properties in a manner that would diminish the integrity of each property's location, design, setting, materials, workmanship, feeling, or association.

CEQA Impact Analysis for Historical Resources

The potential for differential settlement could constitute a substantial adverse change that would impair the significance of any or all of the historical resources noted in this section. Implementation of MM-BE-2, MM-BE-3, and MM-BE-5 would reduce potential impacts to a less than significant level.

Key for CEQA Impacts
LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

5.7.2 Operational Impacts

Operation of the LPA could cause noise and vibration at the Walt Disney Concert Hall (Ape Map 4-4). For this resource the implementation of mitigation measures MM-BE-9 would reduce the adverse effects. Moderate noise effects/impacts from other project activities do not exceed the FTA Noise Impact Criteria, therefore no adverse effects to historic properties and no significant impacts to historical resources are anticipated from project operations. Table 5-10 lists potential effects and impacts by resource.

5.7.3 Cumulative and Indirect Impacts

There are no anticipated indirect impacts from the LPA. Cumulative effects and impacts include short-term effects during construction such as noise, dirt, changes in setting from the use or storage of equipment, or lack of access due to congestion or revisions in traffic patterns. Cumulative effects may also result from long-term effects such as additional traffic generated by an increase in density as new buildings are constructed. Taken collectively, the reasonably foreseeable projects in the project area do not appear to have additional effects upon historic properties or impacts upon historical resources that are affected by the LPA.

5.7.4 Potential Effects to Section 4(f) Resources

The LPA would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map # 8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

LTS = Less Than Significant impact, no mitigation required
SI = Significant Impact that can be mitigated to less than significant
SU = Significant and Unavoidable impact

6.0 POTENTIAL MITIGATION MEASURES

Consistent with 36 CFR 800.6(a), federal agencies are required to develop and evaluate alternatives that could avoid, minimize, or mitigate adverse effects on historic properties. Since the proposed Regional Connector project has the potential for adverse effects, this report outlines measures to mitigate the potential effects. The mitigation measures presented in this section are also intended to assist Metro in reducing the project's potential impacts on historical resources to a less than significant level.

The only National Register eligible historic property that would be adversely affected by any of the project alternatives would be the 2nd Street Tunnel. Proposed mitigation measures for the adverse effects to this property are listed in Table 6-2.

There are 14 historical resources where construction activities could significantly impact the resource. These resources are listed in Table 6-1. The resources and measures proposed as mitigation to reduce potential impacts to a less than significant level are listed in Table 6-3.

LPA = Locally Preferred Alternative

6.1 Proposed Construction Impact Mitigation Measures

MM-BE-1 Historic Properties/Historical Resources Documentation

Documentation of historic properties and historical resources adversely affected by the project would consist of the development of individual Historic American Building Survey/Historic American Engineering Record (HABS/HAER) submissions. The HABS/HAER documents would be prepared so that the original archival-quality documentation could be donated for inclusion in the Library of Congress if the National Park Service accepts these materials. Archival copies of the documentation would also be offered for donation to local repositories, including the Los Angeles Central Library and the Los Angeles Conservancy. The appropriate level of recordation would be established in consultation with the California SHPO and formalized as a part of MM-BE-5.

MM-BE-2 Pre-construction baseline survey and geo-technical investigations

A survey of historic properties and/or historical resources within 21 feet of vibration producing construction activity would be conducted to assess the building category and the potential for GBV to cause damage. The survey would also be used to establish baseline, pre-construction conditions for historic properties and historical resources.

During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken under this measure to evaluate soil, groundwater, seismic, and environmental conditions along the alignment. This analysis would assist in the development of appropriate support mechanisms for cut and fill construction areas. The subsurface investigation would also identify areas that could experience differential settlement as a result of using a tunnel boring machine in close proximity to historic properties and/or historical resources. An architectural historian or historical architect who meets the Secretary of the Interior's Professional Qualification Standards would provide input and review of final design documents prior to implementation of measures (36 CFR Part 61).

MM-BE-3 Building Protection Measures, Geotechnical and Vibration Monitoring, and Post Construction Survey

For those historic properties and historical resources that have the potential to be affected or impacted by ground borne vibrations and/or differential settlement, Metro would use building protection measures such as underpinning, soil grouting, or other forms of ground improvement, as well as lower vibration equipment and/or construction techniques. These techniques, combined with a geotechnical and vibration monitoring program, would help protect identified historic properties and historical resources. The historic property and historical resource protection measures as well as the geotechnical and vibration monitoring program would be reviewed by an architectural historian or historical architect who meets the Secretary of the Interior's Professional Qualification Standards (36 CFR Part 61) to ensure that the measures would adequately protect the properties/resources. A post construction survey

would also be undertaken to ensure that no adverse effects or significant impacts had occurred to historic properties and historical resources.

MM-BE-4 TBM Specifications/Requirements near Historic Properties and Historical Resources

For those historic properties and historical resources that have the potential to be affected or impacted by differential settlement caused by TBM construction, a contractor would be required to develop and use an earth pressure balance or slurry shield tunnel boring machine. The method of machine operation would be based on the anticipated ground conditions near historic properties and historical resources. These construction methods and machinery types would reduce the potential for differential settlement near historic properties and historical resources.

MM-BE-5 Memorandum of Agreement

For those historic properties and that would be anticipated to experience adverse effects, a memorandum of agreement would be developed to resolve those adverse effects consistent with 36 CFR 800. This agreement, developed by FTA and Metro in consultation with the CA SHPO and other consulting parties would resolve and/or avoid, minimize, or mitigate potential effects to historic properties and/or historical resources. The agreement would include stipulations that outline the specific requirements for consultation and decision making between the lead federal agency and consulting parties, specify the level of HABS/HAER recordation, outline specific requirements for pre- and post- construction surveys, geotechnical investigations, building protection measures, and TBM specifications.

MM-BE-6 Relocation of Senor Fish Building

The Señor Fish/Atomic Café building (to be removed) shall be offered for a period of one year following certification of the Final EIS/EIR for the price of $1 to any party willing to move it off of the 1st/Central Avenue station site at their own expense. Should no parties come forward, Metro shall incorporate materials from the building into the project facilities.

MM-BE-7 Interpretive Programs for Senor Fish Building

Metro shall explore keeping portions of the building intact for use in the 1st/Central Avenue station. Metro shall also offer to provide an exhibit commemorating the building at the Japanese American National Museum, the 1st/Central Avenue station site, or other suitable location. An individual Historic American Building Survey/Historic American Engineering Record (HABS/HAER) submission shall be developed. MM-BE-8 Mitigation for effects from noise and vibration during operation to the Walt Disney Concert Hall.

Metro shall conduct additional evaluations during the preliminary engineering phases to verify the appropriate criteria for recording activities and to verify initial estimates. If necessary, Metro shall specify that the contractor will employ high compliance resilient

fasteners, floating slab trackbed or other appropriate measures to reduce operational groundborne noise impact during operation.

6.2 Operation Impacts Mitigation Measures

The implementation of the following mitigation measures would reduce the effects on the Walt Disney Concert Hall from the operation of the LRT.

MM-BE-9 Mitigation for effects from noise and vibration during construction to the Walt Disney Concert Hall

During constructionMetro shall provide monitoring for groundborne noise at the Walt Disney Concert Hall and the Roy and Edna Disney/CalArts Theater (REDCAT). LACMTA shall also provide advance notification to Walt Disney Concert Hall and the Roy and Edna Disney/CalArts Theater (REDCAT) regarding schedules for tunneling and other activities.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

This alternative would not include capital improvements, and thus the No Build Alternative would be expected to result in no adverse construction or implementation-related effects on historic properties in the project APE.

7.1.2 CEQA Determination

The No Build Alternative does not include the introduction of any new improvements that would be expected to result in construction or operational impacts to historical resources in the project APE. The No Build Alternative would not be expected to result in cumulative impacts to historical resources, other than potential impacts on resources through continued high and escalated levels of vehicular traffic, unabated by additional mass transit options. The No Build Alternative would not contribute to a cumulative impact on these resources.

7.1.3 Section 4(f) Effects

The No Build Alternative would not result in any Section 4(f) impacts.

7.2 Transportation System Management (TSM) Alternative

7.2.1 NEPA Findings

Project construction and operation would not result in any direct or indirect adverse effects to historic properties.

7.2.2 CEQA Determination

Construction and operation of the TSM Alternative would not result in any direct or indirect significant impacts on historical resources.

7.2.3 Section 4(f) Effects

The TSM Alternative would not result in the use of any Section 4(f) resources.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

Construction of the At-Grade Emphasis LRT Alternative would be expected to result in one direct adverse effect. Alteration of the 2nd Street Tunnel (APE Map #4-3) during construction to accommodate the At-Grade Emphasis LRT Alternative would require the implementation of MM-BE-1 and MM-BE-5. Consistent with 36 CFR 800, consultation with the California SHPO

and other consulting parties would need to be completed before project construction could begin.

7.3.2 CEQA Determination

Construction of the At-Grade Emphasis LRT Alternative would potentially result in one direct significant impact and 14 indirect significant impacts to historical resources. All of these potential impacts could result in a substantial adverse change to a historical resource. Implementation of mitigation measures MM-BE-1 through MM-BE-5 would reduce these potential impacts to a less than significant level. Project operation is not expected to cause direct or indirect impacts. Refer to Table 7-2 for additional information.

7.3.3 Section 4(f) Effects

The At-Grade Emphasis LRT Alternative would require the acquisition and/or use of property associated with five NRHP-eligible properties: Los Angeles Civic Center Historic District, Los Angeles Police Motor Transport Building (APE Map #6-7), City of Los Angeles Parker Center Police Department Building (APE Map #6-6), City Hall South (APE Map #6-4) as well as the 2nd Street Tunnel (APE Map #4-3). Four of these acquisitions would result in a Section 4(f) *de minimus* finding. The 2nd Street Tunnel alterations could only occur if 1) there is no prudent and feasible alternative to using the resource; and 2) the project includes all possible planning to minimize harm to the tunnel from the use. Additional analysis of project alternatives and consultation with the California SHPO would be required.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Construction and operation of the Underground Emphasis LRT Alternative would be expected to result in no direct or indirect adverse effects to historic properties.

7.4.2 CEQA Determination

Construction of the Underground Emphasis LRT Alternative would result in one direct significant impact and 14 indirect significant impacts to historical resources. Implementation of mitigation measures MM-BE-1 through MM-BE-5 would reduce these potential impacts to a less than significant level. Project operation would not be expected to cause direct or indirect impacts. Refer to Table 7-3 for additional information.

SI = Significant impact that can be mitigated to a less than significant level

7.4.3 Section 4(f) Effects

The Underground Emphasis LRT Alternative would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map #8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

7.5 Fully Underground LRT Alternative - Little Tokyo Variation 1

7.5.1 NEPA Findings

Construction and operation of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would be expected to potentially result in no direct or indirect adverse effects to historic properties.

7.5.2 CEQA Determination

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 1 would potentially result in one direct significant impact and 14 indirect significant impacts to historical resources. Implementation of mitigation measures MM-BE-1 through MM-BE-5 would reduce these potential impacts to a less than significant level. Project operation is not expected to cause direct or indirect impacts. Refer to Table 7-4 for additional information.

7.5.3 Section 4(f) Effects

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map #8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

7.6 Fully Underground LRT Alternative - Little Tokyo Variation 2

7.6.1 NEPA Findings

Construction and operation of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be expected to result in no potential direct or indirect adverse effects to historic properties.

7.6.2 CEQA Determination

Construction of the Fully Underground LRT Alternative - Little Tokyo Variation 2 would potentially result in one direct significant impact and 14 indirect significant impacts to historical resources. Implementation of mitigation measures MM-BE-1 through MM-BE-5, would reduce these potential impacts to a less than significant level. Project operation would not be expected to cause direct or indirect impacts. Refer to Table 7-5 for additional information.

7.7 Locally Preferred Alternative

7.7.1 NEPA Findings

Construction and operation of the LPA would be expected to result in no potential direct or indirect adverse effects to historic properties.

7.7.2 CEQA Determination

Construction of the LPA would potentially result in one direct significant impact and 14 indirect significant impacts to historical resources. Implementation of mitigation measures MM-BE-1 through MM-BE-9, would reduce these potential impacts to a less than significant level. Project operation would not be expected to cause direct or indirect impacts. Refer to Table 7-6 for additional information.

7.7.3 Section 4(f) Effects

The LPA would require the acquisition of a subsurface easement situated on one NRHP-eligible property; Cathedral of Saint Vibiana Rectory (APE Map #8-13). No adverse effects would occur to the Rectory building as a result of the easement. This acquisition would result in a Section 4(f) *de minimus* finding.

CULTURAL RESOURCES - ARCHEOLOGY (UPDATED)

State Clearinghouse Number: 2009031043

LOCALLY PREFERRED ALTERNATIVE IMPACTS TO ARCHEOLOGICAL AND PALEONTOLGICAL RESOURCES

The Draft Technical Memoranda for Archaeological Resources and Paleontological Resources were included with the Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) that was released for public comment on September 3, 2010.This addendum serves to finalize the draft report. Two variations of the Fully Underground LRT Alternative (Little Tokyo Variation 1 and Little Tokyo Variation 2) were analyzed in this report. Little Tokyo Variation 2 was subsequently dropped from consideration, and Little Tokyo Variation 1 became the sole alignment for the Fully Underground LRT Alternative.

On October 28th, 2010, Metro's Board of Directors approved staff's recommendation to designate the Fully Underground LRT Alternative described in the publicly reviewed Draft EIS/EIR for the Regional Connector Transit Corridor as the Locally Preferred Alternative (LPA). After the close of the Draft EIS/EIR comment period, refinements were made to the LPA to reduce impacts and address comments received. This addendum incorporates those refinements. The LPA would provide a direct connection from 7th Street/Metro Center Station to the Metro Gold Line near 1st and Alameda Streets. The Metro Gold, Blue and Expo light rail lines would be connected allowing trains to operate between Claremont and Long Beach, and from Santa Monica to the Eastside. In the action for approval, the Board also directed staff to remove the property located on the southeast corner of 2nd and Spring Streets from the list of potential acquisitions as well as eliminate the station at 5th and Flower Streets. This was due to its close proximity to the existing 7th Street/Metro Center Station and a need to reduce costs. The designated LPA thus includes three new stations instead of the original four described in the Draft EIS/EIR. On January 4th, 2011, the Federal Transit Administration (FTA) authorized Metro to initiate Preliminary Engineering as part of FTA New Starts funding program. In its authorization, FTA requested that Metro among other items pursue the identification of appropriate mitigations and realize potential cost savings. Consistent with FTA's authorization, refinements to the Locally Preferred Alternative have been identified and are to be analyzed as part of the development of the Final EIS/EIR.

This addendum to the Technical Memoranda was developed to describe the project refinements to the LPA. The effects on archeological and paleontological resources are the same as what was described in the Draft Technical Memoranda.

1.0 UPDATED PROJECT DESCRIPTION

On October 28th, 2010, the Metro Board of Directors concurred with staff's recommendation to designate the Fully Underground LRT Alternative as the LPA. The LPA alignment is

essentially the same as the Fully Underground LRT Alternative, except it does not include the Flower/5th/4th Street station and has a modified route through Little Tokyo. However, it still travels under the intersection of 1st and Alameda Streets rather than crossing at-grade, and connects to the Metro Gold Line within 1st Street and north of Temple Street.

LPA refinements made since the Draft EIS/EIR to reduce impacts include:

- Relocation of the proposed tunnel boring machine (TBM) insertion site to the Mangrove property northeast of 1st and Alameda Streets in order to reduce community disruption due to construction activities
- Elimination of cut and cover construction on 2nd Street in Little Tokyo
- Extension of TBM machine operation from 2nd/Hope Street station to 4th and Flower Streets, allowing an additional block of cut and cover construction to be eliminated
- Slight modifications to tunnel depths
- Rerouting of the tunnels beneath Japanese Village Plaza in order to reduce acquisitions on the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street

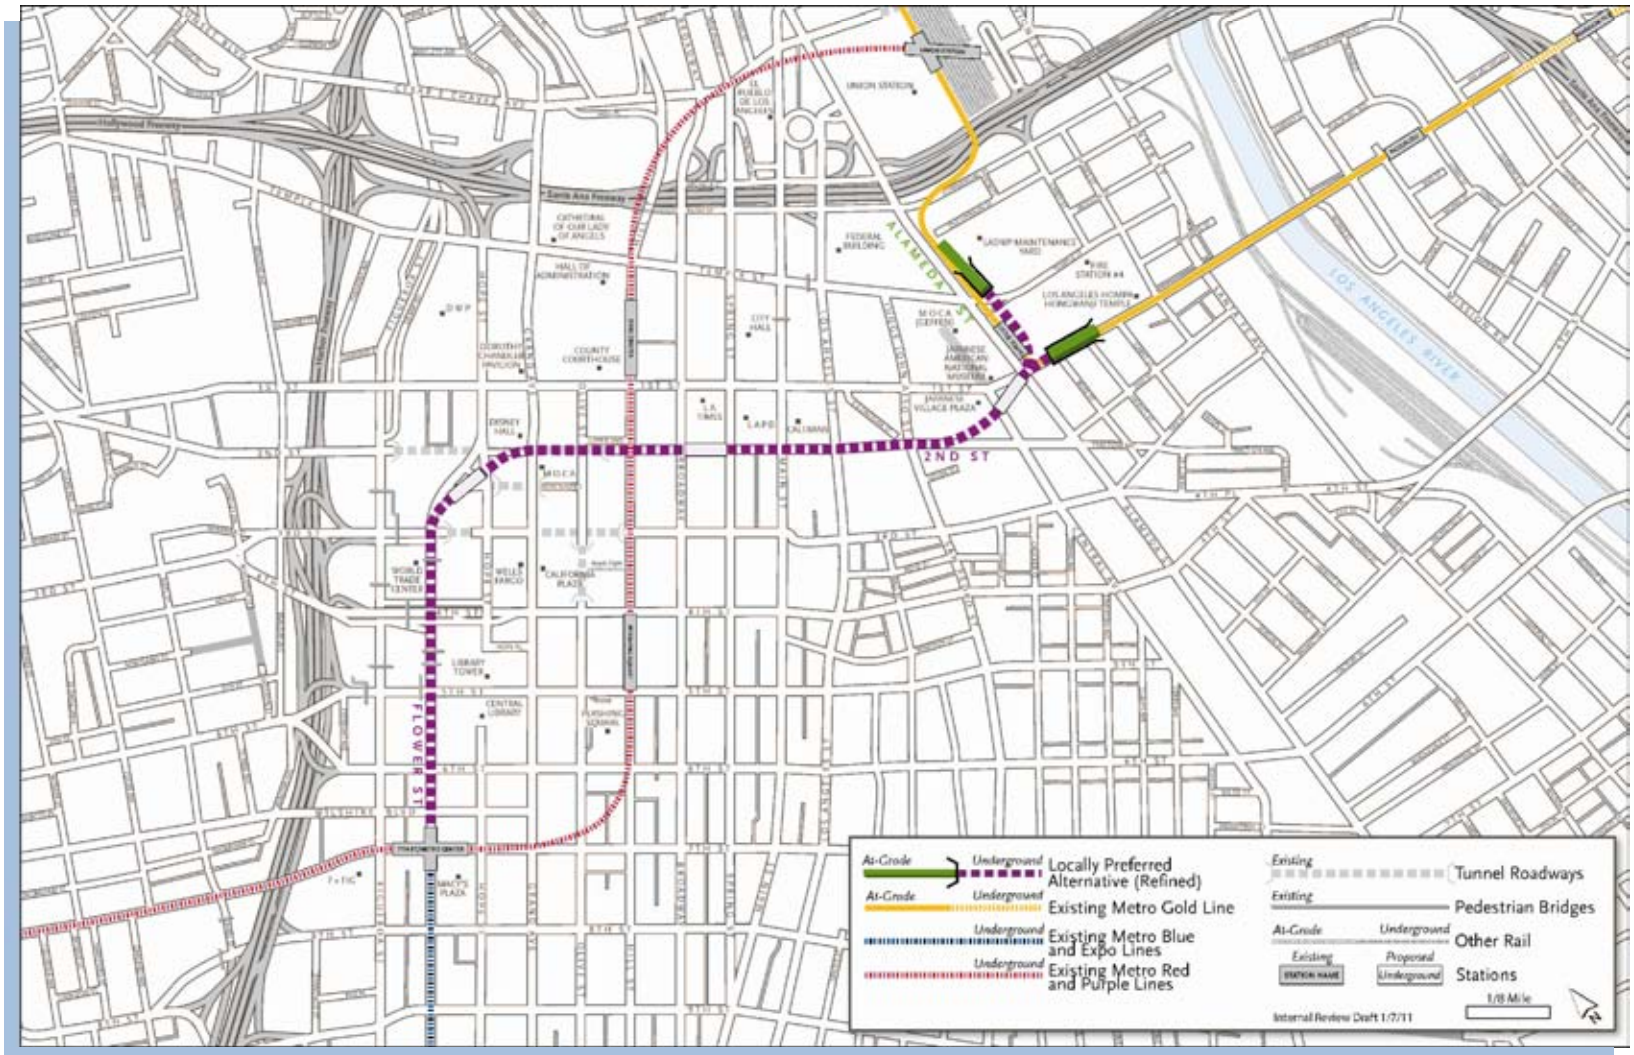

Figure 1 –Locally Preferred Alternative

1.1 Route Overview

The LPA alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station and would run underneath Flower Street. An enhanced pedestrian walkway would be provided along Flower Street from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets, which would improve the pedestrian connection between the Financial District and the 7th Street/Metro Center Station. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets. A new underground station would be located just southwest of the intersection of 2nd and Hope Streets.

At 2nd and Hope Streets, a new pedestrian connection would be made to Upper Grand Avenue. A pedestrian plaza connecting to Upper Grand Avenue is currently planned above General Thaddeus Kosciuszko Way as part of the Broad Museum. Metro would construct an elevator from the station entrance to the plaza if one is not already provided. If the plaza is not built, Metro would build a pedestrian bridge to connect the elevator to Upper Grand Avenue.

Tracks would then head east underneath 2nd Street to the next proposed underground station between Broadway and Spring Street (2nd Street/Broadway station). The tracks would continue east underneath 2nd Street to just west of Central Avenue at approximately the pedestrian signal to the JVP, where the alignment would then veer northeast under privately held property and Central Avenue to a newly proposed Little Tokyo/Arts District underground station (1st/Central Avenue station). The proposed underground station would be partially located within Central Avenue and the northern half of the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street. The Señor Fish, Weiland Brewery, the former Café Cuba (The Spice Table), and associated parking would need to be acquired for construction of this station. However, the remaining businesses on that block would remain, including the Office Depot and associated parking. This station may include a small building at ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans. This shallow station may potentially be built without a roof or mezzanine, leaving the below-grade platform level exposed

An underground junction would be constructed beneath the intersection of 1st Street and Alameda Street. Two new portals would be located to the north and east of the junction, where trains would rise to the surface to connect to the Metro Gold Line heading north to Claremont and east to I-605.

One portal would be located north of Temple Street, northeast of the existing at-grade Little Tokyo/Arts District Station and Metro Gold Line tracks. This portal would rise to the north within the maintenance yard of the City of Los Angeles Department of Water and Power (LADWP) and connect to the existing LRT bridge over US 101, allowing a connection to the Metro Gold Line to Claremont. Tracks would run from the junction under 1st and Alameda Streets through a new tunnel crossing beneath Temple Street and the Mangrove property (the parcel on the northeast corner of 1st and Alameda Streets) to the new portal. This new tunnel

would run immediately east of the existing Little Tokyo/Arts District Station and Metro Gold Line tracks.

The second portal would be located within 1st Street between Alameda and Garey Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. 1st Street would be widened to the north to accommodate this second portal and maintain the existing number of through lanes. The widening would start at Alameda Street and continue east, significantly tapering down as it crosses Hewitt Street, returning to the existing condition prior to the Los Angeles Hompa Hongwanji Buddhist Temple, to join the existing 1st Street LRT tracks, just west of the 1st Street Bridge.

Access to property northeast of 1st and Alameda Streets, the Mangrove property, would need to be acquired for insertion of the TBM, to stage construction of both portals, to connect to the Metro Gold Line LRT bridge, and to construct the tunnels beneath Temple Street and the Mangrove property. During construction, tracks would be installed in this area at-grade to allow service to proceed on the Metro Gold Line while construction activities occur within the project area. Figure 2-10 provides a map of this alternative.

The existing Metro Gold Line Eastside Extension and the Little Tokyo/Arts District Station surface tracks and station would be maintained for continued service during construction with intermittent disruptions related to construction activities. Once construction is complete, operation of the current Metro Gold Line between Pasadena and East Los Angeles and the existing, at-grade Little Tokyo/Arts District Station would terminate. In its place, Metro would initiate operations on two routes:

- Between Claremont and Long Beach
- Between East Los Angeles and Santa Monica

Crossovers could be located just east of the proposed station at 2nd and Broadway Streets, underground beneath 1st Street just east of the intersection of 1st and Alameda Streets, and underground beneath the Mangrove property, north of the rail junction. In addition, a pocket track, which could also serve as a crossover, would be located beneath Flower Street between 5th and 6th Streets. The crossovers and pocket track may not be needed at these locations and may ultimately be placed in other locations. Tunnel boring machines cannot be used for construction of crossovers since underground crossover locations require cut and cover construction. More information on these construction methods is provided in the Description of Construction, Appendix K.

1.2 Operating Characteristics

The Fully Underground LRT Alternative (LPA) consolidates the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes:

East-West Route (Santa Monica to I-605 via the Metro Expo Line, Regional Connector, and Metro Gold Line Eastside Extension tracks): Metro Expo Line trains from Santa Monica would travel on existing Flower Street tracks north of the junction at Washington and Flower Streets. After stopping at the existing 7th Street/Metro Center Station, the trains would continue north along the new Regional Connector tracks to a new junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to a new portal on 1st Street, and continue along the Metro Gold Line Eastside Extension tracks to I-605.

North-South Route (Claremont to Long Beach via the Metro Gold Line, Regional Connector, and Metro Blue Line tracks): After stopping at 7th Street/Metro Center Station, Metro Blue Line trains from Long Beach would continue north along the new Regional Connector tracks to a new junction beneath 1st and Alameda Streets. Trains would then travel to a new portal on the LADWP maintenance yard site, and continue along the Pasadena Metro Gold Line and the Foothill Extension to Claremont.

The east-west and north-south routes would each operate with five minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector.

2.0 LPA EFFECTS, IMPACTS AND MITIGATION FOR ARCHAEOLOGICAL RESOURCES

Construction of the Fully Underground LRT Alternative (LPA) has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles Zanja System, and sites CA-LAN-3588, P-19-003338, and P-19-003339 (Details regarding these resources can be found in the body of the Technical Memorandum for Archaeology).

Archaeological features associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect. Implementation of mitigation measures described in Sections 1.2.2.1 and 1.2.2.2 would reduce potential direct impacts to identified and previously unidentified archaeological resources to a less than significant level. The LPA would not result in operational impacts to both identified and previously unidentified archaeological resources.

Given that implementation of the mitigation measure described in Section 1.2.2.1 1 would reduce potential construction impacts to previously unidentified archaeological resources to a less than significant level, the LPAwould not contribute to a cumulative impact on unidentified archaeological resources.

Potential destruction of portions of the Los Angeles Zanja System could contribute to a cumulative impact to this resource. Implementation of the mitigation measure described in Section 1.2.2.1.2 would reduce both direct and cumulative impacts to known archaeological resources, including the Zanja System, to a less than significant level.

2.1 NEPA Finding and CEQA Determination

Construction of the LPA has the potential to affect previously unknown resources. With implementation of mitigation measures, potential construction and cumulative impacts would not be adverse or significant under NEPA or CEQA. The LPA would not result in adverse or significant operational impacts to archaeological resources.

2.2.Mitigation Measures

Construction of the Regional Connector Transit Corridor project may impact one or more NRHP- or CRHR-eligible archaeological sites along with an unknown number of previously unidentified archaeological resources.

Since operational impacts to archaeological resources, including both previously recorded and undiscovered resources, are not expected for any of the project alternatives, mitigation for operation would not be required for this project.

In the event that resource avoidance is not possible, and to mitigate impacts to previously unidentified archaeological resources, the following mitigation measures related to construction activities are recommended.

Mitigation measures are also documented in the Mitigation Monitoring and Reporting Program (MMRP), which is part of the Final EIS/EIR.

2.2.1 Treatment of Undiscovered Archaeological Resources

A detailed Cultural Resources Monitoring and Mitigation Plan (CRMMP) would be prepared prior to implementing this project, similar in scope to the CRMMP that was prepared for Metro's Eastside Gold Line Transit Corridor (Glenn and Gust 2004). Implementing a CRMMP during ground disturbance in highly sensitive archaeological areas would ensure that cultural resources are identified and adequately protected.

If cultural resources are discovered or if previously identified resources are affected in an unexpected manner, the CRMMP would ensure that such resources receive mitigation to reduce the impact to a less than significant level. This plan would include, but not be limited to, the following elements:

- Worker training
- Archaeological monitoring
- The scientific evaluation and mitigation of archaeological discoveries
- Native American participation, as needed
- Appropriate treatment of human remains

- Reporting of monitoring and mitigation results

Worker Training

Prior to initiating ground-disturbing activities, a qualified archaeologist would conduct a short awareness training session for all construction workers and supervisory personnel. The session would explain the importance of and legal basis for protecting significant archaeological resources.

Each worker would also learn the proper procedures to follow in the event cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection and the immediate contact of the supervisor and the archaeological monitor.

This worker education session could include visual representations of artifacts (prehistoric and historic) that might be found in the project vicinity, and it could take place on-site immediately prior to the start of ground disturbance.

Supervisory personnel may benefit from longer training sessions, while a brief training would suffice for non-supervisory workers. The brief (approximate 30- to 45-minute) training session may be conducted on-site by video, PowerPoint presentation, or similar media.

Archaeological Monitoring, Evaluation, and Mitigation

Due to poor surface visibility and high archaeological sensitivity of the direct APE, an archaeological monitor would be present during ground-disturbing activities in archaeologically sensitive areas. This would reduce the potential level of impact to buried archaeological resources to a less than significant level. This work would be completed under the direction of an archaeologist who meets the Secretary of the Interior's Standards for archaeologists. An adequate number of monitors would be present to ensure that all earth-moving activities are observed and would be on-site during all grading activities for areas to be monitored.

During the original excavation of previously undisturbed soils, the archaeological monitor(s) would be on-site at a frequency determined by the lead archaeologist. Inspection frequency may vary based on the rate of excavation, the materials excavated, and the presence and abundance of artifacts and features. Full-time monitoring is warranted within one-half block of potentially significant archaeological resources that are known or suspected to be present within the direct APE.

If potentially significant archaeological resources are exposed during ground-disturbing activities, the project manager would be notified immediately. Archaeological monitor(s) would have the authority to divert or temporarily halt ground-disturbing operations in the area of discovery to allow the resources to be evaluated. Excavation work would halt until the archaeological monitor makes a determination of the significance of the archaeological resource. Construction activities may continue in other areas.

Evaluation of such resources is typically accomplished by a test-level excavation designed to determine the horizontal and vertical extent of the resource, and to characterize its contents. If the discovery proves to be potentially eligible for listing on the NRHP or the CRHR and project plans cannot be altered to avoid affecting the site, then an adverse effect would result within the project area. This adverse effect may be resolved by implementing a Memorandum of Agreement (MOA) between Metro and the SHPO.

Before construction activities are allowed to resume in an affected area, artifacts would be recovered and features recorded using professional archaeological methods. The lead archaeologist operating under the direction of the MOA would determine the amount of material to be recovered for an adequate artifact sample for analysis.

All cultural material collected during the construction monitoring program would be processed using professional archaeological methods. An appropriate sample of recovered materials, selected by the lead archaeologist, would be curated at a curation facility that meets federal standards per 36 CFR Part 79 and made available to other archaeologists and researchers for further study.

Native American Participation

If Native American cultural resources (i.e., prehistoric or ethnohistoric-period artifacts, food remains, or features associated with Native Americans) are exposed during project-related ground disturbance, Metro would contact the Gabrielino/Tongva San Gabriel Band of Mission Indians and the Tongva Ancestral Territorial Tribal Nation. Both groups have expressed interest in the project. One or both of these groups would be asked to provide the services of a trained Native American consultant to monitor ground-disturbing work in the area containing the Native American cultural resources. This monitoring would occur on an as-needed basis, and would be intended to ensure that Native American concerns are taken into account during the construction process.

Human Remains

The discovery of human remains is always a possibility during ground disturbance. For example, an unmarked early Spanish period Native American cemetery was recently discovered near the APE (Applied Earthworks 1999).

The State of California Health and Safety Code Section 7050.5 addresses what should be done when human remains are found during construction. This code section states that when human remains are encountered, no further disturbance would occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code (PRC) Section 5097.98. The County Coroner would be immediately notified of the find.

If the human remains are determined to be prehistoric, the Coroner would notify the Native American Heritage Commission, which would determine and notify a Most Likely Descendant (MLD). The MLD shall complete inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Impacts to human remains may remain significant even after mitigation.

Reporting

If cultural resources are not discovered in the course of construction monitoring, a brief letter to that effect would be prepared by the consulting archaeologist, indicating that the monitoring activities have been satisfied. If previously unidentified cultural resources are discovered in the course of construction monitoring, a report would be prepared following Archaeological Resource Management Report (OHP 1990) guidelines that documents field and analysis results and interprets the data within an appropriate research context.

2.2.2 Treatment of Known Archaeological Resources

Destruction of a resource that is eligible for listing in the NRFP or CRHR would be a significant adverse effect. This effect may be resolved through by implementing an MOA between FTA, Metro, and the SHPO, as well as other interested parties.

Four archaeological sites that are either within or immediately adjacent to the direct APE are presumed eligible for listing on both the NRHP and the CRHR. These include the Los Angeles Zanja System (the Zanja Madre, CA-LAN-887H, and numerous unrecorded numbered zanjas) and sites CA-LAN-3588, P-19-003338, and P-19-003339.

Effects to the data potential of archaeological sites can be mitigated to a less than significant level by preparing and implementing a data recovery plan under Section 106 and CEQA. The actual mitigation measures agreed upon in the MOA may vary in substance and degree, but the MOA would include a process to resolve any adverse effects upon archaeological resources within the direct APE that are eligible for listing in the NRHP or CRHR. The treatment of sites CA-LAN-3588, P-19-003338, and P-19-003339 may include systematic and scientific exposure, evaluation, and if necessary, archaeological data recovery.

Los Angeles Zanja System

The Los Angeles Zanja system was an extensive and integrated water conveyance network that served large areas of the City for multiple generations. Generally speaking, previous construction projects in downtown Los Angeles have unexpectedly encountered and documented limited exposures of a single zanja segment, often after the segment has been damaged by construction equipment. This incomplete approach does not permit the overall Zanja system to be evaluated, given the requirements that the OHP clarified in its recent letter (Toffelmier 2009).

It is likely that other projects (such as emergency utility repair) have damaged segments of the Zanja system without documentation. This repeated damage (both monitored and unmonitored construction impacts) constitutes a cumulative effect that should be mitigated. Construction monitoring alone is insufficient mitigation to address this effect, particularly given the likelihood of damaging the zanjas prior to discovery during project construction process.

Inadvertent project-related damage to the zanjas may constitute an adverse effect under the Criteria of Adverse Effect, "physical destruction or damage" (36 CFR Part 800.5(a) (2) and material impairment as defined in CEQA. This action would contribute to, rather than mitigate, these cumulative effects.

Both Section 106 of the NHPA (as amended) and CEQA require identification, documentation, and evaluation of historic properties/historic resources in a project area (or direct APE). For a poorly mapped and buried linear resource like the Zanja system, identification alone is challenging.

Rather than a costly archaeological excavation program or a remote sensing (ground-penetrating radar, etc.) survey that is unlikely to produce clear-cut results, a proactive identification and documentation program that would facilitate preservation or mitigation in a cost-effective manner is recommended.

This would include using additional documentary research to identify, as accurately as possible, the precise alignments of the zanjas within the APE. Where these alignments are expected to be affected by the proposed project, particularly where cut-and-cover or other near-surface construction techniques (as opposed to tunneling 20 or more feet below the ground surface) are planned in the vicinity of mapped zanja segments, full-time archaeological monitoring would be instituted to ensure documentation.

The archaeological monitors would work closely with equipment operators to ensure that every effort is made to avoid damaging zanja segments prior to their adequate documentation.

Documenting and evaluating the Los Angeles Zanja system would be best accomplished with a system-wide approach that incorporates historical, archaeological, and engineering research and documentation. This systemic approach to documentation and evaluation is a particularly appropriate mitigation measure for the Regional Connector Transit Corridor project, which has the potential to impact multiple zanja segments. Documentation of the zanja segments' alignments and slopes would have the added benefit of enabling future projects to more accurately predict the location of zanja segments outside of the project area.

To mitigate potential impacts to the Los Angeles Zanja system, the project MOA would provide that the system be adequately documented under the direction of an experienced archaeologist and an experienced historical architect, architectural historian, or historian, both meeting the Secretary of the Interior's qualification standards. This documentation would include a combination of historical research, archaeological testing, and architectural documentation, and would be followed by a formal evaluation of NRFP and CRHR eligibility.

It should be noted that substantial documentation already exists for the Zanja system in the form of maps and engineering records, published books and articles, unpublished technical reports, and site records. The collation of available data for the system as a whole would accomplish much of the documentation effort that is proposed here, while intensive, original research would be restricted to the zanja segments that cross the direct APE.

Research and documentation may include such specific measures as:

- Historical research using historical maps, photographs, and other written sources to document creation, maintenance, modification, and abandonment of the system.
- Archaeological research to establish the physical condition, presence of associated features and artifacts, and precise location of each zanja segment within the project's direct APE by using physical exposure through controlled excavation following its discovery during construction monitoring. Resources would be documented using DPR series 523 primary and detail forms, maps, and photographs. The results would be presented in a detailed technical report following Archaeological Resource Management Report (OHP 1990) guidelines. The report would address research questions and assess the NRHP and CRHR eligibility of the system.

- Architectural documentation of exposed zanja segments by producing narrative records, measured drawings, and photographs in conformance with Historic American Engineering Record (HAER) standards prior to any alteration or demolition activity.
- Preserving the results of the historical, archaeological, and historic architectural studies in repositories (e.g., the local main library branch, the lead agency headquarters library, and with identified non-profit historic groups interested in the subject matter).
- Interpretation of the Los Angeles Zanja system for the public through signage along the project alignment, visual representations of zanja alignments using colored pavement, or other appropriate means such as a dedicated internet website.

3.0 LPA EFFECTS, IMPACTS AND MITIGATION PALEONTOLOGICAL RESOURCES

The LPA involves ground disturbance associated with excavations to construct three new stations and an entirely underground tunnel located from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Any ground disturbances in areas of high sensitivity will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or more below the ground surface. In areas where mitigation measures can be implemented, potential impacts can be reduced to a less than significant level. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources would not be feasible resulting in significant and unavoidable impacts.

The LPA would not result in operational impacts to paleontological resources.

In areas where mitigation measures can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources to less than significant. In areas where mitigation measures cannot be implemented, such as in areas where new underground TBM segments would be constructed, cumulative impacts may be unavoidable.

3.1NEPA Finding and CEQA Determination

The LPA could have adverse effects on paleontological resources. With implementation of mitigation, potential construction and cumulative impacts would not be adverse under NEPA. The LPA would not have significant effects on paleontological resources with implementation of proposed mitigation measures with the exception of areas where tunneling operations cannot be mitigated. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources would not be feasible and thus construction and cumulative impacts would be significant and unavoidable.

The LPA would not result in adverse or significant operational impacts to paleontological resources.

3.2 Mitigation Measures

3.2.1 Construction Mitigation Measures

The following mitigation measures have been developed in accordance with the SVP (1995) standards and guidelines and meet the paleontological requirements of CEQA. Mitigation measures are also documented in the Mitigation Monitoring and Reporting Program (MMRP), which is part of the Final EIS/EIR.

- A qualified paleontologist would produce a Paleontological Monitoring and Mitigation Plan for the proposed project and supervise monitoring of construction excavations. Paleontological resource monitoring would include inspection of exposed rock units during active excavations within sensitive geologic sediments. The monitor would have authority to temporarily divert grading away from exposed fossils to professionally and efficiently recover the fossil specimens and collect associated data.

- All project-related ground disturbances that could potentially affect the Puente Formation, Fernando Formation, and Quaternary older alluvium and terrace deposits would be monitored by a qualified paleontological monitor on a full-time basis (where feasible) because these geologic sediments are determined to have a high paleontological sensitivity (Figure 4.12.3-3). Very shallow surficial excavations (less than 5 feet) within Quaternary younger alluvium would be monitored on a part-time basis to ensure that underlying sensitive units are not adversely affected (Figure 4.12.3-3). Construction monitoring during any tunneling activity is not warranted as any potential fossil specimens present within sensitive geologic units would be crushed and destroyed by the nature of tunneling methodology.

- At each fossil locality, field data forms would be used to record pertinent geologic data, stratigraphic sections would be measured, and appropriate sediment samples would be collected and submitted for analysis.

- Due to the likelihood of the presence of microfossils, matrix samples would be collected and tested within the Puente Formation and Fernando Formation. Testing for microfossils would consist of screen-washing samples (approximately 30 pounds) to determine if significant fossils are present. Productive tests would result in screen-washing of additional bulk matrix up to a maximum of 2,000 pounds per locality to ensure recovery of a scientifically significant sample.

- Recovered fossils would be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposited in a designated paleontological curation facility (such as the Natural History Museum of Los Angeles County).

- The paleontologist would prepare a final monitoring and mitigation report to be filed, at a minimum with Metro and the repository.

3.2.2 Operational Mitigation Measures

No mitigation is required because operational impacts to paleontological resources are not expected for any of the project alternatives.

California State Office of Historic Preservation Coordination

The Cultural Resources – Archaeology Technical Memorandum for the Regional Connector Transit Corridor project contained in this appendix was submitted to the California State Office of Historic Preservation. The State Historic Preservation Officer (SHPO) reviewed the technical memorandum including the determinations of eligibility for all potentially eligible properties within the Area of Potential Effect (APE). On June 1, 2010, the SHPO concurred with the determinations of eligibility and with the findings of effect from project alternatives. That concurrence letter is included in the following pages.

OFFICE OF HISTORIC PRESERVATION

Re: Determinations of Eligibility and Finding of Effect for the Regional Connector Transit Corridor Project, Los Angeles, Los Angeles County, CA

Dear Ms. Saltarelli:

Thank you for your letter of 19 April 2010 continuing consultation on behalf of the Federal Transit Authority (FTA) for the above referenced undertaking in order to comply with Section 106 of the National Historic Preservation Act of 1966 and its implementing regulation at 36 CFR Part 800. You are requesting that I review the determinations of eligibility and assessment of effects for the Regional Connector Transit Corridor Project.

After reviewing the enclosed cultural resources report, I am able to concur with FTA's determinations of eligibility. 289 properties were identified in the APE for the project. Of those 289, 118 were of sufficient age to be considered for inclusion in the National Register of Historic Places (NRHP). Fifteen properties were previously listed in the NRHP and 33 were determined eligible by FTA. FTA has determined the following properties are eligible for inclusion in the NRHP:

1. Barker Brothers, 818 West 7th Street
2. Fine Arts Building, Global Marine House, 811 West 7th Street
3. 811 Wilshire Building, Tishman 615 Building, Wilflower Building, 811 Wilshire Boulevard
4. The California Club, 528 South Flower Street
5. 2nd Street Tunnel, Bridge# 53C 1318
6. Los Angeles Civic Center Historic District
7. Los Angeles Department of Water and Power Building, John Ferraro Office Building, 111 North Hope Street
8. Ahmanson Theater, 135 North Grand Avenue
9. Mark Taper Forum, 135 North Grand Avenue
10. Dorothy Chandler Pavilion, 135 North Grand Avenue
11. Los Angeles County Hall of Administration, Kenneth Hahn Hall of Administration, 500 West Temple Street, 222 North Grand Avenue
12. El Paseo de los Pobladores de Los Angeles, 224 North Grand Avenue
13. Los Angeles County Courthouse, Stanley Mosk Los Angeles County Courthouse, 111 North Hill Street
14. County of Los Angeles Central Heating and Refrigeration Plant, 301 North Broadway
15. Los Angeles County Hall of Records, 320 West Temple Street
16. Court of Historic American Flags, 224 North Hill Street, 100 block Hill Street
17. Los Angeles County Law Library, Mildred L. Lillie Building, 301 West 1st Street
18. Hall of Justice, Los Angeles County Jail, 211 West Temple Street

19. Clara Shortridge Foltz Criminal Justice Center, 210 West Temple Street
20. Los Angeles City Hall, 200 North Spring Street
21. City Health Building, City Hall South, 111 East 1st Street
22. Federal Building, North Los Angeles Field Office, 300 North Los Angeles Street
23. The Police Facilities Building, Parker Center, Motor Transportation Division, 150 North Los Angeles Street and 151 North Judge John Aiso Street
24. Mark Kuwata Real Estate, 301 East 1st Street, 104-106 North San Pedro Street, 104-106 Judge John Aiso Street
25. Koyasan Buddhist Temple, Koyasan Church, Koyasan Temple, 342 East 1st Street
26. John A. Roebling's Sons Co., Robert Arranaga & Company, Incorporated, 216 South Alameda Street,
27. Los Angeles Times Building, 202 West 1st Street
28. The Mirror Building (Site of Butterfield Stage Station), Los Angeles Times-Mirror Annex, Times Building South, Mirror-News Building, 145 South Spring Street
29. Cathedral of Saint Vibiana, 214 South Main Street
30. Cathedral of Saint Vibiana, Rectory, 114 East 2nd Street
31. J.R. Newberry Company Building, 900 East 1st Street
32. 1st Street Viaduct, 1st Street between Vignes Street and Mission Road
33. Walt Disney Concert Hall, 111 South Grand Avenue

I concur with the NRHP determinations but will not comment on those properties identified solely for CRHR determination. The remaining resources in the APE are not eligible for inclusion in the NRHP.

Only one historic property, the 2nd Street Tunnel will be adversely affected by the project. I concur with the FTA's determination of adverse effect. Once FTA has submitted a draft MOA for the consultation I can comment on the mitigation measures for the undertaking.

Thank your for considering historic properties in your planning process. If you have any questions, please contact Amanda Blosser of my staff at (916) 654-7372 or e-mail at ablosser@parks.ca.gov.

Sincerely,

Susan K Stratton for

Milford Wayne Donaldson, FAIA
State Historic Preservation Officer

1.0 SUMMARY

1.1 Purpose and Scope

SWCA Environmental Consultants (SWCA) conducted a cultural resources inventory of the project area that may be affected by the proposed Regional Connector Transit Corridor project. The project is 1.9 miles in length and located in the City of Los Angeles, Los Angeles County, California.

The purpose of the Regional Connector project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line, and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles.

1.2 Dates of Investigation

SWCA conducted an initial cultural resources records search for the project on February 10, 2009; additional data were requested and assessed between February 2009 and January 2010. The Native American Heritage Commission (NAHC) performed a Sacred Lands File search on February 11, 2009. SWCA conducted an intensive pedestrian survey of the direct Area of Potential Effects (direct APEs) on March 16 and April 7, 2009, and on January 7, 2010. This report was completed on January 11, 2010.

1.3 Investigation Constraints

Most of the direct APE is covered in buildings, pavement, or landscaping due to the urban nature of the project area. Consequently, ground-surface visibility ranges from extremely poor (0 to 5 percent) to good (70 percent) throughout the project area. Average visibility was extremely poor (less than 5 percent). Three parts of the direct APE were fenced to protect to active construction projects and not accessible to SWCA archeologists.

1.4 Summary of Findings

The records and literature search indicated that 24 previously recorded cultural resources are located within a 0.25-mile radius of the APE, including 21 historic archaeological sites, one prehistoric archaeological site, one multi-component site, and one historic isolate. Of the 24 previously recorded archaeological resources, five (CA-LAN-887H, CA-LAN-3588, P-19-003097, P-19-003338, and P-19-003339) are located within the project direct APE and four are adjacent (within one city block) to the direct APE.

The records and literature search also identified 143 previously conducted cultural resource studies within a 0.25-mile radius of the APE. Of these, 23 are located within the project direct APE, and 12 are adjacent to the direct APE.

Historic maps indicate that the direct APE was completely developed prior to 1888, and that several streets within the project area have been realigned over the past 120 years. The Los Angeles zanja system (the city' original water system, which operated from 1781 through the early 1900s) also crosses the direct APE in numerous locations.

The NAHC Sacred Lands File search indicated the presence of cultural resources important to Native Americans in the project area. The NAHC response included a list of five Native American contacts that may have knowledge of cultural resources in the project area. SWCA sent location maps, a description of the proposed project, and its APE to these five groups via U.S. mail; each letter was followed up with a telephone call.

Responses were received from two of the five Native American contacts. These responses are documented in Table 3-1. SWCA recommends that Metro consult with the Gabrielino/Tongva San Gabriel Band of Mission Indians and the Tongva Ancestral Territorial Tribal Nation.

In the course of the pedestrian survey, a single archaeological site (RC-1) within the direct APE was encountered. This resource consists of a historic brick alignment, likely representing part of a late nineteenth/early twentieth century structure foundation. Available evidence suggests that RC-1 lacks sufficient integrity; it is recommended not eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (California Register).

None of the five previously recorded archaeological sites within the direct APE were observed during the pedestrian survey. Site P-19-003097, a historic site consisting of nineteenth and twentieth century features and artifacts, was considered to be significant by its excavators.

Data recovery in 2002 indicated that impacts to this resource would be mitigated to less than significant levels and the site was subsequently destroyed. Site CA-LAN-3588, a historic site consisting of features and artifacts dating to ca. 1880–1935, is presumed eligible for listing on both the NRHP and California Register due to its association with earliest Japanese occupation of Little Tokyo.

Sites P-19-003338 and P-19-003339 are American period artifact deposits that have not been formally evaluated. For purposes of this analysis they are presumed eligible for both registers.

The Los Angeles zanja system (recorded as CA-LAN-887H, P-19-003103, and P-19-003352) crosses the direct APE in numerous places. A segment of the zanja system (P-19-003103) north of the APE was nominated for listing in the National Register under Criterion A at the local level of significance for its direct role in the development of Los Angeles between 1781

and ca. 1900. The system as a whole is presumed eligible for listing in the National Register and California Register for the same reason.

Resources are "presumed eligible" when, in the professional opinion of a qualified archeologist, there are reasons to believe that it may be eligible for listing in the National Register or California Register, but there are factors that inhibit excavation or direct examination of the resource. Therefore, resources presumed eligible may or may not ultimately be determined eligible.

1.5 Potential Impacts

The background research and archaeological survey results indicate that subsurface archaeological deposits are commonly encountered during construction projects in downtown Los Angeles. Consequently, most of the direct APE is considered highly sensitive for the presence of historical resources, including both prehistoric and historic archaeological sites.

Although the No Build Alternative would not affect archaeological resources, the remaining alternatives have the potential to alter, remove, or destroy both known and previously undiscovered archaeological resources within the APE. These potential impacts include direct construction impacts and cumulative impacts.

1.6 Recommendations

This evaluation identified four extant properties within the direct APE that are presumed to be eligible for listing in the National Register and California Register: the Los Angeles zanja system (CA-LAN-887H) and sites CA-LAN-3588, P-19-003338, and P-19-003339. The build alternatives have the potential to adversely affect these resources. Implementing two mitigation measures—Treatment of Previously Unrecorded Archaeological Resources (MM-A-1) and Treatment of Known Archaeological Resources (MM-A-2)—would reduce both direct and cumulative impacts to these resources. After mitigation, potential construction and cumulative impacts would not be significant under both the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA).

1.7 Disposition of Data

This report will be filed with the Federal Transit Administration (FTA), Metro, CDM, the South Central Coastal Information Center (SCCIC) located at California State University in Fullerton, and SWCA. All field notes and records related to the project will remain on file at the South Pasadena office of SWCA.

2.0 INTRODUCTION

This technical memorandum identifies and evaluates archaeological resources and potential effects of construction and implementation of the proposed Regional Connector Transit Corridor project. Historic built environment and paleontological resources are addressed in separate reports.

2.1 Regulatory Setting

National Environmental Policy Act (NEPA) guidelines include compliance with related federal laws that require identification of historic properties, and consideration of project-related effects on those properties. This report was prepared to comply with Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and with regulations contained in 36 Code of Federal Regulations (CFR) Part 800. These regulations require federal agencies to consider the effects of proposed projects on historic properties as part of the environmental assessment process.

Section 106 of NHPA requires federal agencies take into account effects of undertakings on historic properties and allow the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on those undertakings, following these regulations (36 CFR Part 800).

This technical memorandum was also prepared to comply with requirements of CEQA and the CEQA Guidelines (CERES 2009) as they apply to cultural resources. Under CEQA, it is necessary for a lead agency to evaluate proposed projects for the potential to cause significant impacts on "historical resources." A proposed project that may affect historical resources is submitted to the State Historic Preservation Officer (SHPO) for review and comment prior to project approval by the lead agency and before any project-related clearance, demolition, or construction activities are commenced.

If a proposed project could be expected to cause substantial adverse change to a historical resource, environmental clearance for the project would require evaluating alternatives and/or implementing mitigation measures to reduce or avoid impacts. If a project is expected to result in an impact on historical resources, CEQA Guidelines require analysis of a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most the basic objectives of the project and avoid or substantially lessen any significant impacts on the historical resource.

Properties that may be historic resources within the identified project APE were evaluated for National Register of Historic Places (National Register)-eligibility according to criteria set forth in 36 CFR Part 60.4. The age criterion for inclusion in the National Register is 50 years and older, except in cases of overriding significance (criteria consideration G).

Properties were also considered for California Register of Historical Resources (California Register) eligibility; although there is no established age threshold for the California Register, the same 50-year cutoff was used for this project. Under Public Resources Code (PRC) Section 5024.1, the California Register was established to serve as an authoritative guide to the state's significant historical and archaeological resources.

If a proposed project and its related impacts would adversely affect the values of an archaeological or built environment site that is either listed in or determined eligible for inclusion in the National or California Register, such effects and/or impacts would be considered adverse.

2.2 Report Format

The report format used in this report follows *Archaeological Resource Management Reports: Recommended Contents and Format* (Office of Historic Preservation 1990). Archaeologist John Dietler, Ph.D., RPA was the principal investigator for this technical memorandum.

2.3 Project Description

The proposed project would extend 1.9 miles through downtown Los Angeles and provide enhanced Metro service throughout four distinct travel corridors that span over 50 miles across Los Angeles County (Figure 2-1). The proposed 1.9 miles of new dual-tracks in downtown Los Angeles would provide a direct link between the Metro Gold, Blue, and Expo Lines by bridging the gap in the regional light rail network between 7th Street/Metro Center Station at 7th and Flower Streets and the Little Tokyo/Arts District station at 1st and Alameda Streets. This would allow trains to travel directly from East Los Angeles to Culver City and from Long Beach to Pasadena. The project also includes construction of new stations in downtown that would allow all passengers on the Metro Gold, Blue, and Expo Lines to reach multiple destinations in the central business district without transferring.

The following alternatives are evaluated in this technical memorandum:

- No Build Alternative
- Transportation System Management (TSM) Alternative
- At-Grade Emphasis Light Rail Transit (LRT) Alternative
- Underground Emphasis LRT Alternative
- Fully Underground LRT Alternative- Little Tokyo Variation 1
- Fully Underground LRT Alternative- Little Tokyo Variation 2

2.3.1 No Build Alternative

Transit service under the No Build Alternative is focused on preservation of existing services and projects. The No Build Alternative does not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP).

By the projection year of 2035, the Metro Expo Line and the Metro Gold Line to East Los Angeles will have opened, and a number of bus routes will have been reorganized and expanded to provide connections with these new rail lines. All bus and rail lines would operate using a fleet of vehicles similar to those currently in service or identified for purchase in the LRTP. The transit network within the project area will otherwise be largely the same as it is now.

2.3.2 Transportation System Management (TSM) Alternative

The Transportation System Management (TSM) Alternative includes all of the provisions of the No Build Alternative, plus two new express shuttle bus lines linking the 7th Street/Metro Center and Union Stations. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. Rail service would remain the same as described for the No Build Alternative.

The two routes are described below and illustrated on Figure 2-2, TSM Alternative.

- Upper Grand Route – From the 7th Street/Metro Center Station, buses would proceed east on 7th Street, north on Olive Street, west on 5th Street, north on Grand Avenue, east on Temple Street, and then north on Los Angeles Street to Union Station. As a variation, buses could use Alameda Street between Temple Street and Union Station to allow a stop at Temple and Alameda Streets, near the Little Tokyo/Arts District Station. The alignment is assumed to follow the same route as part of the existing Los Angeles Department of Transportation (LADOT) DASH Route B service, proceeding from the 7th Street/Metro Center Station to Union Station using Grand Avenue, Temple Street, and Los Angeles Street. Shuttle buses would run less than eight minutes apart and provide coverage of the Bunker Hill and Civic Center areas.

- Lower Grand Route – This route would use the existing northbound bus-only lanes on Figueroa Street and mixed flow lanes on 2nd and 3rd Streets, which are lightly used by other bus lines. From the 7th Street/Metro Center Station, buses would proceed north on Figueroa Street, west on 2nd Street, and north on Alameda Street to Union Station. To return to 7th Street/Metro Center Station, buses would travel south on Alameda Street, west on 3rd Street, and south on Flower Street. The alignment passes by both

the Little Tokyo/Arts District Station and Union Station, and would provide good coverage of Little Tokyo and the southern edge of the Civic Center.

2.3.2.1 Operating Characteristics

The shuttle routes would be operated by Metro, and could use vehicles ranging from 30-foot shuttle buses to 60-foot articulated buses. Buses would run every few minutes during peak periods, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes. Similar to the Metro Rapid Bus lines, a Transit Priority System (TPS) that allows longer green lights to oncoming transit vehicles would be used where possible to increase bus speed and efficiency.

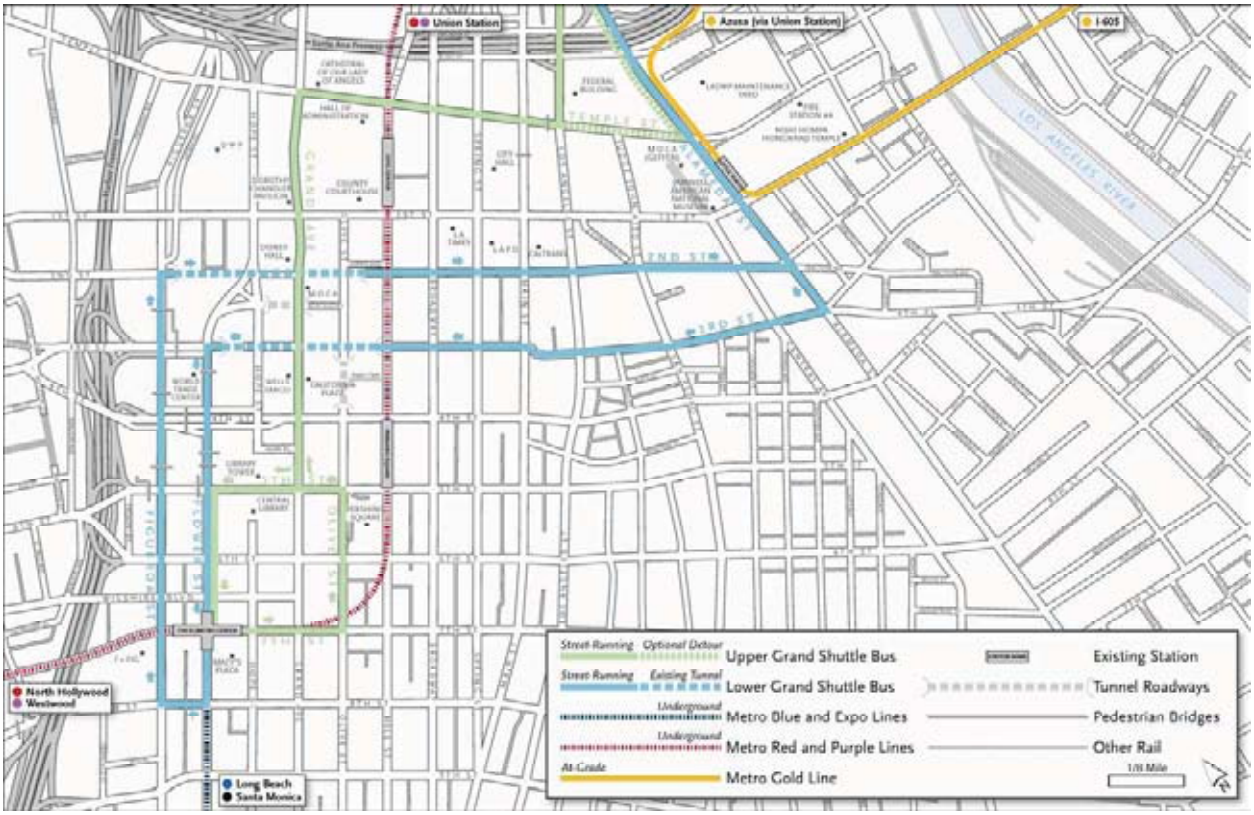

Figure 2-2. Transportation System Management (TSM) Alternative

2.3.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

2.3.3.1 Overview

The At-Grade Emphasis LRT Alternative would provide a direct connection from the existing underground 7th Street/Metro Center Station to the Metro Gold Line at Temple and Alameda Streets. Three new stations would be added, one would be a split station with single-direction platforms one block apart. This alignment includes a combination of underground and at-

grade segments, with 46 percent of the route underground. New stations would serve the Civic Center, Grand Avenue, and the Financial District. Conversion of 2nd Street to a pedestrian-friendly transit mall is assumed.

To implement this alternative, the number of traffic lanes and on-street parking spaces on 2nd Street would be reduced. As a result, traffic is likely to divert to adjacent parallel streets such as 1st and 3rd Streets, but the roadway capacity along these streets would remain unchanged, as with the No Build Alternative. Traffic congestion along these streets would likely increase. Figure 2-3 illustrates the At-Grade Emphasis LRT Alternative.

2.3.3.2 Route Configuration

From the existing platform at the 7th Street/Metro Center Station, the tracks would extend north underneath Flower Street to a new underground station just south of 5th Street. The tracks would then continue north, surface just south of 3rd Street, cross 3rd Street at grade, and veer northeast through a portal in the hillside to an underground station at 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The tracks would continue northeast, "punch" through the wall of the existing 2nd Street tunnel, and then travel east in the 2nd Street tunnel toward Hill Street.

This alignment would reduce the 2nd Street tunnel from four lanes to one (potentially two lanes, pending further detailed engineering). Trains would proceed east on 2nd Street to Main Street. 2nd Street would be transit-dedicated, with its current two travel lanes and two parking lanes reduced to a single travel lane primarily for access to parking lots and loading zones. This type of configuration would extend from Hill Street to Los Angeles Street.

At Main Street, the alignment would split into two single-track alignments. One track (for northbound trains) would continue east to Los Angeles Street and then north to Temple Street. The other track (for southbound trains) would travel north on Main Street and then west on Temple Street. Both tracks would have an at-grade station just north of 1st Street.

At Temple and Los Angeles Streets, the two tracks would rejoin and proceed west on Temple Street to Alameda Street, where the tracks would join the Metro Gold Line to East Los Angeles in a three-way (wye) junction. Before reaching Alameda Street, the tracks would shift to the south side of Temple Street to provide an adequate turning radius for trains turning north onto the Metro Gold Line's existing ramp leading to the bridge over the US 101 freeway to Union Station. The ramp would need to be reconfigured to a steeper slope to facilitate turning movements in the three-way junction area. The intersection of Temple and Alameda Streets would also have a vehicular underpass for through-traffic on Alameda Street and a pedestrian bridge to reduce potential conflicts between pedestrians, trains, and automobiles. The pedestrian bridge could potentially have endpoints located on each of the intersection's four corners.

At-grade crossovers could be located on 2nd Street between Hill Street and Broadway, and on 2nd Street between Broadway and Spring Street. Crossovers are mechanical track installations along the double-track alignment that allow trains traveling in either direction on either track to move to the other track and continue traveling in the same direction without stopping. Trains may also pass through the crossover without switching tracks. A wider right-of-way may be required in the vicinity of at-grade crossovers, thus potentially increasing the amount of roadway space needed for LRT facilities.

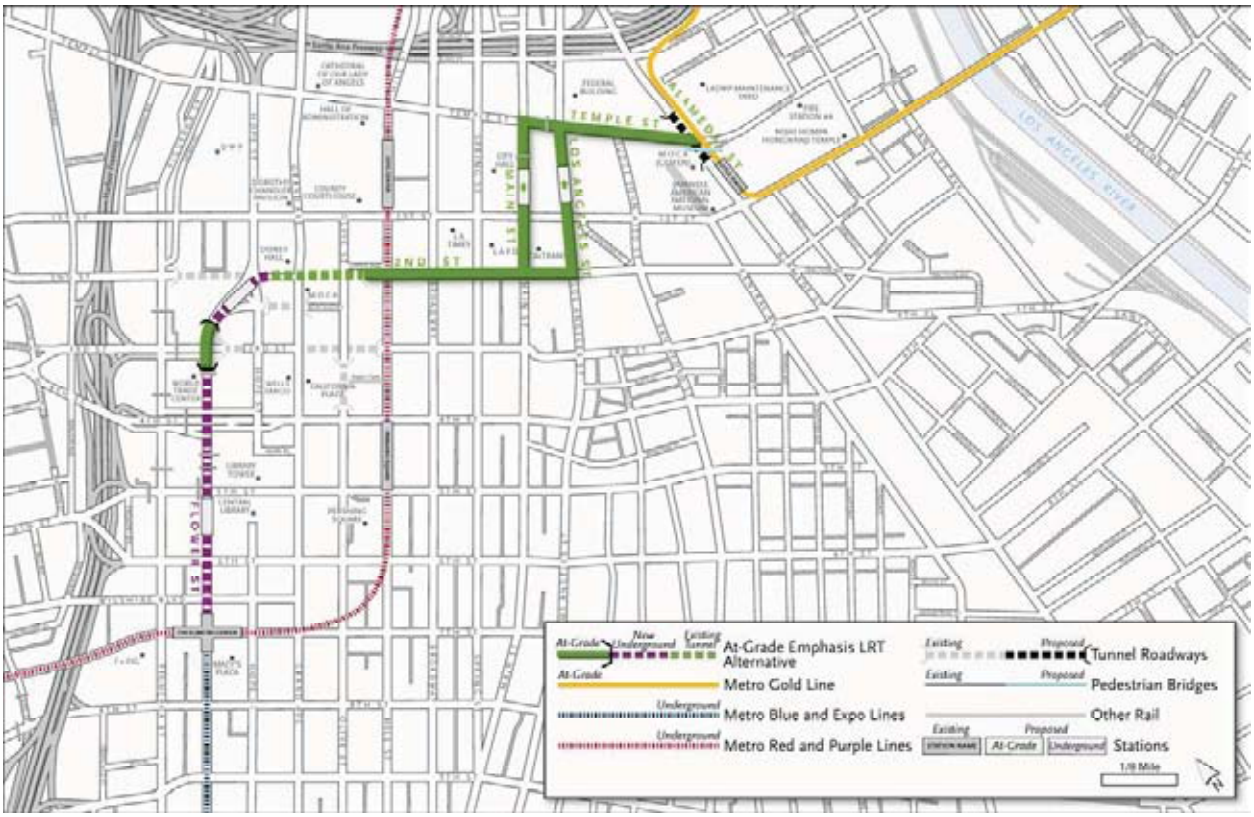

Figure 2-3. At-Grade Emphasis Light Rail Transit (LRT) Alternative

In summary, the At-Grade Emphasis LRT Alternative would connect the Metro Blue and Expo Line tracks at the 7th Street/Metro Center Station to the Metro Gold Line tracks at a new junction north of the Little Tokyo/Arts District Station. This would be accomplished using new light rail right-of-way and new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated into two routes.

This report analyzes maximum potential effects for each station. Therefore, the actual effects may be smaller in magnitude than the impacts discussed in this analysis. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.3.3 Operating Characteristics

Two consolidated routes:

- East-West Route – Trains on the Metro Expo Line tracks from Santa Monica would use existing tracks to the 7th Street/Metro Center Station, continuing along the new Regional Connector tracks to the new three-way junction at Temple and Alameda Streets. The alignment would then continue east along the Metro Gold Line tracks to East Los Angeles.

- North-South Route – Trains on the Metro Blue Line tracks would travel from the 7th Street/Metro Center Station north along the new Regional Connector tracks to the new three-way junction at Temple and Alameda Streets. The alignment would then continue north along the existing Metro Gold Line tracks to Pasadena and the future Metro Gold Line extension to Azusa.

Vehicle and Pedestrian Circulation

For the at-grade segments of the At-Grade Emphasis LRT Alternative, the two LRT tracks would typically occupy a 26-foot-wide surface right-of-way bordered by mountable curbs. It is expected that this width would increase to 39 feet at center platform station locations.

Vehicular and pedestrian crossings would be limited to traffic signal–controlled intersections, with the signal phasing modified to provide adequate green time for the LRT vehicles to safely cross. For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted.

Access to existing parking structures, parking lots, loading docks, and commercial frontage would be affected by the at-grade LRT facilities. Left-turn parking access and egress is presently allowed at many downtown sites. However, the at-grade LRT facilities would prohibit uncontrolled mid-block left turns, thus modifying existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT Alternative alignment would travel at-grade along 2nd Street. It is assumed that this street would be dedicated as a transit-only roadway between the tunnel and Los Angeles Street. This segment of 2nd Street may be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties. As a result of this proposed change in street circulation, through traffic using 2nd Street would be diverted to parallel roadways such as 1st and 3rd Streets east of Los Angeles Street; 2nd Street would maintain its current physical features and operating characteristics.

The one-way transit couplet near City Hall along Main and Los Angeles Streets between 2nd and Temple Streets would consist of a single LRT track along each roadway. Both Main and Los Angeles Streets are wide enough to accommodate a single track and maintain acceptable

vehicular operations. The curb-to-curb width of Temple Street, between Main and Alameda Streets, is 62 to 71 feet, leaving one lane of traffic in each direction with potentially mountable curbs for use by emergency vehicles. Traffic operations along this segment of Temple Street would be affected by the lane reduction.

To minimize conflicts between rail, vehicular, and pedestrian traffic and minimize delays at the intersection of Temple and Alameda Streets, a vehicular underpass and a proposed pedestrian overpass are proposed along Alameda Street to route the through traffic beneath the rail tracks and Temple Street traffic. Temple Street and the rail tracks would remain at-grade and the existing at-grade segment of Alameda Street lowered to pass under Temple Street.

Through traffic traveling north and south on Alameda Street would operate unimpeded without being stopped or delayed at the intersection. Through traffic traveling east and west on Temple Street would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation. In addition, a one-lane southbound at-grade frontage road would be provided along Alameda Street to maintain access to the businesses and properties on the west side of the street.

2.3.4 Underground Emphasis LRT Alternative

2.3.4.1 Overview

The Underground Emphasis LRT Alternative would provide a direct connection from 7th Street/Metro Center Station to the Gold Line tracks at the Little Tokyo/Arts District Station, including three new station locations. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to a new portal on the parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue.

It is expected that a portion of this property would need to be acquired to construct the portal and stage construction of the tunnels beneath 2nd Street. The tracks would then connect to the Gold Line tracks.

The Underground Emphasis LRT Alternative would be located entirely underground except for a single at-grade crossing at the intersection of 1st and Alameda Streets in the same type of three-way junction proposed for the At-Grade Emphasis LRT Alternative. Figure 2-4 illustrates this alternative.

2.3.4.2 Route Configuration

The Underground Emphasis LRT Alternative alignment would extend north from the existing platform at the 7th Street/Metro Center Station. Tracks would run underneath Flower Street to

the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue.

The tracks would then head east underneath 2nd Street to the next proposed station. There are two options for a station on 2nd Street. The Broadway Station option would place an underground station on 2nd Street between Broadway and Spring Street, and the Los Angeles Street Station option would include an underground station between Main and Los Angeles Streets.

The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast and surface in the lot bounded by 1st, Alameda, and 2nd Streets, and Central Avenue. The tracks would then enter an at-grade three-way junction in the intersection of 1st and Alameda Streets.

A new underpass would carry car and truck traffic along Alameda Street beneath 1st Street and the rail junction, and a proposed overhead pedestrian bridge structure would reduce most potential conflicts between pedestrians and trains. The pedestrian overpass could potentially have endpoints at each of the four corners of the intersection.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station on 2nd Street (whether it is between Broadway and Spring Street or between Main and Los Angeles Streets). Crossovers may not be needed at all of these locations and may ultimately be placed in locations that are not adjacent to stations. Underground crossover locations require cut-and-cover construction; tunnel-boring machines cannot be used to construct underground crossovers.

In summary, the Underground Emphasis LRT Alternative would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line from a new junction just south of the Little Tokyo/Arts District Station at 1st and Alameda Streets. This would be accomplished using new light-rail right-of-way and new stations, enabling the consolidation of the Metro Gold, Blue, and Expo Line services into two routes.

This study analyzes maximum potential impacts for each station. Ultimate impacts may therefore be less in magnitude than the impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

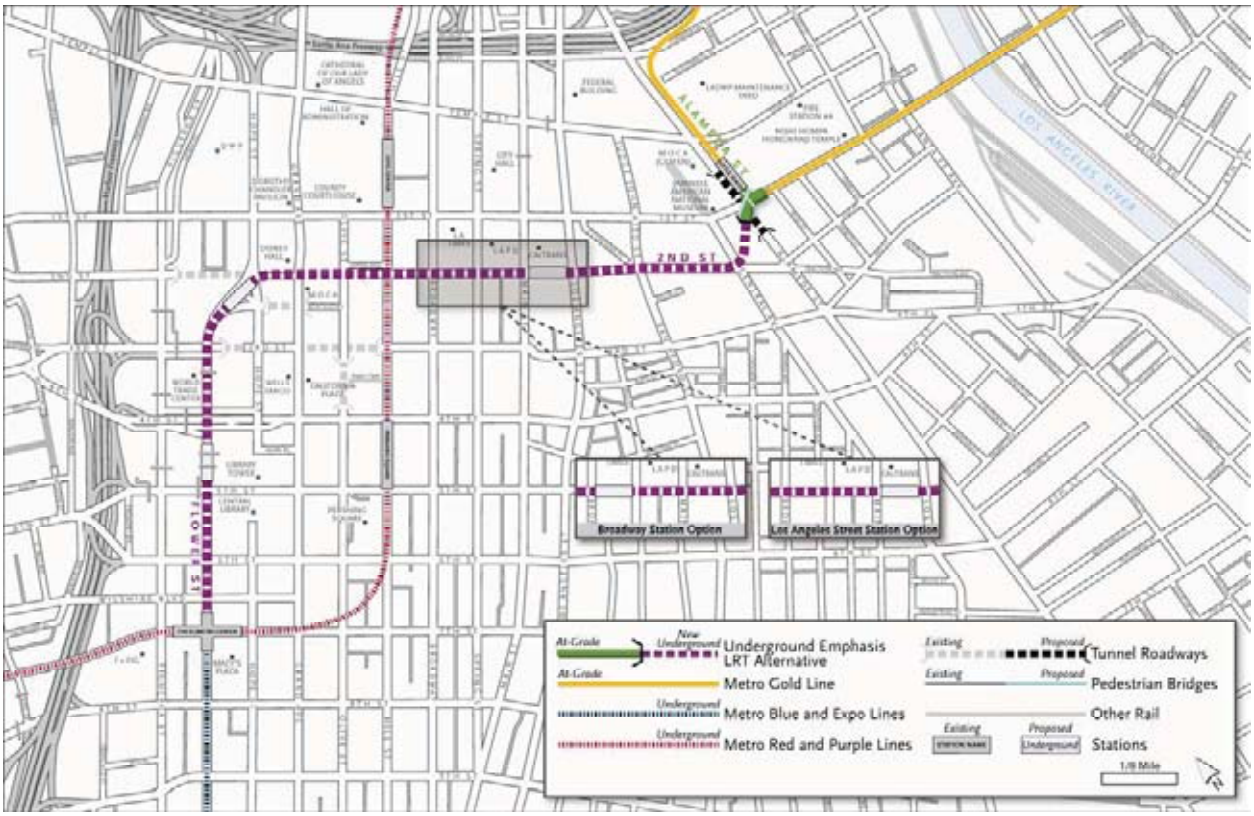

Figure 2-4. Underground Emphasis LRT Alternative

2.3.4.3 Operating Characteristics

Two consolidated routes:

- East-West Route – Trains on the Metro Expo Line tracks from Santa Monica would run on tracks to the 7th Street/Metro Center Station, then continuing north along the new Regional Connector tracks to the new three-way junction at the intersection of 1st and Alameda Streets. Trains would then turn east on 1st Street, bypassing the Little Tokyo/Arts District Station, and continue along the Metro Gold Line tracks to East Los Angeles.

- North-South Route – From the 7th Street/Metro Center Station, trains from Long Beach would continue north along the new Regional Connector tracks to the new three-way junction at 1st and Alameda Streets. The trains would then turn north on 1st Street and stop at the existing Little Tokyo/Arts District Station before continuing along the Metro Gold Line route to Pasadena and Azusa.

Vehicle and Pedestrian Circulation

The Underground Emphasis LRT Alternative alignment would not affect surface traffic or pedestrian circulation except at the intersection of 1st and Alameda Streets, where the LRT

alignment would operate in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns.

The future roadway levels of service for this alternative would be the same as the No Build Alternative except at the intersection of 1st and Alameda Streets, where a vehicular underpass and pedestrian overpass are proposed to separate the heavy traffic volumes along Alameda Street from rail traffic to minimize delays. The proposed underpass would result in uninterrupted flow along Alameda Street in the north and south directions between 2nd and Temple Streets. Through traffic traveling east and west on 1st Street would continue to operate at-grade with a signal to control the movements between the vehicular and rail modes of transportation.

To maintain access to adjacent businesses and properties, at-grade frontage roads would be provided along both sides of Alameda Street south of the intersection and on the southbound side of the street north of the intersection. A full northbound frontage road crossing 1st Street is not feasible because of the location of the tracks and the Little Tokyo/Arts District Station on the east side of Alameda Street.

2.3.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

2.3.5.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue.

At 2nd and Central, the tracks would continue underground heading northeast under 1st and Alameda Streets. A three-way junction would be constructed underground beneath the 1st and Alameda intersection. To the north and east of the junction, trains would rise to the surface through two new portals to connect to the Metro Gold Line heading north to Azusa and east to the San Gabriel Valley. One portal would be located northeast of the Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the City of Los Angeles Department of Water and Power (LADWP) Maintenance Yard and connect to the existing LRT bridge over the US-101 freeway, allowing a connection to the Metro Gold Line to Azusa. The portal would be connected to the 1st and Alameda junction by a new tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (the parcel on the northeast corner of 1st and Alameda Streets), running immediately east of the Little Tokyo/Arts District Station and tracks.

The second portal would be located within 1st Street between Alameda and Vignes Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. 1st Street would be widened to the north to accommodate the portal. Street widening would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street to join the existing 1st Street LRT tracks about one and half blocks west of the 1st Street Bridge.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT Bridge, and complete the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 1 would be located entirely underground from east of the intersection of 1st and Alameda Streets to the 7th Street/Metro Center Station. Figure 2-5 illustrates this alternative.

2.3.5.2 Route Configuration

The Fully Underground LRT Alternative- Little Tokyo Variation 1 alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The bridge could begin at street level near the station entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

The tracks would then head east underneath 2nd Street to the next proposed station at Broadway. The 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street. The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new underground station, which would potentially be located within the property currently occupied by Office Depot and other small commercial uses.

The tracks would continue from the station under the 1st and Alameda intersection into a new underground three-way junction. Separating from the junction, one set of tracks would continue underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station. These tracks would travel under Temple Street before surfacing in the LADWP yard and rising to connect to the existing Metro Gold Line LRT bridge over the US-101 Freeway. This would allow trains to continue along the Metro Gold Line to Pasadena, which will be extended to Azusa per Metro's Long Range Transportation Plan. Traffic lanes on Alameda Street would be reconfigured temporarily during construction.

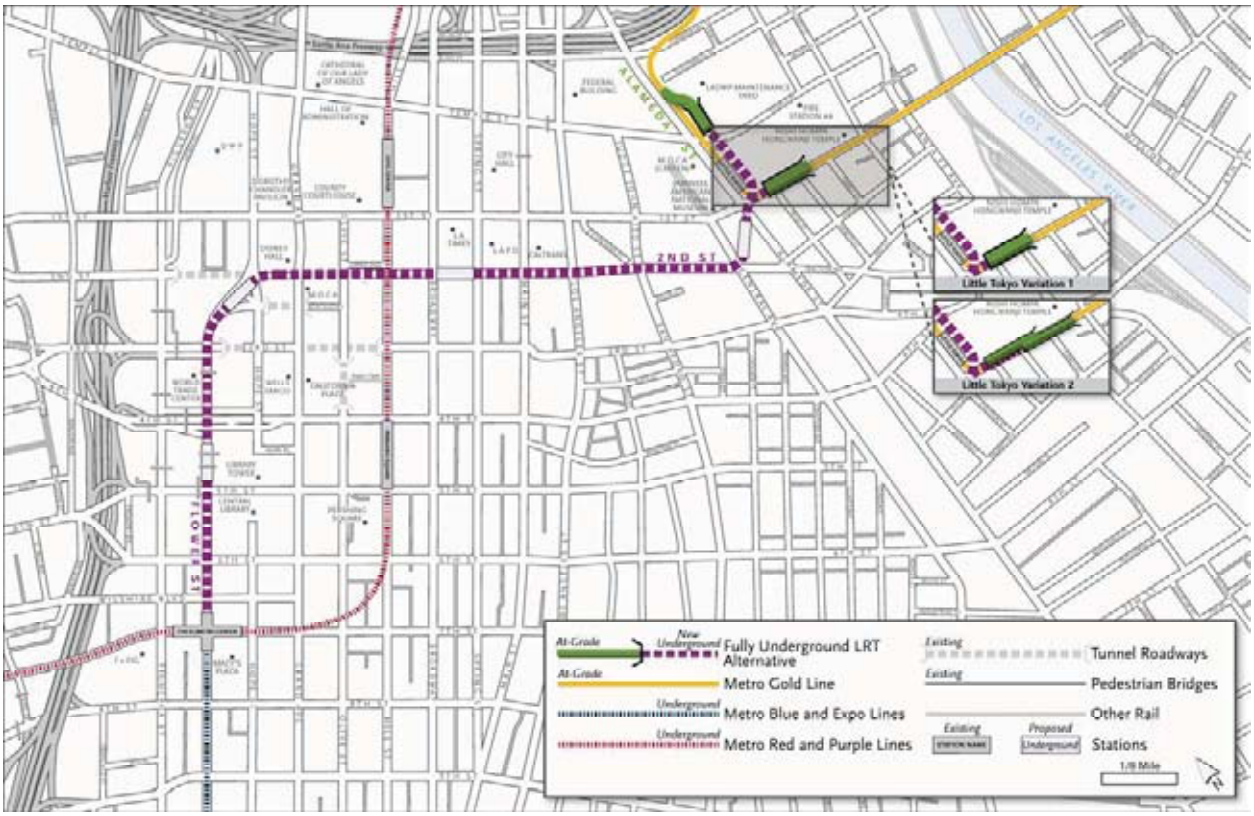

Figure 2-5. Fully Underground Emphasis LRT Alternative - Little Tokyo Variation 1 and Little Tokyo Variation 2

The other set of tracks leaving the three-way junction would rise to the east within 1st Street to accommodate a new portal as well as existing Metro Gold line tracks. 1st Street would be widened to the north to accommodate the portal. Street widening would be initiated at Alameda and continue east, tapering down significantly as the alignment crosses Hewitt Street to join the existing 1st Street LRT tracks, about one and half blocks west of the 1st Street Bridge. This would allow trains to continue along the Metro Gold Line to East Los Angeles, which will be eventually extended to about I-605 per Metro's Long Range Transportation Plan.

The signalized intersection of 1st and Hewitt Streets would be removed. North-south traffic along Hewitt Street would no longer be able to cross 1st Street. All left turns at 1st and Hewitt would be prohibited. Right turns to and from Hewitt Street would continue to be permitted. Automobile access to the proposed Nikkei Center parcel would continue to be available from Temple and 1st Streets. However, access at any driveways into the parcel along 1st Street would be restricted to right turns only.

The existing Metro Gold Line and the Little Tokyo/Arts District Station surface tracks and station would be maintained for continued service during construction, with only intermittent disruptions related to construction activities. Once construction is complete, operation of the

current Metro Gold Line between Pasadena and East Los Angeles would terminate. Metro would initiate operations on two routes: between Azusa and Long Beach, and between East Los Angeles and Santa Monica.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station at 2nd Street and Broadway. Crossovers may not be needed at both of these locations, and may ultimately be placed in locations that are not adjacent to stations.

Underground crossover locations require cut-and-cover construction; tunnel boring machines cannot be used to construct underground crossovers. More information on these construction methods is provided in the Description of Construction.

In summary, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line from a new junction under 1st and Alameda Streets. This would be accomplished using new light rail right-of-way and new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated.

This technical memorandum analyzes maximum potential impacts for each station. Ultimate impacts may therefore be smaller in magnitude than the impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.5.3 Operating Characteristics

Two consolidated routes:

The Regional Connector would consolidate the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes:

- East-West Route - Metro Expo Line trains from Santa Monica would run on the existing tracks north of the existing 7th Street/Metro Center Station, continuing north along new Regional Connector tracks to a new three-way junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to the new portal on 1st Street, and continue along the Metro Gold Line tracks to about I-605.

- North-South Route - After stopping at 7th Street/Metro Center Station, Metro Blue Line trains from Long Beach would continue north along the new Regional Connector tracks to the new three-way junction beneath 1st and Alameda Streets. Trains would then travel to the new portal on the LADWP site, and continue along the Pasadena Metro Gold Line to Azusa.

The east-west and north-south routes would each operate with 5-minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector corridor.

Vehicle and Pedestrian Circulation

The Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment would not affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street bridge, where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area.

Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns except where a newly installed traffic signal at 1st and Hewitt Streets would be removed. Through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possible.

Permanent roadway and lane reconfigurations around the proposed 2nd/Hope Street and Flower/5th/4th Street stations would also be needed. At the proposed 2nd/Hope Street station, a short connector roadway would be removed, but all existing traffic movements would still be possible via the remaining connector roadways. At the proposed Flower/5th/4th Street station, one traffic lane would need to be removed from Flower Street to accommodate station entrances along the sidewalk.

2.3.6 Fully Underground LRT Alternative- Little Tokyo Variation 2

2.3.6.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would be the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1 from the 7th Street/Metro Center Station to 2nd Street and Central Avenue.

A new two-level underground junction would be constructed beneath the 1st and Alameda Streets intersection. Trains traveling north toward Azusa and east toward I-605 would use the lower level of the junction, and trains travelling south toward Long Beach and west toward Santa Monica would use the upper level. To the north and east of the junction, trains would rise to the surface through new portals to connect to the Metro Gold Line heading north to Azusa and east towards I-605.

One portal containing the northbound and southbound tracks would be located northeast of the Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the

LADWP Maintenance Yard and connect to the existing LRT bridge over the US-101 freeway, allowing a connection to the Metro Gold Line.

This portal would be connected to the 1st and Alameda junction by a new cut-and-cover tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (the parcel on the northeast corner of 1st and Alameda Streets), running immediately east of the existing Little Tokyo/Arts District station and tracks. The new tunnel would feed southbound trains from the portal into the upper level of the junction, and carry northbound trains away from the lower level of the junction toward the portal.

Two portals, each containing one track, would rise to the east within the widened median of 1st Street to allow a connection to the Metro Gold Line towards I-605. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

1st Street would be widened to the north to accommodate the westbound portal. The widening would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street. There, the new tracks would feed into the existing 1st Street LRT tracks, about a block west of the 1st Street Bridge. 1st Street would also be widened to the south between Hewitt and Vignes Streets to accommodate the eastbound track portal. The widening would taper down as it approaches Vignes Street. No modification to the 1st Street Bridge would be necessary.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT Bridge, and complete the tunnels beneath 2nd Street and the Nikkei Center property.

The Fully Underground Alternative – Little Tokyo Variation 2 would be located entirely underground from the 7th Street/Metro Center Station to west of the intersection of 1st and Alameda Streets. Figure 2-5 illustrates this alternative.

2.3.6.2 Route Configuration

The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge could be constructed to connect the station to Upper Grand Avenue. The bridge could begin at street level near the station

entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

From 3rd and Flower Streets, the tracks would head east underneath 2nd Street to the next proposed station at Broadway. The 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street.

The tracks would then continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new underground station that would potentially be located within the property currently occupied by Office Depot and other small commercial uses.

As the tunnels turn northeast from 2nd Street, the northbound tunnel would descend and the southbound tunnel would rise so that the southbound tunnel would be stacked on top of the northbound tunnel. The new underground station near 2nd Street and Central Avenue would have two underground levels, each with a single-track platform. The northbound track with trains headed north and east would be on the lower level, and the southbound track with trains headed south and west would be on the upper level.

The tracks would continue from the station under the 1st and Alameda intersection into a new two-level underground junction. Separating from the junction, one track from the lower level (northbound) and one track from the upper level (southbound) would continue underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station.

These tracks would travel under Temple Street before surfacing in the LADWP yard and rising to connect to the existing Metro Gold Line LRT bridge over the US-101 Freeway. This would allow trains to continue along the Metro Gold Line to Pasadena, which will be extended to Azusa per Metro's Long Range Transportation Plan. Traffic lanes on Alameda Street would be reconfigured temporarily during construction.

A second track (westbound) leaving the upper level of the junction would rise to the east within 1st Street between Alameda and Hewitt Streets and link to the existing Metro Gold Line track. Another track (eastbound) leaving the lower level of the junction would rise to the east within 1st Street between Hewitt and Vignes Streets, adjacent to the westbound track, and link to the existing Metro Gold Line track.

1st Street would be widened to the north and south to accommodate the portal and temporary tracks to maintain Metro Gold Line service during construction. Widening would be initiated at Alameda and continue east, tapering down significantly as the alignment crosses Hewitt Street and again at Vignes Street, where tracks would join the existing 1st Street LRT tracks, just west of the 1st Street Bridge. This would allow trains to continue along the Metro Gold

Line to East Los Angeles, which will be eventually extended toward I-605 per Metro's Long Range Transportation Plan.

The signalized intersection of 1st and Hewitt Streets would be removed. North-south traffic along Hewitt Street would no longer be able to cross 1st Street. All left turns at 1st and Hewitt would be prohibited. Right turns to and from Hewitt Street would continue to be permitted.

Automobile access to the proposed Nikkei Center parcel would continue to be available from Temple and 1st Streets. However, access at any driveways into the parcel along 1st Street would be restricted to right turns only. The existing Metro Gold Line and Little Tokyo/Arts District Station and surface tracks would be maintained for continued service during construction, with intermittent disruptions related to construction activities.

One lane of 1st Street would need to be temporarily closed during construction between Alameda and Vignes Streets to maintain these surface tracks. The surface tracks would not remain in place beyond construction. Once construction is complete, operation of the current Metro Gold Line between Pasadena and East Los Angeles would terminate. Metro would initiate operations on two routes: between Azusa and Long Beach, and between East Los Angeles and Santa Monica.

Crossovers could be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station at 2nd Street and Broadway. Crossovers may not be needed at both of these locations and may ultimately be placed in locations that are not adjacent to stations. Underground crossover locations require cut-and-cover construction; tunnel boring machines cannot be used to construct underground crossovers. More information on these construction methods is provided in the Description of Construction.

In summary, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would link the Metro Blue and Expo Lines at the 7th Street/Metro Center Station to the Metro Gold Line. The link would be provided by a new two-level junction under 1st and Alameda Streets using new light rail right-of-way and new stations, enabling Metro Gold, Blue, and Expo Line services to be consolidated.

This technical memorandum analyzes maximum potential impacts for each station. Ultimate impacts may therefore be smaller in magnitude than the impacts disclosed. Tunnel construction would be constrained by basements of existing buildings. No encroachments upon existing basements would occur except potentially at underground stations.

2.3.6.3 Operating Characteristics

Two consolidated routes:

- The Regional Connector would consolidate the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes: East-West Route - Metro Expo Line trains from Santa Monica would run on the existing Flower Street tracks north of the junction at Washington and Flower Streets. After stopping at the existing 7th Street/Metro Center Station, they would continue north along the new Regional Connector tracks to the new two-level junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to the new portals on 1st Street, and continue along the Metro Gold Line tracks towards I-605.

- North-South Route - After stopping at 7th Street/Metro Center Station, Metro Blue Line trains from Long Beach would continue north along the new Regional Connector tracks to the new two-level junction beneath 1st and Alameda Streets. The trains would then travel to the new portal on the LADWP site, and continue along the Pasadena Metro Gold Line to Azusa.

The east-west and north-south routes would each operate with 5-minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector.

Vehicle and Pedestrian Circulation

The Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment would not permanently affect surface traffic or pedestrian circulation on 1st Street between Alameda Street and the 1st Street bridge, where the LRT alignment would rise within a portal to an at-grade configuration. Street widening and sidewalk modifications would be required in this area.

Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate under current traffic flow patterns except where a newly installed traffic signal at 1st and Hewitt Streets would be removed. Through traffic movements along Hewitt Street would no longer be permitted at 1st Street, and no left turns to or from Hewitt Street would be possible.

Permanent roadway and lane reconfigurations around the proposed 2nd/Hope Street and Flower/5th /4th Street stations would also be needed. At the proposed 2nd/Hope Street station, a short connector roadway would be removed, but all existing traffic movements would still be possible via the remaining connector roadways. At the proposed Flower/5th /4th Street station, one traffic lane would need to be removed from Flower Street to accommodate station entrances along the sidewalk.

3.0 METHODOLOGY FOR IMPACT EVALUATION

This section describes the processes for identifying cultural resources, determining the significance of those resources, evaluating potential effects from construction and operation of the project, assessing potential permanent changes to historic properties and/or their contextual settings, and determining thresholds of significance that are applied to potential impacts. Section 4.0 describes the historic properties identified in the project area and their significance. Section 5.0 evaluates potential direct, indirect, and cumulative impacts to these resources from construction and operation.

3.1 Regulatory Framework and Standards of Significance

3.1.1 Federal

A number of federal laws address the protection of historic and cultural resources. The analysis of potential effects to built environment resources are primarily guided by the National Environmental Policy Act of 1969; Section 106 of the National Historic Preservation Act of 1966, as amended; and Section 4(f) of the U.S. Department of Transportation Act (USDOT Act) of 1966.

3.1.1.1 National Environmental Policy Act (NEPA)

The intent of NEPA is to protect the natural and built environment, including historic properties, from adverse effects resulting from federal actions. Before a federal agency may proceed with a proposed action, an environmental evaluation must be made to determine whether the action may have a significant effect on the environment. Effects on historic properties are usually assessed in coordination with the process established under Section 106 of the NHPA. The Section 106 process typically must be completed before an EIS can be finalized.

Under NEPA, historic and cultural resources generally include properties that are listed in or determined eligible for listing in the National Register. While NEPA does not provide specific definitions or criteria for determining the significance of historic properties, CEQA guidelines direct agencies to comply with Section 106 of the NHPA to be in compliance with NEPA.

NEPA requires federal agencies to evaluate the significance of potential project-related effects including both direct and tangible (e.g., demolition or alteration) and indirect effects (less tangible effects such as noise or visual). NEPA provides guidance for determining significance as a measure of impact intensity (Section 1508.27).

Intensity refers to the severity of impact. Decision-makers must bear in mind that more than one agency may make decisions about partial aspects of a major action. The following should be considered in evaluating intensity:

- Impacts may be both beneficial and adverse. A significant effect may exist even if the federal agency believes that on balance the effect will be beneficial.
- Unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas.
- The degree to which the effects on the quality of the human environment are likely to be highly controversial.
- The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.
- The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration.
- Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to expect a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.
- The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places, or may cause loss or destruction of significant scientific, cultural, or historical resources.
- Whether the action threatens a violation of federal, state, or local laws or requirements imposed for the protection of the environment.

3.1.1.2 National Historic Preservation Act (NHPA)

This report was completed under the provisions of NHPA Section 106 (36 CFR 800) in its applications for determining "effects," or impacts, as described in Part 800.5(a)(1). Section 106 of the NHPA requires that federal agencies take into account effects on "historic properties" that may be caused by undertakings, and that the Advisory Council on Historic Preservation be afforded an opportunity to comment on those undertakings (16 USC 470a, 36 Code of Federal Regulations, CFR Part 800). Section 106 requires that historic properties be identified, that effects be analyzed, and if adverse effects would be expected, that appropriate mitigation be identified and implemented under a Memorandum of Agreement (MOA).

Cultural resources (or "historic properties" under NHPA) include any district, site, building, structure, or object that is included in or eligible for listing in the National Register (36 CFR Part 800.1).

Section 106 defines a historic property as:

> Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria (36 CFR Part 800 Protection of Historic Properties, Section 800.16 Definitions[l][1]).

Properties of traditional religious and cultural importance— also referred to as Traditional Cultural Properties/Places, or TCPs)—to Native Americans are considered under Section 101(d)(6)(A) of the NHPA. TCPs can be National Register-eligible under any of the criteria, described in the following section.

National Register of Historic Places

The National Register of Historic Places is the nation's official list of districts, sites, buildings, structures, and objects worthy of preservation. The National Register currently includes approximately 80,000 listings, including icons of American architecture, engineering, culture, and history. Overseen by the National Park Service (NPS), under the Department of the Interior, the National Register was authorized under the NHPA, as amended. Its listings encompass all National Historic Landmarks, as well as historic areas administered by NPS.

For a property to be listed in or determined eligible for National Register listing, it must be demonstrated to have the quality of significance in American history, architecture, archaeology, engineering, and culture present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and meet at least one of the following criteria:

- Be associated with events that have made a significant contribution to the broad patterns of our history;
- Be associated with the lives of persons significant in our past;
- Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- Have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in the National Park Service's National Register guidance as the ability of a property to convey its significance. To be listed in the National Register, a property must not only be shown to be significant under the National Register criteria, but it also must retain integrity.

The National Register guidance asserts that properties be at least 50 years old to be considered for eligibility. Properties completed less than 50 years before they are evaluated must be "exceptionally important" (Criteria Consideration G) to be considered eligible for listing, or under certain circumstances they must be part of a historic district whose period of significance extends forward to a date less than 50 years ago.

Effects on historic properties under Section 106 of the NHPA are defined in the Assessment of Adverse Effects in 36 *CFR* Part 800.5(a) (1):

> An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance, or be cumulative.

Adverse effects on historic properties are defined as and include, but are not limited to:

- Physical destruction of or damage to all or part of the property;
- Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the *Secretary's Standards for the Treatment of Historic Properties* (36 CFR Part 68) and applicable guidelines;
- Removal of the property from its historic location;
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

- Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance (36 *CFR* Part 800.5(a) (2)).

To comply with Section 106, the criteria of adverse effect are applied to historic properties in the project Area of Potential Effects (APE), pursuant to 36 *CFR* Part 800.5 (a)(1). A finding of no adverse effect may be appropriate when the undertaking's effects do not meet the thresholds set forth in the criteria of adverse effect, or in certain cases when the undertaking is modified to avoid or lessen effects, or conditions are imposed to ensure review of rehabilitation plans for conformance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties* (codified in 36 *CFR* Part 68). If adverse effects findings are made, mitigation would be proposed and resolution of adverse effects occurs through consultation pursuant to 36 *CFR* Part 800.6(a) to avoid, minimize, or mitigate adverse effects on historic properties.

Historic properties in the APE are described in Section 4. Sections 5 and 7 present the analysis of potential effects on historic properties in the APE. Recommended mitigation to reduce adverse effects is described in Section 6.

3.1.1.3 U.S. Department of Transportation Act (USDOT), Section 4(f)

Section 4(f) (23 CFR 774) of the USDOT Act of 1966, as amended (49 USC 1653[f]), defines impacts of transportation agency projects as the "use" of certain types of resources, including "historical sites."

USDOT agencies, including FTA, cannot approve the use of land from publicly owned parks, recreational areas, wildlife and waterfowl refuges, or public and historical sites (defined as listed in or determined eligible for listing in the National Register) unless the following conditions apply:

- There is no feasible and prudent alternative to the use of land.

- The action includes all possible planning to minimize harm to the property resulting from use (FHWA 2009).

In the Federal Highway Administration (FHWA) guidance "What is Section 4(f)?" the regulations are described as applying to "any publicly or privately owned historic site listed or [determined] eligible for listing on the National Register" (FHWA 2009). The guidance defers

to the definitions of "historical sites" found in the NHPA and its National Register criteria for historic properties as described in Section 3.1.1.2.

Impacts to 4(f) properties, defined as "use" of the property, must be either avoided, minimized, or mitigated, in that order. FTA follows FHWA procedures for resolving "*de minimis*" impacts through recorded administrative decisions, and mitigating impacts through 4(f) procedures (FHWA 2009).

3.1.1.4 Other Federal Regulations

Other federal laws include the Archaeological Data Preservation Act of 1974, the American Indian Religious Freedom Act of 1978, the Archaeological Resources Protection Act of 1979, and the Native American Graves Protection and Repatriation Act of 1989, among others. Section 106 and NEPA procedures—particularly through involvement of Native American and other public constituents in the identification, evaluation, and mitigation processes—might address impact resolution through these other federal laws.

3.1.2 State

3.1.2.1 California Environmental Quality Act (CEQA)

Concurrently with the federal process, the California Environmental Quality Act (*Public Resources Code or PRC*, Section 5024) requires evaluation of proposed projects that may cause significant effects on historical resources. Under CEQA, "historical resources" must be identified, expected impacts must be analyzed, and mitigation must be identified and implemented as above, where necessary. For CEQA conformance, historical resources include the built environment as well as "unique paleontological resources" or "unique geologic features."

CEQA guidelines define a "historical resource" as:

- A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (California Register) PRC Section 5024.1, Title 14 CCR, Section 4850 et seq.).
- A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in an historical resource survey meeting the requirements section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant.
- Any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered an historical resource, provided the

lead agency's determination is supported by substantial evidence in light of the whole record.

CEQA equates a "substantial adverse change" in the historic significance of a resource with a significant effect on the environment (PRC Section 21084.1). Thresholds of substantial adverse change are established in PRC Section 5020.1 as demolition, destruction, relocation, or "alteration activities that would impair the significance of the historic resource."

If a project is expected to result in an effect on historic resources, CEQA guidelines require analysis of a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain the most basic objectives of the project and avoid or substantially lessen any significant effects on the historical resource.

A proposed project that may affect historic resources is submitted to the SHPO for review and comment prior to project approval by the lead CEQA agency, and before any project-related clearance, demolition, or construction activities commence. If any CEQA impact conditions are met by the project's effects on historic properties, mitigation measures are recommended for avoidance, to minimize impacts, or to provide balanced compensation for adverse effects. See Sections 5.0 and 7.0 for an evaluation of project effects and impacts on those properties, and Section 6.0 for recommended mitigation measures.

3.1.2.2 California Register of Historical Resources (California Register)

Under California PRC Section 5024.1, the California Register was established to serve as an authoritative guide to the state's significant historic and archaeological resources. A resource is considered historically significant if it meets the criteria for listing in the California Register of Historical Resources (PRC Section 5024.1, Title 14 CCR, Section 4852). For a property to be considered eligible for listing in the California Register, it must be found to be significant under at least one of the following four criteria by the State Historical Resources Commission. If the resource:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Has yielded, or may be likely to yield, information important in prehistory or history

In addition to possessing one of the above-listed characteristics, resources must retain "substantial" integrity to their period of significance to be eligible for listing in the California Register. The seven aspects or qualities of integrity are the same as those applied to National Register-eligible properties: location, design, setting, materials, workmanship, feeling, and association.

The California Register also includes properties that:

- Have been determined eligible for listing in, or are listed in the National Register.
- Are registered State Historical Landmark No. 770 and all consecutively numbered landmarks above Number 770 (see Section 3.1.2.3).
- Are points of historical interest that have been reviewed and recommended to the State Historical Resources Commission for listing (see Section 3.1.2.4).
- Are city- and county-designated landmarks or districts (see Section 3.1.3). Historic Districts are a concentration of historic buildings, structures, objects, or sites within precise boundaries that share a common historical, cultural or architectural background. Individual resources within an historic district may lack individual significance but be considered a contributor to the significance of the historic district.
- Are identified as significant in a historic resource survey and meet the following criteria:

    1) The survey has been or will be included in the State Historical Resources Inventory.

    2) The survey and the survey documentation were prepared in accordance with California Office of Historic Preservation (OHP) procedures and requirements.

    3) The resource is evaluated and determined by the office to have a significance rating of category "1 to 5" on California Department of Parks and Recreation (CDPR) series 523 form.

    4) If the survey is five or more years old at the time of its nomination for inclusion in the California Register, it is updated to identify historical resources that have become eligible or ineligible due to changed circumstances or further documentation and those that have been demolished or altered in a manner that substantially diminishes the significance of the resource (PRC Section 5024.1[g]).

3.1.2.3 California Historical Landmarks

Designated California Historical Landmarks (CHLs) are numbered sequentially as they are listed by the State Historical Resources Commission. CHLs numbered 770 and higher are

automatically listed in the California Register. According to PRC Section 5031(a), to be eligible for California Historical Landmark designation, a property must be of "statewide historical importance" and must demonstrate its statewide significance by meeting one of the following three requirements:

- The property is the first, last, only, or most significant historical property of its type in the region. The regions are Southern California, Central California, and Northern California. If a property has lost its historic appearance (integrity), it may not be listed as a site.
- The property is associated with an individual or group having a profound influence on the history of California. The primary emphasis should be the place or places of achievement of an individual. Birthplace, death place, or place of interment shall not be a consideration unless something of historical importance is connected with his or her birth or death. If a property has lost its historic appearance (integrity), it may not be listed as a site.
- The property is a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or is one of the more notable works, or the best surviving work in a region, of a pioneer architect, designer, or master builder.

3.1.2.4 California Points of Historical Interest

California Points of Historical Interest include "sites, buildings, features, or events that are of local (city or county) significance and have an anthropological, cultural, military, political, architectural, economic, scientific, or technical, religious, experimental, or other value." Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission are also listed in the California Register. To be designated, a property must meet at least one of the following criteria:

- The first, last, only, or most significant of its type within the local geographic region (city or county);
- Associated with an individual or group having a profound influence on the history of the local area; or
- A prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer, or master builder.

3.2 Delineation of Area of Potential Effects

The project-specific APE (Figures E-1 through E-9, Appendix E) was established through consultation between the lead federal agency, FTA, the lead CEQA agency, Metro, the SHPO,

and other consulting parties in accordance with 36 CFR 800.16(d). Section 106 defines an APE as:

> the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking.

The project APE was delineated to ensure identification of significant cultural resources that may be directly or indirectly affected by the project, and are listed in or eligible for inclusion in the National and/or California Register. The APE was established using methodology consistent with those of previous Metro projects (Figures E-1 through E-9, Appendix E). The 1.9-mile-long APE consists of 213 Los Angeles County Office of the Assessor parcels, some of which are subdivided into multi-property entities.

The proposed project APE was determined by consensus between the undertaking's lead federal agency, FTA, and consulting parties, led by the SHPO. The California OHP defines the boundaries within which properties are identified and evaluated for their historic significance, and effects of the proposed project are analyzed. The project APE was approved on September 9, 2009. Correspondence between FTA and SHPO for this project is included in Appendix D.

For archaeological and paleontological resources, the proposed direct APE includes the proposed at-grade and underground right-of-way and/or areas of direct ground disturbance. The direct APE also includes areas with permanent site improvements and areas for staging and temporary construction activities. For much of the project alignment, the direct APE includes the full width of the street along which the alignment runs, as well as the adjacent sidewalks. The direct APE includes additional street segments and portions of adjacent city blocks in areas of proposed stations, connections with existing rail lines, alignments that deviate from existing streets, and staging areas.

To anticipate effects that may result by implementing both above-ground and subterranean construction and implementation, the proposed vertical APE extends from approximately the existing ground surface to 25 feet above the existing ground surface and approximately 100 feet below the existing ground surface.

3.3 Native American Coordination

SWCA contacted the California Native American Heritage Commission (NAHC) by letter dated February 10, 2009, requesting a review of the Sacred Lands File and a list of appropriate Native American contacts for the project. The NAHC search of the Sacred Lands File

indicated the presence of Native American cultural resources in the project area. The NAHC also provided a list of five Native American contacts.

SWCA sent letters via U.S. mail to the five Native American contacts on April 16, 2009, requesting information regarding potential cultural resources that may be located within the project APE. These letters included location maps and a description of the proposed project and its related APE (Appendix B). A follow-up contact with each group was made via telephone on May 11, 2009, and subsequent follow-ups via telephone and/or email were made as necessary. Not all of the contacts responded.

One of the groups, the Gabrieleno/Tongva San Gabriel Band of Mission Indians, expressed dismay with Metro because the Band had never been contacted by anyone about the Metro Gold Line to East Los Angeles project, which was completed in November 2009. Tribal Chairperson Anthony Morales stated that he was concerned with the proposed project's proximity to the prehistoric village of Yangna and considers the project area highly sensitive for Native American resources and sacred places.

Mr. Morales further stated that he is aware that cultural resources, including human remains, have been uncovered during construction of various projects in the downtown area, and he wants Metro to know that his tribe has concerns.

A second tribe, the Tongva Ancestral Territorial Tribal Nation, responded via email that it objects to the proposed project and would like to prepare a detailed response, but has not received sufficient information to do so.

Metro is consulting with the Gabrieleno/Tongva San Gabriel Band of Mission Indians and Tongva Ancestral Territorial Tribal Nation should the project proceed. Details of SWCA's contacts with the Gabrieleno/Tongva San Gabriel Band of Mission Indians and Tongva Ancestral Territorial Tribal Nation are provided in Table 3-1.

Table 3-1. Contacts with Native Americans

Native American Contact	Letter Sent	Reply Date	Follow Ups	Results
Cindi Alvitre Ti'At Society 6515 E. Seaside Walk, #C Long Beach, CA 90803	4/16/09, via U.S. Priority Mail		5/11/09, message and email by Kip Harper (KH)	Left message. No further action necessary.
Robert Dorame Gabrielino Tongva Indians of California Tribal Council P.O. Box 490 Bellflower, CA 90707	4/16/09, via U.S. Priority Mail	5/11/09, telephone call from Mr. Dorame	5/11/09, telephone and email by KH	Mr. Dorame suggested that we look at historic maps/roadways. He said that he received the letter and would review the information and would respond via letter/email. He said that if we did not hear from him, then he had no response. SWCA re-sent the letter via email to facilitate his response. No response received. No further action necessary.
Sam Dunlap Gabrielino Tongva Nation P.O. Box 86908 Los Angeles, CA 90086	4/16/09, via U.S. Priority Mail		5/11/09, telephone and email by KH	Left message. No further action necessary.
Anthony Morales Gabrieleno/Tongva San Gabriel Band of Mission Indians P.O. Box 693 San Gabriel, CA 91778	4/16/09, via U.S. Priority Mail	4/17/09, telephone call from Mr. Morales	4/17/09, telephone by KH	On 4/17/09, Mr. Morales left a message stating that he wanted to talk about the project. On 4/17/09, K. Harper spoke to Mr. Morales about the proposed project. Mr. Morales expressed dismay that Metro had never contacted him about the Gold Line Extension project. Mr. Morales stated that he is concerned with the Regional

Table 3-1. Contacts with Native Americans

Native American Contact	Letter Sent	Reply Date	Follow Ups	Results
				Connector's proximity to the village of Yangna. In addition, he stated that he considers the project area to be highly sensitive for Native American resources and sacred places considering that the project is located in the heart of the city. Mr. Morales said that he is aware that cultural resources have been uncovered during construction of pipelines in the downtown area, and that human remains were uncovered during construction of the Metropolitan Water District building. Mr. Morales wants Metro to know that a local tribe—the Gabrielino—has concerns. SWCA recommends that Metro consult with the Gabrielino/Tongva San Gabriel Band of Mission Indians.
John Tommy Rosas Tongva Ancestral Territorial Tribal Nation (TATTN)	4/16/09, via email (Samantha Murray)	4/16/09, via email; 4/17/09 via email; 5/11/09 via email	4/17/09, email by KH 5/11/09, email by KH	On 4/17/09, K. Harper responded to Mr. Rosas' email stating that his comments were received. Mr. Rosas responded via email on 4/17/09. In his email, Mr. Rosas stated that he objects to the proposed project "on the grounds that it[']s a growth inducing negative impact under CEQA, on violations to our indigenous rights, and that the TATTN lands are ours and so the claimed land titles by project [owners] is defective and illegal."

Table 3-1. Contacts with Native Americans

Native American Contact	Letter Sent	Reply Date	Follow Ups	Results
				On 4/17/09, Mr. Rosas also responded stating that he would send a more detailed response. No response was received. On 5/11/09, K. Harper emailed Mr. Rosas to follow up on his 4/17/09 response to facilitate his response. Mr. Rosas responded stating "Your information attachment-does not contain any environmental construction reports or details so we can continue our detailed response." Mr. Rosas did not provide any consequential information regarding cultural resource in the project area. SWCA recommends that Metro consult with the TATTN.

4.0 AFFECTED ENVIRONMENT

The project is located within the City of Los Angeles in Los Angeles County, California. Specifically, the direct APE extends in a northeasterly direction from the intersection of Flower and 7th Streets to the Gold Line at Alameda Street between 2nd and Temple Streets within downtown Los Angeles. The project crosses several communities of downtown Los Angeles, including the Bunker Hill, Historic Core, Civic Center, and Little Tokyo communities.

This area is highly urbanized, with development ranging from commercial to public and institutional uses. Most of the native vegetation has been removed and replaced by non-native trees and grasses. Elevations range from 250 to 270 feet (76 to 82 meters) above mean sea level. The nearest natural water source includes the now channelized course of the Los Angeles River, located approximately 0.72 miles (1.1 km) east of the project area.

The climate within the project area is typified by hot, dry summers with moderate winter precipitation. Summers are influenced by a high-pressure zone associated with descending dry air from the upper atmosphere. This persistent high pressure generally prevents rain-bearing storms from entering the area, keeping summers dry.

Summer temperatures can be hot, commonly reaching 80 or 90 degrees Fahrenheit (°F) and sometimes exceeding 100°F. Autumn brings the Santa Ana winds, which blow from the Mojave Desert westward toward the Pacific Ocean. Winter is generally characterized by alternating sporadic rainstorms with predominantly clear, sunny days (Schoenherr 1992).

4.1 Cultural Setting

4.1.1 Prehistoric Overview

Numerous chronological sequences have been devised to help understand cultural changes within southern California. Building on early studies and focusing on data synthesis, Wallace (1955, 1978) developed a prehistoric chronology for the southern California coastal region that is still widely used today and is applicable to near-coastal and many inland areas. Four periods are presented in Wallace's prehistoric sequence: Early Man, Milling Stone, Intermediate, and Late Prehistoric. Although Wallace's (1955) synthesis initially lacked chronological precision due to a paucity of absolute dates (Moratto 1984), this situation has been alleviated by the availability of thousands of radiocarbon dates that have been obtained by southern California researchers in the last three decades (Byrd and Raab 2007).

Several revisions have been made to Wallace's (1955) synthesis using radiocarbon dates and projectile point assemblages (e.g., Koerper and Drover 1983; Mason and Peterson 1994; Koerper et al. 2002). The summary of prehistoric chronological sequences for southern California coastal and near-coastal areas presented in this memorandum is a composite of

information in Wallace (1955) and Warren (1968) as well as more recent studies, including Koerper and Drover (1983).

4.1.1.1 Horizon I – Early Man (ca. 10,000–6,000 B.C.)

When Wallace defined the Horizon I (Early Man) period in the mid-1950s, there was little evidence of human presence on the southern California coast prior to 6000 B.C. Archaeological work in the intervening years has identified numerous pre-8000 B.C. sites, both on the mainland coast and the Channel Islands (e.g., Erlandson 1991; Johnson et al. 2002; Moratto 1984; Rick et al. 2001).

The earliest accepted dates for occupation are from two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area about 10,000 years ago (Erlandson 1991). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002). Present-day Orange and San Diego Counties contain several sites dating to 9,000 to 10,000 years ago (Byrd and Raab 2007; Macko, 1998a; Mason and Peterson 1994; Sawyer and Koerper 2006).

Recent data from Horizon I sites indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones, et al. 2002) and on Pleistocene lake shores in eastern San Diego County (Moratto 1984). Although few Clovis-like or Folsom-like fluted points have been found in southern California (e.g., Dillon 2002; Erlandson, et al. 1987), it is generally thought that the emphasis on hunting may have been greater during Horizon I than in later periods. Common elements in many sites from this period include, for example, leaf-shaped bifacial projectile points and knives, stemmed or shouldered projectile points, scrapers, engraving tools, and crescents (Wallace 1978).

Subsistence patterns shifted around 6000 B.C. coincident with the gradual desiccation associated with the onset of the Altithermal climatic regime, a warm and dry period that lasted for about 3,000 years. After 6000 B.C., a greater emphasis was placed on plant foods and small animals.

4.1.1.2 Horizon II – Milling Stone (6000–3000 B.C.)

The Milling Stone Horizon of Wallace (1955, 1978) and Encinitas Tradition of Warren (1968) (6000 to 3000 B.C.) are characterized by subsistence strategies centered on collecting plant foods and small animals. Food procurement activities included hunting small and large terrestrial mammals, sea mammals, and birds; collecting shellfish and other shore species; near-shore fishing with barbs or gorges; processing yucca and agave; and extensively using seed and plant products (Kowta 1969; Reinman 1964).

The importance of seed processing is apparent in the dominance of stone grinding implements in contemporary archaeological assemblages; namely, milling stones (metates and slabs) and handstones (manos and mullers). Milling stones occur in large numbers for the first time during this period, and are even more numerous near the end of this period. Recent research indicates that Milling Stone Horizon food procurement strategies varied in both time and space, reflecting divergent responses to variable coastal and inland environmental conditions (Byrd and Raab 2007).

Milling Stone Horizon sites are common in the southern California coastal region between Santa Barbara and San Diego, and at many inland locations, including the Prado Basin in western Riverside County and the Pauma Valley in northeastern San Diego County (e.g., Herring 1968; Langenwalter and Brock 1985; Sawyer and Brock 1999; Sutton 1993; True 1958). Wallace (1955, 1978) and Warren (1968) relied on several key coastal sites to characterize the Milling Stone period and Encinitas Tradition, respectively. These include the Oak Grove Complex in the Santa Barbara region, Little Sycamore in southwestern Ventura County, Topanga Canyon in the Santa Monica Mountains, and La Jolla in San Diego County. The well-known Irvine site (CA-ORA-64) has occupation levels dating between ca. 6000 and 4000 B.C. (Drover, et al. 1983; Macko 1998b).

Stone chopping, scraping, and cutting tools made from locally available raw material are abundant in Milling Stone/Encinitas deposits. Less common are projectile points, which are typically large and leaf-shaped, and bone tools such as awls. Items made from shell, including beads, pendants, and abalone dishes, are generally rare. Evidence of weaving or basketry is present at a few sites.

Kowta (1969) attributes the presence of numerous scraper-planes in Milling Stone sites to preparation of agave or yucca for food or fiber. The mortar and pestle, associated with pounding foods such as acorns, were first used during the Milling Stone Horizon (Wallace 1955, 1978; Warren 1968).

Cogged stones and discoidals are diagnostic Milling Stone period artifacts, and most specimens have been found within sites dating between 4000 and 1000 B.C. (Moratto 1984). The cogged stone is a ground stone object with gear-like teeth on its perimeter. Discoidals are similar to cogged stones, differing primarily in their lack of edge modification. Discoidals are found in the archaeological record subsequent to the introduction of the cogged stone.

Cogged stones and discoidals are often purposefully buried, and are found mainly in sites along the coastal drainages from southern Ventura County southward, with a few specimens inland at Cajon Pass, and heavily in Orange County (Dixon 1968; Moratto 1984). These artifacts are often interpreted as ritual objects (Eberhart 1961; Dixon 1968), although alternative interpretations (such as gaming stones) have also been suggested (e.g., Moriarty and Broms 1971).

Characteristic mortuary practices of the Milling Stone period or Encinitas Tradition include extended and loosely flexed burials, some with red ochre, and few grave goods such as shell beads and milling stones interred beneath cobble or milling stone cairns. "Killed" milling stones, exhibiting holes, may occur in the cairns. Reburials are common in the Los Angeles County area, with north-oriented flexed burials common in Orange and San Diego Counties (Wallace 1955, 1978; Warren 1968).

Koerper and Drover (1983) suggest that Milling Stone period sites represent evidence of migratory hunters and gatherers who used marine resources in the winter and inland resources for the remainder of the year. Subsequent research indicates greater sedentism than previously recognized.

Evidence of wattle-and-daub structures and walls has been identified at several sites in the San Joaquin Hills and Newport Coast area (Koerper 1995; Strudwick 2005), while numerous early house pits have been discovered on San Clemente Island (Byrd and Raab 2007). This architectural evidence and seasonality studies suggest semi-permanent residential base camps that were relocated seasonally (de Barros 1996; Koerper, et al. 2002; Mason, et al. 1997) or permanent villages from which a part of the population left at certain times of the year to exploit available resources (Cottrell and Del Chario 1981).

4.1.1.3 Horizon III – Intermediate (3000 B.C.–A.D. 500)

Following the Milling Stone Horizon, Wallace's Intermediate Horizon and Warren's Campbell Tradition in Santa Barbara, Ventura, and parts of Los Angeles Counties, date from approximately 3000 B.C. to 500 A.D. and are characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. The Campbell Tradition (Warren 1968) incorporates David B. Rogers' (1929) Hunting Culture and related expressions along the Santa Barbara coast. In the San Diego region, the Encinitas Tradition (Warren 1968) and the La Jolla Culture (Moriarty 1966; Rogers 1939, 1945) persist with little change during this time.

During the Intermediate Horizon and Campbell Tradition, there was a pronounced trend toward greater adaptation to regional or local resources. For example, an increasing variety and abundance of fish, land mammal, and sea mammal remains are found in sites along the California coast during this period. Related chipped stone tools suitable for hunting are more abundant and diversified, and shell fishhooks become part of the toolkit during this period. Larger knives, a variety of flake scrapers, and drill-like implements are common during this period.

Projectile points include large side-notched, stemmed, and lanceolate or leaf-shaped forms. Koerper and Drover (1983) consider Gypsum Cave and Elko series points, which have a wide distribution in the Great Basin and Mojave deserts between ca. 2000 B.C. and A.D. 500, to be

diagnostic of this period. Bone tools, including awls, were more numerous than in the preceding period, and the use of asphaltum adhesive was common.

Mortars and pestles became more common during this period, gradually replacing manos and metates as the dominant milling equipment. Hopper mortars and stone bowls, including steatite vessels, appeared in the toolkit at this time as well. This shift appears to correlate with the diversification in subsistence resources.

Many archaeologists believe this change in milling stones signals a shift away from the processing and consuming of hard seed resources to the increasing importance of the acorn (e.g., Glassow, et al. 1988; True 1993). It has been argued that mortars and pestles may have been used initially to process roots (e.g., tubers, bulbs, and corms associated with marshland plants), with acorn processing beginning at a later point in prehistory (Glassow 1997) and continuing to European contact.

Characteristic mortuary practices during the Intermediate Horizon and Campbell Tradition included fully flexed burials, placed face down or face up, and oriented toward the north or west (Warren 1968). Red ochre was common, and abalone shell dishes infrequent. Interments sometimes occurred beneath cairns or broken artifacts. Shell, bone, and stone ornaments, including charmstones, were more common than in the preceding Encinitas Tradition.

Some later sites include *Olivella* shell and steatite beads, mortars with flat bases and flaring sides, and a few small points. The broad distribution of steatite from the Channel Islands and obsidian from distant inland regions, among other items, attest to the growth of trade, particularly during the later part of this period. Howard and Raab (1993) have argued that the distribution of *Olivella* grooved rectangle beads marks "a discrete sphere of trade and interaction between the Mojave Desert and the southern Channel Islands" (Byrd and Raab 2007).

4.1.1.4 Horizon IV – Late Prehistoric (A.D. 500–Historic Contact)

In the Late Prehistoric Horizon (Wallace 1955, 1978), which lasted from the end of the Intermediate Horizon (ca. A.D. 500) until European contact, there was an increase in the use of plant food resources in addition to an increase in land and sea mammal hunting. There was a concomitant increase in the diversity and complexity of material culture during the Late Prehistoric, demonstrated by more classes of artifacts.

The recovery of a greater number of small, finely chipped, projectile points, usually stemless with convex or concave bases, suggests an increased utilization of the bow and arrow rather than the atlatl (spear thrower) and dart for hunting. Other items include steatite cooking vessels and containers, the increased presence of smaller bone and shell circular fishhooks, perforated stones, arrow shaft straighteners made of steatite, a variety of bone tools, and

personal ornaments made from shell, bone, and stone. There is also an increased use of asphalt for waterproofing and as an adhesive.

Many Late Prehistoric sites contain beautiful and complex objects of utility, art, and decoration. Ornaments include drilled whole venus clam (*Chione* spp.) and drilled abalone (*Haliotis* spp.). Steatite effigies become more common, with scallop (*Pecten* spp. and *Argopecten* spp.) shell rattles common in middens.

Mortuary customs are elaborate and include cremation and interment with abundant grave goods. By A.D. 1000, fired clay smoking pipes and ceramic vessels began to appear at some sites (Drover 1971, 1975; Meighan 1954; Warren and True 1961).

The scarcity of pottery in coastal and near-coastal sites implies ceramic technology was not well developed in that area, or that ceramics were obtained by trade with neighboring groups to the south and east. The lack of widespread pottery manufacture is usually attributed to the high quality of tightly woven and watertight basketry that functioned in the same capacity as ceramic vessels.

There was an increase in population size during this period, accompanied by the advent of larger, more permanent villages (Wallace 1955). Large populations and, in places, high population densities are characteristic, with some coastal and near-coastal settlements containing as many as 1,500 people. Many of the larger settlements were permanent villages in which people resided year-round. The populations of these villages may have also increased seasonally.

In Warren's (1968) cultural ecological scheme, the period between A.D. 500 and European contact is divided into three regional patterns. The Chumash Tradition is present mainly in the region of Santa Barbara and Ventura Counties; the Takic or Numic Tradition is present in the Los Angeles, Orange, and western Riverside Counties region; and the Yuman Tradition is present in the San Diego region.

The seemingly abrupt changes in material culture, burial practices, and subsistence focus at the beginning of the Late Prehistoric period are thought to be the result of a migration of people to the coast from inland desert regions to the east. In addition to the small triangular and side-notched points similar to those found in the desert regions in the Great Basin and Lower Colorado River, Colorado River pottery and introduction of cremation in the archaeological record are diagnostic of the Yuman Tradition in the San Diego region. This combination suggests a strong influence from the Colorado Desert region.

In Los Angeles, Orange, and western Riverside Counties, similar changes (introduction of cremation, pottery, and small triangular arrow points) are thought to be the result of a Takic migration to the coast from inland desert regions. This Takic, or Numic, Tradition was

formerly referred to as the "Shoshonean wedge" or "Shoshonean intrusion" (Warren 1968). This terminology, used originally to describe a Uto-Aztecan language group, is generally no longer used to avoid confusion with ethnohistoric and modern Shoshonean groups who spoke Numic languages (Heizer 1978; Shipley 1978). Modern Gabrielino/Tongva, Juaneño, and Luiseño in this region are considered the descendents of the prehistoric Uto-Aztecan, Takic-speaking populations that settled along the California coast during this period or perhaps somewhat earlier.

4.1.2 Ethnographic Overview

The project area is located in the heart of Gabrielino/Tongva territory (Bean and Smith 1978; Kroeber 1925). Surrounding native groups included the Chumash and Tatataviam/Alliklik to the north, the Serrano to the east, and the Luiseño/Juaneño to the south. There is documented interaction between the Gabrielino and many of their neighbors in the form of intermarriage and trade.

4.1.2.1 Gabrielino/Tongva

The name Gabrielino denotes those people who were administered by the Spanish from Mission San Gabriel, including people from the Gabrielino area proper as well as other social groups (Bean and Smith 1978; Kroeber 1925). Therefore, in the post-Contact period, the name does not necessarily identify a specific ethnic or tribal group.

The names by which Native Americans in southern California identified themselves have, for the most part, been lost. Many contemporary Gabrielino identify themselves as descendants of the indigenous people living across the plains of the Los Angeles Basin and refer to themselves as the Tongva (King 1994). This term is used in the remainder of this section to refer to the pre-Contact inhabitants of the Los Angeles Basin and their descendants.

Tongva lands encompassed the greater Los Angeles Basin and three Channel Islands, San Clemente, San Nicolas, and Santa Catalina. Their mainland territory was bounded on the north by the Chumash at Topanga Creek, the Serrano at the San Gabriel Mountains in the east, and the Juaneño on the south at Aliso Creek (Bean and Smith 1978; Kroeber 1925).

The Tongva language, as well as that of the neighboring Juaneño/Luiseño, Tatataviam/Alliklik, and Serrano, belongs to the Takic branch of the Uto-Aztecan language family, which can be traced to the Great Basin area (Mithun 2004). This language family's origin differs substantially from that of the Chumash to the north and the Ipai, Tipai, and Kumeyaay farther south. The language of the Ipai, Tipai, and Kumeyaay is derived from the California-Delta branch of the Yuman-Cochimi language family, which originated in the American Southwest (Mithun 2004).

The Chumash language is unlike both the Yuman-Cochimi and Uto-Aztecan families, and may represent a separate lineage (Mithun 2004). Linguistic analysis suggests that Takic-speaking immigrants from the Great Basin area began moving into southern California around 500 B.C. (Kroeber 1925). This migration may have displaced both Chumashan- and Yuman-speaking peoples, but the timing and extent of the migrations and their impact on indigenous peoples is not well understood.

The Tongva language consisted of two main dialects, Eastern and Western; the Western group included much of the coast and the Channel Island population (King 2004). Lands of the Western group encompassed much of the western Los Angeles Basin and San Fernando Valley, northward along the coast to the Palos Verdes Peninsula (McCawley 1996).

Tongva society was organized along patrilineal non-localized clans, a characteristic Takic pattern. Clans consisted of several lineages, each with their own ceremonial leader. The chief, or *tómyaar*, always came from the primary lineage of the clan/village. One or two clans generally made up the population of a village.

Even though the Tongva did not have a distinctly stratified society, there were two general classes of individuals: elites and commoners. The elites consisted of primary lineage members, other lineage leaders (who maintained a separate ceremonial language), the wealthy, and the elite families of the various villages who commonly married among themselves. The commoner class contained those from "fairly well-to-do and long-established lineages" (Bean and Smith 1978). A third, lower class consisted of slaves taken in war and individuals, unrelated to the inhabitants, who drifted into the village.

The Tongva established large, permanent villages in the fertile lowlands along rivers and streams, and in sheltered areas along the coast, stretching from the foothills of the San Gabriel Mountains to the Pacific Ocean. A total tribal population has been estimated of at least 5,000 (Bean and Smith 1978), but recent ethnohistoric work suggests a number more likely approaching 10,000 (O'Neil 2002).

Several Tongva villages appear to have served as trade centers, largely due to their centralized geographic position in relation to the Southern Channel Islands and other tribes. These villages maintained particularly large populations and hosted annual trade fairs that would bring their population to 1,000 or more for the duration of the event (McCawley 1996).

Houses constructed by the Tongva were large, circular, domed structures made of willow poles thatched with tule that could hold up to 50 people (Bean and Smith 1978). Other structures served as sweathouses, menstrual huts, ceremonial enclosures, and probably communal granaries. Fields for races and games, such as lacrosse and pole throwing, were cleared adjacent to Tongva villages (McCawley 1996).

The Tongva subsistence economy was based on gathering and hunting. The surrounding environment was rich and varied, and the tribe exploited mountains, foothills, valleys, and deserts as well as riparian, estuarine, and open and rocky coastal ecological niches. As with most native Californians, acorns were the staple food (an established industry by the time of the early Intermediate period). Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh- and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978; Kroeber 1925; McCawley 1996).

A wide variety of tools and implements were employed by the Tongva to gather and collect food resources. These included the bow and arrow, traps, nets, blinds, throwing sticks and slings, spears, harpoons, and hooks. Many plant foods were collected with woven seed beaters, several forms of burden baskets, carrying nets, and sharpened digging sticks, sometimes with stone weights fitted onto them.

Groups residing near the ocean used ocean-going plank canoes (known as a *ti'at*) and tule balsa canoes for fishing, travel, and trade between the mainland and the Channel Islands. The ocean-going canoes were capable of holding six to 14 people and were used for travel and trade between the mainland and the Channel Islands. The tule balsa canoes were used for near-shore fishing (Blackburn 1963; McCawley 1996).

Tongva people processed food with a variety of tools, including portable and bedrock mortars, pestles, basket hopper mortars, manos and metates, hammerstones and anvils, woven strainers and winnowers, leaching baskets and bowls, woven parching trays, knives, bone saws, and wooden drying racks. Food was consumed from a number of woven and carved wood vessels.

The ground meal and unprocessed hard seeds were stored in large, finely woven baskets, and the unprocessed acorns were stored in large granaries woven of willow branches raised off the ground on platforms. Santa Catalina Island steatite was used to make comals, ollas, and cooking vessels that would not crack after repeated firings. In addition to cooking vessels, steatite was used to make effigies, ornaments, and arrow straighteners (Blackburn 1963; Kroeber 1925; McCawley 1996).

The Tongva participated in an extensive exchange network, trading coastal goods for inland resources. They exported Santa Catalina Island steatite products, roots, seal and otter skins, fish and shellfish, red ochre, and lead ore to neighboring tribes, as well as people as far away as the Colorado River. In exchange they received ceramic goods, deer skin shirts, obsidian, acorns, and other items. This burgeoning trade was facilitated by the use of craft specialists, a standard medium of exchange (*Olivella* bead currency), and the regular destruction of valuables in ceremonies, which maintained a high demand for these goods (McCawley 1996).

At the time of Spanish contact, the basis of Tongva religious life was the *Chinigchinich* cult, centered on the last of a series of heroic mythological figures. Chinigchinich gave instruction on laws and institutions, and also taught the people how to dance, the primary religious act for this society. He later withdrew into heaven, where he rewarded the faithful and punished those who disobeyed his laws (Kroeber 1925). The Chinigchinich religion seems to have been relatively new when the Spanish arrived. It was spreading south into the Southern Takic groups even as Christian missions were being built and may represent a mixture of native and Christian belief and practices (McCawley 1996).

Deceased Tongva were either buried or cremated, with inhumation being more common on the Channel Islands and the neighboring mainland coast and cremation predominating on the remainder of the coast and in the interior (Harrington 1942; McCawley 1996). Cremation ashes have been found in archaeological contexts buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966), as well as scattered among broken ground stone implements (Cleland, et al. 2007). Archaeological data such as this correspond with ethnographic descriptions of an elaborate mourning ceremony that included a wide variety of offerings, including seeds, stone grinding tools, otter skins, baskets, wood tools, shell beads, bone and shell ornaments, and projectile points and knives. Offerings varied with the sex and status of the deceased (Dakin 1978; Johnston 1962; McCawley 1996). At the behest of the Spanish missionaries, cremation essentially ceased during the post-Contact period (McCawley 1996).

4.1.2.2 Native American Communities in Los Angeles

Ethnohistoric data indicate that the Gabrielino ethnographic village of *Yaanga* (*Yang-na*, *Yabit*, or other spellings) was located in or near the original Pueblo of Los Angeles. In 1852, Hugo Reid indicated that *Yang-na* and Los Angeles were one and the same (Dakin 1978). Gabrielino informant José Zalvidea told ethnographer J. P. Harrington that *Yaanga* "is the old name of the site of the Los Angeles plaza" and the name means "it is alkali, like the earth is salty" (McCawley 1996).

Alternative names associated with the community include *Iyakha* (meaning "poison oak" in Luiseño) and *Wenot* (meaning "river" in Gabrielino). *Yaanga* was abandoned prior to 1836, but was succeeded by a series of Native American settlements in the same area. The community of *Geveronga*, which contributed 31 neophytes to the San Gabriel Mission between 1788 and 1809, may have been located nearby (McCawley 1996).

The precise location of Contact-era (late seventeenth century) Native American communities within downtown Los Angeles, including *Yaanga*, *Geveronga*, and related settlements, is unclear. Historical records place *Yaanga* in the vicinity of the pueblo plaza, which was located less than 0.25 mile north northwest of the project area, although historians and archaeologists have presented multiple possible village locations within this general area (Applied Earthworks 1999).

The archaeological evidence for these settlements is not clear-cut. Early Spanish period Native American deposits have been identified in several locations, the most significant being the cemetery next to Union Station. It is unclear whether this cemetery was adjacent to, affiliated with, or precisely contemporary with *Yaanga* (Applied Earthworks 1999).

The preponderance of available evidence indicates that early historic Native American communities in the area were situated near the Los Angeles River, which is currently located approximately 0.5 mile east of the project. Consequently, the project has the potential to encounter archaeological deposits associated with these communities.

4.1.3 Historic Overview

The post-Contact history of California is divided into three periods: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). Each of these periods is briefly described below.

4.1.3.1 Spanish Period (1769–1822)

The first Europeans to observe what became southern California were members of the 1542–1543 expedition of Juan Rodriguez Cabrillo. Cabrillo noted the numerous campfires of the Gabrielino and thus named the area the Bay of Smokes. Cabrillo and other early explorers sailed along the coast and made limited expeditions into Alta (upper) California between 1529 and 1769. Although Spanish, Russian, and British explorers briefly visited Alta California during this nearly 250-year span, they did not establish permanent settlements (Starr 2007).

Gaspar de Portolá and Franciscan Father Junipero Serra established the first Spanish settlement in Alta California at San Diego in 1769. Mission San Diego de Alcalá was the first of 21 missions built by the Spanish between 1769 and 1823. Portolá continued north, passing through the project area and reaching San Francisco Bay on October 31, 1769.

On September 4, 1781, 12 years after the Portolá's initial visit, a dozen families from Sonora, Mexico founded *El Pueblo de la Reina de los Angeles* under the specific directions of Governor Felipe de Neve (Robinson 1979:238). The site chosen for the new pueblo was elevated on a broad terrace one-half mile west of the river (Gumprecht 1999). As a planned pueblo (one of only three in California), four square leagues (about 28 square miles) of land were set aside for the settlement (Robinson 1979).

The area's rich, well-watered soils created an ideal locale for a town meant to supply livestock and feed to the presidios of San Diego and Santa Barbara, and to serve as a home for retired Spanish soldiers. The soldiers were given vast tracts of land to start farms and ranches.

To expand their herds of cattle, colonists enlisted the labor of the surrounding Indian population (Engelhardt 1927b). By 1786, the flourishing pueblo attained self-sufficiency, and funding by the Spanish government ceased. Fed by a steady supply of water and an

expanding irrigation system, agriculture and ranching grew, and by the early 1800s the pueblo produced 47 different agricultural products (Gumprecht 1999).

The process of converting the local Native American population to Christianity through baptism and relocation to mission grounds began in this region by the Franciscan padres at the San Gabriel Mission, which was established in 1771 (Engelhardt 1927a). The San Fernando Mission was founded 26 years later, its location chosen as a stopping point between the San Gabriel and San Buenaventura missions (Engelhardt 1927b).

The majority of the Native Americans from the Los Angeles Basin were persuaded to settle in the vicinity of the two missions. These included the Eastern Gabrielino of the plains as far south as the Santa Ana River and west to the Los Angeles River. The padres also proselytized the Serrano of the San Gabriel and San Bernardino Mountains, the Vanyume Serrano of the Mojave Desert, many of the western Cahuilla in the Coachella and San Jacinto Valley, some Luiseño of the San Jacinto Valley, and Western Gabrielino of the plains west of the Los Angeles River, San Fernando Valley, and the southern Channel Islands.

The missions were charged with administering to the Indians within their areas. Although mission life gave the Indians skills needed to survive in their rapidly changing world, the close quarters and regular contact with Europeans transmitted diseases for which they had no immunity, decimating their populations (McCawley 1996).

4.1.3.2 Mexican Period (1822–1848)

After the end of the Mexican Revolution against the Spanish crown (1810–1821), all Spanish holdings in North America (including both Alta and Baja California) became part of the new Mexican republic. Alta California became a state in 1821, and Los Angeles selected its first city council the following year.

Independence and removal of economic restrictions attracted settlers to Los Angeles, and the town slowly grew in size, expanding to the south and west. The population nearly doubled during this period, rising from 650 to 1,250 between 1822 and 1845 (Weber 1992). Until 1832, Los Angeles was essentially a military post, with all able-bodied males listed on the muster rolls and required to perform guard duty and field duty whenever circumstances required (Los Angeles County 1963). The Mexican Congress elevated Los Angeles from pueblo to city status in 1835, declaring it the new state capital (Robinson 1979).

Under Mexican rule, the authority of the California missions gradually declined, culminating with their secularization in 1834. Although the Mexican government directed that each mission's lands, livestock, and equipment be divided among its neophytes, the majority of these holdings quickly fell into non-Indian hands. Mission buildings were abandoned and quickly fell into decay.

If mission life was difficult for Native Americans, secularization was worse. After two generations of dependence upon the missions, they were suddenly disenfranchised. After secularization, "nearly all of the Gabrielinos went north while those of San Diego, San Luis and San Juan overran this county, filling the Angeles and surrounding ranchos with more servants than were required" (Dakin 1978).

Former mission lands were quickly divided and granted to private citizens for use as agricultural and pastoral land. Most of the land grants to Mexican citizens in California (Californios) were located inland, a policy intended to increase the population away from the coastal areas where the Spanish settlements were concentrated (Dakin 1978).

After years of surreptitious commerce, the first party of American immigrants arrived in Los Angeles in 1841, including William Workman and John Rowland, who soon became influential landowners. As the possibility of a takeover of California by the United States loomed large in the 1840s, the Mexican government increased the number of land grants in an effort to keep the land in Mexican hands (Wilkman and Wilkman 2006). Governor Pío Pico and his predecessors made more than 600 rancho grants between 1833 and 1846, putting most of the state's lands into private ownership for the first time (Gumprecht 1999).

4.1.3.3 American Period (1848–Present)

The United States took control of California in 1846, seizing Monterey, San Francisco, San Diego, and Los Angeles with little resistance. Los Angeles soon slipped from American control, however, and needed to be retaken in 1847.

Approximately 600 U.S. sailors, marines, Army dragoons, and mountain men converged under the leadership of Colonel Stephen W. Kearney and Commodore Robert F. Stockton in early January of 1847 to challenge the California resistance, which was led by General Jose Maria Flores. The American party scored a decisive victory over the Californios in the Battle of the Rio San Gabriel and at the Battle of La Mesa the following day, effectively ending the war and opening the door for increased American immigration (Harlow 1992).

Hostilities officially ended with the signing of the Treaty of Guadalupe Hidalgo in 1848, in which the United States agreed to pay Mexico $15 million for the conquered territory, including California, Nevada, Utah, Arizona, New Mexico, Wyoming, and parts of Colorado. This represented nearly half of Mexico's pre-1846 holdings. California joined the Union in 1850 as the 31st state (Wilkman and Wilkman 2006).

Although the discovery of gold in northern California in 1848 gave rise to the California gold rush, Los Angeles was where the first California gold was found. Francisco López had found several gold nuggets clinging to wild onion roots near the San Fernando Mission in 1842 (Guinn 1977; Workman 1935). The big strike at Sutter's Creek seven years later led to an

enormous influx of American citizens in the 1850s and 1860s, and these "forty-niners" rapidly displaced the old rancho families.

One year after discovering gold, nearly 90,000 people journeyed to the California gold fields. With most miners drawn to central California by its well-known strikes, Los Angeles attracted people who were largely peripheral to the gold rush, including a healthy contingent of gamblers (Robinson 1979).

Surrounded by miles of ranchos, Los Angeles was the center of a vibrant cattle industry throughout the nineteenth century. The city served as a trading hub for southern California's "cow counties," and at mid-century the plaza was lined with the shops and town homes of ranch owners (Robinson 1979). In 1835, Los Angeles County had approximately 75,000 to 100,000 cattle, 1,700 horses, and 13,000 sheep, and produced about 4,000 bushels of cereal and legumes each year (Los Angeles County 1963).

Agricultural interests were gradually supplanted by more urban industries, with about a third of Los Angeles residents supporting themselves with non-agricultural pursuits by 1836 (Weber 1992). By 1853, the population of the state exceeded 300,000. Thousands of settlers and immigrants continued to pour into the state, particularly after completion of the transcontinental railroad in 1869.

When the Southern Pacific Railroad extended its line from San Francisco to Los Angeles in 1876, it signaled the beginning of Los Angeles' first major growth spurt. Newcomers poured into the city, nearly doubling the population between 1870 and 1880.

Completion of the second transcontinental line, the Santa Fe, took place in 1886, causing a price war that drove fares to an unprecedented low, including a promotional one-way ticket from Kansas City that sold for one dollar. More settlers continued to head west and the demand for real estate skyrocketed. As real estate prices soared, land that had been farmed for decades outlived its agricultural value and was sold to become residential communities.

The large ranchos that surrounded the City were each annexed, subdivided, and developed in turn. Los Angeles' population more than quadrupled in a decade, from 11,183 in 1880 to 50,395 by 1890 (Meyer 1981; Robinson 1979; Wilkman and Wilkman 2006). During the first three decades of the twentieth century, more than 2 million people moved to Los Angeles County, transforming it from a largely agricultural region into a major metropolitan area (Gumprecht 1999).

4.1.3.4 City of Los Angeles

The Spanish Governor of California, Felipe de Neve, recognized the need to establish a pueblo north of the Mission San Gabriel to help supply Spain's military Presidios in California as well as maintain Spain's control over the region. On September 4, 1781, 22 settlers from Mexico

accompanied by the governor, soldiers, mission priests, and several Native Americans arrived at the site alongside the Los Angeles River, which was officially declared *El Pueblo de la Reina de los Angeles,* or the Town of the Queen of the Angels (Ríos-Bustamante 1992).

Less than one month after the pueblo's founding, Los Angeles residents began constructing an extensive water management system. They diverted water from the river (near the present N. Broadway bridge) into a ditch named the *Zanja Madre* (mother ditch), which in turn fed numerous smaller zanjas. The city's residents used this water for ranching and agriculture, as well as domestic purposes such as drinking, bathing, and clothes washing (Newmark 1977). The Los Angeles zanja system was expanded and improved in subsequent decades and remained in use until the early 1900s.

Many zanja segments were converted into masonry-lined canals, iron or cement pipes, or brick-lined, subsurface conduits (Costello and Wilcoxon 1978; Gumprecht 1999; Slawson 2006). The early construction, extensive footprint, and longevity of this water system are evidence of its great importance to the city.

The Pueblo of Los Angeles grew in population during the Mexican period, but retained an emphasis on ranching as the primary economic activity. Mexican governors granted numerous ranchos during this period, and the few granted during the Spanish period continued to operate or were broken up into smaller ranchos.

On May 23, 1835, Los Angeles was officially declared a city by Mexican national decree (Bancroft 1886). During the Mexican period, Anglo-Americans such as Hugo Reid and Don Juan Forster were assimilated into Los Angeles's citizenry and culture (Dakin 1978).

On April 4, 1850, only two years after the Mexican American War and five months prior to California receiving statehood, the City of Los Angeles was formally incorporated. Los Angeles maintained its role as a regional business center in the early American period; the transition of many former rancho lands to agriculture and development of citriculture in the late 1800s further strengthened this status (Caughey and Caughey 1977).

These factors, combined with the expansion of port facilities and railroads throughout the region, contributed to the real estate boom of the 1880s in Los Angeles (Caughey and Caughey 1977; Dumke 1944). The boom's fiscal impact can be observed through the city's tax assessments: in 1886, Los Angeles was assessed $18 million; in 1889, the total was $46 million (Dumke 1944). Since the real estate boom largely occurred in surrounding areas, Los Angeles, as the commercial center, reaped substantial benefits from the explosive growth.

The City of Los Angeles recognized the need for water to sustain the growing population in the late 1800s, and Irish immigrant William Mulholland personified the city's efforts to establish a plentiful and stable water supply (Dumke 1944; Nadeau 1997). The city purchased

large tracts of land in the Owens Valley, and Mulholland planned and directed the construction of the 240-mile aqueduct that brought the valley's water to the city by 1913 (Nadeau 1997).

Los Angeles continued to grow in the twentieth century in part due to the discovery of oil in the area and its strategic location as a wartime port. The military presence led to the aviation and eventually aerospace industries having a large presence in the city and region.

Mines Field, which would become Los Angeles International Airport (LAX), was established in 1928. The complexion of this multicultural city continued to change; however, the process was frequently painful for new and often unwelcome ethnic groups (Garcia et al. 2004).

Hollywood became the entertainment capital of the world through the presence of film and television industries and continues to tenuously maintain that position. With nearly four million residents, Los Angeles is the second largest city in the U.S. (by population) and remains a city with worldwide influence, while continuing to struggle with its population's growth and needs.

4.2 CHRIS Literature Search

A cultural resources records search for the Regional Connector Transit Corridor project was performed by SWCA at the California Historical Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC) on February 10, 2009 (Appendix A). Subsequent requests for information were made in March, April, and May 2009. The records search included a review of the available documents and site records within a 0.25-mile radius of the project area. In addition to official maps and records, the following sources of information were consulted as part of the records search:

- National Register of Historic Places – Listed Properties (2006, updated to present)
- California Register of Historical Resources (2006, and review of minutes from State Historic Resources Commission meetings thereafter)
- California Inventory of Historical Resources (1976)
- California State Historical Landmarks (1996 and updates)
- California Points of Historical Interest (1992 and updates)
- Office of Historic Preservation Historic Property Directory and Determinations of Eligibility (2008)

- Survey of Surveys: A Summary of California's Historical and Architectural Resource Surveys (1986)
- Five Views: An Ethnic Sites Survey for California (1988)

The records search focused on obtaining information about private and public lands located within a 0.25-mile search radius of the project alignment.

4.2.1 Previous Studies in 0.25-mile Radius of APE

Downtown Los Angeles has been the subject of a large number of cultural resources studies in the last three decades. The SCCIC records search identified 143 prior cultural resources studies within a 0.25-mile radius of the direct APE. Of these, 23 studies were located within the direct APE and 12 were adjacent to the direct APE (Table 4-1).

4.2.3 Historic Maps

A review of historic maps, including Sanborn Fire Insurance Maps, indicate a long and varied occupation history within the project Direct APE. Generally speaking, Los Angeles expanded from the original plaza (near today's N. Los Angeles and W. Arcadia Streets) to the west and south, and subsequently to the north and east. In terms of the current project, the city's development proceeded from the northeast to the southwest ends of the direct APE.

Sanborn maps from 1888 show nearly every parcel in the direct APE developed with commercial or residential buildings. The heaviest development is shown in the part of the direct APE between Alameda Street and Hill Street. Numerous commercial buildings such as hotels, banks, restaurants, and government buildings were located within this part of the direct APE. The western and southern parts of the direct APE, primarily along 2nd Street between Hill and Flower Streets and on Flower Street between 2nd and 7th Streets, were less heavily developed. Parcels within this part of the direct APE contained one or two buildings, primarily private residences, on large lots or were not developed at all. Street alignments for Flower and Temple Streets differ from their current alignments. The 1888 Sanborn shows Flower Street extending further north to Temple Street and Temple Street ending at Main Street.

Sanborn Maps from 1951 show the direct APE between Alameda and Hill Streets continuing as an area dense with commercial and government buildings. The parts of the direct APE along 2nd Street between Hill and Flower Streets and on Flower Street between 2nd and 7th Streets are shown as more developed but continue to be primarily a residential area containing numerous apartment buildings and private residences.

A review of historic maps indicates that the route of the zanjas, Los Angeles' original domestic and irrigation water system, cross the direct APE in numerous locations. The original water system consisted of the main ditch, the Zanja Madre, and several branch ditches that flowed south and southwest into the city and beyond. A ca. 1880 map of the zanja system (reproduced in Gumprecht 1999) indicates that the route of the Zanja Madre and Zanjas 3, 4, 5, and 8 cross the project area in the northeastern part or the project direct APE. In addition, route of the West Branch Zanja 8R crosses the southwestern part of the direct APE.

Figure 4-1 depicts the approximate layout of the Los Angeles zanja system in 1880 in relation to the direct APE. This overlay is a digitization of Gumprecht's (1999:72) map of the system, which is based on a tracing of H.J. Stevenson's 1876 map of Los Angeles. The digitization uses the latest georeferencing tools (ArcGIS 9.3) to overlay Gumprecht's map on current (2009) County of Los Angeles parcel data. However, street alignments have changed, often dramatically, and the zanjas have been altered (moved, changed, or destroyed) to an unknown extent over the last 130 years. The margin of error inherent to Gumprecht's and Stevenson's maps is also unknown. Finally, these data have not been verified archaeologically within the direct APE. Consequently, Figure 4-1 should be thought of as an informed approximation of the location of the zanjas, but not as an "as built" plan of their current alignments.

4.3 Sacred Lands Files Search

SWCA initiated a Sacred Lands File Search for the project on February 3, 2009. SWCA contacted the California Native American Heritage Commission (NAHC) by letter to request a review of the Sacred Lands File. The NAHC responded on February 9, 2009, and stated that there are Native American cultural resources present in the project area and provided a list of Native American groups and individual contacts for Los Angeles County.

Figure 4-1. Archaeological Resources within Direct APE including the Los Angeles Zanja System (Approximate Alignment)

4.4 Archaeological Survey

4.4.1 Survey Methods

SWCA Archaeologists John Dietler and Gini Austerman conducted an intensive-level archaeological survey of the original 1.8-mile-long direct APE on March 16, 2009. SWCA Archaeologist Robert Ramirez conducted an additional survey on April 7, 2009, to account for revisions in the project direct APE. Dr. Dietler conducted another survey of the additional 0.1 mile length of alignment where the Fully Underground LRT Alternatives differ from the previously analyzed Underground Emphasis LRT Alternative on January 7, 2010 of the portions of the direct APE associated with the Fully Underground alternatives. The archaeologists conducted pedestrian surveys using parallel transects spaced no more than 10 m (32.8 feet) apart. For most of the direct APE, this amounted to walking along paved sidewalks, either singly or in pairs. The archaeologists paid special attention to areas with exposed soil, which consisted primarily of planters and other landscaped areas.

SWCA archaeologists inspected the direct APE for the presence of archaeological deposits where ground visibility and access was possible. They took digital photographs of each street within the direct APE. All field notes, digital photographs, and records related to the current study are on file at SWCA's South Pasadena office. At the conclusion of the project, these materials will be transitioned to Metro for archiving.

4.4.2 Survey Results

Ground visibility was extremely poor (less than 5 percent) throughout most of the direct APE due to the presence of buildings, pavement, and/or landscaping.

Three areas of the direct APE were inaccessible due to the presence of construction site fences. These included sidewalks in the following locations:

- Northeast corner of parcel at 2nd Street and Spring Street (Assessor's Parcel Number [APN] 5149008032; see Figure E-5 in Appendix E)
- Parcel at 2nd Street and Main Street (APN 5149001902; see Figure E-5 in Appendix E)
- Parcel at Alameda Street between Temple Street and Ducommun Street (APN 5173006900; see Figure E-7 in Appendix E)

Numerous planters and unpaved areas that afforded fair to good (20–70 percent) visibility are present within the APE. These areas contained modern trash and the occasional un-diagnostic brick fragment. Planters and unpaved areas are present at the following locations:

- Parcels at Flower Street between 4th Street and 3rd Street (APN 5149001902; see Figure E-3 in Appendix E)

- Parcels and medians along W. General Thad Kosciuszko Way and Flower Street between 3rd Street and S. Grand Street (APNs 5151014033, 5151004911, 5151004912, 5151004913; see Figures E-3 through E-5 in Appendix E)
- Parcel at Los Angeles Street south of 2nd Street (APN 5161026035; see Figure E-6 in Appendix E)
- Parcels on 2nd Street between Central Avenue and Alameda Street (APNs 5161018007, 5161018011; see Figure E-6 in Appendix E)
- Parcels on Alameda Street between 2nd Street and 1st Street (APNs 5161018011, 5161018020, 5163001088; see Figure E-6 in Appendix E)
- Parcels at Los Angeles Street and Temple Street (APNs 5161013904, 5161014901; see Figure E-7 in Appendix E)
- Parcels on 1st Street between Alameda Street and Garey Street (APNs 5173011901, 5173011901; see Figure E-8 in Appendix E)

SWCA archaeologists encountered a single archaeological site within the direct APE, RC-1. This resource is described below. The five previously recorded archaeological sites (CA-LAN-887H, CA-LAN-3588, P-19-003338, P-19-003339, and P-19-003097) within the direct APE were encountered during ground-disturbing construction activities associated with earlier projects. They were not visible during this pedestrian survey.

Portions of Section 4.4.2 removed to protect confidential locations of archeological resources.

Portions of Section 4.4.2 removed to protect confidential locations of archeological resources.

Section 4.4.3 removed to protect confidential locations of archeological resources.

Section 4.4.3 removed to protect confidential locations of archeological resources.

Section 4.4.3 removed to protect confidential locations of archeological resources.

5.0 IMPACTS

The majority of the direct APE (see Figures E-1 through E-9, Appendix E) should be considered highly sensitive for the presence of historical resources, including both prehistoric and historic archaeological sites. Five previously recorded archaeological sites, all of historic age, are located within the Direct APE.

Sanborn maps indicate that most parcels within the direct APE were occupied by commercial or residential buildings by 1888. Additional historic maps indicate that the routes of seven zanjas (Zanja Madre and Zanjas 8-R, 8, 5, 4, 3, and 6-1) cross parts of the direct APE. Archaeological studies that have been undertaken in the project vicinity support the map data: subsurface archaeological deposits, including zanja segments, are commonly encountered during construction projects in downtown Los Angeles.

For the proposed project's cumulative impact analysis, the potentially affected cultural resources under consideration include those located within the indirect APE, which is generally bounded by US 101 to the north, Center Street to the east, 3rd Street to the south, and Figueroa Street to the west. The indirect APE, as well as adjacent areas in and around downtown Los Angeles, includes some of the oldest sections of the City of Los Angeles. In these areas there are numerous examples of historic properties and historical resources (including archaeological resources) that are significant on local, state, and/or national levels.

In support of this analysis, lists have been compiled of major projects that are anticipated to be completed within the general project area prior to the start of construction (2009 to 2014) and during the projected construction period (2014 to 2018). These include 20 major renovation projects, 66 new construction projects, and 14 large transportation projects. No major utility projects were identified.

Direct cumulative impacts to archaeological resources generally occur when the destruction or substantial modification of resources or their contexts result in the degradation of resource significance. Indirect cumulative impacts generally occur when the context of a resource is destroyed or modified. Projects that do not include substantial ground disturbance are unlikely to cause direct cumulative effects to archaeological resources. The primary cumulative impact concern in this evaluation is the systematic demolition or alteration of archaeological resources.

5.1 No Build Alternative

5.1.1 Construction Impacts

The No Build Alternative, in which the project site would remain in its existing condition, would not result in construction impacts to archaeological resources because no ground disturbance would occur.

5.1.2 Operational Impacts

The No Build Alternative would not result in operational impacts to archaeological resources.

5.1.3 Cumulative and Indirect Impacts

The No Build Alternative would not result in impacts to archaeological resources. Therefore, the No Build Alternative would not contribute to a cumulative impact on these resources.

5.2 Transportation System Management (TSM) Alternative

5.2.1 Construction Impacts

The TSM Alternative has the potential to alter, remove, or destroy archaeological resources within the APE during ground disturbance related to construction of bus stops and shelters. These facilities will be constructed every two to three blocks, but their precise locations have not yet been established.

The TSM Alternative crosses the Los Angeles zanja system, including the Zanja Madre (CA-LAN-887H) and the approximate alignments of Zanjas 3, 4, 5, 8, and 8-R. These alignments have not been confirmed archaeologically within the direct APE, but zanja segments have been observed in the project vicinity as shallow as 0.45 m (1.5 feet) below current grade (Zanja 6-1; P-19-003352). The potential to affect previously unrecorded archaeological resources elsewhere in the direct APE is high. Such damage to archaeological resources would represent a significant effect that could be mitigated. Implementation of Mitigation Measures (MM) A-1 and MM-A-2 would reduce this potential effect to less-than-significant level.

5.2.2 Operational Impacts

The TSM Alternative would not result in operational impacts to archaeological resources.

5.2.3 Cumulative and Indirect Impacts

Construction of the TSM Alternative, as stated above, has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources and the Los Angeles zanja system. Implementation of MM-A-1 (see Section 6.1) would reduce direct impacts to previously unidentified archaeological resources to less-than-significant level. Therefore, the TSM Alternative would not contribute to a cumulative impact on these resources.

The zanja system is a large, linear resource that winds throughout downtown Los Angeles and may be found immediately below current street grade. It has been affected by at least five previous construction projects and is likely to be affected by numerous future projects.

The system as a whole has not been documented by historians, archaeologists, or architectural historians in the modern era because it has been obscured by pavement and buildings for more than a century. Consequently, the zanja system is particularly vulnerable to cumulative impacts that would not be adequately addressed with standard archaeological mitigation measures. By providing documentation and interpretation of the zanja system on a system-wide scale, implementing MM-A-2 (see Section 6.1) would reduce both direct and cumulative impacts to this resource to less-than-significant level.

5.3 At-grade Emphasis Light Rail Transit (LRT) Alternative

5.3.1 Construction Impacts

The At-Grade Emphasis LRT Alternative has the potential to alter, remove, or destroy archaeological resources within the APE. Site RC-1, a historic brick alignment (see Section 4.4.2), may be affected during ground disturbance from construction of a proposed pedestrian bridge at the intersection of Temple and Alameda Streets.

Site RC-1 appears to be not eligible for National Register or California Register listing. However, previously unrecorded parts of the site that retain substantial integrity may be present. This alternative also has the potential to affect previously unrecorded archaeological resources during ground disturbance from constructing new underground tunnel segments on Flower Street between 7th Street and Hope Street; new stations proposed at Main/1st Streets, Los Angeles/1st Streets, 2nd/Hope Streets, and Flower/6th/5th Streets; and an automobile underpass and pedestrian overpass on Alameda Street at Temple Street. Such damage to archaeological resources would represent a significant effect that could be mitigated. Implementing MM-A-1 (see Section 6.1) would reduce this effect to a less-than-significant level.

5.3.2 Operational Impacts

The At-Grade Emphasis LRT Alternative would not result in operational impacts to archaeological resources.

5.3.3 Cumulative and Indirect Impacts

Construction of the At-Grade Emphasis LRT Alternative has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources and previously undiscovered portions of site RC-1. However, implementing MM-A-1 would reduce this effect/impact to a less-than-significant level. Therefore, this alternative would not contribute to a cumulative impact on these resources.

5.4 Underground Emphasis LRT Alternative

5.4.1 Construction Impacts

The Underground Emphasis LRT Alternative involves substantial ground disturbance, and therefore has the potential to alter, remove, or destroy archaeological resources within the APE. It has the potential to affect archaeological resources during ground disturbance from constructing a new underground tunnel along its entire route; underground stations on 2nd Street (either at Broadway or at Los Angeles Street), 2nd/Hope Street, and Flower/5th/4th Streets; an automobile underpass on Alameda Street between 2nd and Temple Streets; and a potential pedestrian bridge at the intersection of Alameda and 1st Streets.

Potentially affected resources include site CA-LAN-3588 and the Los Angeles zanja system (specifically Zanjas 3, 4, 5, and 8; see Figure 4-1). Although the precise location and local integrity of the zanjas have not been established, the project's 2nd Street alignment likely crosses the system multiple times.

Archaeological remains associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect that could be mitigated. Construction of new stations would almost certainly affect any extant archaeological resources within their footprints. Construction of new tunnel segments through deep tunneling, as opposed to cut-and-cover techniques, could avoid effects to shallow archaeological resources, although the maximum depth of these resources and minimum depth of construction would both need to be established prior to reaching this conclusion. Implementing MM-A-1 and MM-A-2 (see Section 6.1) would reduce this effect to a less-than-significant level.

5.4.2 Operational Impacts

The Underground Emphasis LRT Alternative would not result in operational impacts to archaeological resources.

5.4.3 Cumulative and Indirect Impacts

Construction of the Underground Emphasis LRT Alternative has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and site CA-LAN-3588. Implementing MM-A-1 would reduce potential direct impacts to previously unidentified archaeological resources to a less-than-significant level. Therefore, the Underground Emphasis LRT Alternative would not contribute to a cumulative impact on unidentified archaeological resources. Implementing MM-A-2 would reduce both direct and cumulative potential impacts to the Los Angeles zanja system to a less-than-significant level.

5.5 Fully Underground LRT Alternative- Little Tokyo Variation 1

5.5.1 Construction Impacts

The Fully Underground LRT Alternative-Little Tokyo Variation 1 involves substantial ground disturbance, and therefore has the potential to alter, remove, or destroy archaeological resources within the APE. It has the potential to affect archaeological resources during ground disturbance from constructing a new underground tunnel along its entire route; underground stations at 2nd Street/Broadway, 2nd/Hope Street, Flower/5th/4th Streets, and 2nd/Central Avenue; and portals at 1st /Hewitt Streets and Alameda/Temple Streets.

Potentially affected resources include sites CA-LAN-3588, P-19-003338, and P-19-003339 and the Los Angeles zanja system (specifically Zanjas 3, 4, 5, and 8; see Figure 4-1). Although the precise location and local integrity of the zanjas have also not been established, the project's 2nd Street alignment likely crosses the system multiple times. Archaeological remains associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect that could be mitigated.

Construction of new stations would almost certainly affect any extant archaeological resources within their footprints. Construction of new tunnel segments through deep tunneling, as opposed to cut-and-cover techniques, could avoid effects on shallow archaeological resources, although the maximum depth of these resources and minimum depth of construction would both need to be established prior to reaching this conclusion. Implementing MM-A-1 and MM-A-2 (see Section 6.1) would reduce this effect to a less-than-significant level.

5.5.2 Operational Impacts

The Fully Underground LRT Alternative-Little Tokyo Variation 1 would not result in operational impacts to archaeological resources.

5.5.3 Cumulative and Indirect Impacts

Construction of the Fully Underground LRT Alternative-Little Tokyo Variation 1 has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and sites CA-LAN-3588, P-19-003338, and P-19-003339. Implementing MM-A-1 would reduce potential direct impacts to previously unidentified archaeological resources to a less-than-significant level. Therefore, the Fully Underground LRT Alternative-Little Tokyo Variation 1 would not contribute to a cumulative impact on unidentified archaeological resources. Implementing MM-A-2 would reduce both direct and cumulative potential impacts to the Los Angeles zanja system to a less-than-significant level.

5.6 Fully Underground LRT Alternative- Little Tokyo Variation 2

5.6.1 Construction Impacts

The Fully Underground LRT Alternative-Little Tokyo Variation 2 involves substantial ground disturbance, and therefore has the potential to alter, remove, or destroy archaeological resources within the APE. It has the potential to affect archaeological resources during ground disturbance from constructing a new underground tunnel along its entire route; underground stations at 2nd Street/Broadway, 2nd/Hope Street, Flower/5th/4th Streets, and 2nd/Central Aveune; and portals at 1st /Hewitt Streets, 1st/Garey Streets, and Alameda/Temple Streets.

Potentially affected resources include sites CA-LAN-3588, P-19-003338, and P-19-003339 and the Los Angeles zanja system (specifically Zanjas 3, 4, 5, 8, and 6-1; see Figure 4-1). Although the precise location and local integrity of the zanjas have not been established, the project's 2nd Street alignment likely crosses the system multiple times.

Archaeological remains associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect that could be mitigated. Construction of new stations would almost certainly affect any extant archaeological resources within their footprints.

Construction of new tunnel segments through deep tunneling, as opposed to cut-and-cover techniques, could avoid effects on shallow archaeological resources, although the maximum depth of these resources and minimum depth of construction would both need to be established prior to reaching this conclusion. Implementing MM-A-1 and MM-A-2 (see Section 6.1) would reduce this effect to a less-than-significant level.

5.6.2 Operational Impacts

The Fully Underground LRT Alternative-Little Tokyo Variation 2 would not result in operational impacts to archaeological resources.

5.6.3 Cumulative and Indirect Impacts

Construction of the Fully Underground LRT Alternative-Little Tokyo Variation 2 has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles zanja system, and sites CA-LAN-3588, P-19-003338, and P-19-003339. Implementing MM-A-1 would reduce potential direct impacts to previously unidentified archaeological resources to a less-than-significant level. Therefore, the Fully Underground LRT Alternative-Little Tokyo Variation 2 would not contribute to a cumulative impact on unidentified archaeological resources. Implementing MM-A-2 would reduce both direct and cumulative potential impacts to the Los Angeles zanja system to a less-than-significant level.

6.0 POTENTIAL MITIGATION MEASURES

Direct impacts to archaeological resources are typically mitigated on a project-specific basis by construction monitoring, testing, and data recovery. This approach to mitigation is adequate for small archaeological sites, including many prehistoric sites and the historic sites that are commonly encountered within urban settings, such as building foundations, privies, and artifact deposits. However, it may not be adequate for large, linear resources such as water conveyance systems because most projects in established urban areas encounter and mitigate impacts only on small segments of these resources.

Even the most comprehensive investigation of a small segment of a large, linear resource may fail to provide adequate documentation and contextual information for the system as a whole. These linear resources are repeatedly affected by construction projects because of their large spatial extent, resulting in the loss of contributing segments and, ultimately, system integrity.

The successive destruction of multiple linear resource segments without adequate documentation of the broader system constitutes a significant and adverse impact to the system that could be cumulatively considerable. The Los Angeles zanja system is a large, linear resource that is vulnerable to such cumulative impacts because it is almost entirely buried beneath the City's streets. These potential impacts and corresponding mitigation measures are discussed below.

6.1 Construction Impact Mitigation Measures

Portions of Section 6.1 removed to protect confidential locations of archeological resources.

Mitigation Measure 1 (MM-A-1): Treatment of Undiscovered Archaeological Resources

A detailed Cultural Resources Monitoring and Mitigation Plan (CRMMP) would be prepared prior to implementing this project, similar in scope to the CRMMP that was prepared for Metro's Eastside Gold Line Transit Corridor (Glenn and Gust 2004). Implementing a CRMMP during ground disturbance in highly sensitive archaeological areas would ensure that cultural resources are identified and adequately protected.

If cultural resources are discovered or if previously identified resources are affected in an unexpected manner, the CRMMP would ensure that such resources receive mitigation to reduce the impact to a less-than-significant level. This plan would include, but not be limited to, the following elements:

- Worker training;
- Archaeological monitoring;
- The scientific evaluation and mitigation of archaeological discoveries;
- Native American participation, as needed;
- Appropriate treatment of human remains, if applicable; or
- Reporting of monitoring and mitigation results.

Worker Training

Prior to initiating ground-disturbing activities, a qualified archaeologist would conduct a short awareness training session for all construction workers and supervisory personnel. The session would explain the importance of and legal basis for protecting significant archaeological resources.

Each worker would also learn the proper procedures to follow in the event cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection and the immediate contact of their supervisor and the archaeological monitor.

This worker education session could include visual representations of artifacts (prehistoric and historic) that might be found in the project vicinity, and it could take place on-site immediately prior to the start of ground disturbance. Supervisory personnel may benefit from longer training sessions, while a brief training would suffice for non-supervisory workers. The

brief (approximate 30- to 45-minute) training session may be conducted on-site by video, PowerPoint presentation, or similar media.

Archaeological Monitoring, Evaluation, and Mitigation

Due to poor surface visibility and high archaeological sensitivity of the direct APE an archaeological monitor would be present during ground-disturbing activities in archaeologically sensitive areas. This would reduce the potential level of impact to buried archaeological resources to a less-than-significant level. This work would be completed under the direction of an archaeologist (Principal Investigator) who meets the Secretary of the Interior's Standards for archaeologists. An adequate number of monitors would be present to ensure that all earth-moving activities are observed and would be on-site during all grading activities for areas to be monitored.

During the original excavation of previously undisturbed soils, the archaeological monitor(s) would be on-site at a frequency determined by the Principal Investigator. Inspection frequency may vary based on the rate of excavation, the materials excavated, and the presence and abundance of artifacts and features. Full-time monitoring is warranted within one-half block of potentially significant archaeological resources that are known or suspected to be present within the direct APE.

If potentially significant archaeological resources are exposed during ground-disturbing activities, the project manager would be notified immediately. Archaeological monitor(s) would have the authority to divert or temporarily halt ground-disturbing operations in the area of discovery to allow the resources to be evaluated. Construction activities may continue in other areas.

Evaluation of such resources is typically accomplished by a test-level excavation designed to determine the horizontal and vertical extent of the resource, and to characterize its contents. If the discovery proves to be potentially eligible for listing on the National Register or California Register, and project plans cannot be altered to avoid affecting the site, then an adverse effect would result. This adverse effect may be resolved by implementing a Memorandum of Agreement (MOA) between Metro and the State Historic Preservation Officer.

Before construction activities are allowed to resume in an affected area, artifacts would be recovered and features recorded using professional archaeological methods. The Principal Investigator operating under the direction of the MOA would determine the amount of material to be recovered for an adequate artifact sample for analysis.

All cultural material collected during the construction monitoring program would be processed using professional archaeological methods. An appropriate sample of recovered materials, selected by the Principal Investigator, would be curated at a curation facility that

meets federal standards per 36 Code of Federal Regulations [CFR] Part 79 and made available to other archaeologists and researchers for further study.

Native American Participation

If Native American cultural resources (i.e., prehistoric or ethnohistoric-period artifacts, food remains, or features associated with Native Americans) are exposed during project-related ground disturbance, Metro would contact the Gabrielino/Tongva San Gabriel Band of Mission Indians and the Tongva Ancestral Territorial Tribal Nation. Both groups have expressed interest in the project. One or both of these groups would be asked to provide the services of a trained Native American consultant to monitor ground-disturbing work in the area containing the Native American cultural resources. This monitoring would occur on an as-needed basis, and would be intended to ensure that Native American concerns are taken into account during the construction process.

Human Remains

The discovery of human remains is always a possibility during ground disturbance. An unmarked early Spanish period Native American cemetery was recently discovered less than 0.15 mile from the direct APE (Applied Earthworks 1999). Other historic period remains are known less than 0.3 mile from the direct APE as well.

The State of California Health and Safety Code Section 7050.5 addresses these findings. This code section states that when human remains are encountered, no further disturbance would occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code (PRC) Section 5097.98. The County Coroner would be notified of the find immediately.

If the human remains are determined to be prehistoric, the Coroner would notify the Native American Heritage Commission, which would determine and notify a Most Likely Descendant (MLD). The MLD shall complete inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Impacts to human remains may remain significant even after mitigation.

Reporting

If no cultural resources are discovered in the course of construction monitoring, a brief letter to that effect would be prepared by the consulting archaeologist, indicating that the monitoring activities have been satisfied. If previously unidentified cultural resources are discovered in the course of construction monitoring, a report would be prepared following Archaeological Resource Management Report (OHP 1990) guidelines that documents field and analysis results and interprets the data within an appropriate research context.

Mitigation Measure 2 (MM-A-2): Treatment of Known Archaeological Resources

Destruction of a resource that is eligible for listing in the National Register or California Register would be a significant adverse effect. This effect may be resolved through by implementing an MOA between FTA, Metro, and the SHPO, as well as other interested parties.

Four archaeological sites that are either within or immediately adjacent to the direct APE are presumed eligible for listing on both the National Register and the California Register. These include the Los Angeles zanja system (the Zanja Madre, CA-LAN-887H, and numerous unrecorded numbered zanjas) and sites CA-LAN-3588, P-19-003338, and P-19-003339.

Effects to the data potential of archaeological sites can be mitigated to a less than significant level by preparing and implementing a data recovery plan under Section 106 and CEQA. The actual measures agreed upon in the MOA may vary in substance and degree, but the MOA would include a process to resolve any adverse effects upon archaeological resources within the direct APE that are eligible for listing in the National Register or California Register. The treatment of sites CA-LAN-3588, P-19-003338, and P-19-003339 may include systematic and scientific exposure, evaluation, and if necessary, archaeological data recovery.

Los Angeles Zanja System

The Los Angeles zanja system was an extensive and integrated water conveyance network that served large areas of the City for multiple generations. Generally speaking, previous construction projects in downtown Los Angeles have unexpectedly encountered and documented limited exposures of a single zanja segment, often after the segment has been damaged by construction equipment. This incomplete approach does not permit the overall zanja system to be evaluated, given the requirements that the OHP clarified in its recent letter (Toffelmier 2009).

It is likely that other projects (such as emergency utility repair) have damaged segments of the zanja system without documentation. This repeated damage (both monitored and unmonitored construction impacts) constitutes a cumulative effect that should be mitigated. Construction monitoring alone is insufficient mitigation to address this effect, particularly given the likelihood of damaging the zanjas prior to discovery during project construction process.

Inadvertent project-related damage to the zanjas may constitute an adverse effect under the Criteria of Adverse Effect, "physical destruction or damage" (36 CFR Part 800.5(a) (2) and material impairment as defined in CEQA. This action would contribute to, rather than mitigate, these cumulative effects.

Both Section 106 of the National Historic Preservation Act (as amended) and the California Environmental Quality Act require identification, documentation, and evaluation of historic

properties/historic resources in a project area (or direct APE). For a poorly mapped and buried linear resource like the zanja system, identification alone is challenging.

Rather than a costly archaeological excavation program or a remote sensing (ground-penetrating radar, etc.) survey that is unlikely to produce clear-cut results, SWCA recommends a proactive identification and documentation program that would facilitate preservation or mitigation in a cost-effective manner. This would include using additional documentary research to identify, as accurately as possible, the precise alignments of the zanjas within the APE. Where these alignments are expected to be affected by the proposed project, particularly where cut-and-cover or other near-surface construction techniques (as opposed to tunneling 20 or more feet below the ground surface) are planned in the vicinity of mapped zanja segments, full-time archaeological monitoring would be instituted to ensure documentation. The archaeological monitors would work closely with equipment operators to ensure that every effort is made to avoid damaging zanja segments prior to their adequate documentation.

Documenting and evaluating the Los Angeles zanja system would be best accomplished with a system-wide approach that incorporates historical, archaeological, and engineering research and documentation. This systemic approach to documentation and evaluation is a particularly appropriate mitigation measure for the Regional Connector Transit Corridor project, which has the potential to impact multiple zanja segments. Documentation of the zanja segments' alignments and slopes would have the added benefit of enabling future projects to more accurately predict the location of zanja segments outside of the project area.

To mitigate potential impacts to the Los Angeles zanja system, the project MOA would provide that the system be adequately documented under the direction of an experienced archaeologist and an experienced historical architect, architectural historian, or historian, both meeting the Secretary of the Interior's qualification standards. This documentation would include a combination of historical research, archaeological testing, and architectural documentation, and would be followed by a formal evaluation of National Register and California Register eligibility.

It should be noted that substantial documentation already exists for the zanja system in the form of maps and engineering records, published books and articles, unpublished technical reports, and site records. The collation of available data for the system as a whole would accomplish much of the documentation effort that is proposed here, while intensive, original research would be restricted to the zanja segments that cross the direct APE.

Such research and documentation may include such specific measures as:

- Historical research using historical maps, photographs, and other written sources to document creation, maintenance, modification, and abandonment of the system.

- Archaeological research to establish the physical condition, presence of associated features and artifacts, and precise location of each zanja segment within the project's direct APE by using physical exposure through controlled excavation following its discovery during construction monitoring. Resources would be documented using DPR series 523 primary and detail forms, maps, and photographs. The results would be presented in a detailed technical report following Archaeological Resource Management Report (OHP 1990) guidelines. The report would address research questions and assess the National Register and California Register eligibility of the system.

- Architectural documentation of exposed zanja segments by producing narrative records, measured drawings, and photographs in conformance with Historic American Engineering Record (HAER) standards prior to any alteration or demolition activity.

- Preserving the results of the historical, archaeological, and historic architectural studies in repositories such as the local main library branch, the lead agency headquarters library, and with identified non-profit historic groups interested in the subject matter.

- Interpretation of the Los Angeles zanja system for the public through signage along the project alignment, visual representations of zanja alignments using colored pavement, or other appropriate means such as a dedicated internet website.

6.2 Operational Impacts Mitigation Measures

Because operational impacts to archaeological resources, including both previously recorded and as-yet-undiscovered resources, are not expected for any of the project alternatives, no mitigation is required.

7.0 CONCLUSIONS

This evaluation included a review of relevant historic maps and archaeological records, a Native American coordination program, and an intensive archaeological survey of the project direct APE. The background study indicates that subsurface archaeological deposits are commonly encountered during construction projects in downtown Los Angeles.

The direct APE was found to contain five previously recorded (CA-LAN-887H, CA-LAN-3588, P-19-003097, P-19-003338, and P-19-003339) and one newly recorded (site RC-1) archaeological resources. Of these, P-19-003097 has been destroyed, RC-1 is recommended not eligible for listing in the National Register and California Register, and CA-LAN-887H, CA-LAN-3588, P-19-003338, and P-19-003339 are presumed eligible for listing in the National Register and California Register.

None of the alternatives will have operational impacts to archaeological resources, and the No Build Alternative will have no construction or cumulative impacts on archaeological resources. Construction of each of the other alternatives has the potential to alter, remove, or destroy archaeological resources within the APE, including both known and previously undiscovered archaeological resources.

Physical destruction of an archaeological resource eligible for listing in the National Register and California Register would result in an adverse effect under Section 106 regulations and a significant impact under CEQA. Potential destruction of portions of the Los Angeles zanja system could also contribute to a cumulative impact to this resource.

To address potential impacts to previously undiscovered archaeological resources, the project would include producing and implementing a detailed Cultural Resources Monitoring and Mitigation Plan (CRMMP) (MM-A-1). To address potential impacts to known archaeological resources that are eligible for listing in the National Register and California Register, the project would be implemented by treating these known resources under an MOA (MM-A-2). After mitigation, potential construction and cumulative impacts would not be significant under NEPA or CEQA.

Re: Request for a Sacred Lands File records search and Native American Contacts list for."**Regional Connector Transit Corridor Project, City and County of Los Angeles."** The project will extend the Blue Line from the 7th Street/Metro Center Terminus to the Union Station via the Little Tokyo/Arts District Station on the Metro Gold Line Extension, Los Angeles County, California

Dear Ms. Harper:

The Native American Heritage Commission was able to perform a record search of its Sacred Lands File (SLF) for the affected project area (APE). The SLF search did indicate the presence of Native American cultural resources in the project area (APE or 'area of potential effect).

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries once a project is underway. Enclosed are the names of the nearest tribes that may have knowledge of cultural resources in the project area. We recommend that you contact persons on the attached list of Native American contacts. A Native American tribe or individual may be the only source of information about a cultural resource. They may have specific knowledge as to whether or not the known cultural resources identified may be at-risk by the proposed project

Lead agencies should consider avoidance, as defined in Section 15370 of the California Environmental Quality Act (CEQA) when significant cultural resources could be affected by a project. Also, Public Resources Code Section 5097.98 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery. Discussion of these should be included in your environmental documents, as appropriate.

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

RE: Regional Connector Transit Corridor Project, City of Los Angeles, Los Angeles County, CA

Dear Ms. Alvitre:

SWCA Environmental Consultants has been retained to conduct a cultural resources survey for the Regional Connector Transit Corridor Project in the City of Los Angeles, Los Angeles County, California. As part of the process of identifying cultural resources issues for this project, the Native American Heritage Commission (NAHC) was contacted by SWCA to conduct a Sacred Lands File search and to provide a list of Native American individuals and/or tribal organizations that may have knowledge of cultural resources in or near the project area. The NAHC search "did indicate the presence of Native American cultural resources in the project area," and recommended that we consult with you directly regarding your knowledge of the presence of cultural resources that may be impacted by this project.

The Regional Connector Transit Corridor Project is a proposed transit infrastructure improvement project that would construct 1.8 miles of a new set of dual tracks in order to connect four vital travel corridors that stretch across 50 miles of Los Angeles County. The proposed project would directly link the 7th St./Metro Center Station (the Metro Blue Line and Metro Expo Line [2010] terminus) located at 7th and Figueroa Streets to the Little Tokyo/Arts District Station (a new Metro Gold Line Station opening in 2009) located at 1st and Alameda Streets. The project would include the construction of several new Metro stations in Downtown Los Angeles and would create direct trains between Long Beach and Pasadena, as well as East Los Angeles and Culver City. It would also provide passengers with direct trains into the heart of the business and civic districts. These improvements would provide regional benefits to people throughout Los Angeles County.

Metro will evaluate the following four (4) alternatives in a Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR):

- No Build (Baseline)
- Transportation System Management (TSM)
- At-Grade Emphasis LRT Alternative
- Underground Emphasis LRT Alternative

Please refer to the enclosed project maps, Figure 2-2A (At-Grade Emphasis LRT Alternative Alignment and Configuration) and Figure 2-2B (Underground Emphasis LRT Alternative Alignment and Configuration) for an overview of the proposed alignments.

SWCA
ENVIRONMENTAL CONSULTANTS

Ground disturbing construction activities associated with the at-grade portions of the At-Grade Emphasis LRT Alternative are anticipated to a maximum depth of 20 feet below grade. Ground disturbing activities for the underground portions of the At-Grade Emphasis LRT Alternative and the Underground LRT Alternative are anticipated to an approximate maximum depth of 100 feet below grade.

Archaeological and Built-Environment Survey Reports are being prepared by our technical staff, however, we acknowledge that some areas may contain values not readily apparent and would appreciate any such information you can provide. Please notify us in writing, if you have information on potential or identified cultural resources in the project study area by no later than close of business, **Thursday, April 30, 2009**. If we do not receive a response, we will follow up to ensure receipt of the letter. Please contact me with any applicable comments:

CONVERSATION RECORD

DATE 4/17/09 **TIME** 3:55 ☐ **A.M.** ☒ **P.M.**

NAME OF CONTACT Anthony Morales
COMPANY/AGENCY Gabrielino/Tongva San Gabriel Band of Mission Indians
PHONE NUMBER
PROJECT NAME Regional Connector Transit Corridor Project **PROJECT NO.** 14104

Notes:

On 4/17/09 Mr. Morales called to discuss the letter that he received regarding the proposed Regional Connector Transit Corridor Project (Regional Connector). At first he thought the letter was in regards to construction on Alameda Street related to the Gold Line Extension. Mr. Morales was concerned that so much construction is underway for that project, and he had not been contacted about it by an archaeologist (or anyone). He said that he was concerned about that project because if its proximity to the village of Yangna and the Metropolitan Water District (MWD) building. He expressed dismay that MTA had never contacted him about the project.

I explained that the project that we are working on is Regional Connector that would connect the Red Line station at 7th/Flower with the Gold Line Extension station at Alameda/Temple.

Mr. Morales said that he had similar concerns about Regional Connector's proximity to the village of Yangna. In addition, Mr. Morales said that he considers the project area to be highly sensitive for Native American resources and sacred places considering that this is in the heart of the city.

Mr. Morales said that he is aware of the fact that cultural resources have been uncovered during the construction of pipelines in the downtown area, and that human remains were uncovered during construction of the MWD [Metropolitan Water District] building.

Mr. Morales wants the MTA [Metro] to know that a local tribe—the Gabrielino--has concerns.

PROJECT-RELATED FTA/SHPO CORRESPONDENCE

Preserving America's Heritage

March 31, 2009

Mr. Roger Snoble
Chief Executive Officer
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, CA 90012-2952

RE: ***Regional Connector Transit Project***
Los Angeles County, California

Dear Mr. Snoble:

On March 17, 2009, the Advisory Council on Historic Preservation (ACHP) received your invitation to participate in the environmental review process for the referenced undertaking pursuant to Section 6002 of the *Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users* (SAFETEA-LU). At this time, we do not expect to attend meetings or provide formal comments at environmental review milestones. However, we retain the right to become involved in the environmental review for this action in the future if, based on information provided by the Federal Transit Administration (FTA) or other consulting parties, we determine that our involvement is warranted.

In order to ensure compliance with Section 106 of the *National Historic Preservation Act,* the ACHP encourages FTA to initiate the Section 106 process by notifying, at its earliest convenience, the appropriate State Historic Preservation Officer (SHPO) and/or Tribal Historic Preservation Officer (THPO), Indian tribes, and other consulting parties pursuant to our regulations, "Protection of Historic Properties" (36 CFR Part 800). Through early consultation, FTA and your agency will be able to determine the appropriate strategy to ensure Section 106 compliance for this undertaking. Please note that FTA, as the federal agency, must be involved in the notification of consulting parties.

FTA and the Los Angeles County Metropolitan Transportation Authority should continue consultation with the appropriate SHPO/THPO, Indian tribes, and other consulting parties to identify and evaluate historic properties and to assess any potential adverse effects on those historic properties. If you determines through consultation with the consulting parties that the undertaking will adversely affect historic properties, or that the development of an agreement document is necessary, FTA must notify the ACHP and provide the documentation detailed at 36 CFR § 800.11(e). In the event that this undertaking is covered under the terms of an existing agreement document, you should follow the process it outlines.

Should you have any questions as to how your agency should comply with the requirements of Section 106, please contact Blythe Semmer by telephone at (202) 606-8552 or by e-mail at bsemmer@achp.gov.

Sincerely,

LaShavio Johnson

Attention: Dr. Susan Stratton, Supervisor, Project Review Unit

Re: Regional Connector Transit Corridor Project

Dear Mr. Donaldson:

The Federal Transit Administration (FTA), in coordination with the Los Angeles County Metropolitan Transportation Authority (LACMTA), is pleased to initiate efforts in the identification of historic properties and the analysis of effects on those properties for various components of the proposed Regional Connector Transit Corridor Project in downtown Los Angeles, California. This letter is to request your review and concurrence with the Area of Potential Effects (APE) and to delegate the authority to consult directly with the LACMTA.

Cultural resources identification and analysis will be prepared in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended, as required by the Advisory Council on Historic Preservation, with regulations contained in 36 Code of Federal Regulations (CFR), Part 800, and applicable sections of the California Environmental Quality Act (CEQA).

Project Description

The Regional Connector Transit Corridor Project is a proposed light rail transit infrastructure improvement project that would construct approximately 1.8 miles of a new set of dual tracks in order to connect four vital travel corridors that stretch across 50 miles of Los Angeles County. The proposed project would directly link the 7th Street/Metro Center Station (the terminus of the existing Metro Blue Line and Metro Expo Line under construction and opening in 2010) located at 7th and Figueroa Streets to the Little Tokyo/Arts District Station (a new Metro Gold Line Station opening in 2009) located at 1st and Alameda Streets. The project would include the construction of several new Metro stations in downtown Los Angeles and would create direct connections between Long Beach and Pasadena, as well as East Los Angeles and Culver City. It would also provide passengers with direct connections into the heart of the business and civic districts. These improvements would provide regional benefits to people throughout Los Angeles County.

Metro will evaluate the following four (4) alternatives in a Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR):

- No Build (Baseline)
- Transportation System Management (TSM)
- Build Alternative 1: At-Grade Emphasis Light Rail Transit (LRT) Alternative (includes two options for station locations)
- Build Alternative 2: Underground Emphasis LRT Alternative

Stations

Proposed station locations would include the following (depending on the selected alternative):

- Build Alternative 1:
    - Underground station on Flower Street, just north of 5th (Option A only)
    - At-grade station on Flower Street, just south of 3rd Street (Option B only)
    - Underground station just south of the intersection of Hope and Flower Streets
    - At-grade northbound only station on Los Angeles Street, just north of 1st Street
    - At-grade southbound only station on Main Street, just north of 1st Street
- Build Alternative 2:
    - Underground station on Flower Street, just north of 5th Street
    - Underground station just south of the intersection of Hope and Flower Streets
    - Underground station on 2nd Street between Broadway and Los Angeles Streets.

Area of Potential Effects

A proposed project-specific APE was established in accordance with 36 CFR Part 800.16 (d), which defines an APE as:

> the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking.

The proposed project APE (see enclosed map) was delineated to ensure identification of significant historic and architectural resources that may be directly or indirectly affected by the proposed project and are listed in or eligible for inclusion in the National Register of Historic Places (National Register) and/or California Register of Historical Resources (California Register). The APE was established using methodology consistent with those of previous LACMTA projects.

For historic and architectural resources, the proposed APE includes all parcels adjacent to both sides of the proposed project alignment, including stations, subway or open cut construction areas, and areas proposed for acquisition. In addition, the APE includes areas that may be subject to potential project-related effects, including visual or audible effects, and settlement effects that may

result from construction or implementation the proposed project. Additionally, the built environment APE includes the boundaries of two known identified historic districts that are listed in or eligible for the National Register.

For archaeological resources, the proposed APE includes the proposed at-grade and underground right-of-way and/or areas of direct ground disturbance. The APE also includes areas with permanent site improvements and areas for staging and temporary construction activities.

The proposed vertical APE extends from approximately 0 to 25 feet above the existing ground surface to approximately 100 feet below the existing ground surface.

Because the proposed project is expected to be constructed by 2018, identification efforts will be focused on parcels containing improvements constructed in or before 1968 (2018-50 years=1968). Those improvements will be evaluated for National and California register eligibility as part of the project identification phase, as well as noting all previously identified historic properties and historical resources.

Consultation Coordination

To the extent that it facilitates the review and approval process, FTA has authorized certain experienced and knowledgeable agencies to consult directly with you in addressing Section 106 requirements. In permitting this arrangement, agencies have been instructed to keep FTA informed by forwarding copies of all transmittals to our attention, and immediately contacting FTA on matters deemed to be of significant importance. Until further notice, this authority is extended to the LACMTA for the Regional Connector Transit Corridor project.

Previous scoping efforts have taken place and are expected to continue over the next several months. On behalf of FTA, the LACMTA supported by its consultants Camp Dresser and McKee (CDM) and Steven W. Carothers & Associates (SWCA), is currently contacting local historic groups, Native American groups, and other stakeholders that may have an interest in the project. The LACMTA also expects to meet with the Los Angeles Conservancy and the City of Los Angeles, Office of Historic Resources, to address their concerns.

Please let us know if you have comments on the project description, APE definition, methodology, or map. If you or your staff is interested in a site visit of the corridor, we would be pleased to accommodate your request. The LACMTA appreciates your assistance in the preservation of cultural resources related to all aspects of their transit system. If you or any members of your staff have questions, please contact Mr. Ray Tellis of our Los Angeles Metropolitan Office at (213) 202-3956.

Sincerely,

Leslie T. Rogers
Regional Administrator

Leslie T. Rodgers
Regional Administrator
U.S. Department of Transportation
Federal Transit Administration, Region IX
201 Mission Street, Suite 1650
San Francisco, CA 94105-1839

RE: Section 106 Consultation for Proposed Regional Connector Transit Corridor Project, Los Angeles, CA

Dear Mr. Rodgers:

Thank you for initiating consultation with me pursuant to 36 CFR Part 800, the implementing regulation of Section 106 of the National Historic Preservation Act of 1966 (16 U.S.C. 470f), as amended. On behalf of the U.S. Department of Transportation, Federal Transit Administration (FTA), you are both initiating consultation with me and seeking my comments on your initial documentation of the undertaking's Area of Potential Effect (APE).

As I understand it, the Regional Connector Transit Corridor Project is a proposed light rail transit infrastructure improvement project that will necessitate the construction of approximately 1.8 miles of new dual tracks. The project will connect four travel corridors that stretch across 50 miles of Los Angeles County. The proposed project will directly link the 7th Street/Metro Center Station located at 7th and Figueroa Streets to the Little Tokyo/Arts District Station located at 1st and Alameda Streets. The project will include the construction of several new Metro stations in downtown Los Angeles and would create direct connections between Long Beach and Pasadena, as well as East Los Angeles and Culver City. In addition to your project description, you have submitted descriptions of route and design alternatives, detailed aerial maps of the project area, and a summary of initial consultation efforts pertaining to potentially interested Native American groups, local government entities, and local historic preservation organizations.

Having reviewed this documentation, I have the following comments:

1) The initial APE for this undertaking has been adequately determined and documented pursuant to 36 CFR Part 800.4 (a) (1);

2) As outlined in conversations between State Historian Tristan Tozer, State Associate Archaeologist William Soule and Francesca Smith of SWCA Environmental Consultants, I will be sent draft cultural resource/built environment surveys and archaeology technical reports encompassing the project area. Once I have received this information, I will provide further comment;

3) Please submit proof of public notification and consultation, including copies of notification letters and any responses you may receive.

Thank you for considering historic resources during project planning. I look forward to continuing this consultation. If you have any questions or comments, please contact staff historian Tristan Tozer at (916) 651-0304 or email at ttozer@parks.ca.gov.

Sincerely,

Susan K Stratton for

Milford Wayne Donaldson, FAIA
State Historic Preservation Officer

Re: Zanja Madre
National Register of Historic Places Nomination

Dear Ms. Taniguchi:

Thank you for submitting the Zanja Madre National Register nomination. The nomination provides a good overview of the history of the Zanja Madre, and discusses its beginnings in 1781 as an interconnected open ditch system, the introduction of enclosed pipes to the system, and its abandonment in 1904 as the City of Los Angeles' dominate water system. The overview introduces the context in which the system's significance can be evaluated under National Register Criterion A in the area of Engineering for important associations with the urban and agricultural development of Los Angeles. However, the nomination also indicates that the Zanja Madre water system no longer retains sufficient integrity to meet National Register eligibility, and that only a 75-foot segment of the Zanja Madre is being nominated.

Segments of linear resources can meet eligibility requirements for listing on the National Register if the nominated segment retains integrity, and is sufficiently long enough to convey the significance of the resource of which it represents. The nomination does not demonstrate how this segment of the Zanja Madre meets National Register eligibility requirements under Criterion A. While the segment is "directly associated" with the Zanja Madre, the nomination does not discuss how this small segment of the extensive water conveyance system conveys the Zanja Madre's significance for important associations with the development of Los Angeles (the historic context developed in the nomination for Criterion A eligibility).

It is possible for a segment of a larger resource to meet eligibility requirements if it can be documented to be a rare surviving element of the larger system. In this case, the nomination must establish the segment as the only or best surviving element of the system and demonstrate that the segment retains the essential physical features necessary to convey historic character of the resource. Although the nomination states, "this 75 foot long segment is by far the longest example left intact from this important period in the city's history" the nomination does not establish that as fact. A discussion of all of the components that made up the Zanja Madre system, including the

underground linear features, structures, and buildings associated with the system, and an analysis of the existing conditions of extant components would be necessary to understand the rarity of the segment. The nomination would still need to establish that enough of the property is surviving to convey significance.

If you determine the segment of the Zanja Madre might have the potential to meet National Register eligibility as a rare surviving example and will be redrafting the nomination, a few technical errors will need to be addressed. We would be happy to discuss the revision suggestions for the Zanja Madre nomination with you if you feel it would be of benefit. Please contact me at 916-653-5789, ctoffelmier@parks.ca.gov.

Sincerely,

Cynthia Toffelmier
State Historian II

Regional Connector Transit Corridor
Draft Environmental Impact Statement/ Draft Environmental Impact Report

APPENDIX Z

CULTURAL RESOURCES - PALEONTOLOGY (UPDATED)

State Clearinghouse Number: 2009031043

LOCALLY PREFERRED ALTERNATIVE IMPACTS TO ARCHEOLOGICAL AND PALEONTOLGICAL RESOURCES

The Draft Technical Memoranda for Archaeological Resources and Paleontological Resources were included with the Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) that was released for public comment on September 3, 2010.This addendum serves to finalize the draft report. Two variations of the Fully Underground LRT Alternative (Little Tokyo Variation 1 and Little Tokyo Variation 2) were analyzed in this report. Little Tokyo Variation 2 was subsequently dropped from consideration, and Little Tokyo Variation 1 became the sole alignment for the Fully Underground LRT Alternative.

On October 28th, 2010, Metro's Board of Directors approved staff's recommendation to designate the Fully Underground LRT Alternative described in the publicly reviewed Draft EIS/EIR for the Regional Connector Transit Corridor as the Locally Preferred Alternative (LPA). After the close of the Draft EIS/EIR comment period, refinements were made to the LPA to reduce impacts and address comments received. This addendum incorporates those refinements. The LPA would provide a direct connection from 7th Street/Metro Center Station to the Metro Gold Line near 1st and Alameda Streets. The Metro Gold, Blue and Expo light rail lines would be connected allowing trains to operate between Claremont and Long Beach, and from Santa Monica to the Eastside. In the action for approval, the Board also directed staff to remove the property located on the southeast corner of 2nd and Spring Streets from the list of potential acquisitions as well as eliminate the station at 5th and Flower Streets. This was due to its close proximity to the existing 7th Street/Metro Center Station and a need to reduce costs. The designated LPA thus includes three new stations instead of the original four described in the Draft EIS/EIR. On January 4th, 2011, the Federal Transit Administration (FTA) authorized Metro to initiate Preliminary Engineering as part of FTA New Starts funding program. In its authorization, FTA requested that Metro among other items pursue the identification of appropriate mitigations and realize potential cost savings. Consistent with FTA's authorization, refinements to the Locally Preferred Alternative have been identified and are to be analyzed as part of the development of the Final EIS/EIR.

This addendum to the Technical Memoranda was developed to describe the project refinements to the LPA. The effects on archeological and paleontological resources are the same as what was described in the Draft Technical Memoranda.

1.0 UPDATED PROJECT DESCRIPTION

On October 28th, 2010, the Metro Board of Directors concurred with staff's recommendation to designate the Fully Underground LRT Alternative as the LPA. The LPA alignment is

essentially the same as the Fully Underground LRT Alternative, except it does not include the Flower/5th/4th Street station and has a modified route through Little Tokyo. However, it still travels under the intersection of 1st and Alameda Streets rather than crossing at-grade, and connects to the Metro Gold Line within 1st Street and north of Temple Street.

LPA refinements made since the Draft EIS/EIR to reduce impacts include:

- Relocation of the proposed tunnel boring machine (TBM) insertion site to the Mangrove property northeast of 1st and Alameda Streets in order to reduce community disruption due to construction activities
- Elimination of cut and cover construction on 2nd Street in Little Tokyo
- Extension of TBM machine operation from 2nd/Hope Street station to 4th and Flower Streets, allowing an additional block of cut and cover construction to be eliminated
- Slight modifications to tunnel depths
- Rerouting of the tunnels beneath Japanese Village Plaza in order to reduce acquisitions on the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street

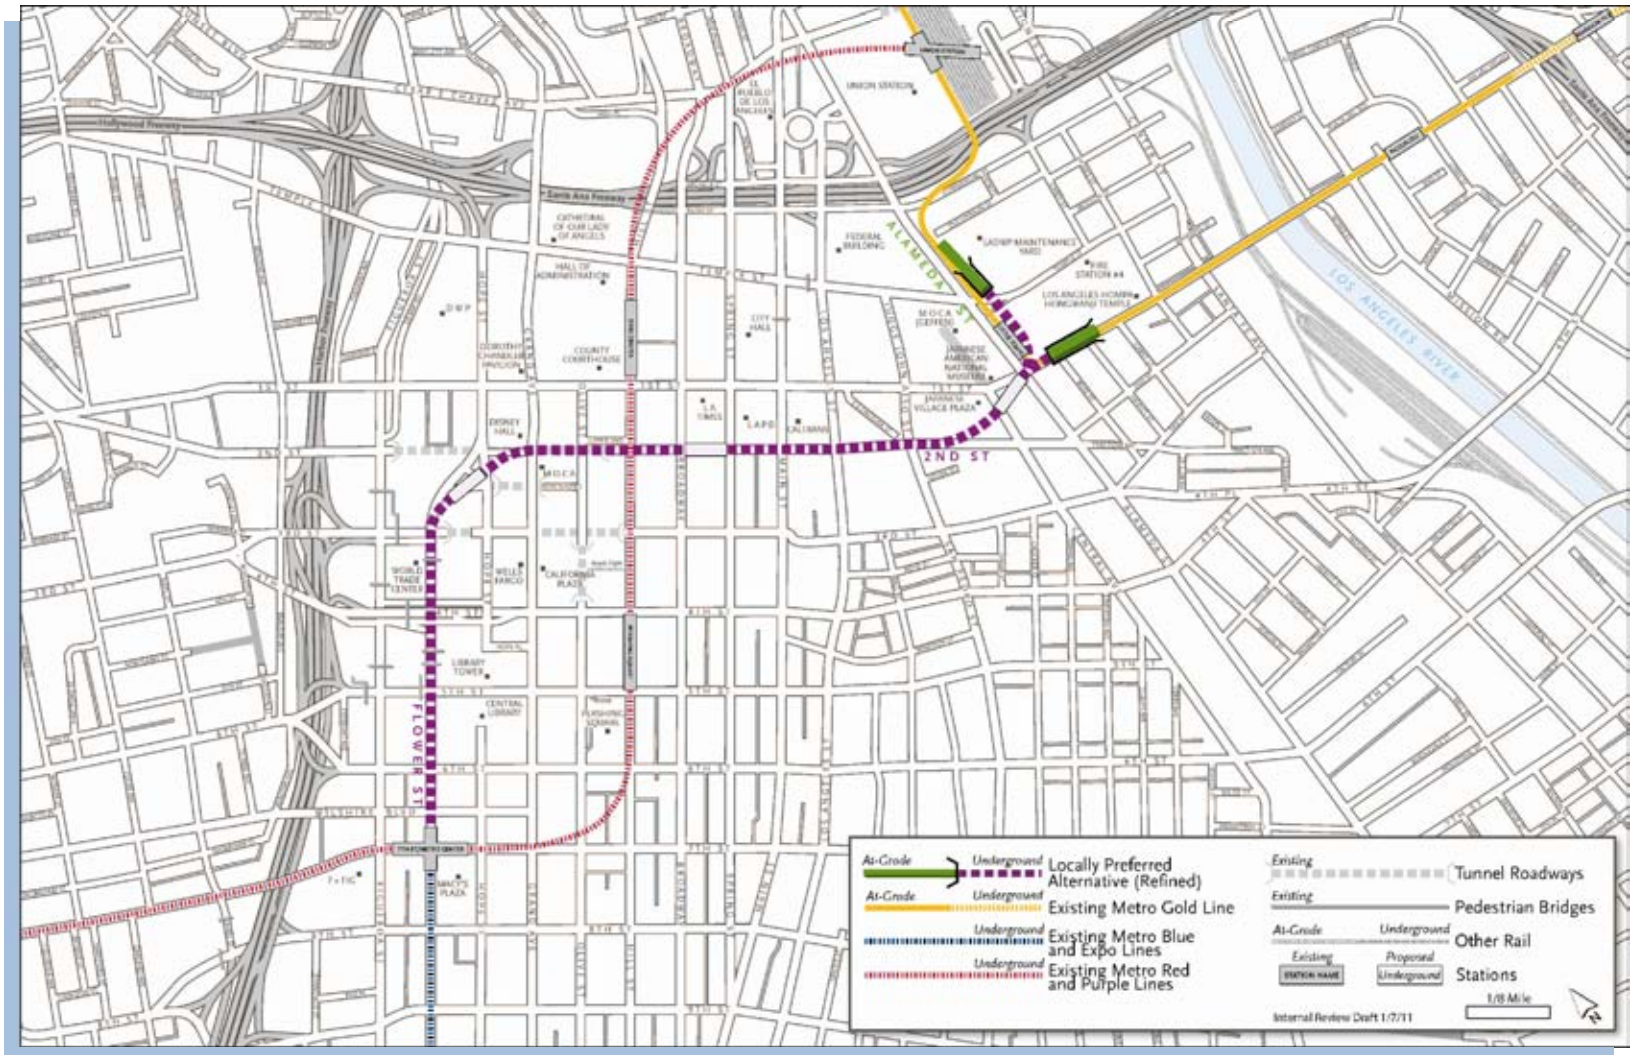

Figure 1 –Locally Preferred Alternative

1.1 Route Overview

The LPA alignment would extend north from the existing LRT platform at 7th Street/Metro Center Station and would run underneath Flower Street. An enhanced pedestrian walkway would be provided along Flower Street from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets, which would improve the pedestrian connection between the Financial District and the 7th Street/Metro Center Station. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets. A new underground station would be located just southwest of the intersection of 2nd and Hope Streets.

At 2nd and Hope Streets, a new pedestrian connection would be made to Upper Grand Avenue. A pedestrian plaza connecting to Upper Grand Avenue is currently planned above General Thaddeus Kosciuszko Way as part of the Broad Museum. Metro would construct an elevator from the station entrance to the plaza if one is not already provided. If the plaza is not built, Metro would build a pedestrian bridge to connect the elevator to Upper Grand Avenue.

Tracks would then head east underneath 2nd Street to the next proposed underground station between Broadway and Spring Street (2nd Street/Broadway station). The tracks would continue east underneath 2nd Street to just west of Central Avenue at approximately the pedestrian signal to the JVP, where the alignment would then veer northeast under privately held property and Central Avenue to a newly proposed Little Tokyo/Arts District underground station (1st/Central Avenue station). The proposed underground station would be partially located within Central Avenue and the northern half of the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street. The Señor Fish, Weiland Brewery, the former Café Cuba (The Spice Table), and associated parking would need to be acquired for construction of this station. However, the remaining businesses on that block would remain, including the Office Depot and associated parking. This station may include a small building at ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans. This shallow station may potentially be built without a roof or mezzanine, leaving the below-grade platform level exposed

An underground junction would be constructed beneath the intersection of 1st Street and Alameda Street. Two new portals would be located to the north and east of the junction, where trains would rise to the surface to connect to the Metro Gold Line heading north to Claremont and east to I-605.

One portal would be located north of Temple Street, northeast of the existing at-grade Little Tokyo/Arts District Station and Metro Gold Line tracks. This portal would rise to the north within the maintenance yard of the City of Los Angeles Department of Water and Power (LADWP) and connect to the existing LRT bridge over US 101, allowing a connection to the Metro Gold Line to Claremont. Tracks would run from the junction under 1st and Alameda Streets through a new tunnel crossing beneath Temple Street and the Mangrove property (the parcel on the northeast corner of 1st and Alameda Streets) to the new portal. This new tunnel

would run immediately east of the existing Little Tokyo/Arts District Station and Metro Gold Line tracks.

The second portal would be located within 1st Street between Alameda and Garey Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. 1st Street would be widened to the north to accommodate this second portal and maintain the existing number of through lanes. The widening would start at Alameda Street and continue east, significantly tapering down as it crosses Hewitt Street, returning to the existing condition prior to the Los Angeles Hompa Hongwanji Buddhist Temple, to join the existing 1st Street LRT tracks, just west of the 1st Street Bridge.

Access to property northeast of 1st and Alameda Streets, the Mangrove property, would need to be acquired for insertion of the TBM, to stage construction of both portals, to connect to the Metro Gold Line LRT bridge, and to construct the tunnels beneath Temple Street and the Mangrove property. During construction, tracks would be installed in this area at-grade to allow service to proceed on the Metro Gold Line while construction activities occur within the project area. Figure 2-10 provides a map of this alternative.

The existing Metro Gold Line Eastside Extension and the Little Tokyo/Arts District Station surface tracks and station would be maintained for continued service during construction with intermittent disruptions related to construction activities. Once construction is complete, operation of the current Metro Gold Line between Pasadena and East Los Angeles and the existing, at-grade Little Tokyo/Arts District Station would terminate. In its place, Metro would initiate operations on two routes:

- Between Claremont and Long Beach
- Between East Los Angeles and Santa Monica

Crossovers could be located just east of the proposed station at 2nd and Broadway Streets, underground beneath 1st Street just east of the intersection of 1st and Alameda Streets, and underground beneath the Mangrove property, north of the rail junction. In addition, a pocket track, which could also serve as a crossover, would be located beneath Flower Street between 5th and 6th Streets. The crossovers and pocket track may not be needed at these locations and may ultimately be placed in other locations. Tunnel boring machines cannot be used for construction of crossovers since underground crossover locations require cut and cover construction. More information on these construction methods is provided in the Description of Construction, Appendix K.

1.2 Operating Characteristics

The Fully Underground LRT Alternative (LPA) consolidates the Metro Gold Line, Metro Expo Line, and Metro Blue Line into the two following routes:

East-West Route (Santa Monica to I-605 via the Metro Expo Line, Regional Connector, and Metro Gold Line Eastside Extension tracks): Metro Expo Line trains from Santa Monica would travel on existing Flower Street tracks north of the junction at Washington and Flower Streets. After stopping at the existing 7th Street/Metro Center Station, the trains would continue north along the new Regional Connector tracks to a new junction beneath the intersection of 1st and Alameda Streets. Trains would then travel to a new portal on 1st Street, and continue along the Metro Gold Line Eastside Extension tracks to I-605.

North-South Route (Claremont to Long Beach via the Metro Gold Line, Regional Connector, and Metro Blue Line tracks): After stopping at 7th Street/Metro Center Station, Metro Blue Line trains from Long Beach would continue north along the new Regional Connector tracks to a new junction beneath 1st and Alameda Streets. Trains would then travel to a new portal on the LADWP maintenance yard site, and continue along the Pasadena Metro Gold Line and the Foothill Extension to Claremont.

The east-west and north-south routes would each operate with five minute headways during peak hours, combining to yield trains every 2 ½ minutes in each direction along the Regional Connector.

2.0 LPA EFFECTS, IMPACTS AND MITIGATION FOR ARCHAEOLOGICAL RESOURCES

Construction of the Fully Underground LRT Alternative (LPA) has the potential to directly affect archaeological resources within the APE, including previously unidentified archaeological resources, the Los Angeles Zanja System, and sites CA-LAN-3588, P-19-003338, and P-19-003339 (Details regarding these resources can be found in the body of the Technical Memorandum for Archaeology).

Archaeological features associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect. Implementation of mitigation measures described in Sections 1.2.2.1 and 1.2.2.2 would reduce potential direct impacts to identified and previously unidentified archaeological resources to a less than significant level. The LPA would not result in operational impacts to both identified and previously unidentified archaeological resources.

Given that implementation of the mitigation measure described in Section 1.2.2.1 1 would reduce potential construction impacts to previously unidentified archaeological resources to a less than significant level, the LPAwould not contribute to a cumulative impact on unidentified archaeological resources.

Potential destruction of portions of the Los Angeles Zanja System could contribute to a cumulative impact to this resource. Implementation of the mitigation measure described in Section 1.2.2.1.2 would reduce both direct and cumulative impacts to known archaeological resources, including the Zanja System, to a less than significant level.

2.1 NEPA Finding and CEQA Determination

Construction of the LPA has the potential to affect previously unknown resources. With implementation of mitigation measures, potential construction and cumulative impacts would not be adverse or significant under NEPA or CEQA. The LPA would not result in adverse or significant operational impacts to archaeological resources.

2.2.Mitigation Measures

Construction of the Regional Connector Transit Corridor project may impact one or more NRHP- or CRHR-eligible archaeological sites along with an unknown number of previously unidentified archaeological resources.

Since operational impacts to archaeological resources, including both previously recorded and undiscovered resources, are not expected for any of the project alternatives, mitigation for operation would not be required for this project.

In the event that resource avoidance is not possible, and to mitigate impacts to previously unidentified archaeological resources, the following mitigation measures related to construction activities are recommended.

Mitigation measures are also documented in the Mitigation Monitoring and Reporting Program (MMRP), which is part of the Final EIS/EIR.

2.2.1 Treatment of Undiscovered Archaeological Resources

A detailed Cultural Resources Monitoring and Mitigation Plan (CRMMP) would be prepared prior to implementing this project, similar in scope to the CRMMP that was prepared for Metro's Eastside Gold Line Transit Corridor (Glenn and Gust 2004). Implementing a CRMMP during ground disturbance in highly sensitive archaeological areas would ensure that cultural resources are identified and adequately protected.

If cultural resources are discovered or if previously identified resources are affected in an unexpected manner, the CRMMP would ensure that such resources receive mitigation to reduce the impact to a less than significant level. This plan would include, but not be limited to, the following elements:

- Worker training
- Archaeological monitoring
- The scientific evaluation and mitigation of archaeological discoveries
- Native American participation, as needed
- Appropriate treatment of human remains

- Reporting of monitoring and mitigation results

Worker Training

Prior to initiating ground-disturbing activities, a qualified archaeologist would conduct a short awareness training session for all construction workers and supervisory personnel. The session would explain the importance of and legal basis for protecting significant archaeological resources.

Each worker would also learn the proper procedures to follow in the event cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection and the immediate contact of the supervisor and the archaeological monitor.

This worker education session could include visual representations of artifacts (prehistoric and historic) that might be found in the project vicinity, and it could take place on-site immediately prior to the start of ground disturbance.

Supervisory personnel may benefit from longer training sessions, while a brief training would suffice for non-supervisory workers. The brief (approximate 30- to 45-minute) training session may be conducted on-site by video, PowerPoint presentation, or similar media.

Archaeological Monitoring, Evaluation, and Mitigation

Due to poor surface visibility and high archaeological sensitivity of the direct APE, an archaeological monitor would be present during ground-disturbing activities in archaeologically sensitive areas. This would reduce the potential level of impact to buried archaeological resources to a less than significant level. This work would be completed under the direction of an archaeologist who meets the Secretary of the Interior's Standards for archaeologists. An adequate number of monitors would be present to ensure that all earth-moving activities are observed and would be on-site during all grading activities for areas to be monitored.

During the original excavation of previously undisturbed soils, the archaeological monitor(s) would be on-site at a frequency determined by the lead archaeologist. Inspection frequency may vary based on the rate of excavation, the materials excavated, and the presence and abundance of artifacts and features. Full-time monitoring is warranted within one-half block of potentially significant archaeological resources that are known or suspected to be present within the direct APE.

If potentially significant archaeological resources are exposed during ground-disturbing activities, the project manager would be notified immediately. Archaeological monitor(s) would have the authority to divert or temporarily halt ground-disturbing operations in the area of discovery to allow the resources to be evaluated. Excavation work would halt until the archaeological monitor makes a determination of the significance of the archaeological resource. Construction activities may continue in other areas.

Evaluation of such resources is typically accomplished by a test-level excavation designed to determine the horizontal and vertical extent of the resource, and to characterize its contents. If the discovery proves to be potentially eligible for listing on the NRHP or the CRHR and project plans cannot be altered to avoid affecting the site, then an adverse effect would result within the project area. This adverse effect may be resolved by implementing a Memorandum of Agreement (MOA) between Metro and the SHPO.

Before construction activities are allowed to resume in an affected area, artifacts would be recovered and features recorded using professional archaeological methods. The lead archaeologist operating under the direction of the MOA would determine the amount of material to be recovered for an adequate artifact sample for analysis.

All cultural material collected during the construction monitoring program would be processed using professional archaeological methods. An appropriate sample of recovered materials, selected by the lead archaeologist, would be curated at a curation facility that meets federal standards per 36 CFR Part 79 and made available to other archaeologists and researchers for further study.

Native American Participation

If Native American cultural resources (i.e., prehistoric or ethnohistoric-period artifacts, food remains, or features associated with Native Americans) are exposed during project-related ground disturbance, Metro would contact the Gabrielino/Tongva San Gabriel Band of Mission Indians and the Tongva Ancestral Territorial Tribal Nation. Both groups have expressed interest in the project. One or both of these groups would be asked to provide the services of a trained Native American consultant to monitor ground-disturbing work in the area containing the Native American cultural resources. This monitoring would occur on an as-needed basis, and would be intended to ensure that Native American concerns are taken into account during the construction process.

Human Remains

The discovery of human remains is always a possibility during ground disturbance. For example, an unmarked early Spanish period Native American cemetery was recently discovered near the APE (Applied Earthworks 1999).

The State of California Health and Safety Code Section 7050.5 addresses what should be done when human remains are found during construction. This code section states that when human remains are encountered, no further disturbance would occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code (PRC) Section 5097.98. The County Coroner would be immediately notified of the find.

If the human remains are determined to be prehistoric, the Coroner would notify the Native American Heritage Commission, which would determine and notify a Most Likely Descendant (MLD). The MLD shall complete inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Impacts to human remains may remain significant even after mitigation.

Reporting

If cultural resources are not discovered in the course of construction monitoring, a brief letter to that effect would be prepared by the consulting archaeologist, indicating that the monitoring activities have been satisfied. If previously unidentified cultural resources are discovered in the course of construction monitoring, a report would be prepared following Archaeological Resource Management Report (OHP 1990) guidelines that documents field and analysis results and interprets the data within an appropriate research context.

2.2.2 Treatment of Known Archaeological Resources

Destruction of a resource that is eligible for listing in the NRFP or CRHR would be a significant adverse effect. This effect may be resolved through by implementing an MOA between FTA, Metro, and the SHPO, as well as other interested parties.

Four archaeological sites that are either within or immediately adjacent to the direct APE are presumed eligible for listing on both the NRHP and the CRHR. These include the Los Angeles Zanja System (the Zanja Madre, CA-LAN-887H, and numerous unrecorded numbered zanjas) and sites CA-LAN-3588, P-19-003338, and P-19-003339.

Effects to the data potential of archaeological sites can be mitigated to a less than significant level by preparing and implementing a data recovery plan under Section 106 and CEQA. The actual mitigation measures agreed upon in the MOA may vary in substance and degree, but the MOA would include a process to resolve any adverse effects upon archaeological resources within the direct APE that are eligible for listing in the NRHP or CRHR. The treatment of sites CA-LAN-3588, P-19-003338, and P-19-003339 may include systematic and scientific exposure, evaluation, and if necessary, archaeological data recovery.

Los Angeles Zanja System

The Los Angeles Zanja system was an extensive and integrated water conveyance network that served large areas of the City for multiple generations. Generally speaking, previous construction projects in downtown Los Angeles have unexpectedly encountered and documented limited exposures of a single zanja segment, often after the segment has been damaged by construction equipment. This incomplete approach does not permit the overall Zanja system to be evaluated, given the requirements that the OHP clarified in its recent letter (Toffelmier 2009).

It is likely that other projects (such as emergency utility repair) have damaged segments of the Zanja system without documentation. This repeated damage (both monitored and unmonitored construction impacts) constitutes a cumulative effect that should be mitigated. Construction monitoring alone is insufficient mitigation to address this effect, particularly given the likelihood of damaging the zanjas prior to discovery during project construction process.

Inadvertent project-related damage to the zanjas may constitute an adverse effect under the Criteria of Adverse Effect, "physical destruction or damage" (36 CFR Part 800.5(a) (2) and material impairment as defined in CEQA. This action would contribute to, rather than mitigate, these cumulative effects.

Both Section 106 of the NHPA (as amended) and CEQA require identification, documentation, and evaluation of historic properties/historic resources in a project area (or direct APE). For a poorly mapped and buried linear resource like the Zanja system, identification alone is challenging.

Rather than a costly archaeological excavation program or a remote sensing (ground-penetrating radar, etc.) survey that is unlikely to produce clear-cut results, a proactive identification and documentation program that would facilitate preservation or mitigation in a cost-effective manner is recommended.

This would include using additional documentary research to identify, as accurately as possible, the precise alignments of the zanjas within the APE. Where these alignments are expected to be affected by the proposed project, particularly where cut-and-cover or other near-surface construction techniques (as opposed to tunneling 20 or more feet below the ground surface) are planned in the vicinity of mapped zanja segments, full-time archaeological monitoring would be instituted to ensure documentation.

The archaeological monitors would work closely with equipment operators to ensure that every effort is made to avoid damaging zanja segments prior to their adequate documentation.

Documenting and evaluating the Los Angeles Zanja system would be best accomplished with a system-wide approach that incorporates historical, archaeological, and engineering research and documentation. This systemic approach to documentation and evaluation is a particularly appropriate mitigation measure for the Regional Connector Transit Corridor project, which has the potential to impact multiple zanja segments. Documentation of the zanja segments' alignments and slopes would have the added benefit of enabling future projects to more accurately predict the location of zanja segments outside of the project area.

To mitigate potential impacts to the Los Angeles Zanja system, the project MOA would provide that the system be adequately documented under the direction of an experienced archaeologist and an experienced historical architect, architectural historian, or historian, both meeting the Secretary of the Interior's qualification standards. This documentation would include a combination of historical research, archaeological testing, and architectural documentation, and would be followed by a formal evaluation of NRFP and CRHR eligibility.

It should be noted that substantial documentation already exists for the Zanja system in the form of maps and engineering records, published books and articles, unpublished technical reports, and site records. The collation of available data for the system as a whole would accomplish much of the documentation effort that is proposed here, while intensive, original research would be restricted to the zanja segments that cross the direct APE.

Research and documentation may include such specific measures as:

- Historical research using historical maps, photographs, and other written sources to document creation, maintenance, modification, and abandonment of the system.
- Archaeological research to establish the physical condition, presence of associated features and artifacts, and precise location of each zanja segment within the project's direct APE by using physical exposure through controlled excavation following its discovery during construction monitoring. Resources would be documented using DPR series 523 primary and detail forms, maps, and photographs. The results would be presented in a detailed technical report following Archaeological Resource Management Report (OHP 1990) guidelines. The report would address research questions and assess the NRHP and CRHR eligibility of the system.

- Architectural documentation of exposed zanja segments by producing narrative records, measured drawings, and photographs in conformance with Historic American Engineering Record (HAER) standards prior to any alteration or demolition activity.
- Preserving the results of the historical, archaeological, and historic architectural studies in repositories (e.g., the local main library branch, the lead agency headquarters library, and with identified non-profit historic groups interested in the subject matter).
- Interpretation of the Los Angeles Zanja system for the public through signage along the project alignment, visual representations of zanja alignments using colored pavement, or other appropriate means such as a dedicated internet website.

3.0 LPA EFFECTS, IMPACTS AND MITIGATION PALEONTOLOGICAL RESOURCES

The LPA involves ground disturbance associated with excavations to construct three new stations and an entirely underground tunnel located from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Any ground disturbances in areas of high sensitivity will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or more below the ground surface. In areas where mitigation measures can be implemented, potential impacts can be reduced to a less than significant level. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources would not be feasible resulting in significant and unavoidable impacts.

The LPA would not result in operational impacts to paleontological resources.

In areas where mitigation measures can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources to less than significant. In areas where mitigation measures cannot be implemented, such as in areas where new underground TBM segments would be constructed, cumulative impacts may be unavoidable.

3.1NEPA Finding and CEQA Determination

The LPA could have adverse effects on paleontological resources. With implementation of mitigation, potential construction and cumulative impacts would not be adverse under NEPA. The LPA would not have significant effects on paleontological resources with implementation of proposed mitigation measures with the exception of areas where tunneling operations cannot be mitigated. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources would not be feasible and thus construction and cumulative impacts would be significant and unavoidable.

The LPA would not result in adverse or significant operational impacts to paleontological resources.

3.2 Mitigation Measures

3.2.1 Construction Mitigation Measures

The following mitigation measures have been developed in accordance with the SVP (1995) standards and guidelines and meet the paleontological requirements of CEQA. Mitigation measures are also documented in the Mitigation Monitoring and Reporting Program (MMRP), which is part of the Final EIS/EIR.

- A qualified paleontologist would produce a Paleontological Monitoring and Mitigation Plan for the proposed project and supervise monitoring of construction excavations. Paleontological resource monitoring would include inspection of exposed rock units during active excavations within sensitive geologic sediments. The monitor would have authority to temporarily divert grading away from exposed fossils to professionally and efficiently recover the fossil specimens and collect associated data.

- All project-related ground disturbances that could potentially affect the Puente Formation, Fernando Formation, and Quaternary older alluvium and terrace deposits would be monitored by a qualified paleontological monitor on a full-time basis (where feasible) because these geologic sediments are determined to have a high paleontological sensitivity (Figure 4.12.3-3). Very shallow surficial excavations (less than 5 feet) within Quaternary younger alluvium would be monitored on a part-time basis to ensure that underlying sensitive units are not adversely affected (Figure 4.12.3-3). Construction monitoring during any tunneling activity is not warranted as any potential fossil specimens present within sensitive geologic units would be crushed and destroyed by the nature of tunneling methodology.

- At each fossil locality, field data forms would be used to record pertinent geologic data, stratigraphic sections would be measured, and appropriate sediment samples would be collected and submitted for analysis.

- Due to the likelihood of the presence of microfossils, matrix samples would be collected and tested within the Puente Formation and Fernando Formation. Testing for microfossils would consist of screen-washing samples (approximately 30 pounds) to determine if significant fossils are present. Productive tests would result in screen-washing of additional bulk matrix up to a maximum of 2,000 pounds per locality to ensure recovery of a scientifically significant sample.

- Recovered fossils would be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposited in a designated paleontological curation facility (such as the Natural History Museum of Los Angeles County).

- The paleontologist would prepare a final monitoring and mitigation report to be filed, at a minimum with Metro and the repository.

3.2.2 Operational Mitigation Measures

No mitigation is required because operational impacts to paleontological resources are not expected for any of the project alternatives.

1.0 SUMMARY

1.1 Background

This technical memorandum discusses the results of a Paleontological Resource analysis of the proposed Regional Connector Transit Corridor project. The study was performed to evaluate the paleontological sensitivity of the project area and vicinity, assess potential project-related impacts to paleontological resources, and provide recommendations. This analysis included a records search conducted at the Natural History Museum of Los Angeles County on February 5, 2008 and a literature review.

This study was conducted in accordance with the professional guidelines established by the Society of Vertebrate Paleontology (SVP) (1995). This technical memorandum will be filed with the Federal Transit Administration (FTA), Metro, CDM, and SWCA. All records related to the project will also remain on file at Metro and the South Pasadena office of SWCA.

1.2 Summary of Findings

According to geologic mapping published by Yerkes and Graham (1997a; 1997b) and records maintained by the Natural History Museum of Los Angeles County, the project area is underlain by the following geologic units, from oldest to youngest: (1) Miocene Puente Formation, (2) Pliocene Fernando Formation, (3) Quaternary terrace deposits, and (4) Quaternary alluvium. Museum records revealed that at least 12 previously recorded vertebrate fossil localities have been documented either along the proposed project alignment or within a 2-mile radius from the same sedimentary deposits underlying the project.

The combined results of the museum records search and literature review indicate that the geologic units underlying the project area have a paleontological sensitivity ranging from low to high. Therefore, construction of the project may potentially result in an adverse impact to nonrenewable fossil resources and will require implementation of paleontological resources mitigation measures, where feasible.

1.3 Mitigation and Monitoring

A qualified paleontologist would design and implement a Paleontological Resources Monitoring and Mitigation Plan (PRMPP) during any ground disturbances related to the proposed project, where feasible. All significant fossils recovered during construction monitoring would be prepared, stabilized, identified, and permanently curated in an approved repository or museum (such as the Natural History Museum of Los Angeles County).

2.0 INTRODUCTION

2.1 Project Description

The proposed project area extends 1.9 miles through downtown Los Angeles and would provide enhanced Metro service throughout four distinct travel corridors that span more than 50 miles across Los Angeles County (Figure 2-1). The proposed alternatives include from 1.6 to 1.9 miles of new dual tracks in downtown Los Angeles and would provide a direct link between the Metro Gold, Blue, and Expo Lines by bridging the gap in the regional light rail network between 7th Street/Metro Center Station and the Little Tokyo/Arts District Station. This would allow for direct trains from East Los Angeles to Culver City and from Long Beach to Pasadena.

The project also includes construction of several new stations downtown that would allow passengers on the Metro Gold, Blue, and Expo Lines to reach multiple destinations in the central business district without transferring. The following alternatives were evaluated:

- No Build Alternative
- Transportation System Management (TSM)Alternative
- At-Grade Emphasis Light Rail Transit (LRT) Alternative
- Underground Emphasis LRT Alternative
- Fully Underground LRT Alternative- Little Tokyo Variation 1
- Fully Underground LRT Alternative- Little Tokyo Variation 2

Each of these alternatives are described in the following sections.

2.1.1 No Build Alternative

Transit service under the No Build Alternative is focused on preserving existing services and projects. The No Build Alternative does not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP).

By the projection year of 2035, the Metro Expo Line to Santa Monica, the Metro Purple Line to Westwood, the Metro Crenshaw Line, and the Metro Gold Line extensions to Azusa and about I-605 will have opened, and a number of bus routes will have been reorganized and expanded to provide connections with these new rail lines. All bus and rail lines would operate using a fleet of vehicles similar to those currently in service or identified for purchase in the LRTP. The transit network within the project area would otherwise be largely the same as it is now.

2.1.2 Transportation System Management (TSM) Alternative

The TSM Alternative includes all the provisions of the No Build Alternative, plus two new express shuttle bus lines linking the 7th Street/Metro Center and Union Stations. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. Rail service would remain the same as described for the No Build Alternative. The two new shuttle bus routes are illustrated on Figure 2-2.

2.1.3 At-Grade Emphasis Light Rail Transit (LRT) Alternative

2.1.3.1 Overview

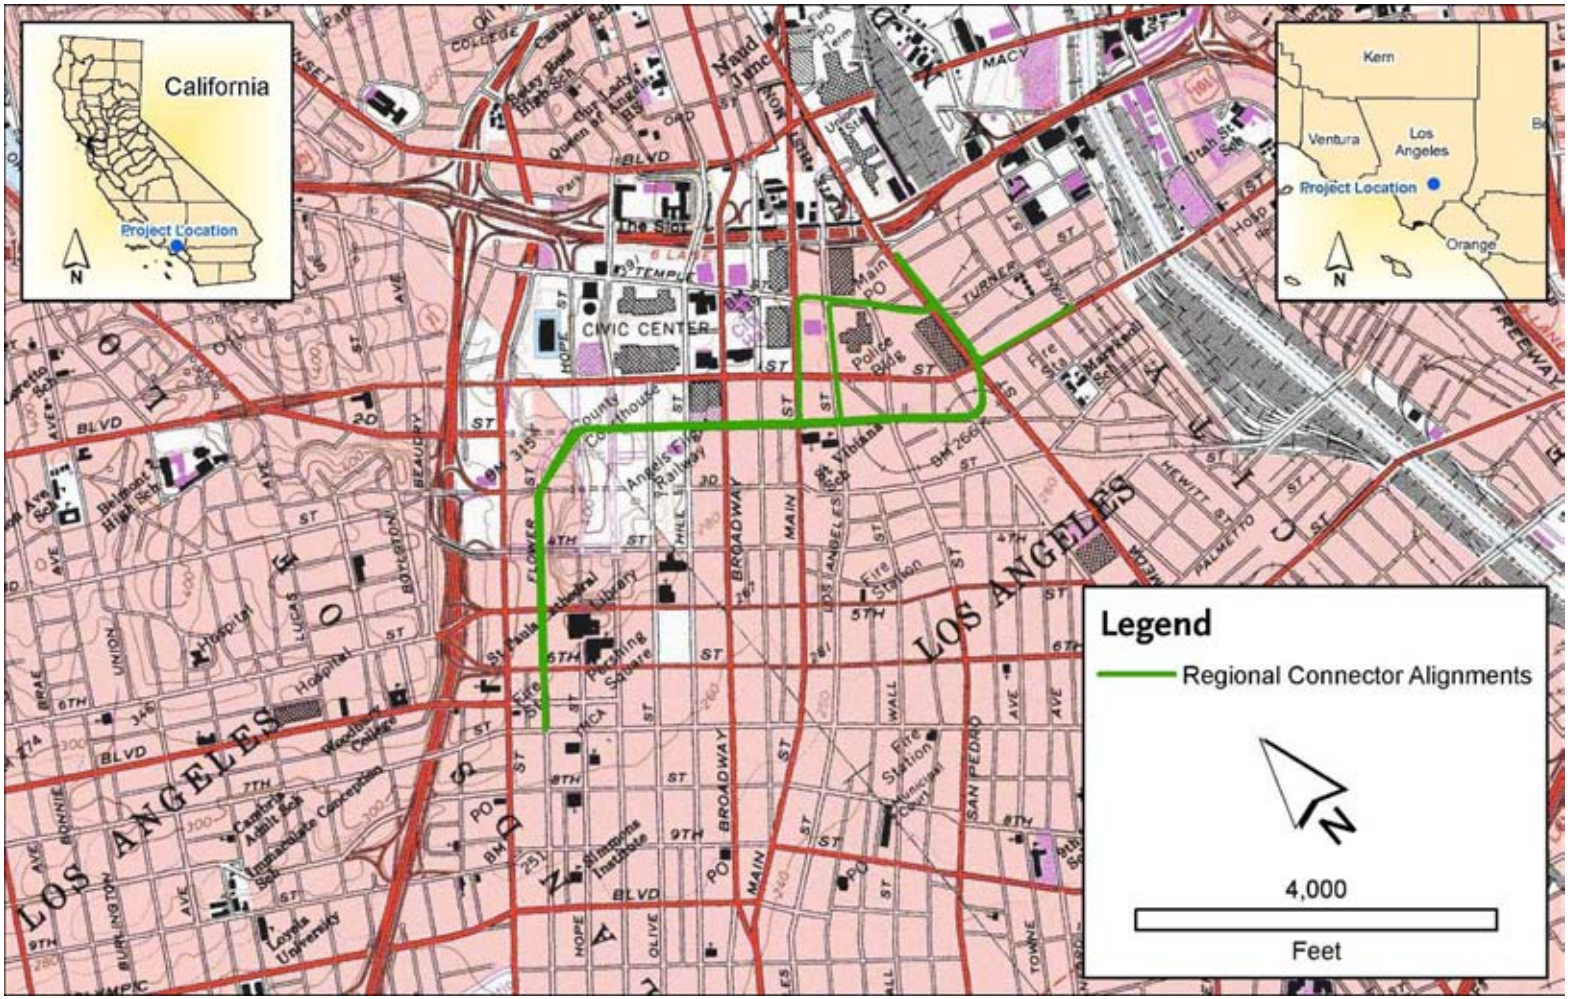
The At-Grade Emphasis LRT Alternative would provide a direct connection from the existing underground 7th Street/Metro Center Station to the Metro Gold Line at Temple and Alameda Streets with three new station locations proposed. This alignment includes a combination of underground and at-grade segments, with 46 percent of the route underground. New stations would serve the Civic Center, Grand Avenue, and Financial District.

Conversion of 2nd Street to a pedestrian-friendly transit mall is assumed. To implement this alternative, the number of traffic lanes and on-street parking spaces on 2nd Street would be reduced. As a result, traffic would be likely to divert to adjacent parallel streets such as 1st and 3rd Streets, but the roadway capacity along these streets would remain unchanged, as with the No Build Alternative. Traffic congestion along these streets would likely increase. Figure 2-3 illustrates the At-Grade Emphasis LRT Alternative.

2.1.3.2 Route Configuration

From the existing platform at the 7th Street/Metro Center Station, the tracks would extend north underneath Flower Street to a new underground station just south of 5th Street. The tracks would then continue north, surface just south of 3rd Street, cross 3rd Street at grade, and veer northeast through a portal in the hillside to an underground station at 2nd and Hope Streets. Tunnel construction would be constrained by existing buildings.

At 2nd and Hope Streets, a new pedestrian bridge would be constructed to connect the station to Upper Grand Avenue. The tracks would continue northeast, punch through the wall of the existing 2nd Street tunnel, and then travel east in the 2nd Street tunnel toward Hill Street.



Source: USGS

Figure 2-1. Project Location

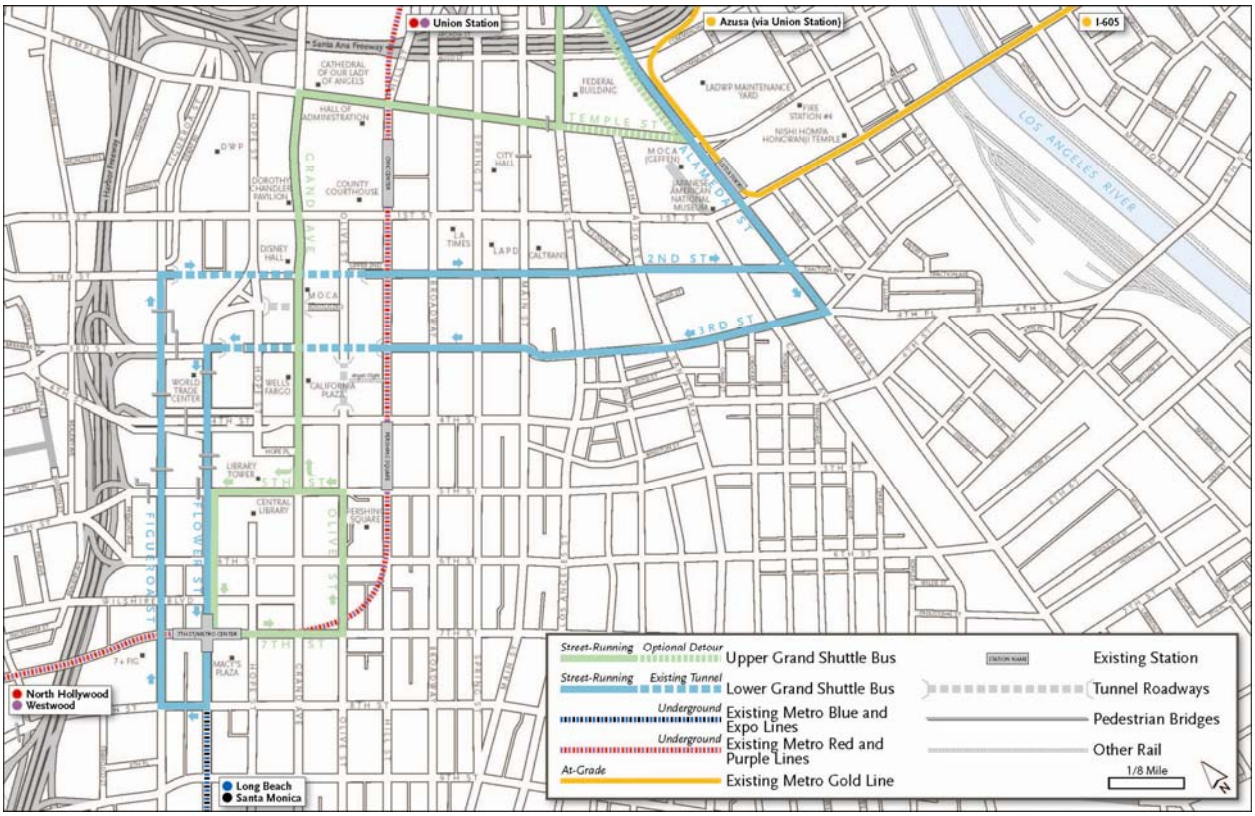


Figure 2-2. TSM Alternative

Trains would proceed east on 2nd Street to Main Street. At Main Street, the alignment would split into two single-track alignments. One track (for northbound trains) would continue east to Los Angeles Street and then north to Temple Street. The other track (for southbound trains) would travel north on Main Street and then west on Temple Street. Both tracks would have an at-grade station just north of 1st Street.

At Temple and Los Angeles Streets, the two tracks would rejoin and proceed west on Temple Street to Alameda Street, where the tracks would join the Metro Gold Line in a three-way junction.

A vehicular underpass and pedestrian overpass are proposed along Alameda Street to route through traffic beneath the rail tracks and Temple Street traffic. This would minimize potential conflicts between rail, vehicular, and pedestrian traffic, and reduce delays at the intersection of Temple and Alameda Streets. Temple Street and the rail tracks would remain at grade, and the existing at-grade segment of Alameda Street would be lowered to pass under Temple Street. The pedestrian bridge could potentially have endpoints located on each of the intersection's four corners.

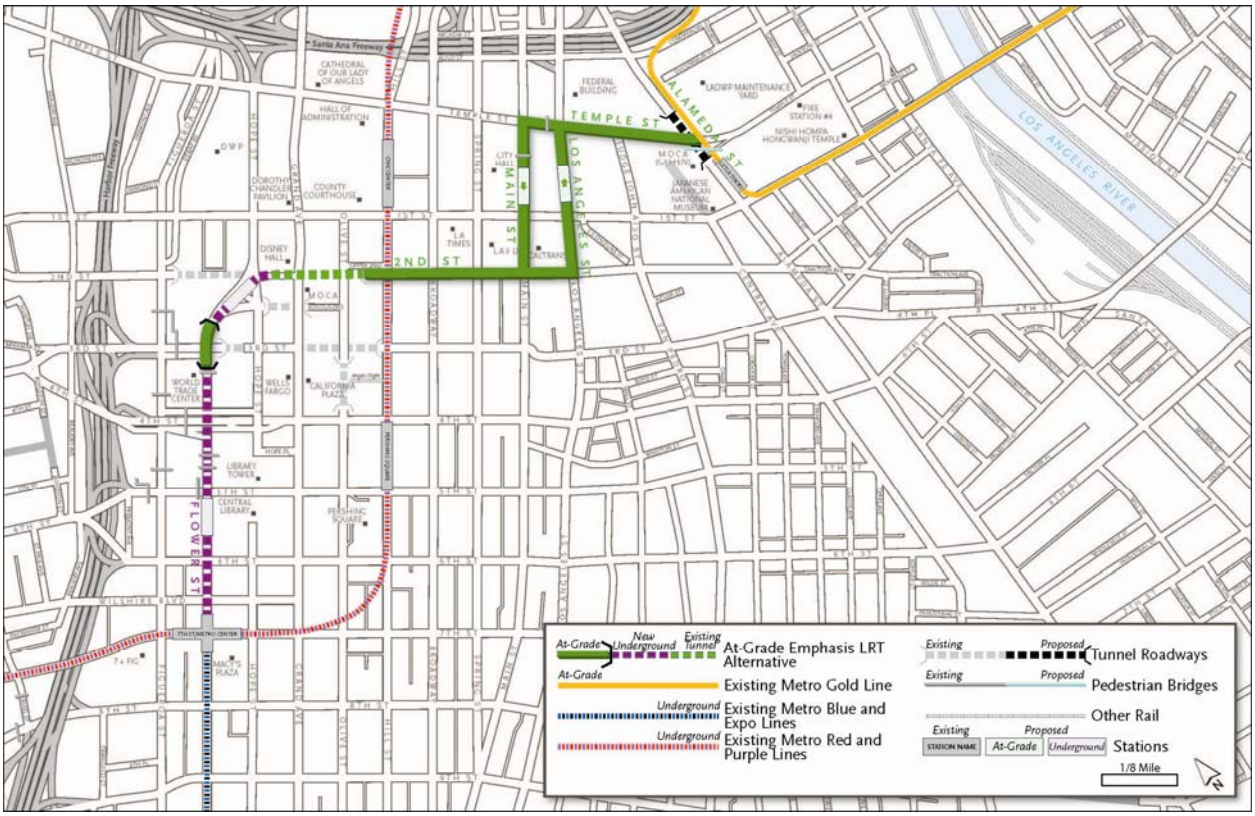

Figure 2-3. At-Grade Emphasis LRT Alternative Alignment and Configuration

Locations of new light rail right-of-way and stations proposed for the At-Grade Emphasis LRT Alternative are identified in the following sections. It should be noted that this report analyzes maximum potential effects and impacts for each proposed project facility. Thus, ultimate effects and impacts may be smaller in magnitude than the impacts discussed herein.

New light rail right-of-way

- Underground double track beneath Flower Street from the 7th Street/Metro Center Station to a new portal between 4th and 3rd Streets
- At-grade double track on Flower Street from the portal between 4th and 3rd Streets to 3rd Street, then across the intersection of 3rd and Flower Streets to a new portal into the hillside on the northeast corner
- Underground double track from the portal on the northeast corner of 3rd and Flower Streets to a new portal through the southern wall of the 2nd Street tunnel
- At-grade double track in the 2nd Street tunnel and on 2nd Street, from the new portal in the 2nd Street tunnel to Main Street

- At-grade single southbound-only track on Main Street between 2nd and Temple Streets, and on Temple Street between Main and Los Angeles Streets
- At-grade single northbound-only track on 2nd Street between Main and Los Angeles Streets, and on Los Angeles Street between 2nd and Temple Streets
- At-grade double track on Temple Street between Los Angeles and Alameda Streets

New stations

- Underground station on Flower Street just south of 5th Street
- Underground station just southwest of 2nd and Hope Streets
- At-grade southbound-only station on Main Street just north of 1st Street
- At-grade northbound-only station on Los Angeles Street just north of 1st Street

2.1.4 Underground Emphasis LRT Alternative

2.1.4.1 Overview

The Underground Emphasis LRT Alternative would provide a direct connection from 7th Street/Metro Center Station to the Gold Line tracks at the Little Tokyo/Arts District Station with three new station locations. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to a new portal on the parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue.

It is expected that property would need to be acquired to construct the portal and stage construction of the tunnels beneath 2nd Street. The tracks would then connect to the Gold Line tracks.

The Underground Emphasis LRT Alternative would be located primarily underground except for a single at-grade crossing at the intersection of 1st and Alameda Streets in the same type of three-way junction as proposed for the At-Grade Emphasis LRT Alternative. Tunnel construction would be constrained by existing buildings. Figure 2-4 illustrates this alternative.

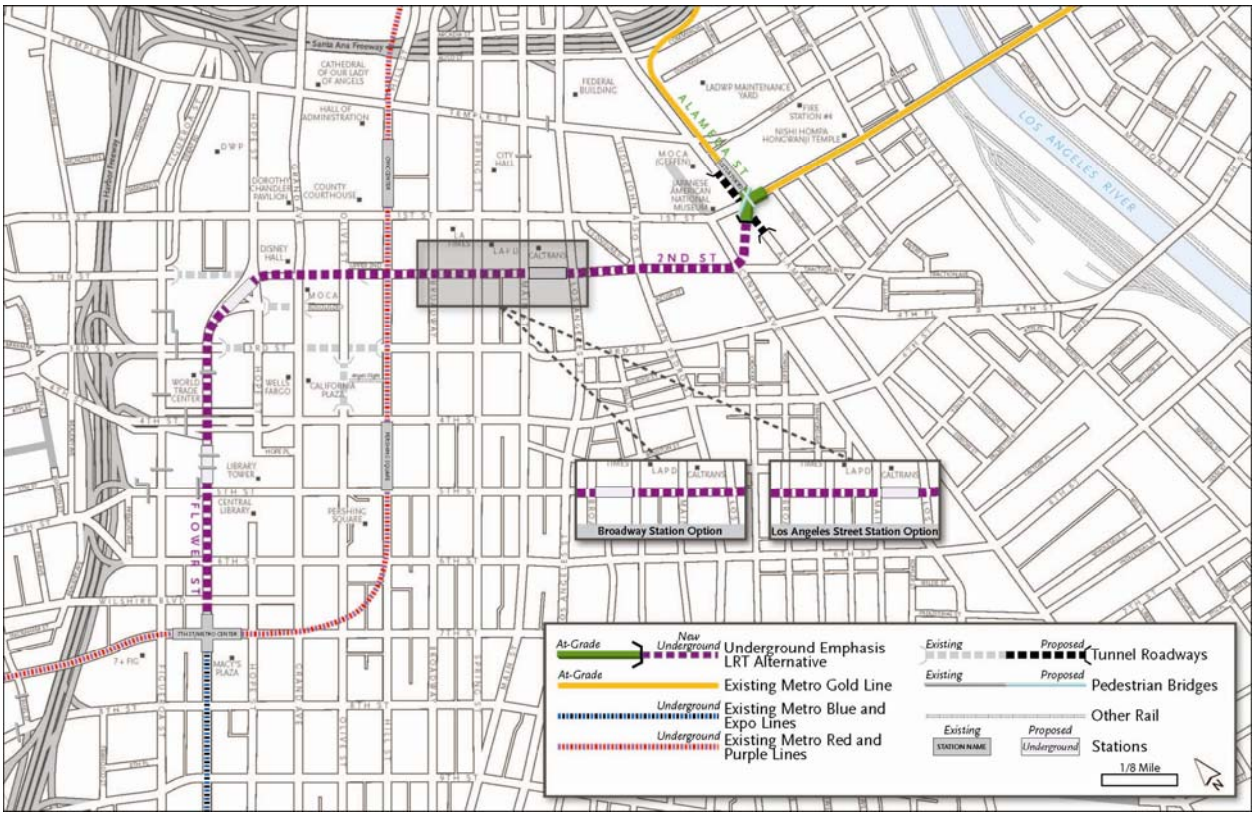

Figure 2-4. Underground Emphasis LRT Alternative Alignment and Configuration

2.1.4.2 Route Configuration

The Underground Emphasis LRT Alternative alignment would extend north from the existing platform at the 7th Street/Metro Center Station. Tracks would run underneath Flower Street to the next proposed station, just north of 5th Street. The tracks would then continue north underneath Flower Street and veer northeast near the intersection of 3rd and Flower Streets.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge may be constructed to connect the station to Upper Grand Avenue. The tracks would then head east underneath 2nd Street to the next proposed station.

There are two options for a station on 2nd Street. The Broadway Station option would place an underground station on 2nd Street between Broadway and Spring Street. The Los Angeles Street Station option would include an underground station between Main and Los Angeles Streets.

The tracks continue east under 2nd Street to Central Avenue, where they would veer northeast and surface in the lot bounded by 1st, Alameda, and 2nd Streets, and Central Avenue. The tracks would then come to the surface through a portal within this block and enter an at-grade three-way junction at the intersection of 1st and Alameda Streets.

A new underpass would carry car and truck traffic along Alameda Street beneath 1st Street and the rail junction, and a new overhead pedestrian bridge structure would eliminate most potential conflicts between pedestrians and trains. The proposed pedestrian overpass could potentially have endpoints at each of the four corners of the intersection.

Crossovers would possibly be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station on 2nd Street (whether it is between Broadway and Spring Street or between Main and Los Angeles Streets). Crossovers may not be needed at both of these locations, and may ultimately be placed in locations that are not adjacent to stations. Underground crossover locations require cut-and-cover construction; tunnel-boring machines cannot be used to construct underground crossovers.

Locations of new light rail right-of-way, stations, and crossovers proposed for the Underground Emphasis LRT Alternative are identified in the following sections. It should be noted that this report analyzes maximum potential effects and impacts for each proposed project facility. Thus, ultimate effects and impacts may be smaller in magnitude than the impacts discussed herein.

New light rail right-of-way

- Underground double track beneath Flower Street from the existing platform at the 7th Street/Metro Center Station to 3rd Street
- Underground double track curving northeast from the intersection of 3rd and Flower Streets toward 2nd and Hope Streets
- Underground double track beneath the 2nd Street tunnel and 2nd Street from Hope Street to Central Avenue
- At-grade double track from the portal on parcel bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue to a three-way junction at the intersection of 1st and Alameda Streets

New stations

- Underground station on Flower Street just north of 5th Street
- Underground station just southwest of the intersection of 2nd and Hope Streets

- Underground station on 2nd Street either between Broadway and Spring Street (Broadway Station option) or between Main and Los Angeles Streets (Los Angeles Street option)

New crossovers

Locations are preliminary and crossovers may not be placed at both. The two locations proposed for new crossovers include:

- Underground just north of the station at 5th and Flower Street
- Underground just east of the station on 2nd Street, either between Broadway and Spring Street or between Main and Los Angeles Streets

2.1.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

2.1.5.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tunnel construction would be constrained by existing buildings.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge would possibly be constructed to connect the station to Upper Grand Avenue. The bridge would begin at street level near the station entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

The tracks would head east underneath 2nd Street to the next proposed station at Broadway. The proposed 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street. From the new station, the tracks would continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new station, potentially located within the property currently occupied by Office Depot and other small commercial uses.

Crossovers would possibly be located just north of the proposed station at 5th and Flower Streets and just east of the proposed station at 2nd Street and Broadway.

At 2nd Street and Central Avenue, the tracks would continue underground heading northeast under 1st and Alameda Streets. A three-way junction would be constructed underground beneath the 1st and Alameda intersection. To the north and east of the junction, trains would

rise to the surface through two new portals to connect to the Metro Gold Line heading north to Azusa and east to I-605.

From the junction, one set of tracks would continue underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station. These tracks would travel under Temple Street before surfacing through a portal in the LADWP yard and rising to connect to the existing Metro Gold Line LRT bridge over US 101.

The other set of tracks leaving the three-way junction would rise to the east within 1st Street through a new portal to join the existing at-grade Metro Gold Line tracks. This second portal would be located between Alameda and Vignes Streets. 1st Street would be widened to the north to accommodate the portal. Widening 1st Street would be initiated at Alameda and continue east, tapering down significantly as the alignment crosses Hewitt Street to join the existing 1st Street LRT tracks about one and half blocks west of the 1st Street Bridge. .

Additional property would need to be acquired in order to stage construction of both portals, connect to the Gold Line LRT Bridge, and construct the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 1 would be located entirely underground from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Figure 2-5 illustrates this alternative.

2.1.5.2 Route Configuration

Locations of new light rail right-of-way, stations, and crossovers proposed for Fully Underground LRT Alternative – Little Tokyo Variation 1 are identified in the following sections. It should be noted that this report analyzes maximum potential effects and impacts for each proposed project facility. Thus, ultimate effects and impacts may be smaller in magnitude than the impacts discussed herein.

New light rail right-of-way

- Underground double track beneath Flower Street from the existing platform at the 7th Street/Metro Center Station to 3rd Street
- Underground double track curving northeast from the intersection of 3rd and Flower Streets toward 2nd and Hope Streets
- Underground double track beneath the 2nd Street tunnel and 2nd Street from Hope Street to Central Avenue, then to 1st and Alameda
- Underground three-way junction beneath the intersection of 1st and Alameda Streets

- Underground double track from the three-way junction to the portal located within a widened 1st Street between Vignes and Alameda Streets; then at-grade double track connecting to the existing Metro Gold Line Eastside Extension tracks toward I-605
- Underground double track from the three-way junction running north beneath the proposed Nikkei Center parcel and Temple Street, just east of the existing Little Tokyo/Arts District Station, to a new portal at the LADWP site; then at-grade double track rising from the portal on a new ramp structure to connect to the existing Metro Gold Line bridge over US 101

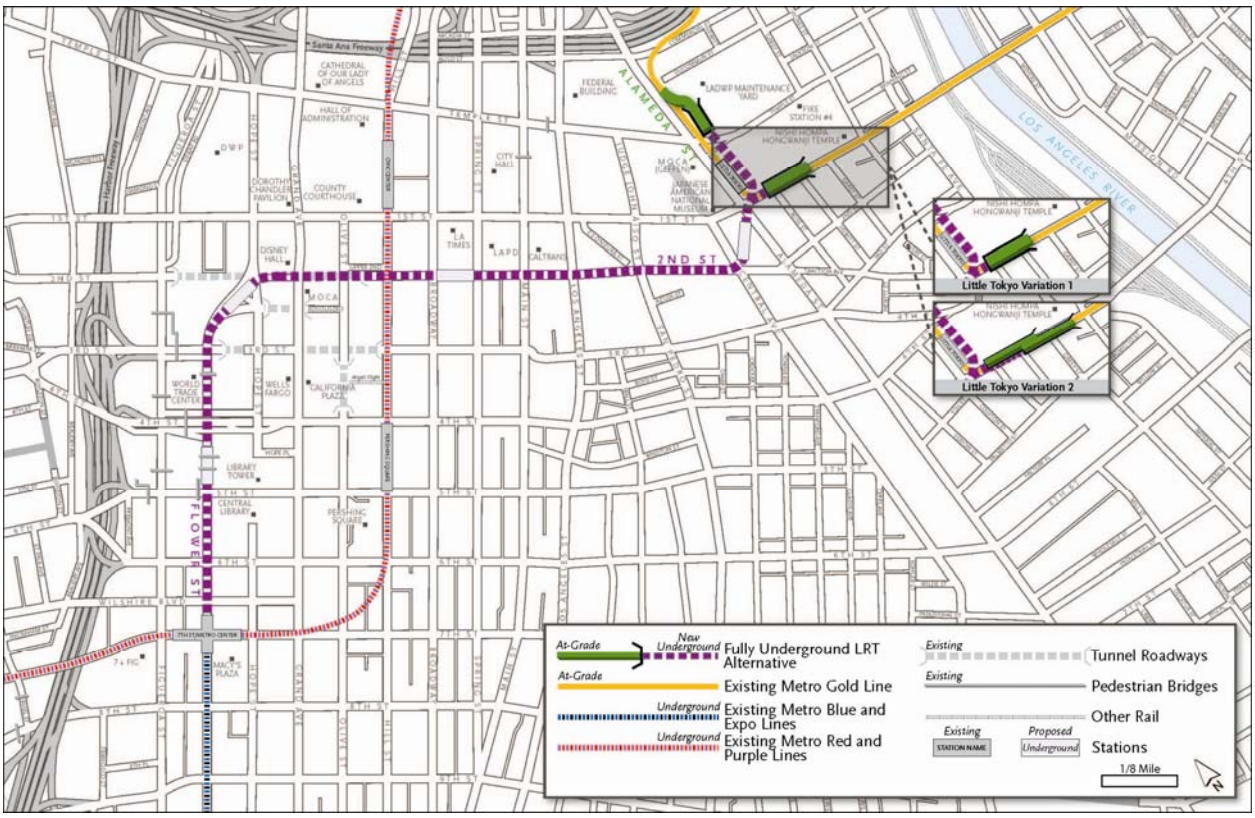

Figure 2-5. Fully Underground LRT Alternatives – Little Tokyo Variation 1 and Little Tokyo Variation 2 Alignment and Configuration

New stations

- Flower/5th/4th Street Station: Underground station on Flower Street just north of 5th Street
- 2nd/Hope Street Station: Underground Station just southwest of the intersection of 2nd and Hope Streets

- 2nd/Broadway Station: Underground station on 2nd Street between Broadway and Spring Street
- 2nd/Central Avenue Station: Underground station just northeast of the intersection at 2nd and Central. This station may include a small building at ground level on the southwest corner of 1st and Alameda streets to house ventilation fans

New crossovers

Underground crossover locations require cut-and-cover construction; tunnel boring machines cannot be used to construct underground crossovers. These construction methods are discussed in detail in the Description of Construction Technical Memorandum.

Locations are preliminary and crossovers may not be needed at both of these locations; and ultimately they may be placed in locations that are not adjacent to stations. The two locations for new crossovers include:

- Underground just north of the station at 5th and Flower Streets.
- Underground just east of the station on 2nd Street, between Broadway and Spring Street.

2.1.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

2.1.6.1 Overview

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks to the north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. Tunnel construction would be constrained by existing buildings.

A new underground station would be located just southwest of the intersection of 2nd and Hope Streets. At this location, a new pedestrian bridge would possibly be constructed to connect the station to Upper Grand Avenue. The bridge would begin at street level near the station entrance and cross above the intersection and along Kosciuszko Way to reach Upper Grand Avenue.

The tracks would head east underneath 2nd Street to the next proposed station at Broadway. The proposed 2nd Street/Broadway station would be located under 2nd Street approximately between Broadway and Spring Street. From the new station, the tracks would continue east underneath 2nd Street to Central Avenue, where they would veer northeast to a new station,

potentially located within the property currently occupied by Office Depot and other small commercial uses.

As the tunnels turn northeast from 2nd Street, the northbound tunnel would descend and the southbound tunnel would rise so that the southbound tunnel would be stacked on top of the northbound tunnel. A new proposed underground station near 2nd Street and Central Avenue would have two underground levels, each with a single-track platform. The northbound track with trains towards Azusa and I-605 would be on the lower level, and the southbound track with trains towards Long Beach and Santa Monica would be on the upper level.

The tracks would continue from the new station under the 1st and Alameda intersection into a new two-level underground junction. Separating from the junction, one track from the lower level (northbound) and one track from the upper level (southbound) would continue underground beneath the proposed Nikkei Center parcel (the parcel on the northeast corner of 1st and Alameda Streets), along the eastern side of the existing Little Tokyo/Arts District Station. These tracks would travel under Temple Street before surfacing in the LADWP yard and rising to connect to the Metro Gold Line LRT bridge over US 101. The portal would be connected to the 1st and Alameda junction by a new cut-and-cover tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (the parcel on the northeast corner of 1st and Alameda Streets). This would allow trains to continue along the Metro Gold Line.

A second track (westbound) leaving the upper level of the junction would rise to the east within 1st Street between Alameda and Hewitt Streets and link to the existing Metro Gold Line track. A second track (eastbound) leaving the lower level of the junction would rise to the east within 1st Street between Hewitt and Vignes Streets, adjacent to the westbound track, and link to the existing Metro Gold Line track.

Two portals, each containing one track, would rise to the east within the middle of a widened 1st Street to allow a connection to the Metro Gold Line towards I-605. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

1st Street would be widened to the north to accommodate the westbound portal. Widening 1st Street would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street, where the new tracks would feed into the existing 1st Street LRT tracks, about half a block west of the 1st Street Bridge. 1st Street would also be widened to the south between Hewitt and Vignes Streets to accommodate the eastbound track portal. Widening this street would taper down as it approaches Vignes Street. No modification to the 1st Street Bridge would be necessary.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT Bridge, and construct the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 2 would be located entirely underground from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Figure 2-5 illustrates this alternative.

2.1.6.2 Route Configuration

Locations of new light rail right-of-way, stations, and crossovers proposed for Fully Underground LRT Alternative – Little Tokyo Variation 2 are identified in the following sections. It should be noted that this report analyzes maximum potential effects and impacts for each proposed project facility. Thus, ultimate effects and impacts may be smaller in magnitude than the impacts discussed herein.

New light rail right-of-way

- Underground double track beneath Flower Street from the existing platform at the 7th Street/Metro Center Station to 3rd Street
- Underground double track curving northeast from the intersection of 3rd and Flower Streets toward 2nd and Hope Streets
- Underground double track beneath the 2nd Street tunnel and 2nd Street from Hope Street to Central Avenue
- Two-level underground structure with a northbound single track on the lower level and a southbound single track on the upper level from 2nd Street and Central Avenue to 1st and Alameda Streets
- Underground two-level junction beneath the intersection of 1st and Alameda Streets
- Two-level underground structure leading from the two-level junction to two single-track portals located within the median of a widened 1st Street (eastbound portal between Hewitt and Vignes Streets, westbound portal between Alameda and Hewitt Streets); then at-grade double track connecting to the existing Metro Gold Line Eastside Extension tracks toward I-605
- Two-level underground structure leading from the two-level junction, running north beneath the proposed Nikkei Center parcel and Temple Street, just east of the existing Little Tokyo/Arts District Station, to a new portal in the LADWP site (tracks would begin to transition to side-by-side tunnels on a single level as they pass beneath the Nikkei parcel); then at-grade double track rising from the portal on a new ramp structure to connect to the existing Metro Gold Line bridge over the U.S.-101 freeway

New stations:

- Flower/5th /4th Street Station: Underground station on Flower Street just north of 5th Street
- 2nd/Hope Street Station: Underground Station just southwest of the intersection of 2nd and Hope Streets
- 2nd/Broadway Station: Underground station on 2nd Street between Broadway and Spring Street
- 2nd/Central Avenue Station: Underground two-level station just northeast of the intersection at 2nd and Central. Each level would have a single-track platform. Northbound trains to Azusa and Eastbound trains to I-605 would use the lower level. Southbound trains to Long Beach and westbound trains to Santa Monica would use the upper level. This station may include a small building at ground level on the southwest corner of 1st and Alameda Streets to house ventilation fans.

New Crossovers

Underground crossover locations require cut-and-cover construction; tunnel boring machines (TBMs) cannot be used to construct underground crossovers. These construction methods are discussed in detail in the Description of Construction technical memorandum.

Both locations are preliminary and crossovers may not be placed at either one. The two locations for new crossovers include:

- Underground just north of the station at 5th and Flower Streets
- Underground just east of the station on 2nd Street, between Broadway and Spring Street

3.0 METHODOLOGY FOR IMPACT EVALUATION

Paleontological resource sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. Due to the nature of the fossil record, paleontologists cannot know either the quality or quantity of fossils present in a given geologic unit prior to natural erosion or human-caused exposure. No field surveys were conducted for the proposed project; therefore, it is necessary to assess the sensitivity of rock units based on their known potential to produce scientifically significant fossils elsewhere within the same geologic unit (both within and outside of the project area) or a unit representative of the same depositional environment.

3.1 Regulatory Framework

Fossils are classified as nonrenewable scientific resources and are protected by various laws, ordinances, regulations, and standards across the country. The Society of Vertebrate Paleontology (SVP) (1995) has established professional standards for assessment and mitigation of adverse impacts to paleontological resources. This paleontological assessment was conducted in accordance with the regulations and standards that are applicable to paleontological resources within the project area. These regulations and standards are summarized in the following sections.

3.1.1 Federal

Federal protection for scientifically significant paleontological resources applies to projects if any construction or other related project impacts occur on federally owned or managed lands, involve the crossing of state lines, or are federally funded. The following federal protections may apply to paleontological resources within the project area:

- American Antiquities Act of 1906 (6 United States Code [USC] 431 433). Establishes a penalty for disturbing or excavating any historic or prehistoric ruin or monument or object of antiquity on federal lands as a maximum fine of $500 or 90 days in jail.
- The National Environmental Policy Act of 1969, as amended (Public Law [PL] 91 190, 42 USC 4321 4347, January 1, 1970, as amended by PL 94 52, July 3, 1975, PL 94 83, August 9, 1975, and PL 97 258 Section 4(b), Sept. 13, 1982). Recognizes the continuing responsibility of the federal government to "preserve important historic, cultural, and natural aspects of our national heritage." (Section 101 [42 USC Section 4321]) (No. 382).
- National Historic Preservation Act of 1966 (PL 89 665; 80 Stat. 915, 16 USC 470 et seq.). Provides for the survey, recovery, and preservation of significant paleontological

data when such data may be destroyed or lost due to a federal, federally licensed, or federally funded project.

- Federal Land Management and Policy Act of 1976 (43 USC 1712[c], 1732[b]); Section 2, Federal Land Management and Policy Act of 1962 [30 USC 611]; Subpart 3631.0 et seq.), Federal Register Vol. 47, No. 159, 1982. Defines significant fossils as: unique, rare, or particularly well preserved; an unusual assemblage of common fossils; being of high scientific interest; or providing important new data concerning (1) evolutionary trends, (2) development of biological communities, (3) interaction between or among organisms, (4) unusual or spectacular circumstances in the history of life, or (5) anatomical structure.

- Paleontological Resources Preservation Act (PRPA). Enacted as a result of the passage of the Omnibus Public Lands Management Act (OPLA) of 2009, PL 111-011. PL 111-011, Title VI, *Subtitle D. Paleontological Resources Preservation* (OPLA-PRA). The PRPA sets forth regulations and provisions pertaining to paleontological resources on all federally administered lands.

3.1.2 State

- California Environmental Quality Act. Guidelines for the Implementation of CEQA, as amended March 29, 1999 (Title 14, Chapter 3, California Code of Regulations: 15000 et seq.) define procedures, types of activities, persons, and public agencies required to comply with CEQA, and include as one of the questions to be answered in the Environmental Checklist (Section 15023, Appendix G, Section XIV, Part a) including the following: "Will the proposed project directly or indirectly destroy a significant paleontological resource or unique geologic feature?"

- Public Resources Code (Chapter 1.7), Sections 5097.5 and 30244. These statutes prohibit removal of any paleontological site or feature on public lands without permission of the jurisdictional agency, define the removal of paleontological sites or features as a misdemeanor, and require reasonable mitigation of adverse impacts to paleontological resources from developments on public (state) lands.

3.1.3 Local

The Conservation Element of the City of Los Angeles General Plan (adopted September 2001) specifically addresses paleontological resources in Section 3 of Chapter 2. The Plan's paleontological objective is to "protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes." Moreover, its policy is to "continue to identify and protect significant archaeological and paleontological sites and/or

resources known to exist or that are identified during land development, demolition or property modification activities."

3.1.4 Professional Standards

The SVP has established standard guidelines (SVP 1995) that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines. State regulatory agencies with paleontological regulations and standards typically accept and use the professional standards set forth by the SVP.

As defined by the SVP (1995:26), significant nonrenewable paleontological resources are defined as:

> Fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP (1995:26), significant fossiliferous deposits are defined as:

> A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens, which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years, BP [before present].

Based on the significance definitions of the SVP (1995), all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new information on the taxon it represents, its paleoenvironment, and/or its distribution. Furthermore, all geologic units in which vertebrate

fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils or if defined as significant by project paleontologists, specialists, or local government agencies.

A geologic unit known to contain significant fossils is considered to be "sensitive" to adverse impacts if there is a high probability that earth-moving or ground-disturbing activities in that rock unit will either disturb or destroy fossil remains directly or indirectly. This definition of sensitivity differs fundamentally from that for archaeological resources as follows:

> It is extremely important to distinguish between archaeological and paleontological (fossil) resource sites when defining the sensitivity of rock units. The boundaries of archaeological sites define the areal extent of the resource. Paleontologic sites, however, indicate that the containing sedimentary rock unit or formation is fossiliferous. The limits of the entire rock formation, both areal and stratigraphic, therefore define the scope of the paleontologic potential in each case. [SVP, 1995]

Many archaeological sites contain features that are visually detectable on the surface. In contrast, fossils are contained within surficial sediments or bedrock and are therefore not observable or detectable unless exposed by erosion or human activity. Monitoring by experienced paleontologists greatly increases the probability that fossils will be discovered during ground-disturbing activities and that, if these remains are significant, successful mitigation and salvage efforts may be undertaken to prevent adverse impacts to these resources.

3.2 Paleontological Sensitivity

Paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey. In its "Standard Guidelines for the Assessment and Mitigation of Adverse Impacts to Nonrenewable Paleontologic Resources," the SVP (1995:23) defines three categories of paleontological sensitivity (potential) for sedimentary rock units:

- High Potential. Rock units from which vertebrate or significant invertebrate fossils or suites of plant fossils have been recovered and are considered to have a high potential for containing significant nonrenewable fossiliferous resources. These units include, but are not limited to, sedimentary formations and some volcanic formations that

contain significant nonrenewable paleontologic resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. Sensitivity comprises both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, or botanical; and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, ecologic, or stratigraphic data. Areas that contain potentially datable organic remains older than Recent, including deposits associated with nests or middens, and areas that may contain new vertebrate deposits, traces, or trackways are also classified as significant.

- Low Potential. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils. Such units will be poorly represented by specimens in institutional collections.

- Undetermined Potential. Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials.

It should be noted that highly metamorphosed rocks and granitic rock units do not generally yield fossils and therefore have low potential to yield significant nonrenewable fossiliferous resources.

In general terms, for geologic units with high potential, full-time monitoring typically is recommended during any project-related ground disturbance. For geologic units with low potential, protection or salvage efforts typically are not required. For geologic units with undetermined potential, field surveys by a qualified paleontologist are usually recommended to specifically determine the paleontologic potential of the rock units present within the study area.

4.0 AFFECTED ENVIRONMENT

The project is located within the City of Los Angeles in Los Angeles County, California. Specifically, the Direct Area of Potential Effects (APE) extends in a northeasterly direction from the intersection of Flower and 7th Streets to the Gold Line Extension project at Alameda Street between 1st and Temple Streets within downtown Los Angeles (Figure 4-1). The project crosses several communities of downtown Los Angeles, including the Bunker Hill, Civic Center, and Little Tokyo communities.

This area is highly urbanized with commercial and public use development. Most of the native vegetation has been removed and replaced by non-native trees and grasses. Elevations range from 250 to 270 feet (76 to 82 meters) above mean sea level. The nearest natural water source includes the now-channelized course of the Los Angeles River, located approximately 0.72 mile (1.1 km) east of the project area.

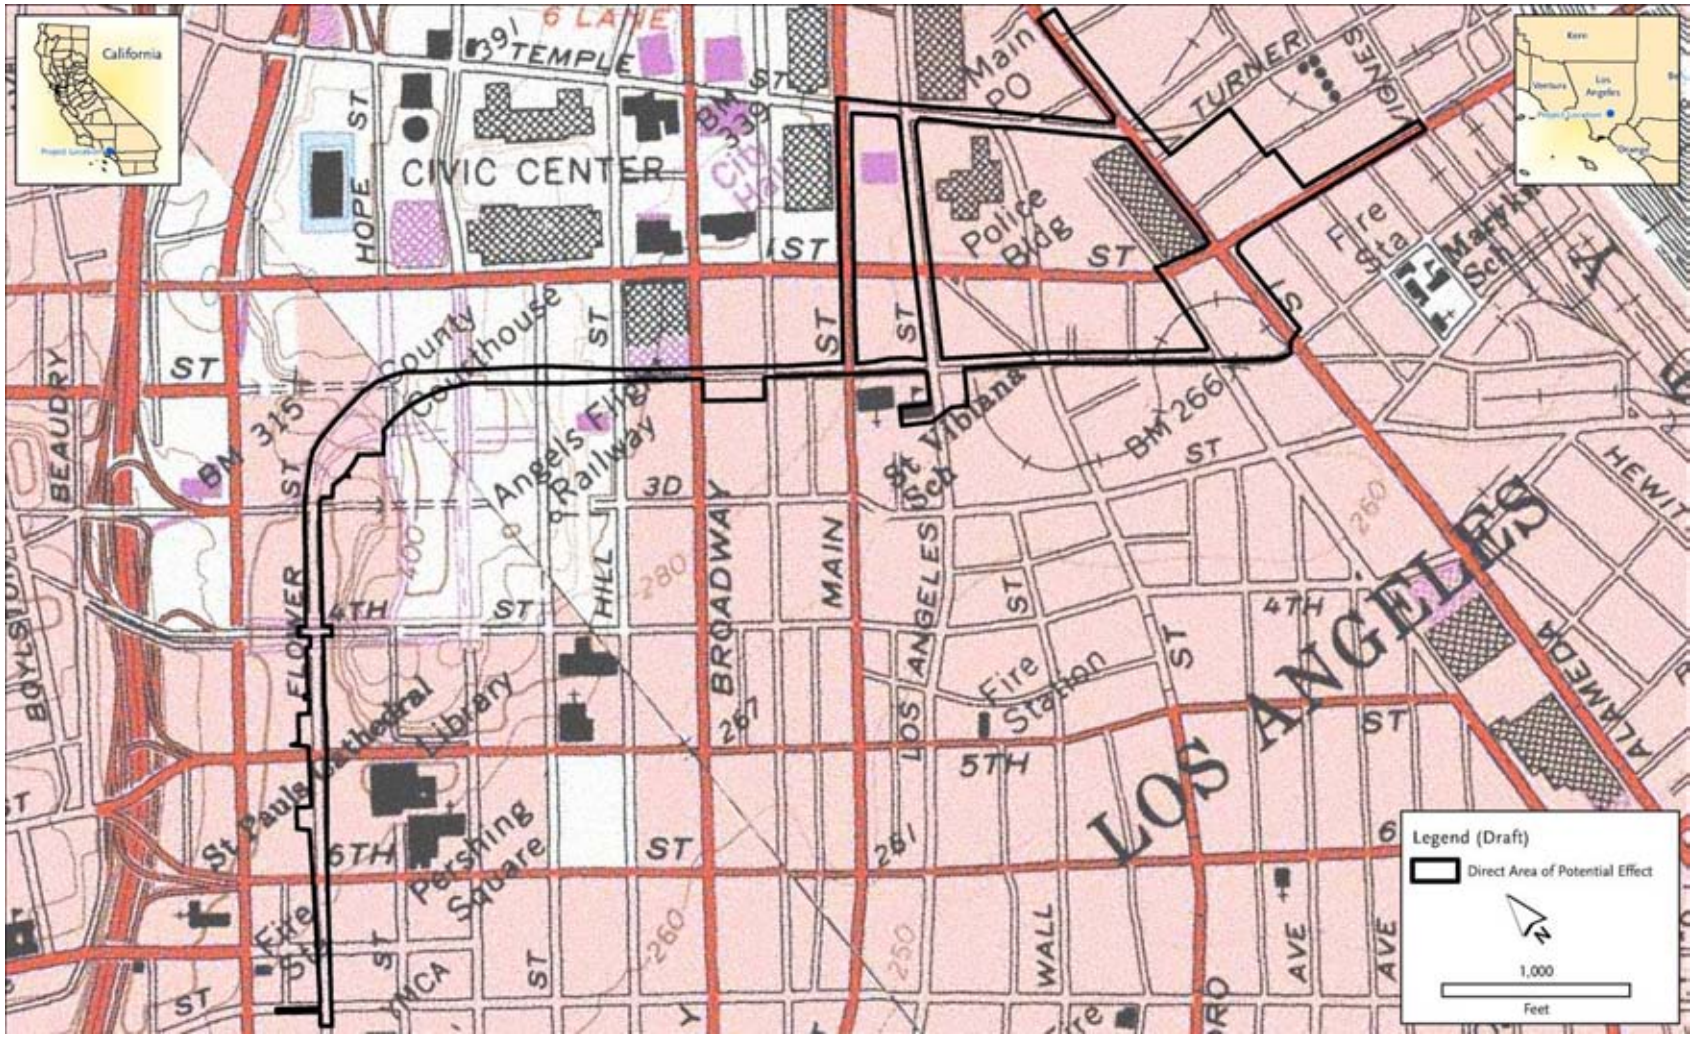
4.1 Resource Assessment Guidelines

For this project, a paleontological collections records search was conducted by the Vertebrate Paleontology Section of the Natural History Museum of Los Angeles County. A detailed review of museum collections records was performed to identify any known vertebrate fossil localities within at least 1 mile of the proposed project and to identify the geologic units within the project area and vicinity. In addition, the following published geologic maps were consulted:

- Preliminary geologic map of the Hollywood 7.5-minute quadrangle, southern California: a digital database: U.S. Geological Survey, Open-File Report OF-97-431, scale 1:24,000 (Yerkes and Graham 1997)
- Preliminary geologic map of the Los Angeles 7.5-minute quadrangle, southern California: a digital database: U.S. Geological Survey, Open-File Report OF-97-432, scale 1:24,000 (Yerkes and Graham 1997)

4.2 Geologic Setting

The project area is situated in the southwestern block of the Los Angeles basin. The Los Angeles basin is one of many basins making up the Neogene continental borderland of southern California. It extends from the Santa Ana Mountains in the north to the San Joaquin Hills to the south, and includes the southern foothills of the San Gabriel Mountains, the Puente Hills, and the Palos Verdes Hills. The southwestern block is mostly submerged by the Pacific Ocean, but is exposed in the low plain extending from Santa Monica southeast to Long Beach (Yerkes et al. 1965).



Source: USGS

Figure 4-1. Project Area of Potential Effect

The Los Angeles basin is a structural depression that has been the site of discontinuous deposition since the Late Cretaceous and of continuous subsidence and primarily marine deposition since the middle Miocene. This and other sedimentary basins formed during the Miocene and Pliocene as a result of an early San Andreas-type phase of transform motion along the western margin of North America.

At least three cycles of shallow marine transgression and regression created embayments and floodplains along the ancient coastline. During much of the middle Miocene, a northwest-trending marine embayment covered the site of the Los Angeles basin. Rivers that drained the highlands to the north and east transported and deposited huge volumes of coarse-grained sandstone and sandy cobble-boulder conglomerate into the embayment (Yerkes, et al. 1965).

Deposition continued until the end of the Pliocene, at which time the Palos Verdes Hills were an island, and large parts of the Santa Monica Mountains, the Puente Hills, the Santa Ana Mountains, and much of the southwest portions of the basin were exposed. In the early Pleistocene, the Palos Verdes Hills and southwestern areas again subsided and marine deposition resumed (Yerkes, et al. 1965).

4.3 Site-specific Geology

According to geologic mapping and museum collections records, the proposed project is immediately underlain by the following geologic units, from oldest to youngest: (1) Miocene Puente Formation, (2) Pliocene Fernando Formation, (3) Quaternary terrace deposits, and (4) Quaternary alluvium. These geologic units and their paleontological resource sensitivity are discussed in the following sections and depicted on Figure 4-2 and Figure 4-3 (respectively).

4.3.1 Puente Formation

The Puente Formation is middle to late Miocene (14 to 5 million years ago [mya]) in age, and was named in 1907 for its exposures in the Puente Hills (Yerkes 1972). The Puente Formation is isochronous (deposited at the same time) with the Monterey and Modelo Formations but consists of more terrigenous sediments because of the basin's proximity to the continental borderlands. Critelli (1995) suggests that an intrabasinal bathymetric ridge probably separated these formations.

The Puente Formation was deposited during an accumulation of sedimentary strata between 14 and 10 mya (Bjorklund 2002). Around 7 mya, north-south contractions formed the Whittier fault and the Puente Hills anticline. Today, the half-dome shape is reflected in the distribution of four members of the Puente Formation (Yerkes 1972). The oldest member, the La Vida Member, outcrops just north of the Whittier fault zone and forms the core of the half dome. In decreasing age, the Soquel, Yorba, and Sycamore Canyon Members outline this core in concentric half circles. According to Dibblee (1989), the Yorba Member underlies the

project area in the vicinity of the intersection of Flower and 3rd Streets and Hope and 2nd Streets (Figure 4-2).

The Yorba Member of the Puente Formation is as much as 2,950 feet thick and is generally made up of thin-bedded diatomaceous siltstone and mudstone as well as interbedded sandstone (Critelli et al. 1995; Yerkes 1972). Within the study area, the Yorba Member is described as a gray to light-brown silty clayey shale with interbedded fine to coarse-grained sandstone and lenses of diatomaceous shale (Dibblee 1989; Yerkes and Graham 1997b). This deep basin deposit is well known for its abundant and diverse assemblage of fossil fish (Eisentraut and Cooper 2002).

The Puente Formation is known to produce significant paleontological resources, including fossilized remains of sharks, fish, and marine and terrestrial mammals, as well as some of the most complete collections of marine algae and terrestrial flora. It has been assigned a high paleontological resource sensitivity (Eisentraut and Cooper 2002; McLeod 2008) for its proven potential to yield scientifically significant fossil resources.

4.3.2 Fernando Formation

The Pliocene (5 to 1.8 mya) age Fernando Formation is present in the eastern Puente Hills and much of the northeastern Los Angeles basin. The formation has been divided into two members, the Pico and the Repetto Members, which are separated by an erosional unconformity.

The Repetto Member (lower member) generally consists of a light grayish-brown to olive-brown siltstone, massive to poorly bedded, and micaceous. Several thin lenticular pebble conglomerate beds are interbedded with the fine-grained strata and form prominent outcrops. The presence of this coarse-grained material within generally fine-grained strata suggests these coarse marginal basin deposits were carried to the deeper basin center by turbidity currents.

Within the project area, the Repetto Member is described as gray to greenish-gray, partly sandy, and vaguely bedded to massive marine claystone and siltstone (Dibblee 1989, 1991; Yerkes and Graham 1997). It outcrops within the project area in the vicinity of the intersection of Flower and 3rd Streets and Hope and 2nd Streets and, according to museum records, is present immediately beneath Quaternary alluvium along Flower Street (Figure 4-2).

In addition to numerous invertebrate fossils collected from the Fernando Formation, some marine vertebrate material has also been documented, including fossilized specimens of great white shark, dolphin, herring, hake, lanternfish, mackerel, swordfish, flounder, and whale (McLeod 2005). The presence of these fossils within this geologic unit, as well as its proven potential to yield vertebrate remains in the vicinity of the study area, has resulted in the designation of the Fernando Formation as having a high paleontological sensitivity.

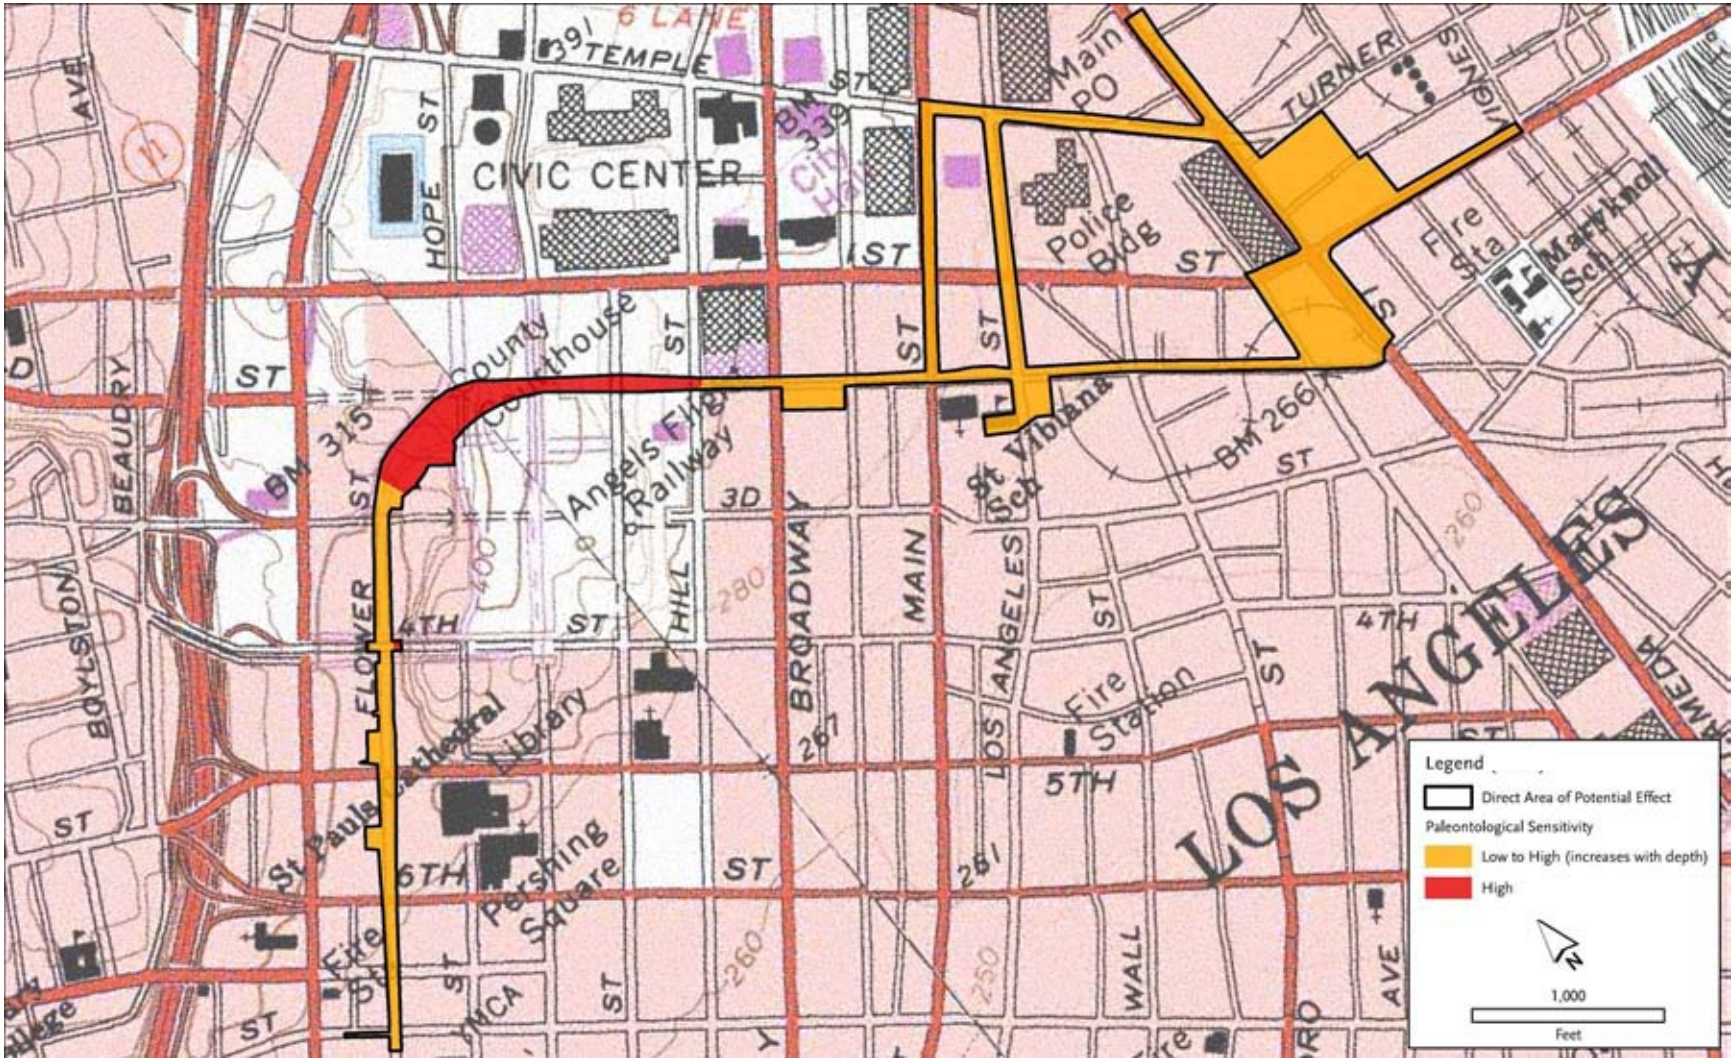
Figure 4-2. Geologic Map



Source: USGS

Figure 4-3. Paleontological Sensitivity Map

4.3.3 Quaternary Terrace Deposits

Older alluvium consists of stream channel or floodplain deposits of Pleistocene (1.8 mya to 10,000 years BP) or early Holocene (10,000 years BP to Recent) age that are no longer part of an active stream channel or its flood banks. Older alluvium in coastal southern California is usually found capping slopes and in areas of higher elevations along ridges and slopes, commonly above modern streambeds in a terrace sequence. These terrace deposits are formed by down-cutting of active stream channels and subsequent abandonment of the old channel/floodplain, resulting in a stair-step sequence of older terraces located above modern stream channels. Older alluvium generally consists of clayey sands and silts, with local concentrations of pebble to cobble conglomerate. Within the project area, Quaternary terrace deposits outcrop in the vicinity of Grand Avenue and 2nd Street (Figure 4-2).

Throughout southern California, older non-marine alluvium and terrace deposits have produced Pleistocene-age fossils from numerous localities. Sixty Pleistocene localities, exclusive of Rancho La Brea, were reviewed by Miller (1971), and many localities have been discovered since then.

Pleistocene taxa from alluvial and terrace deposits include amphibians (toad, frog, newt), reptiles (pond turtle, desert tortoise, fence lizard, alligator lizard, rattlesnake, gopher snake), birds (duck, hawk, burrowing owl, quail, coot, sparrow), and mammals (shrew, ground sloth, jack rabbit, cottontail rabbit, ground squirrel, pocket gopher, pocket mouse, kangaroo rat, deer mouse, mouse, wood rat, vole, muskrat, coyote, dire wolf, weasel, sabertooth cat, mammoth, mastodon, horse, camel, antelope, deer, bison) (Miller 1971). Older alluvium (sediments not part of an active stream channel) can provide important paleoecological data even if it does not contain the remains of extinct organisms. Older alluvium (non-marine terrace deposits) has been assigned a high paleontological resource sensitivity.

4.3.4 Quaternary Alluvium

Quaternary alluvium of Holocene age underlies the majority of the project area, from 7th and Flower Streets north to approximately 3rd and Flower Streets and from the intersection of Hill and 2nd Streets eastward (Figure 4-2). This unit consists of unconsolidated floodplain deposits of clay, silt, sand, and gravel (Dibblee 1989, 1991) that may overlie "older alluvium" of Pleistocene age at depths as shallow as 3 meters (Yerkes and Graham 1997b). Older alluvial sediments may be slightly to moderately consolidated, but are generally only distinguishable through relative dating and stratigraphic position. The Holocene-age alluvial deposits present in the western portion of the project area are estimated to be 1,000 to 10,000 years BP, and the alluvial deposits to the east are less than 1,000 years BP (Yerkes and Graham 1997b).

Holocene-age deposits contain the remains of modern organisms and are generally too young to contain fossils. Fossil localities in older Quaternary alluvium deposits throughout southern

California have yielded terrestrial vertebrates such as mammoths, mastodons, ground sloths, dire wolves, short-faced bears, saber-toothed cats, horses, camels, and bison. Fossilized invertebrates and plant remains have also been collected from this unit. Younger alluvium is determined to have a low potential for paleontological resources, but is often underlain by older alluvium, which is determined to have a high potential for paleontological resources.

4.4 Museum Records Search Results

Museum collections records maintained by the Natural History Museum of Los Angeles County (LACM) were searched, and 12 previously recorded vertebrate fossil localities were discovered either along the proposed project area or within a 2-mile radius (Table 4-1). These significant vertebrate fossil localities were discovered within the same geologic units that are present within the proposed project area (Table 4-1). These localities yielded fossil specimens of mastodon, mammoth, shark, ray, and fish from Quaternary older alluvium, the Fernando Formation, and the Puente Formation. The depth at which these localities were discovered ranges from 5 to 60 feet below the surface (McLeod 2008).

Table 4-1. Previously Discovered Paleontological Resources In and Around the Direct APE

LACM Locality Number(s) and Approximate Location	Geologic Formation	Age	Taxa
LACM 5845; Western Avenue and Beverly Boulevard	Quaternary alluvium	Pleistocene	*Mammutidae* (fossil mastodon)
LACM 3250; east of Vermont Avenue near Madison Avenue and Middlebury Street	Quaternary alluvium	Pleistocene	*Mammuthus* (fossil mammoth)
LACM 6971; 6th and Flower Streets; LACM 4726; 4th and Hill Streets	Fernando	Pliocene	*Myliobatis* (eagle ray), *Carcharodon carcharias* (white shark), *Isurus oxyrinchus* (bonito shark), *Carcharhinus* (requiem shark), *Semicossyphus* (sheepshead)
LACM 3868; Wilshire Boulevard and Lucas Avenue	Fernando Formation	Pliocene	*Carcharodon sulcidens* (white shark)

Table 4-1. Previously Discovered Paleontological Resources In and Around the Direct APE

LACM Locality Number(s) and Approximate Location	Geologic Formation	Age	Taxa
LACM 5961; 1st and Hill Streets	Puente Formation	Late Miocene	*Cyclothone* (bristlemouth fish)
LACM 6198- 6203; Wilshire Boulevard from intersection of Alvarado Street west to past Vermont Avenue	Puente Formation	Late Miocene	*Osteichthyes* (bony fish), *Cetacea* (whale)

5.0 IMPACTS

Surface fossils may be located, evaluated, and salvaged by paleontologists during a field survey prior to a surface-disturbing action. The project area surface is largely obscured by urbanization and a field survey was not warranted. However, subsurface fossils that are not visible cannot be located and evaluated prior to ground disturbance.

Any estimates of adverse impacts to subsurface fossils can be predicted only by determining the number and types of fossils that occur in the study area, based on projections derived from similar areas. The existence of subsurface fossils can be definitively determined only by monitoring excavations during surface-disturbing actions.

Direct adverse impacts on surface or subsurface paleontological resources are the result of destruction by breakage and crushing, typically in construction-related excavations. In areas containing paleontologically sensitive geologic units, surface disturbance has the potential to adversely impact an unknown quantity of surface and subsurface fossils. Without mitigation, these fossils, as well as the paleontological data they could provide if properly salvaged and documented, could be adversely impacted (destroyed), rendering them permanently unavailable.

Direct adverse impacts can typically be mitigated to below a level of significance by implementing paleontological mitigation. Mitigation also creates a beneficial effect because it results in the salvage of fossils that may never have been unearthed via natural processes. With mitigation, these newly salvaged fossils become available for scientific research, education, display, and preservation into perpetuity at a public museum.

Indirect adverse impacts typically include those effects that result from continued implementation of management decisions and resulting activities, including normal ongoing operations of facilities constructed within a given project area. They also occur as the result of constructing new access roads in areas that were previously less accessible. This increases public access and therefore increases the likelihood of the loss of paleontological resources through vandalism and unlawful collecting. No indirect impacts are expected as the result of this project because the area of potential effect is highly urbanized.

Cumulative impacts on the environment can result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions on the cumulative effects area. They can result from individually minor, but collectively significant, actions taken over a period of time.

The incremental loss of paleontological resources over a period of time as a result of project-related ground disturbance has the potential to result in significant cumulative effects because it could result in destruction of nonrenewable paleontological resources and

irretrievable loss of scientific information. However, when paleontological monitoring and mitigation is implemented prior to and during project construction, fossils are protected and information is obtained. By implementing monitoring and mitigation where feasible, the cumulative effects to paleontological resources resulting from the project would be negligible. Further, any scientifically significant fossils discovered prior to or during ground disturbances related to the proposed project would benefit the scientific community by increasing knowledge associated with the fossils.

5.1 No Build Alternative

5.1.1 Construction Impacts

The No Build Alternative, in which the project area would remain in its existing condition, would not result in construction impacts to paleontological resources because no ground disturbance would occur.

5.1.2 Operational Impacts

The No Build Alternative would not result in operational impacts to paleontological resources.

5.1.3 Cumulative and Indirect Impacts

The No Build Alternative would not result in impacts to paleontological resources. Therefore, the No Build Alternative would not contribute to a cumulative impact on these resources.

5.2 Transportation System Management (TSM) Alternative

5.2.1 Construction Impacts

The TSM Alternative may have the potential to adversely affect paleontological resources within the project area during ground disturbance related to construction of bus stop facilities. These facilities will be constructed every two to three blocks, but their precise locations have not yet been established. Should the facilities be constructed in areas of high sensitivity (See Figure 4-3), any excavations at the surface or at depth will have the potential to impact paleontological resources. Should the facilities be constructed in areas of sensitivity ranging from low to high (See Figure 4-3), any excavations occurring to a depth of 5 feet or greater below the ground surface will have the potential to impact paleontological resources. Implementation of the proper mitigation measures (Section 6.1) would reduce potential adverse impacts to a less than significant level.

5.2.2 Operational Impacts

The TSM Alternative would not result in operational impacts to paleontological resources.

5.2.3 Cumulative and Indirect Impacts

Construction of the TSM Alternative has the potential to directly affect paleontological resources within the project area should excavations related to the construction of new bus stations occur in paleontologically sensitive geologic units. Implementing the proper mitigation measures (Section 6.1) would reduce potential adverse impacts to a less than significant level. Therefore, the TSM Alternative would not contribute to a cumulative impact on these resources.

5.3 At-Grade Emphasis LRT Alternative

5.3.1 Construction Impacts

The At-Grade Emphasis LRT Alternative has the potential to adversely impact paleontological resources at the surface and at depth within the project area as a result of ground disturbance related to construction of new underground tunnel segments between 7th and Hope Streets and at new proposed stations at Flower/6th/5th Street, 2nd/Hope Street, Main/1st Street, and Los Angeles/1st Street. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or greater below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level.

5.3.2 Operational Impacts

The At-Grade Emphasis LRT Alternative would not result in operational impacts to paleontological resources.

5.3.3 Cumulative and Indirect Impacts

The At-Grade Emphasis LRT Alternative has the potential to adversely impact paleontological resources within the project area as a result of ground disturbance related to constructing new underground TBM segments on Flower Street between 7th and Hope Streets and at new stations at Flower/6th/5th Street, 2nd/Hope Street, Main/1st Street, Los Angeles/1st Street. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources.

5.4 Underground Emphasis LRT Alternative

5.4.1 Construction Impacts

The Underground Emphasis LRT Alternative involves ground disturbance and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations related to construction of a new underground

tunnel along most of the alignment; new underground stations at Flower/5th/4th Street, 2nd/Hope Street, 2nd Street station (either at Broadway or at Los Angeles Street); an automobile underpass on Alameda Street between 2nd Street and Temple Street; and a proposed pedestrian bridge at the intersection of Alameda and 1st Streets. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or more below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources will not be feasible and are thus unavoidable.

5.4.2 Operational Impacts

The Underground Emphasis LRT Alternative would not result in operational impacts to paleontological resources.

5.4.3 Cumulative and Indirect Impacts

The Underground Emphasis LRT Alternative involves ground disturbance, and therefore has the potential to adversely affect paleontological resources within the project area. This disturbance would result from excavations to construct a new underground tunnel along the alternative's alignment, three new underground stations, an automobile underpass, and a pedestrian bridge. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources. In areas where proper mitigation measures cannot be implemented, such as in areas where new underground TBM segments would be constructed, cumulative impacts may not be avoidable as a result of the Underground Emphasis LRT Alternative.

5.5 Fully Underground LRT Alternative - Little Tokyo Variation 1

5.5.1 Construction Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 1 involves ground disturbance, and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations to construct four new stations and an entirely underground tunnel located from the 7th Street/Metro Center Station to east of the intersection of 1st and Alameda Streets. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or more below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level. In areas where

new underground TBM segments would be constructed, mitigation for paleontological resources will not be feasible and are thus unavoidable.

5.5.2 Operational Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 1 would not result in operational impacts to paleontological resources.

5.5.3 Cumulative and Indirect Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 1 involves ground disturbance, and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations to construct four new stations and an entirely underground tunnel. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources. In areas where proper mitigation measures cannot be implemented, such as in areas where new underground TBM segments would be constructed, cumulative impacts may not be avoidable as a result of the Fully Underground LRT Alternative- Little Tokyo Variation 1.

5.6 Fully Underground LRT Alternative - Little Tokyo Variation 2

5.6.1 Construction Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 2 involves ground disturbance, and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations to construct four new stations, a two-level junction beneath the 1st and Alameda intersection, and an entirely underground tunnel located from east of the 7th Street/Metro Center Station to the intersection of 1st and Alameda Streets. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or greater below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level. In areas where the new underground tunnel will be constructed, mitigation for paleontological resources will not be feasible and are thus unavoidable.

5.6.2 Operational Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 2 would not result in operational impacts to paleontological resources.

5.6.3 Cumulative and Indirect Impacts

The Fully Underground LRT Alternative - Little Tokyo Variation 2 involves ground disturbance and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations to construct new stations, tunnel, and a two-level junction. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level thus reducing any cumulative impact on paleontological resources. In areas where proper mitigation measures cannot be implemented, such as in areas where new underground TBM segments would be constructed, cumulative impacts may not be avoidable as a result of the Fully Underground LRT Alternative- Little Tokyo Variation 2.

6.0 POTENTIAL MITIGATION MEASURES

6.1 Construction Impact Mitigation Measures

The following mitigation measures have been developed in accordance with the SVP (1995) standards and guidelines and meet the paleontological requirements of CEQA. These mitigation measures have been used throughout California and have been demonstrated to be successful in protecting paleontological resources while allowing timely completion of construction.

- MM-P-1. A qualified paleontologist would produce a Paleontological Monitoring and Mitigation Plan for the proposed project and supervise monitoring of construction excavations. Paleontological resource monitoring would include inspection of exposed rock units during active excavations within sensitive geologic sediments. The monitor would have authority to temporarily divert grading away from exposed fossils to professionally and efficiently recover the fossil specimens and collect associated data.

- MM-P-2. All project-related ground disturbances that could potentially affect the Puente Formation, Fernando Formation, and Quaternary older alluvium and terrace deposits would be monitored by a qualified paleontological monitor on a full-time basis (where feasible) because these geologic sediments are determined to have a high paleontological sensitivity (Figure 4-3). Very shallow surficial excavations (less than 5 feet) within Quaternary younger alluvium would be monitored on a part-time basis to ensure that underlying sensitive units are not adversely affected (Figure 4-3). Construction monitoring during any tunneling activity is not warranted as any potential fossil specimens present within sensitive geologic units would be crushed and destroyed by the nature of tunneling methodology.

- MM-P-3. At each fossil locality, field data forms would be used to record pertinent geologic data, stratigraphic sections would be measured, and appropriate sediment samples would be collected and submitted for analysis.

- MM-P-4. Due to the likelihood of the presence of microfossils, matrix samples would be collected and tested within the Puente Formation and Fernando Formation. Testing for microfossils would consist of screen-washing samples (approximately 30 pounds) to determine if significant fossils are present. Productive tests would result in screen-washing of additional bulk matrix up to a maximum of 2,000 pounds per locality to ensure recovery of a scientifically significant sample.

- MM-P-5. Recovered fossils would be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposited in a designated paleontological curation facility (such as the Natural History Museum of Los Angeles County).

- MM-P-6. The paleontologist would prepare a final monitoring and mitigation report to be filed, at a minimum with Metro and the repository.

6.2 Operational Impacts Mitigation Measures

No mitigation is required because operational impacts to paleontological resources are not expected for any of the project alternatives.

7.0 CONCLUSIONS

The potential for direct and indirect effects to paleontological resources is best estimated by the amount of ground disturbance within paleontologically sensitive units associated with a proposed action. Thus, the potential for project-related impacts to paleontological resources increases as the amount of surface disturbance within paleontologically sensitive geologic formations increases.

Construction of the project or alternatives could require substantial excavations in the paleontologically sensitive Puente Formation, Fernando Formation, and Quaternary older alluvium and terrace deposits. Implementing proper mitigation measures, including construction monitoring where feasible, would reduce potential impacts to paleontological resources to below the level of significance. However, tunneling operations cannot be mitigated for paleontological resources because construction monitoring is not feasible. The potential to impact unknown paleontological resources within sensitive geologic units as a result of tunneling would be unpredictable and in essence, unavoidable. Without mitigation, these fossils, as well as the paleontological data they could provide if properly salvaged and documented, could be adversely impacted (destroyed), rendering them permanently unavailable.

7.1 NEPA Findings

The results of this analysis indicate that the geologic units underlying the project area are paleontologically sensitive and that construction of each of the build alternatives has the potential to impact previously undiscovered (buried) paleontological resources. By implementing the mitigation measures identified in Section 6.0, the potential direct and cumulative effects to paleontological resources resulting from the TSM Alternative, the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, or the Fully Underground LRT Alternative - Little Tokyo Variation 2 would be negligible.

Furthermore, scientifically significant fossils discovered prior to or during ground disturbances related to the project would benefit the scientific community by increasing knowledge associated with the fossils. No cumulative effects would result from the No Build Alternative because no ground disturbance would occur.

7.2 CEQA Determinations

The CEQA threshold of significance for a significant impact to paleontological resources is reached when a project is determined to "directly or indirectly destroy a significant paleontological resource or unique geologic feature." In general, for project areas that are underlain by paleontologically sensitive geologic units, the greater the amount of ground disturbance, the higher the potential for significant impacts to paleontological resources.

By implementing the mitigation measures identified in Section 6.0, potential construction impacts to paleontological resources resulting from the TSM Alternative, the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative, and the Fully Underground LRT Alternative – Little Tokyo Variation 1, the Fully Underground LRT Alternative – Little Tokyo Variation 2 could be reduced to below the level of significance with the exception of areas where tunneling operations cannot be mitigated for paleontological resources. Should construction monitoring not be feasible, as would be the case during any tunneling activities, then the potential to impact unknown paleontological resources within sensitive geologic units would be unavoidable. Considering the CEQA threshold of significance with regard to paleontological resources, unavoidable impacts could occur should potentially unknown fossil resources be destroyed as a result of tunneling activities. Accordingly, a CEQA statement of overriding considerations with respect to paleontological resources would be necessary should the Underground Emphasis LRT Alternative, Fully Underground LRT- Little Tokyo Variation 1, or Fully Underground LRT – Little Tokyo Variation 2 be selected. No significant impacts would result in the No Build Alternative because no ground disturbance would occur.
